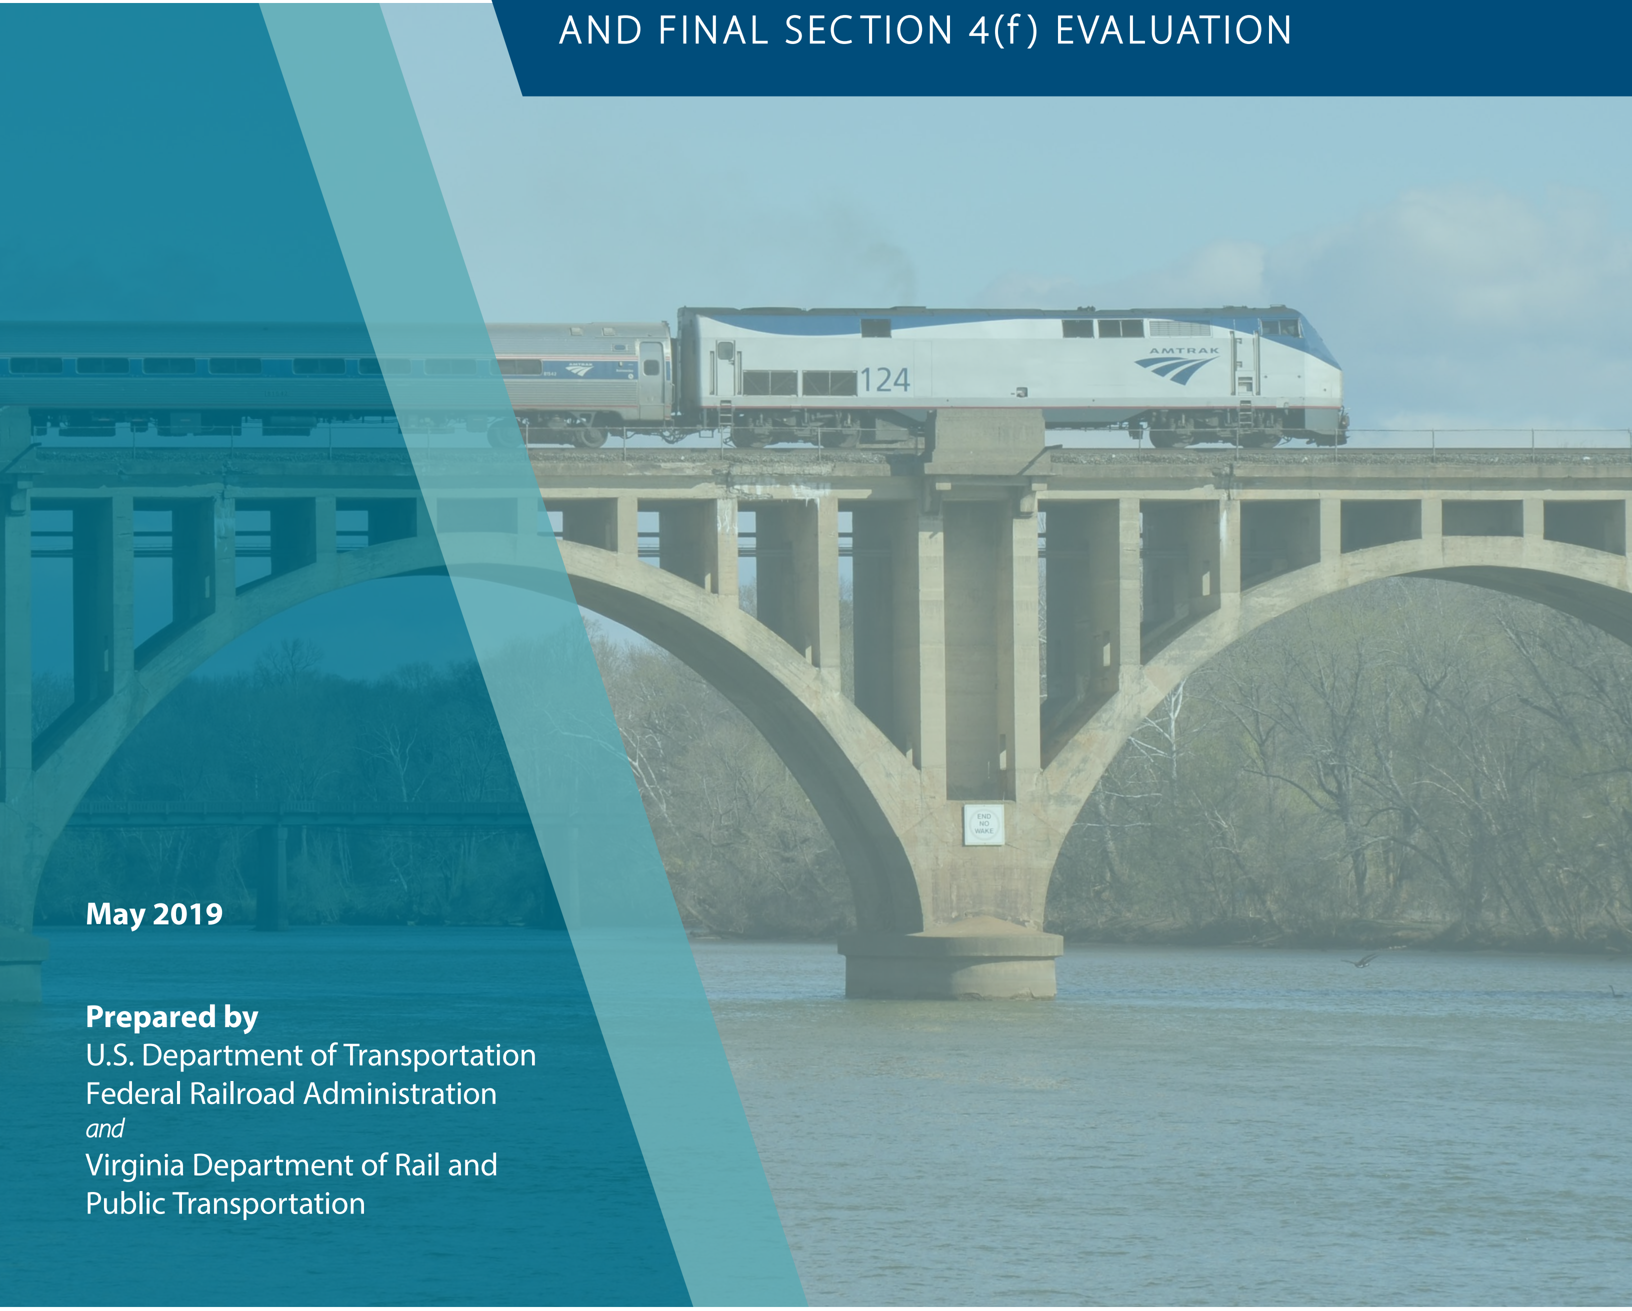
DC TO RICHMOND
SOUTHEAST HIGH SPEED RAIL

TIER II FINAL ENVIRONMENTAL IMPACT STATEMENT AND FINAL SECTION 4(f) EVALUATION



May 2019

Prepared by
U.S. Department of Transportation
Federal Railroad Administration
and
Virginia Department of Rail and
Public Transportation

DRPT
Virginia Department of Rail and Public Transportation

U.S. Department of Transportation
Federal Railroad Administration

SOUTHEAST HIGH SPEED RAIL
WASHINGTON, D.C. TO RICHMOND, VIRGINIA

TIER II FINAL ENVIRONMENTAL IMPACT STATEMENT
AND
FINAL SECTION 4(f) EVALUATION

Submitted Pursuant To:
42 U.S.C. 4332(2)(c)

By:
U.S. Department of Transportation, Federal Railroad Administration
and
Virginia Department of Rail and Public Transportation

Cooperating Agencies:

Federal Highway Administration
Federal Transit Administration
Virginia Department of Transportation

U.S. Army Corps of Engineers
U.S. Coast Guard
U.S. Environmental Protection Agency

3/10/19
Date of Approval

Jennifer Mitchell
Director
Virginia Department of Rail & Public Transportation

5/21/19
Date of Approval

Paul
Associate Administrator for Railroad Policy and Development
Federal Railroad Administration

This Tier II Final Environmental Impact Statement (EIS) defines existing and future transportation conditions and needs within the 123-mile railroad corridor from Washington, D.C. to Richmond, Virginia (DC2RVA); identifies the selection of a Preferred Alternative that will address those needs; evaluates the potential effects of the Preferred Alternative on the natural and human environments; and identifies commitments to mitigate unavoidable adverse impacts. This Final EIS incorporates by text and reference information presented in the Tier II Draft EIS for the Project that was approved by the Federal Railroad Administration on August 30, 2017. The DC2RVA corridor is part of the larger Southeast High Speed Rail (SEHSR) corridor which extends from Washington, D.C. to Charlotte, North Carolina. A Tier I evaluation of the SEHSR Corridor was completed in 2002.

FRA will prepare and submit a Record of Decision for the Project after a 30-day review period following publication of this Final EIS.

The following persons may be contacted for additional information concerning this document:

Copies of this Tier II Final Environmental Impact Statement and supporting technical information may be found on the Project website at www.DC2RVARail.com.

PROJECT COMMITMENTS

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

PROJECT COMMITMENTS

The following special commitments are the result of agency consultations, comments on the Draft Environmental Impact Statement (EIS), and regulatory requirements for the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project. Details for the basis of the commitments are included in the mitigation discussions in both the Draft and Final EIS, including the responses to agency and public comments on the Draft EIS. Each commitment has been agreed to by the Virginia Department of Rail and Public Transportation (DRPT) and will be implemented, as appropriate, in the Project's design and construction phases. The Project will be designed and constructed in increments as funding becomes available; as each Project increment is funded and moves forward through design and construction, the commitments appropriate to that specific Project increment will also be implemented. In the event that the Project is turned over to another sponsor during construction, DRPT will continue to coordinate the following commitments with that sponsor and the appropriate federal, state, and local regulatory and managing agencies.

Commitments are presented within the following topic areas:

A. Continued Coordination
  - Agency Coordination and Permits
  - Coordination with Operating Railroads
  - Coordination with Localities

B. Environmental Protection
  - Wetlands
  - Floodplains/Stormwater Management
  - Wildlife, Habitats, and Trees
  - Hazardous Materials
  - Air Quality
  - Noise and Vibration
  - Parks, Recreation Areas, and Wildlife Refuges
  - Visual and Aesthetics

C. Cultural Resources and Section 106

D. Design Requirements
  - Maintenance of Traffic/Grade Crossings
  - Pedestrian/Bicycle Facilities
  - Bridge Design
  - Utilities
  - Sustainability

E. Right-of-Way Acquisition

F. Supplemental Considerations

A. CONTINUED COORDINATION

A1 DRPT will continue to coordinate with federal and state agencies, affected localities, the general public, and other stakeholders during future phases of design and permitting in accordance with all applicable federal and state laws and regulations.

AGENCY COORDINATION AND PERMITS

A2 DRPT will continue to coordinate with the U.S. Army Corps of Engineers (USACE), U.S. Fish & Wildlife Service (USFWS), U.S. Environmental Protection Agency (EPA), National Marine Fisheries Service (NMFS), Virginia Department of Environmental Quality (DEQ), Virginia Department of Conservation and Recreation (VDCR), Virginia Department of Game and Inland Fisheries (VDGIF), Virginia Marine Resource Commission (VMRC) and other regulatory agencies regarding habitat and wildlife, including any updates to listed species, to ensure impacts are avoided to the extent practicable throughout future phases of design and permitting.

A3 For proposed activities that impact wetlands and/or surface waters, DRPT will prepare a Joint Permit Application (JPA) to be submitted to the USACE, DEQ, VMRC and local wetland boards. Proposed compensatory mitigation will be developed in coordination with the USACE during preparation of the JPA.

A3.1 ▪ Section 401 of the Clean Water Act—Water Quality Certification

A3.2 ▪ Section 402 of the Clean Water Act—National Pollution Discharge Elimination System (NPDES)

A3.4 ▪ Section 404 of the Clean Water Act—Dredge and Fill Materials

A3.5 ▪ Section 408 of the Clean Water Act—USACE permission to alter or occupy civil works projects previously constructed by the Corps such as dams, levees, or flood channels

A3.6 ▪ Code of Virginia Chapter 2, Title 62.1 Subaqueous Stream Bed Bottom—VMRC

A3.7 ▪ Section 9 of the Rivers and Harbors Act—United States Coast Guard

A3.8 ▪ Section 10 of the Rivers and Harbors Act—USACE

A3.9 ▪ MS4 Permit—Small Municipal Separate Storm Sewer Systems

A4 DRPT will consult the Regulatory In-Lieu Fee and Bank Information Tracking System (RIBITS) to investigate the availability of mitigation bank credits during future phases of design. If there are insufficient bank or in-lieu fee credits, DRPT is prepared to develop a permittee-responsible mitigation proposal in coordination with USACE early in the permitting process.

A5 DRPT will coordinate with the National Park Service (NPS) during future phases of design and construction to avoid/minimize temporary impacts to NPS properties. Should such temporary impacts be unavoidable, DRPT will ask NPS for temporary construction access permits, as required, at that time.

A6 DRPT will ensure Project conformance with applicable performance criteria for areas protected by the Chesapeake Bay Preservation Act as specified in 9VAC 25-830-130 of the Chesapeake Bay Preservation Area Designation and Management Regulations and local ordinances, including minimizing land disturbance and impervious cover.

A7 Since the DC2RVA Project would disturb more than 10,000 square feet of land, it must obtain a Virginia Stormwater Management Program (VSMP) general NPDES permit through the VDCR. A site-specific Stormwater Pollution Prevention Plan (SWPPP) will need to be prepared and implemented. The SWPPP outlines the steps and techniques the operator will take to comply with the terms and conditions of the permit, including water quality/quantity requirements that are consistent with the VSMP permit regulations, to reduce pollutants in the stormwater runoff from the construction site. The SWPPP also includes a description of post development stormwater management measures to be installed. Prior to construction, an erosion and sediment control (ESC) plan and a stormwater management plan (SMP) to ensure compliance with state law and regulations will be prepared and implemented.

A8 DRPT will submit a Federal Consistency Determination for the Preferred Alternative that analyzes the coastal effects of the Project in light of the enforceable policies of the Virginia Coastal Zone Management Program and provides commitment to comply with those policies.

COORDINATION WITH OPERATING RAILROADS

A8 Existing operations for Amtrak, Virginia Railway Express (VRE), and CSX Transportation (CSXT) will be maintained during construction to the extent practicable.

A9 DRPT will continue to coordinate with FRA, District Department of Transportation (DDOT), VRE, and the Washington Metropolitan Area Transit Authority (WMATA) on the Long Bridge project throughout the design and construction phases.

A10 DRPT will continue to coordinate with CSXT, Amtrak, and VRE to ensure proposed track improvements under DC2RVA align with any ongoing and planned station expansion projects. Additional commitments for track and station design will be the responsibility of CSXT and Amtrak.

A11 Potential Project impacts to WMATA facilities, and the zone of influence if any impacts are discovered, will be identified as part of future phases of design.

COORDINATION WITH LOCALITIES

A12 DRPT will continue to coordinate with all local governments along the Project corridor through future phases of design and construction. Specific coordination commitments include:

A12.1 ▪ Arlington County: Activities in the vicinity of Long Bridge Park.

A12.2 ▪ City of Alexandria: Coordinate future design improvements for King Street Station and associated spanning of King Street and Commonwealth Avenue.

A12.3 ▪ Fairfax County: Coordinate with Fairfax County Park Authority through future phases of design for mitigation of impacts to Fairfax County parks.

A12.4 ▪ Prince William County: Develop plans for Railroad Avenue (in Woodbridge) to determine the feasibility of providing a frontage road or alternate access, with additional review of traffic data for grade crossings as needed.

A12.5 ▪ City of Fredericksburg: Coordinate future design elements of the Lansdowne Road grade separation, station improvements, and Rappahannock River Bridge.

A12.6 ▪ Spotsylvania County: Continue to coordinate with the County to incorporate future roadway improvements.

A12.7 ▪ Henrico County: Continue to coordinate with the County and other stakeholders during the future design of the Hungary Road overpass and the U.S. Bike Route 1 connectivity.

A12.8 ▪ City of Richmond: Continue coordination and perform additional review of traffic data to update traffic conditions for existing at-grade crossings in Richmond, as required during future phases of design.

A12.9 ▪ City of Richmond: Continue coordination to develop a parking plan for Main Street Station's future intercity passenger needs in conjunction with the City's plans for its property around Main Street Station and other development within Shockoe Bottom.

B. ENVIRONMENTAL PROTECTION

WETLANDS

B1 Efforts to avoid and minimize impacts to wetlands will continue into future phases of design. At that time, the functions, values and condition of wetlands and the availability of mitigation sites will be evaluated. DRPT will use the methodology in use by USACE at the time of application for determining compensation requirements.

B2 A formal jurisdictional determination will be submitted to the USACE during the Joint Permit Application process during future phases of design.

FLOODPLAINS/STORMWATER MANAGEMENT

B3 The Project will be designed and constructed in accordance with Executive Order 11988—Floodplain Management; 23 CFR 650 Subpart A—Location and Hydraulic Design of Encroachments on Flood Plains, and the Virginia Erosion and Sediment Control Regulations, and the Virginia Stormwater Management Law and regulations.

B4 DRPT will coordinate with the Federal Emergency Management Administration (FEMA) to determine if a Conditional Letter of Map Revision (CLOMR) and a subsequent final Letter of Map Revision (LOMR) are required for the Project. Floodplain development permits will be obtained from the local jurisdictions and include a no-rise/impact certification for each regulated floodplain/floodway and/or non-encroachment area crossing or a submittal for a CLOMR per 44 CFR Section 65.12.

B5 Placement of stormwater management facilities will avoid wetlands and other aquatic habitats, to the extent feasible.

B6 DRPT will develop and submit to DEQ site-specific Stormwater Management (SWM) and Erosion and Sediment Control (E&SC) plans.

WILDLIFE, HABITATS, AND TREES

B7 To the maximum extent practicable, DRPT will avoid grading and construction during migratory bird breeding season. If construction is necessary during the breeding season, DRPT will conduct nest surveys, if necessary, and will avoid activities within 100 feet of active nests, where possible.

B8 Bottomless culverts and single-span bridges will be considered at smaller streams to maintain fish passage and channel morphology and to avoid instream work to the extent practicable.

B9 DRPT will continue to consider special design features to improve wildlife corridors. DRPT will evaluate providing oversized culverts and extended bridges in areas where habitat fragmentation would occur.

B10 DRPT will continue coordination with USFWS, VDGIF, and NMFS pursuant to Section 7 of the Endangered Species Act of 1973, as amended, for potential impacts to federally listed species, where required during future phases of design and permitting.

B11 Detailed maps depicting the location of new structures, including areas of pile driving and detailed descriptions of the proposed work, will be provided to VDGIF for review and comment during future phases of design. VDGIF's comments and proposed Time of Year restrictions will be incorporated in the DEQ and/or VMRC permit conditions.

B12 Construction contract documents will include appropriate measures to protect mature trees along the limits of disturbance.

B13 DRPT will provide special provisions for work in waters containing submerged aquatic vegetation (SAV). During future phases of design, DRPT will submit a request to remove SAV from, or plant SAV on, state-administered benthic surfaces as part of a JPA to the VMRC.

HAZARDOUS MATERIALS

B14 DRPT will comply with the requirements for solid and hazardous wastes and hazardous materials specified by DEQ during construction. Prior to the acquisition of right-of-way and construction, thorough site investigations (Phase I or Phase II Environmental Site Assessment, as appropriate) will be conducted, as required, to determine whether any of the sites are contaminated, and, if so, the nature and extent of that contamination. Any additional hazardous material sites discovered during construction will be removed and disposed of in compliance with all applicable federal, state, and local regulations. All structures being demolished, renovated, and/or removed will be inspected for asbestos containing materials (ACM) and lead-based paint (LBP) prior to demolition. If ACM or LBP are found, in addition to the federal waste-related regulations, state regulations for ACM and for LBP will be followed. All necessary remediation will be conducted in compliance with applicable federal, state, and local environmental laws and will be coordinated with the EPA, DEQ, and other federal or state or local agencies as necessary.

B15 All solid waste, hazardous waste, and hazardous materials generated by the Project will be handled and managed in accordance with federal, state and local regulations, including the Virginia Solid Waste Management Regulations.

AIR QUALITY

B16 DRPT will follow the Virginia Department of Transportation (VDOT) Road and Bridge Specifications during design and construction. Dust suppression or containment systems will be implemented, as appropriate, to minimize migration of fugitive dust and airborne contaminants.

B17 DRPT will take all reasonable precautions during Project construction to limit the emissions of volatile organic compounds (VOC) and nitrogen oxides ($NO_{x)}$ and will adhere to limitations on the use of "cut-back" during construction consistent with 9 VAC 5-45-780 *et seq*.

NOISE AND VIBRATION

B18 Noise and vibration mitigation will be addressed during future phases of design using FRA's High-Speed Ground Transportation Noise and Vibration Impact Assessment (September 2012) procedures.

B19 DRPT will coordinate with CSXT to mitigate vibration impacts related to freight trains on realigned or new tracks.

B20 DRPT will consider implementing a community liaison program to address noise and vibration impacts and mitigation during future phases of design of the Project, as applicable.

PARKS, RECREATION AREAS, AND WILDLIFE REFUGES

B21 DRPT will continue coordination with owners and operators of federal, state, and local parks, recreational areas and wildlife refuges throughout future phases of design and construction. Any land that is temporarily impacted will be restored and stabilized through revegetation to as near its prior condition as possible after construction, and the activities of the facility not be affected during the timeframe of the temporary impacts. Access and connectivity to parks and trails will be maintained throughout construction.

B22 Impacts to the existing trees and vegetation within the existing right-of-way will be minimized to the greatest extent practical to maintain the visual buffer between parks and the rail corridor.

VISUAL AND AESTHETICS

B23 DRPT will continue to work with affected communities during the future phases of design on the nature and style of design for visually-significant structures, such as the major waterway crossings of the Occoquan River, Neabsco Creek, Rappahannock River, and James River

C. CULTURAL RESOURCES AND SECTION 106

C1 A "process" Programmatic Agreement (PA) for the Washington, DC to Charlotte, NC high speed rail corridor was developed during the Tier I phase of the Project. A Section 106 Memorandum of Agreement (MOA) is currently under development for the DC2RVA Project to outline the Project commitments under Section 106 of the National Historic Preservation Act; Appendix K of this Final EIS is the Draft MOA. The Final Section 106 MOA will be included in the Record of Decision (ROD) for this Project.

C2 As part of the Section 106 process, DRPT, in consultation with the Virginia Department of Historic Resources (DHR), identified 21 historic properties along the DC2RVA corridor that would be adversely affected by the Project. This includes four buildings, two structures, seven historic districts, and eight archaeological sites. Specific Section 106 mitigations for each of these resources are presented in the following (in north to south order):

- C2.1 Richmond, Fredericksburg and Potomac Railroad (RF&P) (500-0001)
  - C2.1.1 Architectural evaluation/Phase II-level study of bridges to be demolished as part of the Project that are contributing elements to the railroad district
  - C2.1.2 Oral histories of two individuals with an in-depth knowledge/long tenure working on structures along historic RF&P rail line
  - C2.1.3 Creation of an online Project map/story board to highlight historic properties along the corridor
- C2.2 RF&P Bridge over Occoquan River (500-0001-0022)
  - C2.2.1 Design review of new structure to assure historic resource compatibility
  - C2.2.2 Historic American Engineering Record (HAER) documentation of extant structure to include measured drawings, large-format photographs, archival research and production of HAER report
- C2.3 Rippon Lodge (076-0023)
  - C2.3.1 Design review of new railroad structures near the Rippon Lodge to assure historic resource compatibility
  - C2.3.2 Cultural landscape study of the Neabsco Creek watershed between Rippon Lodge and the Neabsco Creek bridge
  - C2.3.3 Interpretive sign on Neabsco Creek watershed to be placed near the Rippon Lodge/Neabsco Creek in a location deemed suitable by Prince William County
  - C2.3.4 Restoration of the viewshed between Rippon Lodge and the Neabsco Creek rail bridge through the removal of underbrush
- C2.4 Civil War Campsite (Site 44ST1223)
  - C2.4.1 Archaeological data recovery at the portion of the site to be impacted by the Project
  - C2.4.2 Installation of interpretive sign on archaeology and camp life in a location deemed appropriate by NPS-Fredericksburg
  - C2.4.3 Scholarly article discussing the historical and archaeological importance of the site
- C2.5 Rappahannock River Railroad Bridge & Structures/ Platform (111-0132-0025)
  - C2.5.1 Design review of new railroad structures to assure historic resource compatibility
  - C2.5.2 Historic American Engineering Record (HAER) documentation of extant structures to include measured drawings, large-format photographs, archival research, and the production of HAER report
  - C2.5.3 Cultural landscape study of the Rappahannock River watershed and historic transportation crossings within the City of Fredericksburg
- C2.6 Bridge/Marye's Mill (Site 44SP0178), Block 49 (Site 44SP0688), and Block 48 (Site 44SP0687)

C2.6.1 – Archaeological data recovery at the portions of each site to be impacted by the Project
C2.6.2 – Scholarly article discussing the historical and archaeological importance of these three sites
C2.6.3 – Lecture presented to the general public on the history and archaeology of the three sites
C2.6.4 – Museum display in new Fredericksburg passenger station to highlight the sites and showcase artifacts retrieved during data recovery
C2.6.5 – Interpretive sign to be placed within or near Fredericksburg passenger station describing the archaeology of the area
C2.7 ▪ Fredericksburg Historic District (111-0132)
C2.7.1 – Design review of new parking deck and passenger station to assure historic district compatibility
C2.7.2 – Development of historic context on the evolution of the rail system in downtown Fredericksburg
C2.7.3 – Lecture for the general public on the results of the contextual study on the evolution of the railroad in Fredericksburg
C2.7.4 – Abbreviated narrative for use in developing a webpage on the history of the railroad in Fredericksburg, as well as details of the Project
C2.8 ▪ Earthwork/Jackson's Earthwork (Site 44SP0468)
C2.8.1 – Archaeological data recovery at the portion of the site to be impacted by the Project
C2.8.2 – Installation of interpretive sign on archaeology and camp life in a location deemed appropriate by NPS-Fredericksburg
C2.8.3 – Scholarly article discussing the historical and archaeological importance of the site
C2.9 ▪ Doswell Historic District (042-5448)
C2.9.1 – National Register of Historic Places (NRHP) nomination form for the historic district
C2.9.2 – Virginia state historical highway marker on the Doswell Historic District
C2.9.3 – Abbreviated narrative for use in developing a webpage on the history of Doswell, as well as details of the Project
C2.10 ▪ Doswell Depot and Tower (042-0093)
C2.10.1 – Historic American Building Survey (HABS) documentation of the tower to include measured drawings, large-format photography, archival research, and production of a HABS report
C2.10.2 – Move tower from limits of disturbance to new site adjacent to tracks but outside Project limits
C2.10.3 – Interpretive sign on the history of the resource to be placed within or near depot or tower

- C2.11 ▪ Berkleytown Historic District (166-5073)
  - C2.11.1 – Design review of new road structure (Vaughan Road) to assure historic district compatibility
  - C2.11.2 – Oral histories of two individuals with long tenure living or working in district
  - C2.11.3 – NRHP nomination form for the historic district
  - C2.11.4 – Create text for historic walking tour of district in consultation with Town of Ashland and Ashland Museum
  - C2.11.5 – Virginia state historical highway marker on the Berkleytown Historic District
- C2.12 ▪ Laurel Industrial School Historic District (043-0292) and Main Building/Robert Styles Building (043-0292-0001)
  - C2.12.1 – Design review of new road structure (Hungary Road) to assure historic district compatibility
  - C2.12.2 – Historic context on late-nineteenth/early-twentieth century reform schools in Central Virginia
  - C2.12.3 – Series of georeferenced, GIS-based overlays to illustrate the evolution of the landscape and road system in this area
  - C2.12.4 – Interpretive sign to be placed within or near Main Building/Robert Styles Building on the history of the resource
- C2.13 ▪ Shockoe Valley & Tobacco Row Historic District (127-0344)
  - C2.13.1 – Design review of platform and other station modifications to assure historic district compatibility
  - C2.13.2 – Development of historic context on the association of the slave trade and the RF&P railroad/the downtown Richmond segment of the Virginia Central Railroad and other precursors of the Chesapeake and Ohio/Seaboard Railroad
  - C2.13.3 – Lecture presented to the general public on the association of the slave trade and the RF&P railroad/the downtown Richmond segment of the Virginia Central Railroad and other precursors of the Chesapeake and Ohio/Seaboard Railroad
  - C2.13.4 – Work with City of Richmond and others to create boundaries for a potential slave trade-related historic district in Shockoe Bottom
  - C2.13.5 – Fabrication and installation of a Virginia state historical highway marker documenting the slave trade and nearby associated sites
- C2.14 ▪ Main Street Station Parking Lot/Railroad (Site 44HE1098), Railroad/Warehouse (Site 44HE1097), and Warehouse (Site 44HE1094)
  - C2.14.1 – Archaeological data recovery at the portions of each site to be impacted by the Project
  - C2.14.2 – Scholarly article discussing the historical and archaeological importance of these four sites

C2.14.3 – Lecture presented to the general public on the history and archaeology of the four sites

C2.14.4 – Interpretive sign describing the postbellum and 20th century history and archaeology of the area to be placed within or near Main Street Station

C2.15 ▪ Main Street Station and Trainshed (127-0172)

C2.15.1 – Design review of platform modifications to assure resource compatibility

C2.15.2 – Development of historic context on the evolution of the rail system in downtown Richmond

C2.15.3 – Creation of webpage documenting the evolution of the rail system in downtown Richmond

C2.16 ▪ Seaboard Air Line Railroad Corridor (127-6271)

C2.16.1 – Design review of modifications to contributing elements to the district to assure resource compatibility

C2.16.2 – Development of historic context on railroad depots and associated facilities along the Seaboard Air Line Railroad in Virginia

C2.16.3 – Document stations and towers that are contributing elements to the Seaboard Air Line Railroad that have not been previously recorded with the Virginia SHPO

C3 As part of the NEPA process but outside of Section 106, DRPT, in consultation with FRA and the DHR, have committed to the following stipulations regarding the Grave Yard for Free People of Color and Slaves (44HE1203) in Richmond:

C3.1 – Completion of a landscape analysis of site 44HE1203 and surrounding area to understand the chronology of area development, including revisiting site boundaries and NRHP eligibility

C3.2 – Archaeological testing within the final limits of disturbance in the area of site 44HE1203 to examine the subsurface integrity and ascertain the potential for intact burials

C3.3 – Archaeological monitoring by a Secretary of the Interior-qualified archaeologist during all DC2RVA construction-related ground disturbing activities in this area to assure that no unanticipated/undiscovered archaeological or burial remains are encountered during ground-disturbing construction

D. DESIGN REQUIREMENTS

MAINTENANCE OF TRAFFIC/GRADE CROSSINGS

D1 Detailed traffic control plans to minimize construction impacts will be developed as part of future phases of design.

D2 Access will be maintained to all properties, including residential properties, during construction and will be coordinated with First Responders.

D3 The specific dynamic crossing safety technology to control exit gates (such as embedded loops or radar) will be determined during future design phases of the Project and is subject to FRA approval at the time of that design.

D4 For private at-grade crossings, DRPT will coordinate with CSXT and property owners to review or confirm means of access to each property, including specific features of locking gates at each crossing identified for such treatment, during future phases of design. At-grade crossing treatments are subject to FRA approval at the time of that design.

PEDESTRIAN/BICYLE FACILITIES

D5 DRPT will continue to work with NPS throughout future phases of design and will maintain trail connectivity and functionality throughout Project construction activities that affect the Mount Vernon Trail.

D6 The DC2RVA Project will address and improve, as necessary, bike/pedestrian safety warning devices at all public crossings along the DC2RVA rail corridor, in keeping with the Project's Basis of Design, ADA requirements, and applicable FRA, Amtrak, CSXT, and VDOT safety standards, as well as local agencies' multimodal plans so as not to preclude any planned connections.

BRIDGE DESIGN

D7 Future phases of design of major water crossings will at a minimum, match the existing horizontal and vertical openings of the existing crossings. Construction phasing will address impacts to recreational uses.

D8 DRPT will coordinate with the Virginia Department of Conservation and Recreation (VDCR) regarding bridge design at scenic river crossings.

D9 DRPT will coordinate with Prince William County on the design and aesthetic features of the Occoquan River and Neabsco Creek rail bridges.

D10 DRPT will coordinate with the City of Fredericksburg on the design and aesthetic features of the Rappahannock River rail bridge.

D11 DRPT will coordinate with the City of Richmond on the design and aesthetic features of the James River rail bridge.

UTILITIES

D12 DRPT will coordinate with local utilities to identify potential impacts to public water distribution systems or sanitary sewage collection systems during future phases of design.

D13 DRPT will inform local communities regarding utility impacts and will develop appropriate measures to minimize or mitigate impacts to the community.

D14 DRPT will coordinate with utility owners, including Dominion Virginia Power, during future phases of design to identify potential conflicts with utilities outside of CSXT right-of-way and to coordinate the location of planned utilities outside of CSXT right-of-way to reduce or eliminate potential future conflicts.

D15 DRPT will submit an application to the local health department(s) to relocate any onsite sewage systems that may be impacted by construction.

SUSTAINABILITY

D16 DRPT will consider energy, environmental, and sustainability concepts listed in the LEED Green Building Rating System for facilities, to the extent practicable.

E. RIGHT-OF-WAY ACQUISITION

E1 Details of the construction easements and restoration plans will be developed in coordination with public and private landowners during future phases of design.

E2 The acquisition of right-of-way and the relocation of displaced persons and businesses will be performed by the Virginia Department of Transportation (Right-of-Way Administration office) and conducted in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (42 U.S.C. 4601), and 24 Virginia Administrative Code (VAC) 30–41.

F. SUPPLEMENTAL CONSIDERATIONS

F1 If during future phases of design, the Project's design or impacts exceed the NEPA commitments established in this Final EIS or the ROD, then DRPT will re-evaluate the design and/or the NEPA documentation.

F2 Potential impacts to environmental resources as identified in this Final EIS will be reconfirmed as part of future phases of design and permitting.

DC TO RICHMOND
SOUTHEAST HIGH SPEED RAIL

TIER II FINAL ENVIRONMENTAL IMPACT STATEMENT AND FINAL SECTION 4(f) EVALUATION

EXECUTIVE SUMMARY

May 2019

Prepared by
U.S. Department of Transportation
Federal Railroad Administration
and
Virginia Department of Rail and Public Transportation

DRPT
Virginia Department of Rail and Public Transportation

U.S. Department of Transportation
Federal Railroad Administration

FOR ADDITIONAL INFORMATION

The Final EIS contains detailed information on the topics summarized in this Executive Summary, as shown in the below table.

TOPIC	FINAL EIS CONTENT	
A. INTRODUCTION & PROJECT OVERVIEW	**Chapter 1**	Introduction
	Chapter 2	Overview of Public Involvement & Agency Coordination
	Appendix A	Errata to the Draft EIS
	Appendix B	Agency and Organization Comments
	Appendix C	Detailed Responses to Public Comments
B. PREFERRED ALTERNATIVE	**Chapter 3**	Additional Information
	Chapter 4	Selection of the Preferred Alternative
	Appendix F	Refined Operations Analysis Modeling Technical Memos
	Appendix G	Final Town of Ashland /Hanover County Community Advisory Committee Summary Report
	Appendix H	Resolution of the Commonwealth Transportation Board
	Appendix I	DC2RVA Recommendation Report for the Preferred Alternative
	Appendix J	Richmond Turning Wye Memo
	Appendix L	Preferred Alternative Mapbook
C. ENVIRONMENTAL EFFECTS & MITIGATION	**Chapter 5**	Environmental Consequences of the Preferred Alternative
	Chapter 6	Final Section 4(f) Evaluation
	Preface	Project Commitments
	Appendix D	Updated Cultural Resources Reports
	Appendix E	Updated Section 106 and Section 4(f) Comments and Coordination
	Appendix K	Draft Memorandum of Agreement
	Appendix M	Updated Environmental Resource Mapbooks
D. FUTURE STEPS	Chapter 7	Overview of Future Steps

This Executive Summary provides a high-level, concise summary of the Preferred Alternative for the Washington, D.C. to Richmond, VA Southeast High Speed Rail (DC2RVA) Project, as evaluated in the Final Environmental Impact Statement (EIS). It is not intended to present all data and analyses, but rather to summarize key changes since the publication of the Draft EIS in September 2017 and to present the Preferred Alternative, which is new to the Final EIS.

Readers who are interested in the full detailed analyses should refer to the chapters and technical appendices of the Final EIS, as summarized on the inside cover of this Executive Summary.

A. INTRODUCTION & PROJECT OVERVIEW......... 1

ENVIRONMENTAL RESOURCES RECAP.......... 29-32
ENVIRONMENTAL IMPACT SUMMARY.......... 33-35
D. FUTURE STEPS...............................39-41

Copies of the Draft and Final EIS documents and their technical appendices are available on the Project website: www.DC2RVARail.com

A. INTRODUCTION & PROJECT OVERVIEW

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are proposing passenger rail service and rail infrastructure improvements in the 123-mile north-south corridor between Washington, D.C. and Richmond, VA—collectively known as the Washington, D.C. to Richmond, VA Southeast High Speed Rail (DC2RVA) Project.

WHAT IS THE FINAL EIS FOR THE DC2RVA PROJECT?

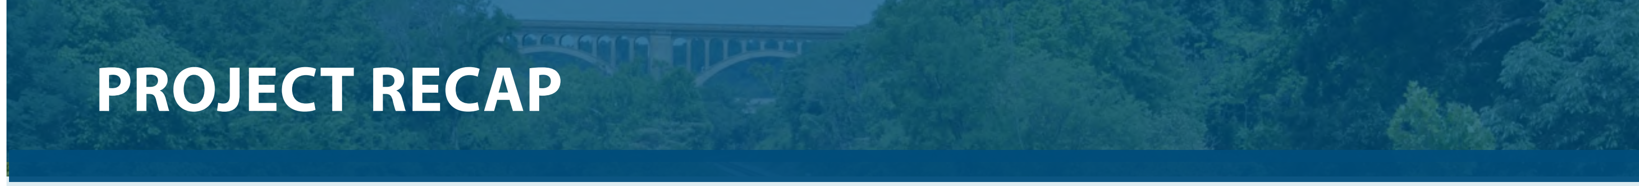
The Project is being evaluated through the mechanism of an Environmental Impact Statement (EIS) to satisfy the requirements of the National Environmental Policy Act (NEPA). The Final EIS follows the Draft EIS for the Project, which was published for public review in September 2017.

The Final EIS focuses on information that is new, revised, or updated since the publication of the Draft EIS. It is presented in a "condensed" format, consistent with the Council of Environmental Quality (CEQ) recommendations, that allows the reader to easily identify the reasons for selecting the Preferred Alternative (which is new to the Final EIS) and the potential environmental impacts and avoidance/mitigation measures associated with the Preferred Alternative.

HOW IS THE FINAL EIS DIFFERENT FROM THE DRAFT EIS FOR THIS PROJECT?

The main elements of the Draft EIS are provided below, with comparison to the Final EIS. The Final EIS format references and summarizes information presented in the Draft EIS, but to avoid duplication, does not republish the Draft EIS content to the same level of detail.

- **Purpose and Need:** There are no changes (only clarifications) to the Purpose and Need between the Draft and Final EIS.
- **Alternatives:** The Draft EIS summarized the alternatives development process and provided details on the six alternative areas of the corridor and the 23 Build Alternatives within those areas. The Final EIS evaluates the Preferred Alternative; it connects a Build Alternative from each of the six alternative areas evaluated in the Draft EIS to form the 123-mile route through the Project corridor that makes up the Preferred Alternative. Alternatives evaluations in both the Draft and Final EIS are based on conceptual engineering (approximately a 10 percent level of design). All design modifications that occurred after the Draft EIS are noted in the Final EIS.
- **Affected Environment:** The Draft EIS presented a full description of existing conditions of the Project corridor, which have not significantly changed since that time.
- **Environmental Consequences:** The Draft EIS presented the potential effects on the environment of all 23 Build Alternatives, while the Final EIS presents potential impacts of only the Preferred Alternative. Refinements to the conceptual engineering resulted in design changes – and therefore changes to anticipated environmental impacts – between the Draft and Final EIS.
- **Section 4(f) Evaluation:** The Final EIS presents the Final Section 4(f) Evaluation in the same format as the Draft Section 4(f) Evaluation, with updates to ongoing coordination and findings, but no changes to the evaluation process.
- **Public Involvement and Agency Coordination:** Both documents summarize the agency coordination and public outreach during the development of the Project to date.

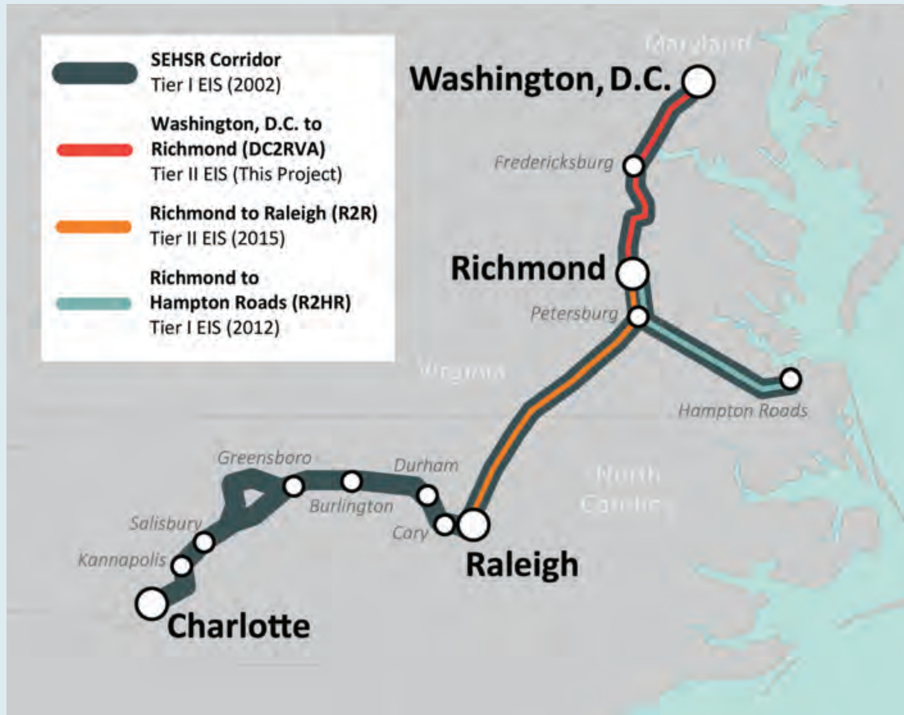


PROJECT RECAP

PURPOSE AND NEED

- The DC2RVA Project's stated purpose is to increase railroad capacity between Washington, D.C. and Richmond, VA to deliver higher speed passenger rail service, while also supporting the planned expansion of Virginia Railway Express (VRE) commuter rail service and accommodating the forecasted growth of freight rail service.
- The Project is a Tier II NEPA study that builds upon the previous Tier I documentation for the Southeast High Speed Rail (SEHSR) corridor between Washington, D.C. and Charlotte, NC that established:
  - The use of existing fossil fuel locomotive technology
  - The use of existing rail corridors (in preference to new alignments)
  - Building the corridor in incremental sections as funds become available

THE SEHSR CORRIDOR



DC2RVA PROJECT QUICK FACTS:

- **123-mile corridor, consisting primarily of two existing main tracks**
- **Northern Terminus: South of Long Bridge (across the Potomac River) in Arlington, VA**
- **Southern Terminus: Centralia in Chesterfield County, VA (south of Richmond)**
- **Shared rail corridor:**
  - **Amtrak provides intercity passenger rail service**
  - **VRE provides commuter rail service**
  - **CSX Transportation (CSXT) owns the tracks and provides freight rail service**
- **The Project will increase passenger trains speeds, where practicable, up to 80 to 90 mph**
- **The Project includes both passenger rail service and rail infrastructure improvements:**
  - **Increased intercity passenger train frequency (i.e., more trains)**
  - **Improved on-time performance of existing service**
  - **Increased rail capacity (i.e., an additional track)**
  - **Improved station areas and roadway crossings, as needed**
- **The Draft EIS for the Project:**
  - **Evaluated 23 Build Alternatives in six Alternative Areas**
  - **Was published in September 2017**
  - **Was followed by a 60-day review period with 5 public hearings**

HOW IS THE TIER II DC2RVA PROJECT DIFFERENT FROM PREVIOUS DOCUMENTATION?

The DC2RVA Project is the second part of a two-tiered environmental process. A first-level Tier I EIS and Record of Decision (ROD) were completed in 2002 for the 500-mile SEHSR corridor between Washington, D.C. and Charlotte, NC.

The 2002 Tier I EIS defined much of the framework upon which the DC2RVA Project is based, including: using existing fossil fuel locomotive technology, upgrading existing rail corridors in preference to new alignments, and building the corridor in incremental sections as funds become available.

The 2002 Tier I EIS also established the overall purpose for the SEHSR corridor: to provide a competitive transportation choice to travelers within the Washington, D.C. to Richmond, Raleigh, and Charlotte travel corridor.

This DC2RVA Tier II EIS carries forward the Purpose and Need of the 2002 Tier I EIS and further builds upon it by recognizing and incorporating several key corridor-specific items that are unique to the Project:

- Recognition that the Project corridor is owned and operated by CSXT
- Creation of a 90 mph maximum authorized speed for intercity passenger trains
- Accommodation of VRE commuter trains, which operate within a portion of the corridor
- Accommodation of CSXT's freight service

It is important to note that subsequent to the 2002 Tier I EIS, the SEHSR corridor was extended south and east to Hampton Roads, VA (to destinations in Norfolk and Newport News). In 2012, FRA and DRPT completed a Tier I EIS and ROD for the Richmond to Hampton Roads (R2HR) project to cover the SEHSR extension. The proposed service plan for the DC2RVA Project includes new train service from both the 2002 Tier I EIS and the 2012 R2HR project – see Section B of this Executive Summary for details.

WHAT HAS HAPPENED BETWEEN THE DRAFT EIS AND THE FINAL EIS?

The selection of the Preferred Alternative, as presented in the Final EIS, included the following considerations that occurred after publication of the Draft EIS:

- Public, agency, and organization comments on the Draft EIS during the 60-day comment period
- Extensive outreach and communication with the public, stakeholders, and elected officials, including five public hearings for the Project
- Additional rail operations simulation analysis to test the infrastructure proposed in the Draft EIS
- Recommendation of the Town of Ashland/Hanover County Community Advisory Committee (CAC)
- Commonwealth Transportation Board (CTB) Resolution for the Project
- Refinement of feasible alternatives of the Long Bridge project, a separate project by the District Department of Transportation (DDOT) in Washington, D.C.
- Refinement to the conceptual engineering, which resulted in both design changes to the proposed Project infrastructure as well as changes to anticipated environmental impacts of the Project, from:
  - Further minimization of potential impacts, based on comments from the public and review agencies
  - New data either provided or discovered during the Draft EIS review period

HOW WERE COMMENTS ON THE DRAFT EIS INCORPORATED INTO THE FINAL EIS?

The 60-day comment period for the Draft EIS was from September 8, 2017 to November 7, 2017. During this time, DRPT received comments from 34 agencies and organizations, and more than 14,000 comments from 4,247 individual commenters, with most citizens commenting on several topics or issues. DRPT and FRA have reviewed and taken into consideration all comments received on the Draft EIS during the decision-making process, which led to the selection of the Preferred Alternative in the Final EIS.

DRPT and FRA do not view the public comment process as a "vote counting" exercise but rather one seeking substantive comments that benefit the FRA and DRPT in their final decision-making process. The public comment process is also an opportunity for the public to inform FRA or DRPT of potential concerns or conditions that were not identified during the preparation of the Draft EIS.

Responses to substantive comments – those that question, with reasonable basis, the accuracy of information and methodology in the Draft EIS or present new information not considered in the Draft EIS – are incorporated and addressed by way of providing additional or revised information and analyses, as needed, in the appropriate sections of the Final EIS.

The following types of comments were received:

- Overall position/opinion for or against the Project
- Preference for and/or opposition to a specific Build Alternative or infrastructure/service element that was evaluated in the Draft EIS, both in general as well as with specific concerns
- Suggestion of additional alternatives to consider, many of which were considered but dismissed during the 2002 Tier I EIS, do not align with the implementing actions that were the outcome of the 2002 Tier I EIS, or do not align with the DC2RVA Purpose and Need
- Request for detailed information or data that is beyond the scope of an environmental document and would be developed during future design phases of the Project

FOR DETAILED RESPONSES TO COMMENTS, REFER TO:

- Appendix B for agency and organization responses
- Appendix C for general public responses

The responses include reference to information provided in both the Draft and Final EIS documents; some responses are the outcome of ongoing analyses and coordination that have occurred since the publication of the Draft EIS that are revised and/or updated in the Final EIS.

FOR REFERENCE:

The chapters of the Final EIS are arranged in chronological order, representing the sequential order of events since the publication of the Draft EIS.

FINAL EIS CHAPTER 1:

Introduction

This chapter guides the reader on how information is presented in the Final EIS. It provides the Project background, including how it relates to previous projects in the corridor, as well as the Project overview, which provides a concise synopsis of the Draft EIS documentation and the Project Purpose and Need.

FINAL EIS CHAPTER 2:

Overview of Public Involvement and Agency Coordination

This chapter describes the public involvement and agency outreach that has occurred since the initiation of the Project. It includes a summary of comments received on the Draft EIS; a complete compilation of comments and responses are included as Appendix B and C to the Final EIS.

FINAL EIS CHAPTER 3:

Additional Information

This chapter presents additional material that provides the reader with a better understanding of various Project elements, in response to comments received on the Draft EIS. FRA and DRPT developed this additional material to document ongoing activities and coordination efforts that extended beyond the Draft EIS that were relevant to the selection of the Preferred Alternative, including historical context within the corridor and additional rail operations modeling simulations.

FINAL EIS CHAPTER 4:

Selection of the Preferred Alternative

This chapter presents the elements of the Preferred Alternative in each of the six alternative areas in the Project corridor, and the reason for the selection of each. It also describes any modifications to the Preferred Alternative since publication of the Draft EIS.

FINAL EIS CHAPTER 5:

Environmental Consequences of the Preferred Alternative

This chapter documents the potential impacts of the Preferred Alternative to each of the environmental resources presented in the Draft EIS. The quantitative range of impacts of the other Build Alternatives from the Draft EIS are provided for comparison purposes only, and efforts to further minimize and mitigate impacts for the Preferred Alternative are described.

FINAL EIS CHAPTER 6:

Final Section 4(f) Evaluation

This chapter presents the Final Section 4(f) Evaluation, which includes updates since the Draft evaluation, results of agency coordination, a summary of all Section 4(f) comments, a least harm analysis, and the basis for a finding that there are no feasible or prudent alternatives to the use of any Section 4(f) properties, when applicable.

FINAL EIS CHAPTER 7:

Overview of Future Steps

This chapter describes the anticipated sequence of events following the publication of the Final EIS.

FINAL EIS APPENDICES

The text and figures that comprise the Final EIS are supported by a series of detailed appendices, as summarized in the table on the inside cover of this Executive Summary. Two appendices provide updated mapping of the Preferred Alternative: Appendix L provides a detailed mapbook of the Preferred Alternative, including permanent and temporary limits of disturbance, and Appendix M provides updated environmental resource mapbooks, as required.

B. PREFERRED ALTERNATIVE

WHAT IS THE PREFERRED ALTERNATIVE FOR THE DC2RVA PROJECT?

The Preferred Alternative includes the following in the DC2RVA corridor:

An intercity passenger rail service plan with increased passenger train frequency (i.e. more trains) and improved on-time performance of existing intercity passenger rail service

A physical infrastructure modification plan to provide an additional track (to provide more capacity for more trains) as well as station area and roadway crossing improvements (to provide better train performance)

Descriptions for each of the six alternative areas provided on the following pages are based on conceptual engineering designs for the Preferred Alternative, which is approximately a 10 percent design level and appropriate for decisions to be made during the NEPA process. FRA and DRPT have assumed the Preferred Alternative would be in place by 2025 for purposes of the NEPA evaluations and planning. The conceptual engineering will be further refined during future design phases of the Project. Additionally, the actual size, design, configuration, and service amenities (such as baggage service or number of parking spaces) of each intercity passenger rail station will be determined by DRPT, Amtrak, and/or the station owners when the proposed service is initiated.

WHAT NEW TRAINS ARE PART OF THE PREFERRED ALTERNATIVE?

The Project proposes to add 9 new daily intercity passenger round trips (18 total trains per day), which will be incorporated into Amtrak's existing intercity passenger network, subject to available capacity and future operating schedule:

- **Interstate Corridor (Carolinian)** service operates between New York and North Carolina through Virginia. The Project will accommodate 4 new daily Interstate Corridor (SEHSR) round trips (8 total trains per day) to/from North Carolina, with station stops in the DC2RVA corridor in: Alexandria, Fredericksburg, and Richmond (both Staples Mill Road and Main Street Station). The new service aligns with the proposed intercity passenger train service between Washington, D.C. and Charlotte, NC from the 2002 Tier I EIS, and will extend from North Carolina north into Amtrak's Northeast Corridor.
- **Northeast Regional (Virginia)** service provides regional passenger rail service from Boston and New York to serve routes in Virginia. Trains make all local station stops. The Project will add 5 new daily Northeast Regional (SEHSR) round trips (10 total trains per day) to/from Virginia, with station stops in the DC2RVA corridor in: Alexandria, Woodbridge, Quantico, Fredericksburg, Ashland, and Richmond (both Staples Mill Road and Main Street Station). Of the new service, 3 new daily round trips start/end in Norfolk, 1 new daily round trip starts/ends in Newport News, and 1 new daily round trip starts/ends in Richmond. The new service completes the service plan defined in the 2012 R2HR EIS, and adds 1 daily round trip to/from Main Street Station in Richmond, which was added to the Project to provide early morning/late evening service from/to Richmond connecting to Washington D.C. and Amtrak's Northeast Corridor.
- **Long Distance** service operates from New York and continues through Washington, D.C. and Virginia to other out-of-state locations, with limited station stops within the Project corridor. The Project will not affect the frequency (i.e., number) of Long Distance trains in service, but will modify routing/scheduling of those trains within the corridor and improve their operating reliability within the corridor to meet Project goals. The Project will add one additional stop for these trains at Main Street Station in Richmond.
- **Auto Train** service operates as a daily nonstop, overnight train between dedicated station facilities in Lorton, VA and Sanford, FL, and carries passengers and their automobiles. The Project will not affect the frequency, routing, or scheduling of the Auto Train within the corridor, but will improve operating reliability within the corridor to meet Project goals.

Under the proposed service plan, intercity passenger trains will operate between Washington, D.C. and Richmond every 1 to 2 hours in each direction during the day and early evening.

Independent of the Project, intercity passenger, VRE, and freight trains will continue to operate in the Project corridor. The Project does not add VRE or freight train frequencies, but does accommodate their planned future growth, as described in Chapter 4 of the Final EIS.

THE PREFERRED ALTERNATIVE FOR THE DC2RVA PROJECT

ALTERNATIVE AREA 1: ARLINGTON (LONG BRIDGE APPROACH)
Alternative 1B
Add Two Main Tracks on the West
Location: CFP 110 – CFP 109.3
Approximate Length: 1 Mile

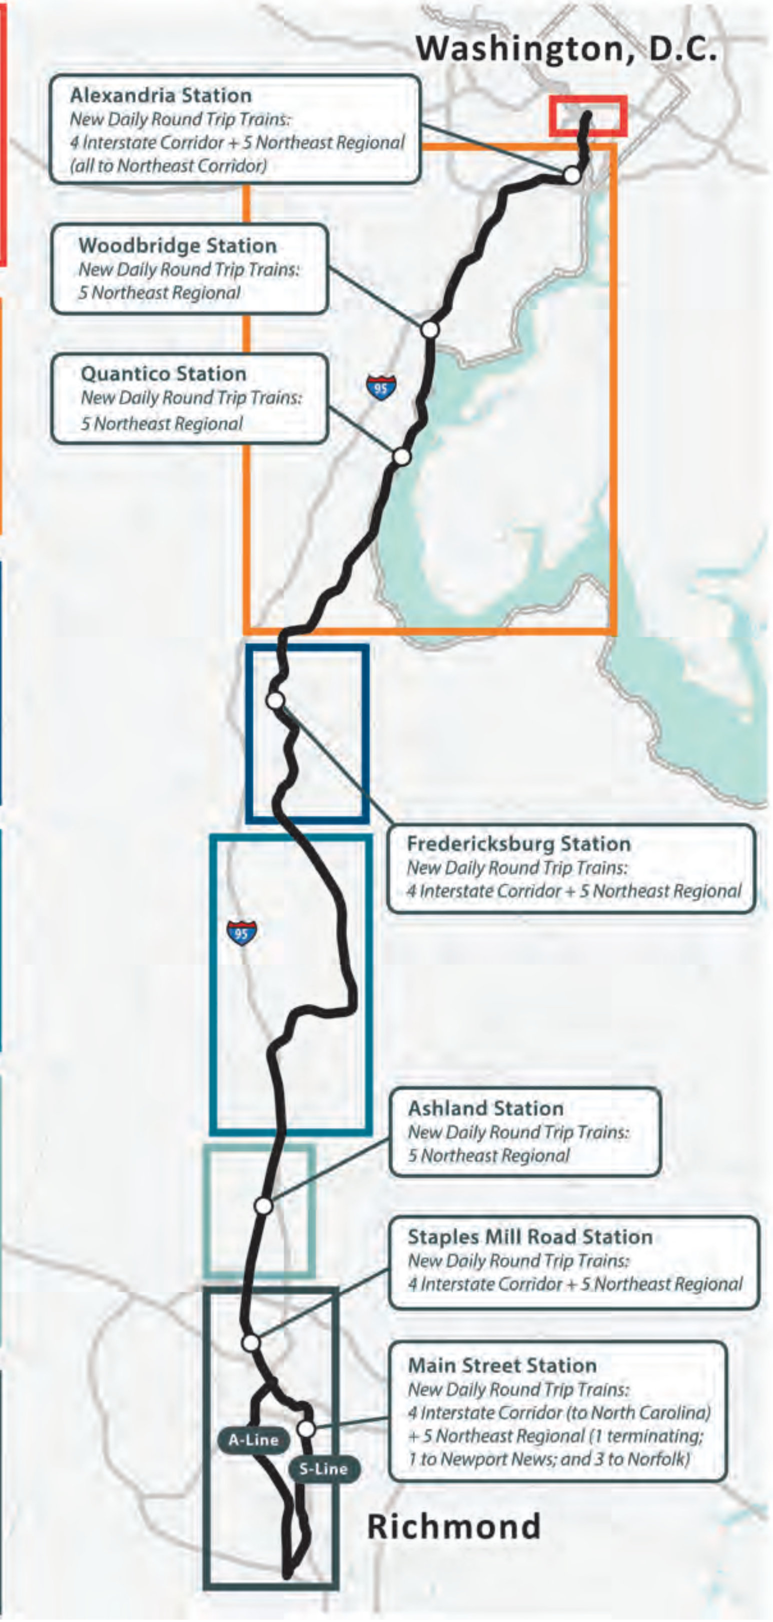
ALTERNATIVE AREA 2: NORTHERN VIRGINIA
Alternative 2A
Add a Third or Fourth Main Track
Location: CFP 109.3 – CFP 62
Approximate Length: 47 Miles

ALTERNATIVE AREA 3: FREDERICKSBURG
Alternative 3B
Add a Third Main Track Through the City,
Add a Third Main Track North and South of the City
Location: CFP 62 - CFP 48
Approximate Length: 14 Miles

ALTERNATIVE AREA 4: CENTRAL VIRGINIA
Alternative 4A
Add a Third Main Track
Location: CFP 48 - CFP 19
Approximate Length: 29 Miles

ALTERNATIVE AREA 5: ASHLAND
Alternative 5A
Maintain Two Tracks Through Town (No Station Improvements), Add a Third Main Track North and South of Town
Location: CFP 19 - CFP 9
Approximate Length: 10 Miles

ALTERNATIVE AREA 6: RICHMOND
Alternative 6F
Staples Mill Road Station and Main Street Station Full Service with S-Line Improvements
Location: CFP 9 - A 11 Centrailia
Approximate Length: 23 Miles



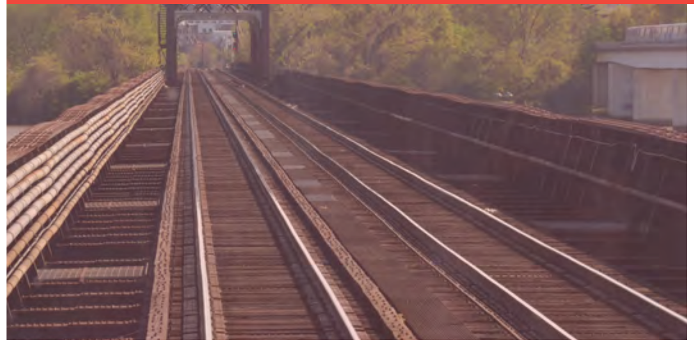
Washington, D.C.
Alexandria Station
New Daily Round Trip Trains:
4 Interstate Corridor + 5 Northeast Regional
(all to Northeast Corridor)
Woodbridge Station
New Daily Round Trip Trains:
5 Northeast Regional
Quantico Station
New Daily Round Trip Trains:
5 Northeast Regional
95
Fredericksburg Station
New Daily Round Trip Trains:
4 Interstate Corridor + 5 Northeast Regional
95
Ashland Station
New Daily Round Trip Trains:
5 Northeast Regional
Staples Mill Road Station
New Daily Round Trip Trains:
4 Interstate Corridor + 5 Northeast Regional
Main Street Station
New Daily Round Trip Trains:
4 Interstate Corridor (to North Carolina)
+ 5 Northeast Regional (1 terminating;
1 to Newport News; and 3 to Norfolk)
A-Line
S-Line
Richmond

Note for figure/text descriptions in this section: CSXT uses prefixes to denote track mileposts within subdivisions: "CFP" is the milepost prefix designating the RF&P subdivision of CSXT, and "A" is the milepost prefix designating the North End (A-Line) subdivision of CSXT

ALTERNATIVE AREAS RECAP

The Draft EIS for the DC2RVA Project identified potential Build Alternatives in six alternative areas along the corridor.

ALTERNATIVE AREA 1: ARLINGTON



An approximately 1-mile section in Arlington from the south side of the Potomac River to Crystal City that includes the approach to the existing two-track Long Bridge, which crosses the Potomac River between Washington, D.C. and Arlington, VA. The Long Bridge is the subject of a separate environmental study being led by DDOT to expand capacity of the crossing to four-tracks. There are no intercity passenger rail stations located in Area 1.

ALTERNATIVE AREA 2: NORTHERN VIRGINIA

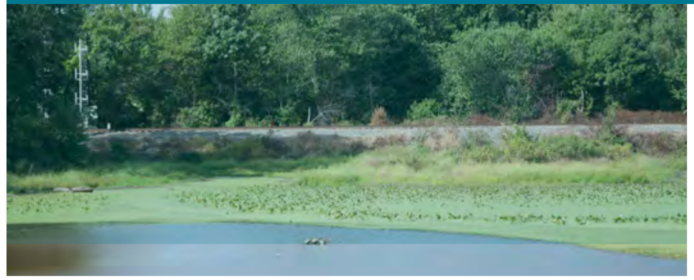
A 47-mile section from Crystal City in Arlington to the Dahlgren Spur just north of the Rappahannock River at Fredericksburg, which passes through developed urban areas and crosses several major waterways, including the Occoquan River, Neabsco Creek, Powells Creek, and Aquia Creek. It is the most congested area in the Project rail corridor, with intercity passenger trains, VRE commuter trains, and CSXT freight trains utilizing capacity on the existing tracks. Three intercity passenger rail stations are in Area 2 at Alexandria, Woodbridge, and Quantico. VRE provides commuter service to the three intercity passenger rail stations in Area 2 as well as at six other stations in Crystal City, Franconia/Springfield, Lorton, Rippon, Brooke, and Leeland Road. A new VRE station at Potomac Shores is scheduled to open in 2020.

ALTERNATIVE AREA 3: FREDERICKSBURG

A 14-mile section through Fredericksburg, from the Dahlgren Spur just north of the Rappahannock River to Crossroads, VA (the southern terminus of VRE's service). The corridor in this area crosses the Rappahannock River, passes through the City of Fredericksburg, and traverses several historic and cultural resources including the Fredericksburg National Military Park. The Fredericksburg Station in the City of Fredericksburg is served by both Amtrak and VRE. Additionally, VRE serves Spotsylvania Station at Crossroads in the southern end of Area 3.

The Preferred Alternative connects a Build Alternative from each of the six alternative areas evaluated in the Draft EIS to form the 123-mile route through the Project corridor.

ALTERNATIVE AREA 4: CENTRAL VIRGINIA



A 29-mile section from Crossroads to Doswell, through a largely rural area with multiple small waterway crossings and extensive wetlands. This portion of the corridor represents the best opportunity for passenger trains to achieve and maintain the 90 mph maximum authorized speed identified for the Project. There are no intercity passenger rail stations located in Area 4.

ALTERNATIVE AREA 5: ASHLAND

A 10-mile section including the Town of Ashland and rural portions of Hanover County, extending from Doswell to I-295. There is one intercity passenger rail station in Area 5 at Ashland. Near the center of the area, the existing two-track main line runs at-grade for approximately two miles on narrow right-of-way through the center of Railroad Avenue/ Center Street in the Town of Ashland.

ALTERNATIVE AREA 6: RICHMOND

A 23-mile section from I-295 to Centralia, VA, that includes Henrico County, the City of Richmond, and Chesterfield County. There are two intercity passenger rail stations in Area 6 at Staples Mill Road Station (in Henrico County) and Main Street Station (in downtown Richmond). Two rail routes diverge at Acca Yard, north of Richmond, and reconnect at Centralia (the southern terminus of the Project):

- The A-Line is the western rail line around Richmond, currently used by the majority of north-south passenger and freight trains. It is CSXT's principal freight route to points north and south and is approximately 14.3 miles from the south end of Acca Yard to Centralia.
- The S-Line runs through the downtown center of Richmond and is currently used primarily by local freight to serve industry and passenger rail service to Newport News. It is approximately 15.6 miles from the south end of Acca Yard to Centralia.

PREFERRED ALTERNATIVE 1B

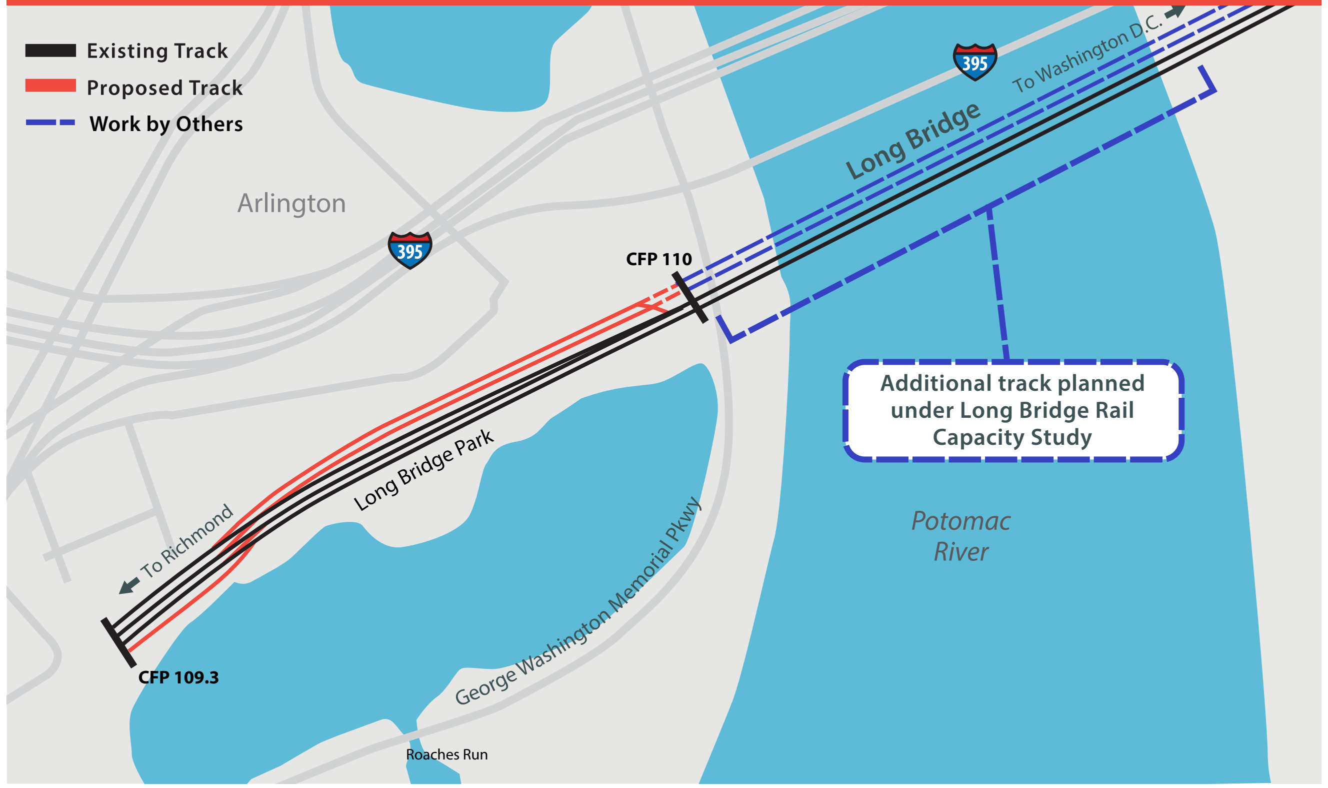
ADD TWO MAIN TRACKS ON THE WEST (CFP 110.0 TO CFP 109.3)

DESCRIPTION

Beginning south of the George Washington Memorial Parkway, Alternative 1B will add two additional main line tracks west of the existing tracks in Arlington to Crystal City, generally staying within the existing right-of-way. Alternative 1B consists of:

- Constructing two main tracks on the west side of existing tracks, with minor track shifts to improve speed through some curves
- Alignment of the alternatives that are part of the separate Long Bridge project by DDOT, which proposes to increase railroad capacity across the Potomac River by adding two tracks upstream (west) of existing rail bridge
- Track improvements generally within existing right-of-way
- No intercity passenger stations in the area
- No changes to existing public roadway crossings

PREFERRED ALTERNATIVE 1B
Add Two Main Tracks on the West
Length: 0.7 miles Approximate Cost: $42.4 million



BASIS FOR SELECTING 1B

DRPT identified the approximately 1-mile Alternative Area 1, located immediately south of the Long Bridge across the Potomac River, to evaluate potential connections between the DC2RVA Project and a future recommendation from the separate Long Bridge project by DDOT. In the Draft EIS, DRPT assumed that an additional two tracks would be added across the Potomac River as part of the Long Bridge project and identified three DC2RVA Project Build Alternatives in Area 1 that added two tracks in various configurations to connect to potential future Long Bridge recommendation options.

Subsequent to the Draft EIS on June 19, 2018, DDOT released the Alternatives Development Report for the Long Bridge project that advanced two alternatives, both of which add two tracks upstream (west) of the existing two-track bridge. Both Long Bridge alternatives align with DC2RVA Alternative 1B, and do not align with DC2RVA Alternatives 1A or 1C. Therefore, Alternative 1B is the Preferred Alternative for the DC2RVA Project.

CHANGES SUBSEQUENT TO THE DRAFT EIS

In addition to the Long Bridge alternative selection, comments from the public and review agencies (such as from Arlington County regarding the Long Bridge Park project), combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alternative 1B:

- Minimizations to impacts by adding or extending retaining walls
- Adjustments to track curves for train operations or impact mitigations
- Track improvements, such as crossovers, proposed between the existing tracks or between the existing and proposed track(s) for train operations

PREFERRED ALTERNATIVE 2A

ADD A THIRD OR FOURTH MAIN TRACK (CFP 109.3 TO CFP 62)

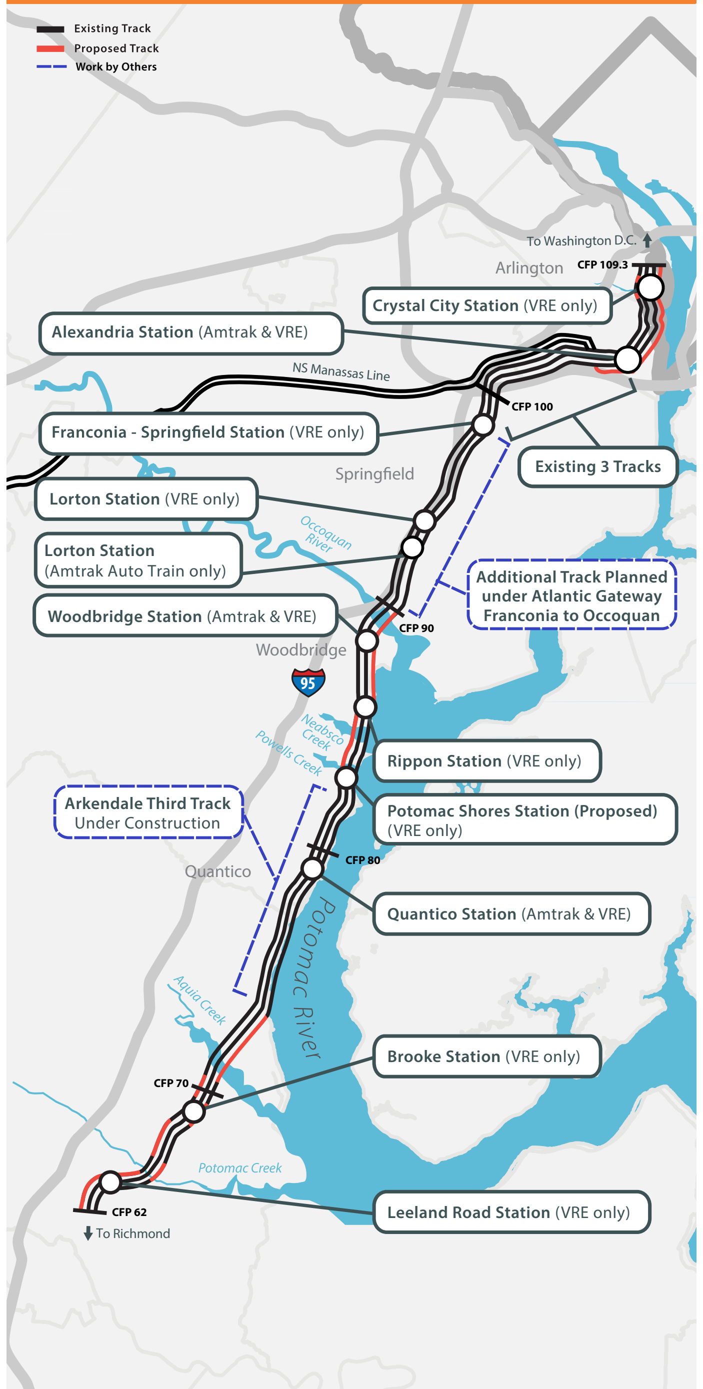
DESCRIPTION

Alternative 2A will add one additional main line track and realign existing tracks in some curves to improve speed. The additional track will be located on either the east or west side of the existing tracks, based on rail operations, site constraints, and potential impacts. Alternative 2A will consist of:

- Constructing one main track*, with realignment of some curves to improve speed, to create:
    - A fourth track from Crystal City in Arlington to Alexandria
    - A third track from Alexandria to north of Fredericksburg

  *Work completed by others in this area includes the installation of a third track in the following sections: Alexandria to Franconia; Franconia to Occoquan; and Powells Creek to Arkendale (the portion of this project from North Possum Point to Arkendale is currently under construction, and construction of the remainder is postponed until additional construction funding is available).
- Track improvements generally within existing right-of-way
- Intercity Passenger Stations:
    - Station improvements at Alexandria (parking improvements) and Woodbridge (platform improvements)
    - Proposed new DC2RVA service at Alexandria, Woodbridge, and Quantico (as shown on map)
    - Track alignments to accommodate platform and other improvements planned by VRE at Alexandria, Woodbridge, and VRE-only stations
- Public At-Grade Crossings:
    - Close one existing crossing in Stafford, VA (Mount Hope Church Road), with alternate access provided
    - No new grade separations proposed
    - All other crossings remain with safety improvements
- Reconstructing some existing grade separations to allow for the addition of a third main line track under bridges with limited horizontal or vertical clearance
- Major water crossings at Occoquan River, Neabsco Creek, Powells Creek, and Aquia Creek

PREFERRED ALTERNATIVE 2A
Add a Third or Fourth Main Track
Length: 47.3 miles Approximate Cost: $1,778.9 million



Existing Track
Proposed Track
Work by Others
To Washington D.C.
Arlington
CFP 109.3
Crystal City Station (VRE only)
Alexandria Station (Amtrak & VRE)
NS Manassas Line
CFP 100
Franconia - Springfield Station (VRE only)
Existing 3 Tracks
Springfield
Lorton Station (VRE only)
Occoquan River
Lorton Station (Amtrak Auto Train only)
Additional Track Planned under Atlantic Gateway Franconia to Occoquan
Woodbridge Station (Amtrak & VRE)
CFP 90
Woodbridge
95
Neabsco Creek
Powells Creek
Rippon Station (VRE only)
Arkendale Third Track Under Construction
Potomac Shores Station (Proposed) (VRE only)
CFP 80
Quantico
Quantico Station (Amtrak & VRE)
Potomac River
Aquia Creek
Brooke Station (VRE only)
CFP 70
Potomac Creek
Leeland Road Station (VRE only)
CFP 62
To Richmond

BASIS FOR SELECTING 2A

In the Draft EIS, DRPT considered and dismissed alternative alignments that increased speed and/or capacity but extended outside the CSXT right-of-way in Area 2 in order to reduce impacts to property, wetlands, and existing infrastructure in this congested area. By adding a fourth track to the existing triple-track section from Crystal City in Arlington to Alexandria and adding a third track in locations that currently only have two tracks from Alexandria to Fredericksburg, where required, Alternative 2A will support expanded intercity passenger service, VRE commuter service, and CSXT freight service, improve reliability, add capacity, and increase passenger train speeds where practicable. New structures will carry the additional track across the river crossings adjacent to the existing rail bridges. Preferred Alternative 2A will also remain primarily within the existing CSXT right-of-way.

CHANGES SUBSEQUENT TO THE DRAFT EIS

Comments from the public and review agencies, combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alternative 2A:

- Coordinating with adjacent active projects - Atlantic Gateway; Powells Creek to Arkendale Third Track project; and, VRE Station expansions/improvements
- Addressing access impacts to driveways and properties along the corridor, including access at Railroad Avenue in Woodbridge, VA
- Incorporating crossing improvements (e.g. additional paving widths for crossing and pedestrian safety, potential locations of gates and equipment sheds)
- Adjustments to track curves for train operations or impact mitigations, and adding crash walls to protect highway bridge piers

PREFERRED ALTERNATIVE 3B

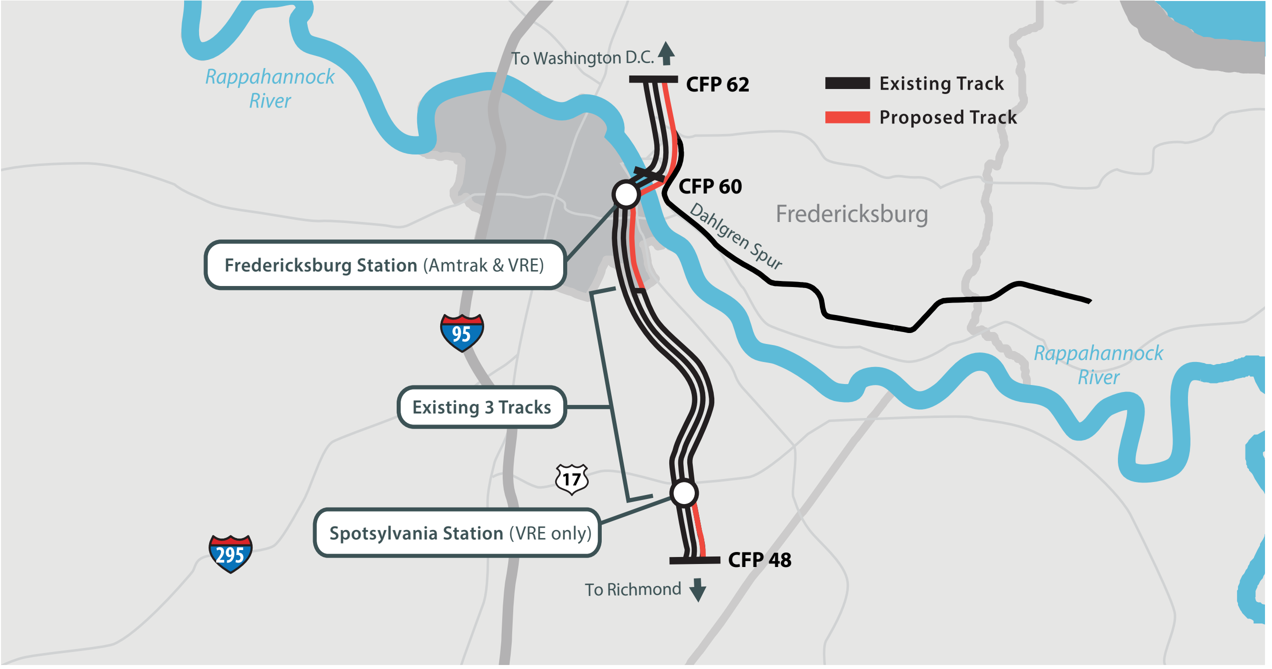
ADD THIRD MAIN TRACK THROUGH THE CITY, ADD A THIRD MAIN TRACK NORTH AND SOUTH OF THE CITY (CFP 62 TO CFP 48)

DESCRIPTION

Alternative 3B will add one additional main line track in areas with only two existing tracks and realign existing tracks to improve speed, while remaining largely within the existing CSXT right-of-way. The additional track will be located on either the east or west side of existing tracks, based on rail operations, site constraints, and potential impacts. Alternative 3B consists of:

- Constructing one main track, with realignment of some curves to improve speed
    - Within the city, the additional track will be added to the east of existing tracks with a new elevated railway at the station
- Track improvements generally within existing right-of-way
- Intercity Passenger Stations:
    - Station improvements at Fredericksburg (including building, platform, and parking improvements)
    - Proposed new DC2RVA service at Fredericksburg
    - No changes to VRE's Spotsylvania Station
- Public At-Grade Crossings:
    - No closures proposed
    - Grade separate one crossing (Lansdowne Road)
    - All other crossings remain with safety improvements
- Reconstructing some existing grade separations to allow for the addition of a third main line track under bridges with limited horizontal or vertical clearance
- Major water crossing at Rappahannock River: new bridge structure added east (downstream) of existing rail bridge

PREFERRED ALTERNATIVE 3B
Add Third Main Track Through the City,
Add a Third Main Track North and South of the City
Length: 14 miles Approximate Cost: $559.4 million



Fredericksburg
Fredericksburg
V65

BASIS FOR SELECTING 3B

In the Draft EIS, DRPT screened multiple alignments and evaluated three Build Alternatives in detail. Maintaining two tracks through the City of Fredericksburg (i.e., Build Alternative 3A as evaluated in the Draft EIS) does not provide sufficient capacity to support the Project Purpose and Need. Adding a two-track bypass to the east of the city (i.e., Build Alternative 3C as evaluated in the Draft EIS) provides sufficient capacity, but would incur substantial impacts to wetlands, historic and cultural resources, property, and infrastructure. In addition, there was strong local opposition to a new greenfield bypass. Therefore, Alternative 3B, which adds a third main track to link existing sections of three or more tracks and provides a continuous three track corridor through the city, was selected as the Preferred Alternative.

CHANGES SUBSEQUENT TO THE DRAFT EIS

Comments from the public and review agencies, combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alternative 3B:

- Addressing train operations improvements within the existing/proposed track limits
- Addressing local planning comments to eliminate a highway bridge replacement at White Oak Road, and to plan for a pedestrian culvert at Naomi Road
- Addressing access impacts to driveways and properties along the corridor
- Including crossing improvements, e.g. additional paving widths for crossing and pedestrian safety, potential locations of gates and equipment sheds
- Adding a fourth track/siding to allow trains to pass a stopped or slow-moving train south of Fredericksburg
- Extending the west side platform at the Fredericksburg station to the maximum allowable by site constraints while avoiding/minimizing impacts

PREFERRED ALTERNATIVE 4A

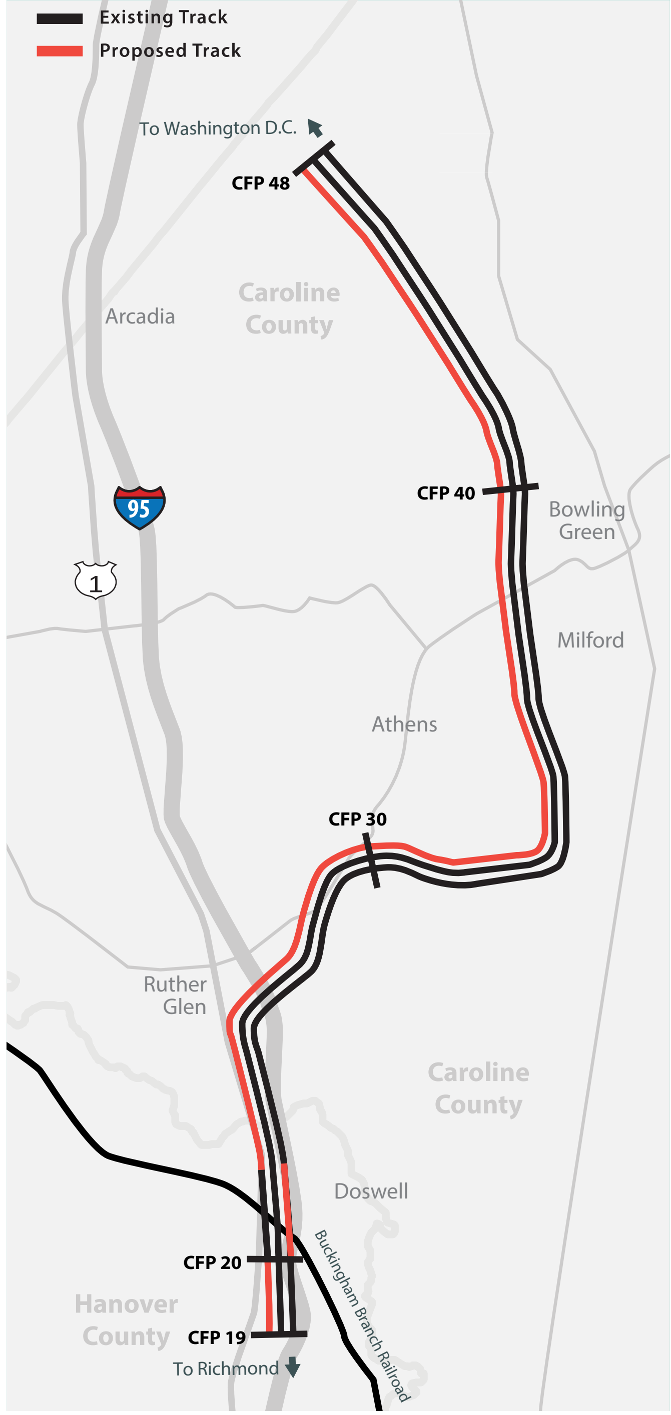
ADD A THIRD MAIN TRACK (CFP 48 TO CFP 19)

DESCRIPTION

Alternative 4A will add one additional main line track and realign existing tracks in some curves to improve speed. The additional track will be located on either the east or west side of the existing tracks based on rail operation considerations, site constraints, and potential impacts. Alternative 4A consists of:

- Constructing one main track with realignment of some curves to improve speed
- Track improvements generally within existing right-of-way
- No intercity passenger stations in the area
- Public At-Grade Crossings:
  - Close one existing crossing (Colemans Mill Road)
  - No new grade separations proposed
  - All other crossings remain with safety improvements
- Reconstructing some existing grade separations to allow for the addition of a third main line track under bridges with limited horizontal or vertical clearance
- Multiple crossings of small waterways and wetlands

PREFERRED ALTERNATIVE 4A
Add a Third Main Track
Length: 29 miles Approximate Cost: $1,143.7 million



BASIS FOR SELECTING 4A

In the Draft EIS, DRPT screened multiple alignments to improve capacity and reach the 90 mph speed, while minimizing impacts to wetlands, waterways, and other resources, and carried one alternative forward for further evaluation in the Draft EIS—Alternative 4A, which adds a third main track to the west of the existing two tracks through most of Area 4. Alternative 4A was selected as the Preferred Alternative as it increases passenger train speed and will add Project improvements largely within the existing CSXT-owned right-of-way. It will support expanded intercity passenger service and CSXT freight service, while minimizing impacts to wetlands and property.

CHANGES SUBSEQUENT TO THE DRAFT EIS

Comments from the public and review agencies, combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alternative 4A:

- Addressing train operations improvements, including crossovers, within the existing or proposed track limits
- Addressing access impacts to driveways and properties along the corridor
- Incorporating crossing improvements (e.g. additional paving widths for crossing and pedestrian safety, potential locations of gates and equipment sheds)

PREFERRED ALTERNATIVE 5A

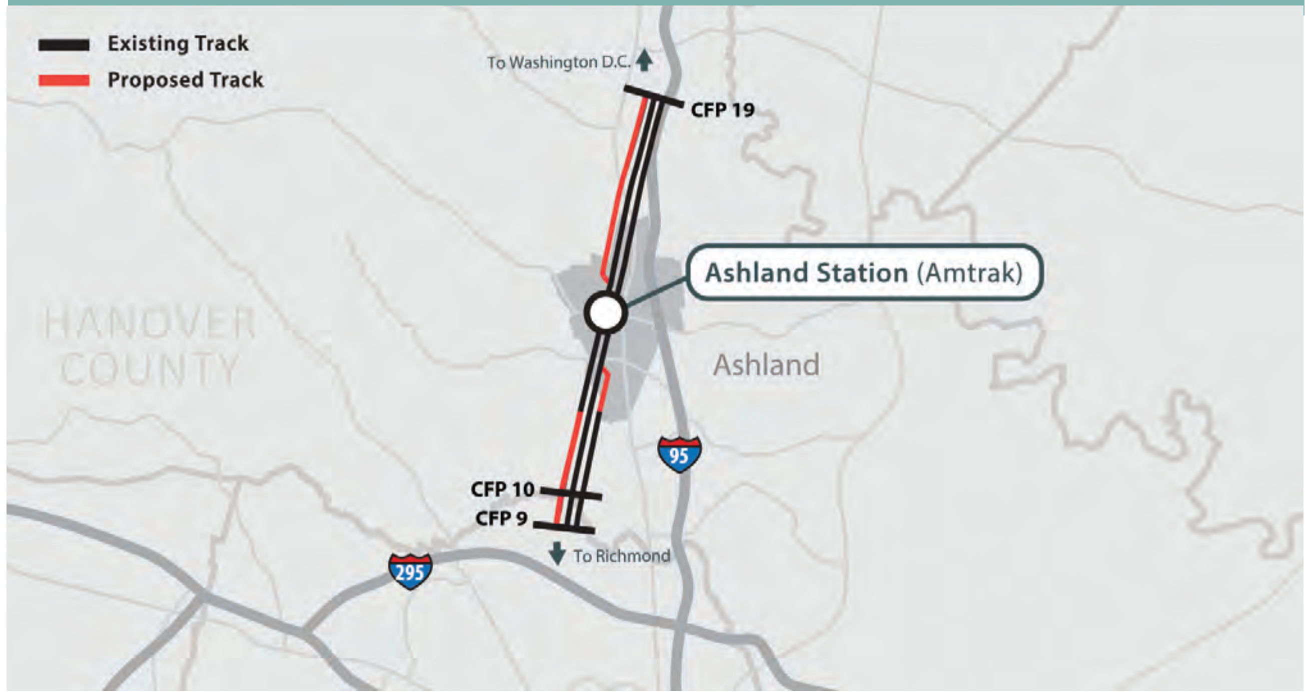
MAINTAIN TWO TRACKS THROUGH TOWN (NO STATION IMPROVEMENTS)
ADD A THIRD MAIN TRACK NORTH AND SOUTH OF TOWN (CFP 19 TO CFP 9)

DESCRIPTION

Through the Town of Ashland, Alternative 5A will maintain the existing two tracks, which will be used by freight and passenger trains similar to current conditions, and does not include any station improvements at the existing Ashland Station. One new track will be constructed north and south of town, where there will be some shifts to improve speed throughout the area. Alternative 5A consists of:

- Constructing one main track north and south of town, with track shifts to improve speed through some curves
- Maintaining two existing tracks (no construction of new track/no additional capacity) through town
- Track improvements generally within the existing right-of-way
- No station improvements at existing Ashland Station
- Public At-Grade Crossings:
  - No closures proposed
  - Two grade separations proposed (Vaughan Road/Archie Cannon Drive and Ashcake Road)
  - No improvements to at-grade road or pedestrian crossings within town
  - Crossings north and south of town remain with safety improvements
- Reconstructing some existing grade separations to allow for the addition of a third main line track under bridges with limited horizontal or vertical clearance

PREFERRED ALTERNATIVE 5A
Maintain Two Tracks Through Town (No Station Improvements)
Add a Third Main Track North and South of Town
Length: 10 miles Approximate Cost: $431.8 million



Ashland Station improvements, including new low-level side platforms, are part of a separate plan by Amtrak for improvements to comply with the Americans with Disabilities Act (ADA). Construction is scheduled to begin in 2019.

In accordance with the December 2017 Commonwealth Transportation Board resolutions, DRPT commits to working with the Town government, Randolph-Macon College, CSXT, FRA, and other stakeholders to develop safety improvements for public road and pedestrian/bicycle crossings in Ashland, separate from the DC2RVA Project.

BASIS FOR SELECTING 5A

FRA and DRPT deferred the recommendation of a preferred alternative for Area 5 to the Final EIS, and DRPT established the Ashland/Hanover Area Community Advisory Committee (CAC) to advise and inform DRPT on DC2RVA alternatives and issues in the Ashland/Hanover County area. The CAC was tasked with reassessing all previous options considered for greater rail capacity in the area and identifying potential options that could meet the Purpose and Need of the DC2RVA Project, while also minimizing or avoiding potential impacts to the community.

Based on the information and analyses of the seven Build Alternatives presented for Area 5 in the Draft EIS, public comments on the Draft EIS, information and comments developed through the CAC process, and subsequent refined rail operations analyses, DRPT selected Alternative 5A as the Preferred Alternative. It provides sufficient railroad capacity to support the Purpose and Need while having the least impact on property, wetlands and other natural resources, historic and cultural resources, and the built environment. Alternative 5A also best addresses the community's concerns, including strong opposition to a bypass from Hanover County residents, and strong opposition to adding a track through Ashland from Town residents and Randolph-Macon College.

CHANGES SUBSEQUENT TO THE DRAFT EIS

Comments from the public and review agencies, combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alternative 5A:

- Addressing agency comments and the CTB resolution to reduce impacts to the Town of Ashland between Vaughan Road/Archie Cannon Drive and Ashcake Road that include:
  - Eliminating Project-related station improvements
  - Reducing/minimizing Project footprint outside of existing CSXT right-of-way
  - Reassigning crossing safety improvements in the Town of Ashland to a future study by the town and DRPT (separate from this DC2RVA Project)
- Addressing access impacts to driveways and properties along the corridor
- Addressing train operations improvements, including crossovers, within the existing or proposed track limits
- Addressing effects of additional information at Washington Highway (Route 1), requiring replacement of the existing overpass due to insufficient horizontal clearance for an additional track and crash wall

PREFERRED ALTERNATIVE 6F

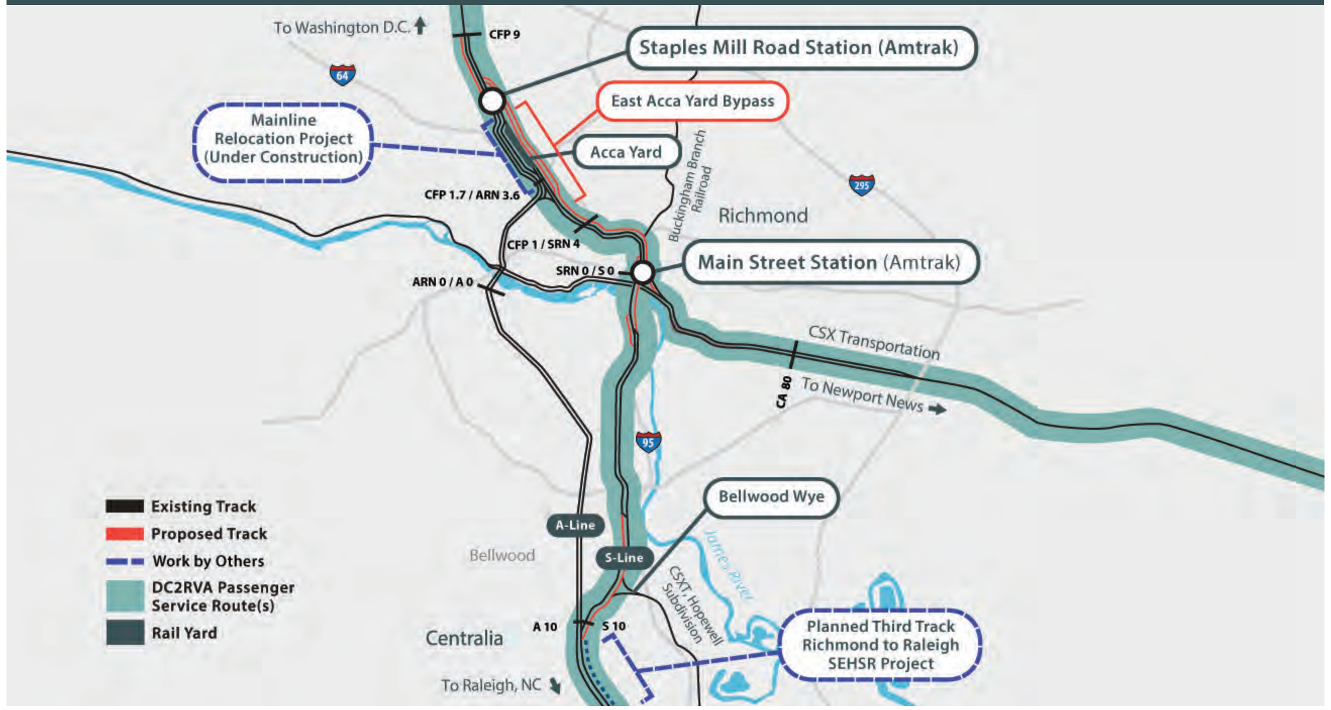
STAPLES MILL ROAD STATION AND MAIN STREET STATION
FULL SERVICE WITH S-LINE IMPROVEMENTS (CFP 9 TO A 11)

DESCRIPTION

Alternative 6F includes one additional main track through the area via the S-Line to provide improved service at Staples Mill Road Station and Main Street Station (Full Service), where both stations remain operational. The additional track will be located on either the east or west side of the existing tracks based on rail operation considerations, site constraints, and potential impacts. Alternative 6F consists of:

- Constructing one main track along portions of existing RF&P (north of Richmond) and S-Line (through Richmond), with track shifts to improve speed, generally within existing right-of-way
- Intercity Passenger Stations: Staples Mill Road Station and Main Street Station
  - All passenger trains that stop in Richmond will serve both stations (as shown on map)
  - Improve both stations to include new/modified station buildings and platforms
- Public At-Grade Crossings:
  - Close five crossings (St James Street, N 2nd Street/Valley Road, Dale/Trenton Avenue, Brinkley Road, and Old Lane)
  - Grade separate four crossings (Hungary Road, Hermitage Road (RF&P), Hospital Street/N 7th Street, and E Commerce Road)
  - All other public roadway crossings remain with safety improvements (note this differs from R2R's proposal to grade separate all crossings between the James River and Centralia, VA)
- Reconstructing some existing grade separations to allow for the addition of a third main line track under bridges with limited horizontal or vertical clearance
- Major water crossing at the James River
- Constructing a new passenger train service facility at the Bellwood wye track
- No changes to CSXT freight service routes through Richmond. Moving all passenger train service (except Auto Train, which does not stop in Richmond) to the S-Line, separate from CSXT's principal freight corridor through Richmond (i.e., the A-Line), will reduce rail congestion/delay

PREFERRED ALTERNATIVE 6F
Staples Mill Road Station and Main Street Station Full Service with S-Line Improvements
Length: 23 miles Approximate Cost: $1,667 million



BASIS FOR SELECTING 6F

In the Draft EIS, DRPT identified eight alternatives in the Richmond area as summarized on pages 23-24. The five Build Alternatives that would rely on the A-Line to carry additional passenger service (Alternatives 6A, 6B–A-Line, 6C, 6E, and 6G from the Draft EIS) were eliminated from further consideration as being unable to meet the Project's Purpose and Need. Three Build Alternatives rely on the S-Line: Alternatives 6B–S-Line, 6D, and 6F from the Draft EIS. Alternative 6B–S-Line is feasible and could meet the Project service performance goals, but the Boulevard Station location would not be consistent with prior FRA and Commonwealth decisions and does not meet FRA and Amtrak guidance for intercity passenger trains to serve the city center. Alternative 6D: Main Street Station Only (S-Line) would not meet the Project's Purpose and Need due to insufficient track and platform capacity at Main Street Station.

Alternative 6F is feasible and supports passenger service and freight service to meet the Purpose and Need. Alternative 6F is also consistent with prior FRA and Commonwealth decisions regarding the SEHSR program and Main Street Station as Richmond's downtown intercity passenger station, including decisions documented in the 2002 Tier I ROD, Richmond to Hampton Roads Tier I ROD (2012), and Richmond to Raleigh Tier II ROD (2016).

CHANGES SUBSEQUENT TO THE DRAFT EIS

Comments from the public and review agencies, combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alternative 6F:

- Addressing comments to minimize right-of-way impacts by adding or extending retaining walls
- Addressing access impacts to driveways and properties along the corridor
- Incorporating crossing improvements (e.g. additional paving widths for crossing and pedestrian safety, potential locations of gates and equipment sheds)
- Addressing train operations improvements within the track limits, including extending the west platforms at Main Street Station and adding crew walkways at both ends of these platforms to reduce the footprint of these improvements
- Addressing effects of extending the tracks across Hermitage Road (RF&P Line), which requires the replacement of the at-grade crossing with a proposed overpass to avoid blockage of the crossing during train operations at Acca Yard
- Addressing the expansion of the existing parking lot at Staples Mill Road Station by DRPT, Amtrak, and the Virginia Department of Transportation (VDOT) in June 2018, which meets the projected parking demand for DC2RVA, and no further parking improvements are recommended
- Limiting impacts in Richmond's Shockoe Valley in response to public and agency comments, specifically:
  - Relocating the proposed turning wye and service yard to Bellwood, which reduces the Project footprint at Brown St. Yard and reduces private property impacts
  - Removing the proposed parking deck on the east side of Main Street Station, thereby reducing adverse effects on cultural resources and private property; DRPT will coordinate with the city as they develop a parking plan for Main Street Station when service is instituted

When future stages of the DC2RVA Project are funded, improvements would advance under the DC2RVA Project design in the area between Main Street Station and Centralia, VA where DC2RVA and R2R overlap.

DRAFT EIS BUILD ALTERNATIVES RECAP

DRAFT EIS BUILD ALTERNATIVE		DESCRIPTION
AREA 1: ARLINGTON		Three Build Alternatives were evaluated in Area 1, the major difference being which side of the existing track the new track would be added (as indicated in the Build Alternative names). There are no intercity passenger rail stations in this area.
1A	Add Two Tracks on the East	Within the Arlington Bridge approach, two tracks would be added to the east side of the existing tracks.
1B	Add Two Tracks on the West	**SELECTED AS THE PREFERRED ALTERNATIVE** This alternative aligns with both alternatives identified in the Alternatives Development Report for the separate Long Bridge Study.
1C	Add One Track East and One Track West	Within the Arlington Bridge approach, one track would be added to the east side of the existing tracks and one track would be added to the west side of the existing tracks.
AREA 2: NORTHERN VIRGINIA:		The sole Build Alternative evaluated in Area 2 adds one main track within the existing railroad right-of-way. There are three intercity passenger rail station in the area: Alexandria, Woodbridge, and Quantico.
2A	Add One Track / Improve Existing Track	**SELECTED AS THE PREFERRED ALTERNATIVE** This alternative adds a third or fourth main track, mostly within existing right-of-way, through the area.
AREA 3: FREDERICKSBURG:		Three Build Alternatives were evaluated in Area 3, including both two- and three-track options on the existing alignment through the city and a two-track bypass alignment around the city. The Fredericksburg Station is within this area.
3A	Maintain Two Tracks Through City	Within Fredericksburg, there would be no construction of new track/no additional rail capacity, and train operations would continue through the city similar to existing conditions, with station improvements. North and south of the city, there would be construction of one additional track within the existing railroad right-of-way.
3B	Add One Track Through City East of Existing	**SELECTED AS THE PREFERRED ALTERNATIVE** This alternative adds a third main track through the city, and adds a third or fourth main track north and south of the city, mostly within existing right-of-way.
3C	Add Two-Track Bypass East of City	A new two-track bypass east of Fredericksburg would be constructed to serve freight and passenger trains that do not stop in the city, which would require additional right-of-way. The existing rail corridor would be maintained in the city and the station would be improved. North and south of the city, there would be construction of one additional track within the existing railroad right-of-way.
AREA 4: CENTRAL VIRGINIA		The sole Build Alternative evaluated in Area 4 adds one main track within existing railroad right-of-way. There are no intercity passenger rail stations in this area.
4A	Add One Track/ Improve Existing Track	**SELECTED AS THE PREFERRED ALTERNATIVE** This alternative adds a third main track, mostly within existing right-of-way.
AREA 5: ASHLAND		Seven Build Alternatives were evaluated in Area 5, varying from track alignment options through town to a new bypass. The alternatives include two different location options for the Ashland Station: a Downtown Station (which would maintain the existing station location with improvements) and an Ashcake Station location (which would close the existing station location and relocate service to a new station south of Ashcake Road). North and south of town, all Build Alternatives would include construction of one additional track within the existing railroad right-of-way.
5A	Maintain Two Tracks Through Town	**SELECTED AS THE PREFERRED ALTERNATIVE** This alternative maintains the existing two-track corridor through downtown, with no improvements to the existing station location, and adds a third main track north and south of town, mostly within existing right-of-way.
5A–Ashcake	Maintain Two Tracks Through Town (Relocate Station to Ashcake)	This alternative is the same as 5A (the Preferred Alternative), but would relocate the station to Ashcake Road.
5B	Add One Track Through Town East of Existing	Within town, one track would be added adjacent to the east side of the existing tracks, which would require additional right-of-way and closure of an existing at-grade crossing within town. The existing station would be improved.

DRAFT EIS BUILD ALTERNATIVE		DESCRIPTION
5B–Ashcake	Add One Track Through Town East of Existing (Relocate Station to Ashcake)	This alternative is the same as 5B (as summarized on the previous page) but would relocate the station to Ashcake Road.
5C	Add Two-Track Western Bypass	A new two-track bypass west of Ashland would be constructed to serve freight and passenger trains that do not stop in town, which would require additional right-of-way. The existing rail corridor would be maintained in the city and the station would be improved.
5C–Ashcake	Add Two-Track Western Bypass (Relocate Station to Ashcake)	This alternative is the same as 5C (as summarized above), but would relocate the station to Ashcake Road.
5D–Ashcake	Three Tracks Centered Through Town (Add One Track, Relocate Station to Ashcake)	Within town, one track would be added with centering of all three tracks on the existing alignment. This would require additional right-of-way and preclude use of the existing station in town. The station would be relocated to Ashcake Road.
AREA 6: RICHMOND:		Eight Build Alternatives were evaluated in Area 6: five single-station options (which would consolidate all service to a single station location) and three two-station options (which would divide service between two stations). Use of the A-Line or S-Line varied by alternative, based primarily on the ability to serve station locations and optimize passenger and freight routes.
6A	Staples Mill Road Station Only	The existing Staples Mill Road Station would be improved to become the single passenger station to serve Richmond, and existing Main Street Station would be closed to service. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6B–A-Line	Boulevard Station Only, A-Line	A new Boulevard Station would be constructed to become the single passenger station to serve Richmond, and existing Staples Mill Road and Main Street Stations would be closed to service. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6B–S-Line	Boulevard Station Only, S-Line	This alternative is similar to 6B–A-Line (as summarized above), but would add one main track on the S-Line (through the city).
6C	Broad Street Station Only	A new Broad Street Station would be constructed to become the single passenger station to serve Richmond, and existing Staples Mill Road and Main Street Stations would be closed to service. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6D	Main Street Station Only	The existing Main Street Station would be improved to become the single passenger station to serve Richmond, and existing Staples Mill Road Station would be closed to service. One main track would be added along the RF&P Line (north of the city) and the S-Line (through the city).
6E	Split Service, Staples Mill Road/ Main Street Stations	Both existing Staples Mill Road and Main Street Stations would be improved and remain operational, with the majority of intercity passenger trains stopping only at Staples Mill Road. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6F	Full Service, Staples Mill Road/ Main Street Stations	**SELECTED AS THE PREFERRED ALTERNATIVE** This alternative improves the S-Line through Richmond and allows for all intercity passenger trains that stop in Richmond to serve both stations.
6G	Shared Service, Staples Mill Road/ Main Street Stations	Both existing Staples Mill Road and Main Street Stations would be improved and remain operational, with the majority of intercity passenger trains stopping at both stations, but some trains following the A-Line to bypass downtown and only serve Staples Mill Road Station. One main track would be added along the RF&P Line (north of the city) and the S-Line (through the city).

HOW MUCH DOES THE PREFERRED ALTERNATIVE INFRASTRUCTURE COST?

Capital infrastructure costs represent the total cost associated with the design, management, land acquisition and construction of the infrastructure improvements, including communications and signaling systems associated with track and crossing improvements, of the DC2RVA Project. These costs include a 30 percent contingency for unknown conditions or unidentified infrastructure. Estimated costs are based on a conceptual (10 percent) level of design for the proposed improvements as described at the beginning of this section, and are based on projected unit costs for the year 2025 (i.e., the year that FRA and DRPT have assumed the Preferred Alternative would be in place for the purposes of the NEPA evaluation and planning). The total capital infrastructure cost for the Preferred Alternative is shown in the table below.

CAPITAL INFRASTRUCTURE COSTS FOR THE PREFERRED ALTERNATIVE

Alternative Area	Preferred Alternative	Capital Cost (2025 $millions)
Area 1: Arlington (Long Bridge Approach)	1B: Add Two Main Tracks on the West	$42.4
Area 2: Northern Virginia (Long Bridge to Dahlgren Spur)	2A: Add Third or Fourth Main Track	$1,778.9
Area 3: Fredericksburg (Dahlgren Spur to Crossroads)	3B: Add a Third Main Track Through the City	$559.4
Area 4: Central Virginia (Crossroads to Doswell)	4A: Add a Third Main Track	$1,143.7
Area 5: Ashland (Doswell to I-295)	5A: Maintain Two Tracks Through Town (No Station Improvements)	$431.8
Area 6: Richmond (I-295 to Centralia)	6F: Staples Mill Road/Main Street Stations Full Service with S-Line Improvements	$1,667.0
Total Capital Infrastructure Cost for the Preferred Alternative		$5,623.2

WHAT OTHER COSTS ARE ASSOCIATED WITH IMPLEMENTING THE PROJECT?

OPERATIONS AND MAINTENANCE COSTS

The estimate of long-term operations and maintenance (O&M) costs include both train operations and infrastructure maintenance. Operations consists of labor costs, fuel and other supplies, and other factors required to keep the DC2RVA Project in service, whereas maintenance includes routine servicing of vehicles, maintenance of the tracks, signals, communications, and other systems needed to keep the system safe and reliable.

DRPT estimates that O&M costs for the Preferred Alternative in the Year 2045 would be $100.3 million (in 2015 dollars). The 2045 Preferred Alternative conditions represent approximately a doubling of today's intercity passenger service and ridership. Accordingly, the O&M costs for the Preferred Alternative are also approximately double the costs of today's service (2015), recognizing that frequency and level of service are the key drivers of operating and maintenance costs.

COSTS OF ROLLING STOCK

Rolling stock consists of the locomotives, passenger cars, and baggage cars that may be necessary to implement the new service as proposed by the Project. DRPT anticipates the cost for rolling stock to support this additional service would be shared by Amtrak and those states that share in the cost of the service; the cost would be apportioned through negotiated agreements at the time of service implementation and is not available at this time.

C. ENVIRONMENTAL EFFECTS & MITIGATION

WHAT IS INCLUDED IN THE ENVIRONMENTAL EVALUATION

The Environmental Consequences section of the Final EIS (Chapter 5) documents the potential effects on the human, physical, and natural environments that may result from construction and operation of the Preferred Alternative and indicates any changes in impacts since the Draft EIS evaluation. Impacts of the DC2RVA Project are associated with the addition of 9 new daily intercity passenger round trips (18 total trains per day) and the construction of new or modification to existing infrastructure. While the Project accommodates future planned growth in freight and VRE train frequencies, the Final EIS does not attempt to quantify additional impacts from potential future changes in their service; the actual growth of. these services during the NEPA period of analysis may increase or decrease beyond planned levels due to external demands separate from the DC2RVA Project.

HOW ARE IMPACTS ESTIMATED?

The environmental impacts for the Project are estimated directly from the design of the Preferred Alternative. Physical impacts to environmental resources are estimated within the Preferred Alternative's Limits of Disturbance (LOD), which are defined as the boundary within which all construction, materials storage, grading, landscaping, and related activities will occur.

- **Permanent effects** (as presented in the table on pages 33 to 35) include all areas where Project infrastructure will physically replace existing conditions and will not be restored after completion of construction.
- **Temporary effects** are areas required for construction of the Preferred Alternative, such as for construction access or staging and storage of equipment, that will temporarily modify the existing conditions, but will be restored after completion of construction.

In general, permanent LOD are 0 to 40 feet outside of existing CSXT railroad right-of-way, but extend to a maximum offset of 650 feet for proposed station improvements. Temporary LOD are generally 10 to 15 feet outside of the permanent LOD, but extend to a maximum offset of 50 feet.

While natural resources are generally affected by direct encroachments or physical effects of the Preferred Alternative permanent and temporary LOD above, the area of potential impact for the human environment, including viewsheds, noise, and air quality are typically larger to account for factors such as community sizes, geographical and political boundaries, and census boundaries, which have not changed since the Draft EIS evaluations.

THE FOLLOWING PAGES PRESENT:

- **A recap of the 23 environmental resources that are included in the evaluation**
- **A quantitative summary of permanent impacts for the Preferred Alternative for all environmental resources**

Refer to Chapter 5 of the Final EIS for details of this summary, including temporary impacts as well as comparison to the environmental impacts that were reported in the Draft EIS.

ENVIRONMENTAL RESOURCES RECAP

NATURAL RESOURCES

Natural resources include water and biologic resources, such as rivers, streams, wetlands, floodplains, wildlife (including threatened and endangered species) and their habitats. The existing rail corridor is rich in natural resources, spanning more than 350 rivers and streams and over 50 major floodplains; nearly one-third of the lands within 500 feet of the rail bed are forested and contain nearly 500 acres of wetlands as well as potential habitat for more than a dozen species of threatened and endangered plants and animals.

GEOLOGIC RESOURCES

Geologic resources include: topography, geology, and soils; mineral resources; and agricultural lands, which includes agricultural/ forestal districts and prime, unique, and state-wide important farmland soils. The landscape of the existing rail corridor is dominated by low rolling hills with sharper topography along streams and rivers. Approximately one-quarter of the acreage within 500 feet of the existing rail line consists of prime and unique farmland soils, and nearly 100 acres are located within designated agricultural/forestal districts. Additionally, well over half of the soils are identified as unsuitable for transportation-related construction.

SOLID WASTES & HAZARDOUS MATERIALS

Hazardous materials include substances with the potential to cause harm to humans, animals, or the environment. Solid wastes and hazardous materials must be disposed of per regulations specific to those substances. Documented reports show that there are just over 1,000 hazardous material sites and facilities within 500 feet of the existing rail bed, the majority of which are petroleum facilities or locations of past spills.

AIR QUALITY

The Clean Air Act requires the U.S. Environmental Protection Agency (EPA) to establish air quality standards for pollutants considered harmful to public health and the environment. As part of the NEPA process, transportation projects are evaluated to determine their potential effect on air quality relative to the EPA standards. All cities and counties along the corridor are in compliance with applicable national air quality standards, except for the Northern Virginia area. A DC2RVA Project Purpose is to improve air quality by diverting automobile and other trips to rail, as well as increasing the reliability and efficiency of freight to divert movement of goods to rail.

NOISE & VIBRATION

Noise is defined as sound that is undesirable because it interferes with communication and sleep, or is otherwise disturbing. Vibration is an oscillatory motion, and it can annoy humans, interfere with sensitive equipment and under severe conditions cause structural damage. Existing train noise and vibration measurements were taken at various residential and industrial sites along the corridor. Noise - and vibration-sensitive land uses and receptors were identified in accordance with the FRA and the Federal Transit Administration (FTA) land use categories.

ENERGY

Intercity travel consumes energy regardless of the mode of travel: rail, air, automobile, or bus. Passenger rail is considered the most energy efficient of these modes on a Passenger Miles of Travel (PMT) basis. Additionally, rail is the most efficient ground transportation mode on a mile-per-ton basis.

AESTHETIC & VISUAL ENVIRONMENT

The Project corridor exhibits a wide variety of visual elements ranging from undisturbed natural lands to densely developed urban areas. The rail line has long been a part of the corridor's landscape and includes many unique visual elements, such as bridges over major waterways, stations, and other railroad structures.

COMMUNITY RESOURCES & ENVIRONMENTAL JUSTICE

This category includes land uses, public facilities, populations, neighborhoods, and community cohesion, as well as consideration of employment trends and effects. The Project corridor includes parts of 150 census tracts. While much of the land use surrounding the rail corridor is agricultural and forest, there are approximately 100 community facilities, including 35 religious facilities and 22 schools, within 1,000 feet of the edge of the rail line. Special attention is paid to Title VI of the Civil Rights Act of 1964, which prohibits discrimination in federal programs and funding. Executive Order 12898 on Environmental Justice directs federal agencies to identify and address disproportionately high and adverse human health and environmental effects on minority and low-income populations.

ENVIRONMENTAL RESOURCES RECAP

PARK RESOURCES

Park resources include federal, state, and locally owned parks, outdoor recreational areas, wildlife refuges, and recreational trails. Resources along the existing rail corridor include federal, state, regional, and local parks and recreational areas; trails; and wildlife refuges.

CULTURAL RESOURCES

Traversing some of the most historic landscapes in the nation, the rail corridor includes a wide range of cultural resources such as historic battlefields, homes, cemeteries, industrial sites and districts, as well as archaeological remains. In all, 120 resources that are eligible for, or listed on, the National Register of Historic Places (NRHP) have been identified within the Preferred Alternative's Area of Potential Effect (APE) as defined by the National Historic Preservation Act (NHPA).

In accordance with Section 106 of the NHPA and the Advisory Council on Historic Preservation regulations, effects to cultural resources resulting in one of the following recommendations for each resource of:

- **No Effect:** There would be no effect, neither adverse nor beneficial, on historic properties.
- **No Adverse Effect:** There would be an effect, but it is determined that the effect would not compromise those characteristics that qualify the property for listing on the NRHP.
- **Adverse Effect:** There would be an effect that would compromise the physical and/or historic integrity of the resource. Archaeological sites may be "adversely affected" when they are threatened with unavoidable physical destruction or damage.

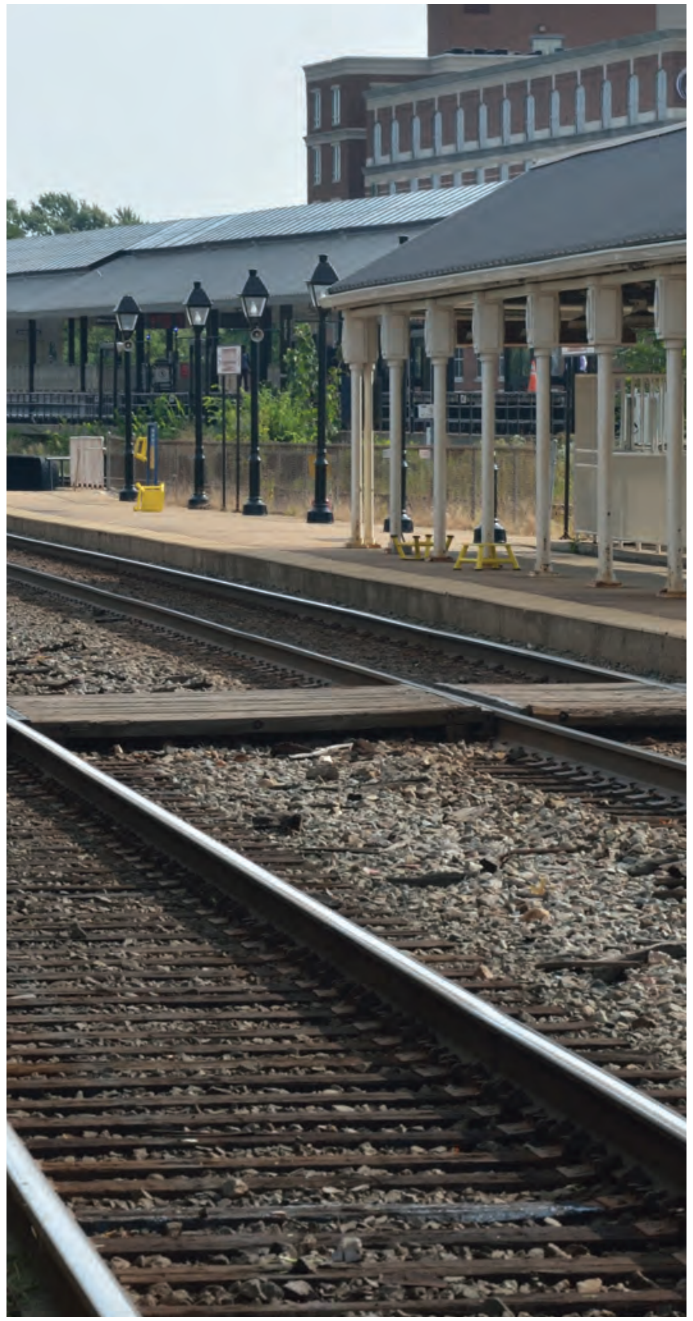
SECTION 4(f) RESOURCES

Section 4(f) of the U.S. Department of Transportation Act of 1966 (23 USC 138) applies to the use for transportation purposes of publicly-owned parks, recreation areas, and wildlife and waterfowl refuges; historic sites listed on or eligible for listing on the NRHP regardless of whether the site is in public or private ownership; and all archaeological sites listed on or eligible for inclusion on the NRHP, excluding those for which there is minimal value to preservation in place as determined by the FRA in consultation with the Virginia Department of Historic Resources (DHR). Section 4(f) applies to these protected resources when a "use" occurs as a result of the proposed action: permanent incorporation; temporary occupancy; or constructive use. Further, a de minimis use may be determined if use of a Section 4(f) resource is generally minor in nature as to not elevate to one of the three primary uses.

TRANSPORTATION FACILITIES

Transportation facilities include the roadway and rail networks between Washington, D.C. and Richmond, VA, as well as where the two modes overlap, such as highway-rail crossings and access to train stations.

The existing rail corridor serves eight intercity passenger rail stations and crosses more than 200 public and private roadways, the majority of which are grade-separated; 55 are public at-grade crossings.



The following resources are addressed in qualitative discussions in the Draft and Final EIS:

Safety & Security: Safety considerations along the corridor include the operations of the freight, commuter and intercity passenger services operating on the corridor today, as well as the projected future increases. Safety is also a major consideration for vehicular operations at public and private at-grade crossings. Security considerations include existing stations and rail yards, as well as along the railroad right-of-way.

Public Health & Safety: FRA is the primary authorized agency for railway safety. FRA administers safety regulations over all aspects of rail operations along the existing corridor.

Construction Impacts: Construction impacts associated with the proposed action are by definition those effects that are temporary or short-term in nature and that occur only during the period of construction.

Indirect & Cumulative Effects: The corridor connects several of the most rapidly developing regions in Virginia – where residential, commercial, industrial, and other transportation projects are constantly emerging. Indirect effects are those effects, positive or negative, that are caused by an action and occur later in time or are farther removed in distance, but are still reasonably foreseeable, such as those related to induced changes in the pattern of land use, population density or growth rate, and related effects on natural resources. Cumulative effects are defined as the effects, positive or negative, on the environment which result from the incremental effect of the action when added to other past, present, and reasonable foreseeable future actions, regardless of what agency or person undertakes such other actions. Cumulative effects can result from individually minor but collectively significant actions taking place over time.

ENVIRONMENTAL IMPACTS SUMMARY

See end of table for notes

Environmental Resource			Preferred Alternative						Total for the Preferred Alternative
			Area 1	Area 2	Area 3	Area 4	Area 5	Area 6	
			1A Arlington (Long Bridge Approach) CFP 110 - 109.3	2A Northern Virginia CFP 109.3 - 62	3B Fredericksburg (Dahlgren Spur to Crossroads) CFP 62 - 48	4A Central Virginia (Crossroads to Doswell) CFP 48 - 19	5A Ashland (Doswell to I-295) CFP 19 - 9	6F Richmond (I-295 to Centralia) CFP 9 - A 011	
Additional ROW (Acres)			0.03	53.77	14.02	1.27	23.45	56.58	149.12
Natural Resources	Wetlands (Acres)		0	5.94	4.2	8.8	0.98	4.27	24.19
	100-Year Floodplains (Acres)		0.1	16.1	9.9	17.2	6.6	44.1	94.0
	Streams & River Crossings (Linear Feet)		0	8,031	1,271	3,616	6,978	10,061	29,957
	Threatened & Endangered Species & Habitat		No	Yes	Yes	Yes	Yes	Yes	–
Geologic Resources	Construction-Limiting Soils		Unknown / Not Rated	Yes	Yes	Yes	Yes	Yes	–
	Prime Farmland	Prime Soils (Acres)	0	27.65	24.62	56.93	15.8	25.4	150.4
		NRCS Form 106 Score (Points)[1]	0	66	80	93	51	19	–
	Agricultural & Forestal Districts (Acres)		0	0	0	0	0	0	0

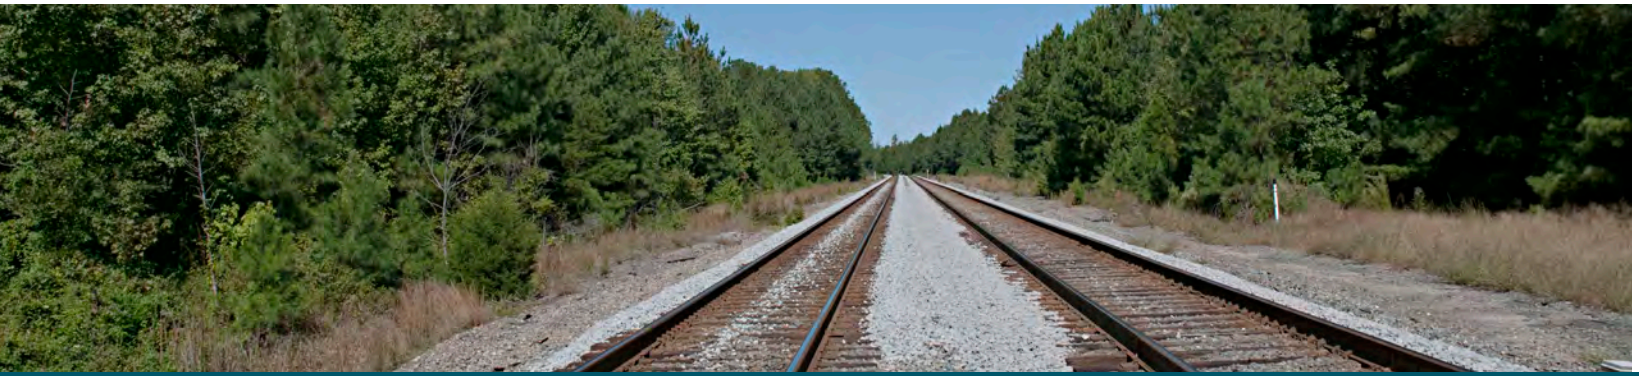
ENVIRONMENTAL IMPACTS SUMMARY

See end of table for notes

Environmental Resource			Preferred Alternative						Total for the Preferred Alternative
			Area 1	Area 2	Area 3	Area 4	Area 5	Area 6	
			1A Arlington (Long Bridge Approach) CFP 110 - 109.3	2A Northern Virginia CFP 109.3 - 62	3B Fredericksburg (Dahlgren Spur to Crossroads) CFP 62 - 48	4A Central Virginia (Crossroads to Doswell) CFP 48 - 19	5A Ashland (Doswell to I-295) CFP 19 - 9	6F Richmond (I-295 to Centralia) CFP 9 - A 011	
Transportation	Proposed Private At-Grade Crossing Improvements	Closure	0	0	0	0	0	0	0
		Four-Quad Gates	0	0	0	0	0	2	2
		Locking Gate	0	0	0	10	0	2	12
		No Action	0	5	0	0	0	0	5
	New Private Crossings		0	0	0	0	0	0	0
	Roadway Travel Patterns: % Change in Daily Traffic, Adjacent Roadways at Stations[7]		–	<1%	7-8%	–	<1%	1-2%	–
	Total Daily Delay (hours) / % Intercity Passenger Trains of Total		–	23.01 / 13%	6.59 / 13%	3.35 / 13%	56.33 / 11%	64.22 / 10%	153.50 / 11%

Notes: Permanent effects include all areas where Project infrastructure will physically replace existing conditions. Temporary effects are areas required for construction of the Preferred Alternative, such as for staging or storage of equipment. Only permanent effects are summarized in this table. Refer to the detailed mapbook of the Preferred Alternative, which show the permanent and temporary LOD throughout the 123-mile Project corridor.

1. Natural Resources Conservation Service (NRCS) treated each alternative area separately; therefore, there is no "cumulative" score for the Project corridor.
2. "Change" shown compares 2045 Preferred Alternative to 2045 No Build conditions. Air Quality and Energy are analyzed corridor-wide based on the station alternative as selected in Richmond (6F), so only a single value is shown in this table.
3. Noise and Vibration categories defined in Section 5.7 of the Final EIS.
4. Fredericksburg & Spotsylvania County Battlefields National Military Park & Cemetery, Lee Drive (111-0147) is both an above and below ground resource, and it is counted in the table twice in the “No Adverse Effect” column, as both an Archaeological Resource and a Historic Resource.
5. The historic RF&P Railroad (500-0001) traverses the Project corridor from the Potomac River on the north to Main Street Station in Richmond on the south; therefore, one resource has been added to the “Adverse Effect” column for “Effects on Buildings, Districts, Structures, & Objects” since it does not fall in a single Alternative Area.
6. Some existing grade-separated crossings will be widened/replaced as part of the Project; these crossings are separate from the proposed new grade separations of existing at-grade crossings that are quantified in this table.
7. "Change" shown compares 2025 Preferred Alternative to 2025 No Build conditions.



HOW HAVE THE ENVIRONMENTAL IMPACTS CHANGED SINCE THE DRAFT EIS?

Between the Draft and Final EIS, there have been design refinements to the conceptual engineering of the Preferred Alternative – and therefore changes to the LOD and associated environmental impacts. The design changes are documented in Chapter 4 of the Final EIS and are a result of either responses to public and/or agency comments or from new/changed data since the publication of the Draft EIS.

For many resources, the changes in LOD resulted in a reduction from what DRPT initially estimated in the Draft EIS for potential impacts. Additionally, for many resources, there are no noteworthy changes to the conceptual engineering that modified impacts; rather, narrow linear increases and decreases in the permanent and temporary LOD resulted in incremental changes in impacts over the length of the 123-mile corridor compared to those reported in the Draft EIS.

WHAT ARE THE DETERMINATIONS OF THE SECTION 106 PROCESS FOR HISTORIC PROPERTIES?

DRPT identified 120 historic properties within the APE, defined as any resource that is eligible for, assumed eligible for, or listed on the NRHP: 13 archaeological sites, 96 above ground resources, one resource with an above ground and below ground component, and 10 battlefields. DHR has reviewed and commented on the technical reports, and they have concurred with resource eligibility and effect determinations.

FRA determined that the Preferred Alternative for the DC2RVA Project will have:

- **No adverse effect** on 69 historic properties
- **No effect** on 30 historic properties
- **Adverse effect** on 21 historic properties
    - Direct impact on 8 resources (all archaeological resources)
    - Both a direct and indirect impact on 12 historic properties (all architectural resources)
    - Indirect/cumulative impact on 1 resource (an architectural resource)

WHAT IS THE FINAL SECTION 4(f) EVALUATION? *(PARKS, RECREATIONAL AREAS, WILDLIFE/WATERFOWL REFUGES, AND HISTORIC PROPERTIES)*

There are 12 public parks/recreation areas and 1 wildlife refuge located within the LOD of the Preferred Alternative. Of those, all 12 are located within the temporary LOD and 1 is also located in the permanent LOD (Walker’s Creek Retention Basin Park in Richmond, south of the James River). FRA has determined that all permanent impacts to parks and recreation areas will be *de minimis* and all temporary impacts to parks and recreation areas will not result in a Section 4(f) use.

Of the 21 historic properties determined to be adversely affected by the Project, FRA anticipates that the Preferred Alternative will result in a Section 4(f) use of 17 resources (permanent incorporation) and a *de minimis* use or no use of 4 resources. Of the remaining Section 106 resources in the Project APE, FRA determined that the Project will have no use or a *de minimis* use.

HOW ARE THE EFFECTS TO THE ENVIRONMENT REDUCED OR MITIGATED?

Effects to the natural and built environments were avoided or minimized where feasible as part of the conceptual engineering for the Preferred Alternative. Where negative effects cannot be avoided or minimized, or when no other reasonable or feasible alternative is available, the effects are mitigated where required. Mitigation can be accomplished through repairing, rehabilitating, or restoring the affected environment. Sometimes effects are compensated for by replacing or providing substitute resources, such as purchasing wetland credits in an approved wetland bank.

DRPT has identified specific commitments beyond the level of best management practices to be implemented during future phases of design and construction. These commitments are the result of agency consultations, comments on the Draft EIS, and regulatory requirements for the Project and are provided in the Project Commitments section of this Final EIS. The list to the right is intended as a high-level summary.

CONTINUED COORDINATION

DRPT will continue to coordinate with:

- Federal and state agencies, affected localities, the general public, and other stakeholders during the future phases of design in accordance with all applicable federal and state laws and regulations.
- Federal and state agencies to ensure impacts to habitat, wildlife, surface waters, wetlands, and parks are avoided to the extent practicable during design and construction.
- Appropriate regulatory agencies for all applications, permits, and approvals required for the design and construction of the Project.
- Railroad operators to maintain existing and proposed rail and station operations in the Project corridor.
- Local governments for proposed non-rail infrastructure improvements along the Project corridor.

ENVIRONMENTAL PROTECTION

DRPT will continue to avoid and minimize impacts to environmental resources during design and construction, and will follow all applicable recommendations and requirements of federal and/or state agencies with jurisdiction over environmental resources, including: wetlands; floodplains and stormwater management; wildlife, habitat, and trees; hazardous materials; air quality; noise and vibration; parks, recreation areas, and wildlife refuges; and visual and aesthetics. DRPT will develop detailed mitigations of unavoidable environmental impacts, such as noise and vibration impacts, in coordination with public and agency stakeholders during future design phases of the Project.

CULTURAL RESOURCES / SECTION 106

DRPT will execute a Memorandum of Agreement as part of the Section 106 process for historic properties to provide specific mitigations to adversely affected resources, in coordination with the appropriate Section 106 Consulting Parties. In addition, mitigations associated with one resource (the Grave Yard for Free People of Color and Slaves, site 44HE1203) made outside of the Section 106 process but as part of the NEPA process are included as Project commitments.

DESIGN REQUIREMENTS

DRPT will develop plans to minimize construction impacts as part of future design phases of the Project; access to properties will be maintained during construction and DRPT will coordinate with CSXT and property owners to review or confirm means of access. DRPT will address and improve, as necessary, bike/pedestrian safety warning devices at all public crossings along the DC2RVA rail corridor, in keeping with the Project's Basis of Design, ADA requirements, and applicable FRA, Amtrak, CSXT, and VDOT safety standards. The final design of major water crossings will at a minimum, match the existing horizontal and vertical openings of the existing crossings. DRPT will coordinate with local utilities and utility owners to identify and mitigate potential impacts.

RIGHT-OF-WAY ACQUISITION

Details of the construction easements and restoration plans will be developed in coordination with public and private landowners during future phases of design. The acquisition of right-of-way and the relocation of displaced persons and businesses will be conducted in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (42 U.S.C. 4601), and 24 Virginia Administrative Code (VAC) 30–41.

SUPPLEMENTAL ENVIRONMENTAL CONSIDERATIONS

If the Project's final design or impacts exceed the NEPA commitments established in this Final EIS and ROD, then DRPT will re-evaluate the design and/or the NEPA documentation. Potential impacts to environmental resources as identified in this Final EIS will be reconfirmed as part of future phases of design and permitting.

D. FUTURE STEPS

WHAT ARE THE NEXT STEPS IN THE NEPA PROCESS?

The Record of Decision (ROD) is the final step in the EIS process and signifies approval of the proposed action. The FRA will issue the ROD, which documents the Selected Alternative: that it best satisfies the Purpose and Need; poses the least environmental impacts to the natural and human environments to the extent practicable; is in compliance with NEPA and other applicable requirements; and may be advanced for final design and construction. The ROD also commits to the measures to mitigate unavoidable environmental impacts. Issuance of the ROD allows the DC2RVA Project to proceed to the next steps, as outlined below.

WHAT HAPPENS AFTER THE NEPA PROCESS?

The anticipated dates provided on the right are intended for planning purposes and reflect what was assumed for the purposes of this environmental evaluation. Actual dates for future Project development are dependent on obtaining a ROD, identifying and securing construction funding, completing Project design, and finalizing all necessary approvals and permits, including agreements with Amtrak and CSXT. Further, FRA and DRPT understand that funding for construction—as well as the timelines of separate but related projects—may require that the DC2RVA Project be constructed incrementally over the 20-year planning horizon from 2025 to 2045.

Project Development Event	Anticipated Date
Record of Decision	Spring 2019
Preliminary Engineering Completion	Spring 2019
Corridor Service Development Plan Completion	Spring 2019
Design and construction of AF – RO 4th main track and two crossovers in Area 4 (funded through Atlantic Gateway program)[1]	2022
Funding for remainder of DC2RVA Project	Undetermined at this Time
Final Design and Permitting	Subject to Funding
Property Acquisition	Subject to Funding
Construction	Subject to Funding
DC2RVA New Passenger Service Starts	Undetermined (2025 used for planning purposes in Final EIS)

Note: 1. The Commonwealth of Virginia received a $165 million FASTLANE grant award in 2016, leveraging additional public and private funding to implement a $1.4 billion program of highway and rail projects along the I-95 corridor (the Atlantic Gateway program). As part of this program, DRPT proposes expediting design, funding, and construction of approximately six miles of fourth main track between Rosslyn (RO – CFP 110.1) and Alexandria (AF – CFP 104.3), referred to as the RO to AF Fourth Track project. As of the publication of this Final EIS, DRPT has confirmed funding for the RO to AF project through Areas 1 and 2, with construction planned to commence in 2020; refer to Section 7.7.1 of the Final EIS for more details on the project, which includes two new crossovers in Caroline County as well.

WHICH PART OF THE PROJECT WILL BE BUILT FIRST?

Construction of the infrastructure improvements that are part of the DC2RVA Preferred Alternative is not currently funded (other than the AF – RO Fourth Track project noted previously), and it is unlikely that funding for full construction will be available all at once. Therefore, DRPT has developed an approach to implement the DC2RVA Project in increments as funding becomes available, and has prioritized the six areas for construction as shown below, with higher priority given to areas with greater rail corridor congestion:

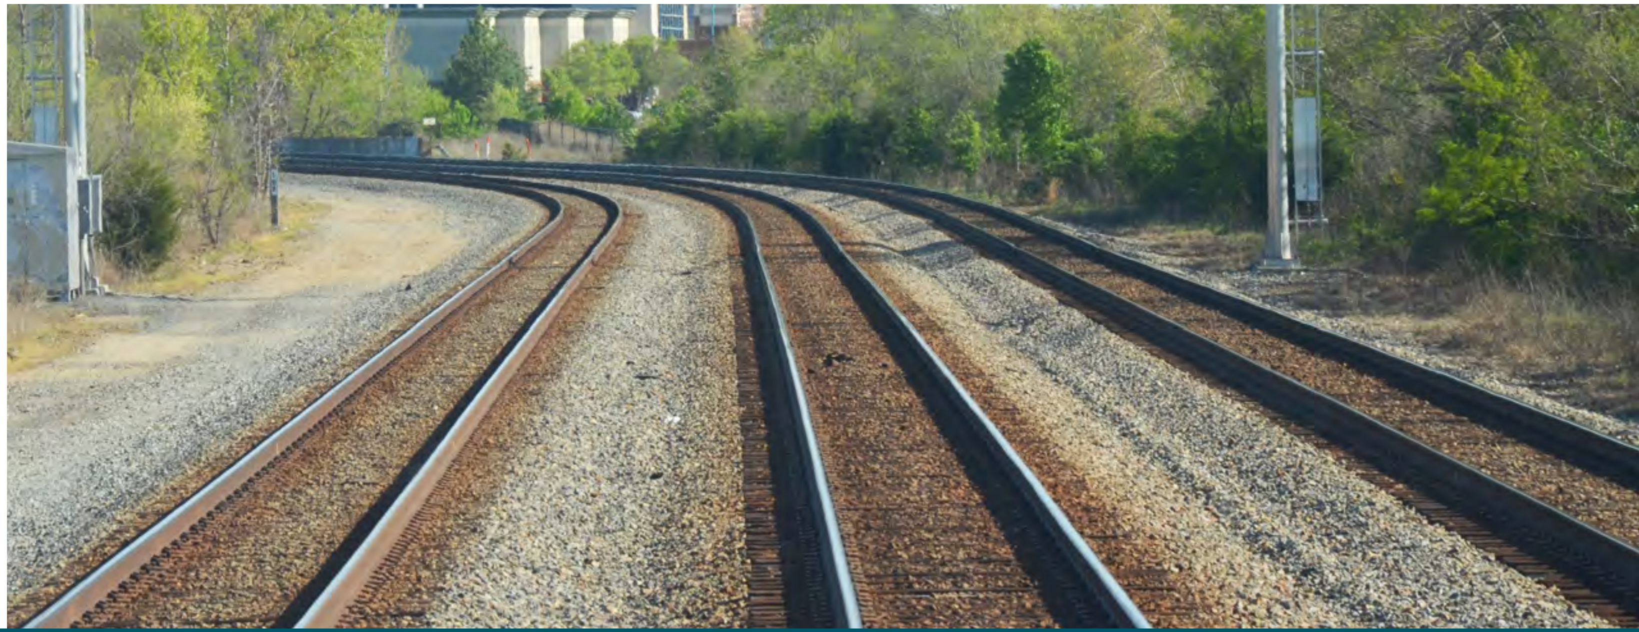
- Areas 1, 2, and 3–Arlington through Fredericksburg
- Area 6–Richmond
- Area 4–Central Virginia
- Area 5–Ashland

These incremental infrastructure construction and service improvements address the Commonwealth's priorities for the DC2RVA Project and reasonable construction sequences, and link service improvements to infrastructure improvements in the DC2RVA Project, Long Bridge project, SEHSR R2R project, and R2HR project corridors. The incremental approach is designed so that existing freight and passenger rail service can be maintained during the Project build-out. Concurrent with the Final EIS, DRPT is providing the Corridor Service Development Plan for the Project which details DRPT's approach to delivering the Project infrastructure and service improvements and is a key step toward meeting federal funding eligibility.

WHAT OTHER RAIL PROJECTS ARE LINKED TO THE DC2RVA PROJECT?

FRA and DRPT acknowledge that the full benefits of the proposed DC2RVA service are dependent upon completion of intercity passenger rail infrastructure projects outside the DC2RVA corridor in the Southeast High Speed Rail (SEHSR) corridor:

- A four-track Long Bridge with a four-track route north of Long Bridge through L'Enfant Plaza to CP Virginia in Washington, D.C. is required to connect the DC2RVA service to Union Station in Washington, D.C. and Amtrak's Northeast Corridor (NEC).
- The SEHSR R2R project included improvements/service between Raleigh, NC and Richmond, VA, and overlaps the DC2RVA Project between Main Street Station and Centralia, VA. The SESHR R2R project infrastructure improvements south of the overlap area are required to implement the four additional Interstate Corridor SEHSR trains originating in North Carolina and traveling through the DC2RVA corridor.
- The R2HR project included improvements/service between Norfolk/Newport News, VA and Richmond, VA, and overlaps the DC2RVA Project between Main Street Station and Centralia, VA. The SESHR R2R project infrastructure improvements south of the overlap area are required to support the four additional Northeast Regional SEHSR trains originating in Newport News and Norfolk and also traveling through the DC2RVA corridor to the Northeast Corridor.



WHAT PERMITS AND REGULATORY APPROVALS ARE REQUIRED?

Throughout Project development, design, and construction, DRPT will continue to coordinate with appropriate federal, state, and local regulatory agencies to obtain the necessary permits and approvals.

The following is a list of permits that may be required for this DC2RVA Project. Final determination of permit applicability lies with the regulatory agencies.

Permit	Authorizing Regulation	Regulatory Agency
Section 401 Water Quality Permit	Clean Water Act	Virginia Department of Environmental Quality
Section 402 Discharge Permit	Clean Water Act	Virginia Department of Environmental Quality
Section 404 Dredge and Fill Permit	Clean Water Act	U.S. Army Corps of Engineers
Section 408 Alteration to Civil Works Permit	Clean Water Act	U.S. Army Corps of Engineers
Subaqueous Bed Permit	Code of Virginia Chapter 2, Title 62.1	Virginia Marine Resources Commission
National Pollutant Discharge Elimination System (NPDES) Permit	Clean Water Act	U.S. Environmental Protection Agency
Municipal Separate Storm Sewer Systems (MS4) Permit	Virginia Stormwater Management Act	Virginia Department of Environmental Quality
Section 9 Bridge Permit	River and Harbors Act	U.S. Coast Guard
Section 10 Work in Navigable Waters Permit	River and Harbors Act	U.S. Army Corps of Engineers

3.5 DC2RVA RECOMMENDATION REPORT....3-38

CHAPTER 4. SELECTION OF THE PREFERRED ALTERNATIVE

4.1 SUMMARY OF SELECTION PROCESS 4-2
4.2 OVERVIEW OF SERVICE PLAN....4-2
4.2.1 Intercity Passenger Rail Service 4-4
4.2.2 Other Service in the DC2RVA Corridor 4-5
4.3 PREFERRED ALTERNATIVE BY AREA....4-6
4.3.1 Area 1: Arlington (Long Bridge Approach) 4-9
4.3.1.1 Description of the Preferred Alternative 1B....4-9
4.3.1.2 Basis for Selecting 1B....4-11
4.3.1.3 Changes to 1B Subsequent to the Draft EIS 4-11
4.3.2 Area 2: Northern Virginia....4-12
4.3.2.1 Description of the Preferred Alternative 2A....4-12
4.3.2.2 Basis for Selecting 2A 4-12
4.3.2.3 Changes to 2A Subsequent to the Draft EIS....4-18
4.3.3 Area 3: Fredericksburg....4-19
4.3.3.1 Description of the Preferred Alternative 3B....4-19
4.3.3.2 Basis for Selecting 3B....4-23
4.3.3.3 Changes to 3B Subsequent to the Draft EIS 4-23
4.3.4 Area 4: Central Virginia 4-24
4.3.4.1 Description of the Preferred Alternative 4A....4-24
4.3.4.2 Basis for Selecting 4A 4-27
4.3.4.3 Changes to 4A Subsequent to the Draft EIS....4-27
4.3.5 Area 5: Ashland....4-27
4.3.5.1 Description of the Preferred Alternative 5A....4-27
4.3.5.2 Basis for Selecting 5A 4-30
4.3.5.3 Changes to 5A Subsequent to the Draft EIS....4-31

4.3.6 Area 6: Richmond 4-31
4.3.6.1 Description of the Preferred Alternative 6F 4-31
4.3.6.2 Basis for Selecting 6F 4-37
4.3.6.3 Changes to 6F Subsequent to the Draft EIS....4-40
4.4 ALTERNATIVES EVALUATED IN THE DRAFT EIS, BUT NOT SELECTED AS THE PREFERRED ALTERNATIVE....4-42
4.4.1 Summary of Build Alternatives Evaluated in the Draft EIS 4-42
4.4.2 No Build Alternative 4-42
4.5 CAPITAL AND OPERATING COSTS 4-45
4.5.1 Capital Infrastructure Costs 4-45
4.5.2 Operations and Maintenance Costs....4-45
4.5.3 Cost of Rolling Stock 4-46

CHAPTER 5. ENVIRONMENTAL CONSEQUENCES

5.1 WATER RESOURCES....5-5
5.1.1 Surface Waters, Rivers, Streams, and Floodplains....5-5
5.1.1.1 Designated Waters....5-7
5.1.1.2 Floodplains and Floodways 5-8
5.1.1.3 Stormwater/Drainage....5-9
5.1.2 Wetlands....5-9
5.1.3 Water Quality 5-11
5.1.3.1 Temporary Effects....5-11
5.1.3.2 Long-Term Effects 5-11
5.1.3.3 Impaired Waters 5-11
5.1.4 Drinking Water/Aquifers/Water Supply 5-12
5.1.5 Permits....5-14
5.1.6 Avoidance, Minimization, and Mitigation Evaluation – Water Resources 5-14
5.1.6.1 Wetlands, Streams, and Water Resources 5-14
5.1.6.2 Floodplains and Stormwater/Drainage 5-16
5.1.6.3 Water Quality 5-16
5.1.6.4 Drinking Water/Aquifers/Water Supply....5-18
5.2 TOPOGRAPHY, GEOLOGY, AND SOILS....5-18
5.2.1 Avoidance, Minimization, and Mitigation Evaluation—Topography, Geology, and Soils 5-18

5.3 AGRICULTURAL LANDS 5-19
    5.3.1 Farmland Soils 5-19
    5.3.2 Agricultural and Forestal Districts 5-20
5.4 MINERAL RESOURCES 5-20
5.5 SOLID WASTES AND HAZARDOUS MATERIAL 5-20
    5.5.1 Effects 5-20
    5.5.2 Avoidance, Minimization, and Mitigation Evaluation—Solid Wastes and Hazardous Materials 5-21
5.6 AIR QUALITY 5-22
    5.6.1 Locomotive Operations—NOx, VOC, and PM 5-23
    5.6.2 Mobile Source Air Toxics 5-24
        5.6.2.1 Regional MSAT Effects 5-24
        5.6.2.2 Local MSAT Effects 5-25
    5.6.3 Highway Vehicle Operations—CO 5-25
    5.6.4 Greenhouse Gas Emissions 5-27
    5.6.5 Construction Effects 5-27
    5.6.6 Conclusion 5-28
    5.6.7 Avoidance, Minimization, and Mitigation Evaluation—Air Quality 5-28
5.7 NOISE AND VIBRATION 5-28
    5.7.1 Noise 5-28
        5.7.1.1 Predicted Noise Levels 5-28
        5.7.1.2 Operational Noise Impacts 5-29
        5.7.1.3 Avoidance, Minimization, and Mitigation Evaluation—Noise 5-31
    5.7.2 Vibration 5-32
        5.7.2.1 Predicted Vibration Levels 5-32
        5.7.2.2 Operational Vibration Impacts 5-32
        5.7.2.3 Avoidance, Minimization, and Mitigation Evaluation—Vibration 5-34
5.8 ENERGY 5-35
    5.8.1 Energy Consumption during Operation 5-35
    5.8.2 Energy Consumption during Construction 5-36
5.9 AESTHETIC AND VISUAL ENVIRONMENT 5-36
    5.9.1 Effects 5-36
    5.9.2 Avoidance, Minimization, and Mitigation Evaluation—Aesthetics and Visual Environment 5-38

5.10 BIOLOGICAL RESOURCES 5-39
5.10.1 Habitat and Natural Communities 5-39
5.10.1.1 Conservation Areas 5-41
5.10.1.2 Invasive Species 5-43
5.10.1.3 Submerged Aquatic Vegetation 5-44
5.10.1.4 Avoidance, Minimization, and Mitigation Evaluation—Habitat and Natural Communities 5-45
5.10.2 Wildlife 5-46
5.10.2.1 Migratory Birds 5-46
5.10.2.2 Aquatic and Marine Life 5-46
5.10.2.3 Avoidance, Minimization, and Mitigation Evaluation—Wildlife 5-48
5.10.3 Threatened and Endangered Species 5-49
5.10.3.1 Bald Eagle and Golden Eagle Protection Act 5-54
5.10.3.2 Avoidance, Minimization, and Mitigation Evaluation – Threatened and Endangered Species 5-55
5.11 COMMUNITY RESOURCES 5-57
5.11.1 Right-of-Way and Relocation Policy and Procedures 5-57
5.11.2 Commercial Relocations 5-58
5.11.3 Neighborhood and Community Effects 5-60
5.11.3.1 Residential Relocations and Associated Effects 5-60
5.11.3.2 Community Effects from Changes to the Transportation Network 5-62
5.11.4 Community Facilities and Services 5-63
5.11.5 Land Use Planning 5-64
5.11.5.1 Changes in Land Use 5-64
5.11.5.2 Compatibility with Future Land Use 5-65
5.11.5.3 Compatibility with Multimodal Transportation Planning 5-66
5.12 TITLE VI AND ENVIRONMENTAL JUSTICE 5-66
5.12.1 Corridor-Wide Impacts 5-67
5.12.2 Community-Level Impacts 5-67
5.12.2.1 Relocations and Displacements 5-67
5.12.2.2 Noise and Vibration 5-68
5.13 ARCHAEOLOGICAL AND ABOVE GROUND CULTURAL AND HISTORIC RESOURCES 5-70
5.13.1 Summary of the Section 106 Process and Determinations of Effect 5-70

5.13.2 Archaeological Resources 5-73
5.13.3 Architectural Resources 5-75
5.13.4 Battlefields 5-78
5.13.5 Avoidance, Minimization, and Mitigation Evaluation—Archaeological and Aboveground Cultural and Historic Resources 5-79

5.14 PARKLANDS, RECREATIONAL AREAS, AND WILDLIFE REFUGES 5-79
5.14.1 Permanent and Temporary Impacts 5-79
5.14.2 Avoidance, Minimization, and Mitigation Evaluation—Parklands, Recreational Areas, and Wildlife Refuges 5-81

5.15 TRANSPORTATION FACILITIES 5-81
5.15.1 Regional Scale 5-82
5.15.1.1 DC2RVA Train Service and Ridership 5-82
5.15.1.2 Ridership Effects on Regional Roadways 5-82
5.15.1.3 Ridership Effects on Roadway Network at Stations 5-83
5.15.1.4 Ridership Effects on Parking Needs at Stations 5-83
5.15.2 Corridor Scale 5-85
5.15.2.1 Preferred Alternative Crossing Improvements 5-85
5.15.2.2 Preferred Alternative Effects on Roadway Connectivity and Accessibility 5-89
5.15.2.3 Crossing Closure Diversion Analysis (Traffic Operations) 5-92
5.15.2.4 Preferred Alternative Effects on Total Daily Vehicle Delay 5-94

5.16 UTILITIES 5-97

5.17 SAFETY AND SECURITY 5-97

5.18 PUBLIC HEALTH AND SAFETY 5-98
5.18.1 Children's Health and Safety 5-99

5.19 CONSTRUCTION IMPACTS 5-100
5.19.1 Impacts 5-101
5.19.1.1 Rail 5-101
5.19.1.2 Land Use and Access 5-101
5.19.1.3 Air Quality 5-101
5.19.1.4 Noise 5-101
5.19.1.5 Water Resources 5-101
5.19.1.6 Wildlife and Habitat 5-102
5.19.2 Avoidance, Minimization, and Mitigation Evaluation—Construction Impacts 5-102

5.19.2.1 Rail 5-102
5.19.2.2 Land Use and Access 5-102
5.19.2.3 Air Quality 5-103
5.19.2.4 Noise 5-103
5.19.2.5 Water Resources 5-104
5.19.2.6 Wildlife and Habitat 5-104

5.20 INDIRECT AND CUMULATIVE EFFECTS 5-105

5.20.1 Indirect Effects 5-105

5.20.1.1 Socioeconomics and Land Use 5-105
5.20.1.2 Parks and Recreation Areas 5-106
5.20.1.3 Historic Properties 5-107
5.20.1.4 Water Resources 5-107
5.20.1.5 Floodplains 5-108
5.20.1.6 Wildlife and Habitat 5-108
5.20.1.7 Summary of Indirect Effects and Mitigation 5-109

5.20.2 Cumulative Effects 5-109

5.20.2.1 Socioeconomics and Land Use 5-109
5.20.2.2 Parks and Recreation Areas 5-111
5.20.2.3 Historic Properties 5-112
5.20.2.4 Water Resources 5-113
5.20.2.5 Floodplains 5-115
5.20.2.6 Wildlife and Habitat 5-116
5.20.2.7 Overall Cumulative Effects 5-116

5.21 RELATIONSHIP BETWEEN SHORT-TERM IMPACTS AND LONG-TERM BENEFITS 5-117

5.22 IRREVERSIBLE AND IRRETRIEVABLE COMMITMENT OF RESOURCES 5-118

5.23 SUMMARY OF IMPACTS 5-119

CHAPTER 6. FINAL SECTION 4(f) EVALUATION

6.1 INTRODUCTION 6-1

6.2 SECTION 4(f) TERMINOLOGY AND METHODOLOGY 6-2

6.2.1 Types of Section 4(f) Properties 6-2
6.2.2 Types of Section 4(f) Uses 6-2
6.2.3 Relationship Between Section 4(f) and Section 106 6-3

6.2.4 How Section 4(f) Properties and Uses were Determined for this Project 6-4
6.2.5 Section 4(f) Avoidance and Minimization Measures 6-5
6.3 DESCRIPTION OF THE PROPOSED ACTION 6-6
6.3.1 Project Background and Approach 6-6
6.3.2 Purpose and Need for the Project 6-7
6.3.3 Project Alternatives 6-7
6.4 DESCRIPTION OF THE 4(f) RESOURCES 6-12
6.4.1 Parks and Recreation Areas 6-12
6.4.2 Wildlife Refuges/Waterfowl Sanctuary 6-14
6.4.3 Historic Properties 6-14
6.5 DETERMINATION OF SECTION 4(f) USES 6-17
6.5.1 Section 4(f) Use of Parks and Recreation Areas 6-17
6.5.2 Section 4(f) Use of Wildlife Refuges/Waterfowl Sanctuaries 6-39
6.5.3 Section 4(f) Use of Historic Properties 6-43
6.5.3.1 Historic Properties with a Section 4(f) Use 6-48
6.5.3.2 Historic Properties with No Section 4(f) Use or *de minimis* Use 6-65
6.6 AVOIDANCE ALTERNATIVES 6-70
6.6.1 Summary of Section 4(f) Use Determinations 6-71
6.6.2 Entire DC2RVA Corridor 6-71
6.6.3 Preferred Alternative in Area 1 6-71
6.6.4 Preferred Alternative in Area 2 6-72
6.6.5 Preferred Alternative in Area 3 6-72
6.6.6 Preferred Alternative in Area 4 6-72
6.6.7 Preferred Alternative in Area 5 6-72
6.6.8 Preferred Alternative in Area 6 6-73
6.7 MEASURES TO MINIMIZE HARM 6-74
6.7.1 Richmond, Fredericksburg, and Potomac Railroad (500-0001) 6-74
6.7.2 RF&P Bridge over Occoquan River (500-001-0022) 6-74
6.7.3 Site 44ST1223 (Civil War Campsite) 6-75
6.7.4 Rappahannock River Railroad Bridge and Associated Structures/Platform (111-0132-0025) and Fredericksburg Historic District (111-0132) 6-75
6.7.5 Site 44SP0187 (Bridge/Marye's Mill), Site 44SP0688 (Block 49) and Site 44SP0687 (Block 48) 6-76
6.7.6 Site 44SP0468 (Earthworks/Jackson's Earthworks) 6-77

6.7.7 Doswell Historic District (042-5448) and Doswell Depot and Tower (042-0093) 6-77
6.7.8 Berkleytown Historic District (166-5073) 6-78
6.7.9 Laurel Industrial School Historic District (043-0292) and Main Building/ Robert Stiles Building (043-0292-0001) 6-78
6.7.10 Shockoe Valley and Tobacco Row Historic District (127-0344) and Main Street Station Trainshed (127-0172) 6-79
6.7.11 Seaboard Air Line (SAL) Railroad Corridor (127-6271) 6-80
6.8 COORDINATION 6-80
6.8.1 Parks, Recreation Areas, Wildlife and Waterfowl Refuge Coordination 6-80
6.8.2 Historic Resources Section 4(f) Coordination 6-83
6.8.3 U.S. Department of Interior 6-83
6.9 FINAL SECTION 4(f) EVALUATION 6-83

CHAPTER 7. OVERVIEW OF FUTURE STEPS

7.1 RECORD OF DECISION 7-3
7.2 PRELIMINARY ENGINEERING 7-3
7.3 CORRIDOR SERVICE DEVELOPMENT PLANNING 7-4
7.4 FUNDING 7-5
7.5 FINAL DESIGN AND PERMITTING 7-7
7.6 CONSTRUCTION, PROPERTY ACQUISITION, AND IMPLEMENTATION 7-9
7.6.1 Construction Packaging 7-9
7.6.2 Construction Phasing 7-9
7.6.3 Coordination with Railroad Operations 7-9
7.7 COORDINATION WITH OTHER STUDIES AND PROJECTS 7-10
7.7.1 Coordination with Local/Regional Rail Projects 7-10
7.7.2 Coordination with Southeast High Speed Rail Corridor Projects 7-13
7.7.3 Coordination with Northeast Corridor Projects 7-15
7.8 OTHER FEDERAL ACTIONS/PERMITS/REGULATORY APPROVALS 7-16

CHAPTER 1

INTRODUCTION

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

1 INTRODUCTION

The Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) are proposing passenger rail service and rail infrastructure improvements in the 123-mile north-south corridor between Washington, D.C. and Richmond, VA—collectively known as the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project. Sections 1.2 and 1.3 provide a brief background and overview of this Project, respectively.

1.1 FINAL EIS READER'S GUIDE

The purpose of this section is to inform the reader on how to review the information presented in this Final Environmental Impact Statement (EIS).

- Section 1.1.1 presents an overview of the EIS process, including guiding federal laws and regulations, and explains the consistency of this Final EIS with previous documentation.
- Section 1.1.2 summarizes how to use this Final EIS document, which is presented in a condensed format in order to streamline the reader's review of the information, particularly that which has been revised or updated since the Draft EIS. The condensed document format is consistent with the Council on Environmental Quality (CEQ) recommendations by allowing the reader to easily focus on the reasons for selecting the Preferred Alternative and the potential environmental impacts and avoidance and mitigation measures associated with the Preferred Alternative.
- Section 1.1.3 summarizes how comments on the Draft EIS are addressed in this Final EIS.
- Section 1.1.4 summarizes the errata table for the Draft EIS, which is provided in lieu of rewriting the Draft EIS documentation in its entirety.
- Section 1.1.5 summarizes the content included in the chapters of this Final EIS.

Existing Intercity Passenger Service in the DC2RVA Corridor

1.1.1 EIS Process Overview

The DC2RVA Project is being evaluated through the mechanism of an EIS to satisfy the requirements of the National Environmental Policy Act (NEPA). NEPA is a federal environmental law that establishes study policies and facilitates public disclosure of a proposed project. Per NEPA, an EIS must be prepared by a federal agency for any major federal action significantly affecting or with the potential to significantly affect the quality of the natural and built environment. FRA, as the lead federal agency, prepared this EIS to evaluate the potential impacts to the human and natural environment resulting from the DC2RVA Project. FRA published the Notice of Intent (NOI) to prepare an EIS for the Project in the Federal Register on October 23, 2014.

This EIS was developed in accordance with CEQ regulations (40 CFR part 1500 et. seq.) implementing NEPA and FRA's Procedures for Considering Environmental Impacts (64 FR 28545, May 26, 1999). In addition to NEPA, this EIS addresses other applicable statutes, regulations, and executive orders, including the 1980 Clean Air Act Amendments, Section 404 of the Clean Water Act, the National Historic Preservation Act, Section 4(f) of the Department of Transportation Act, the Endangered Species Act, and Executive Order 12898 on Environmental Justice. This EIS provides FRA, reviewing and cooperating agencies, and the public with information to assess alternatives that will: meet the Project's Purpose and Need; evaluate the potential environmental impacts; and identify potential avoidance and mitigation measures.

As described in 23 CFR 777.111(g)[1] and CEQ regulations 1502.20 and 1508.28, a tiered approach to NEPA documentation occurs when a first-level document (Tier I) evaluates what is to be done at the program level and a second-level document (Tier II) provides a more detailed analysis of specific actions necessary to implement Tier I decisions. This document is a Tier II Final EIS for the DC2RVA Project, and follows publication of the Tier II Draft EIS.

Consistency with the 2002 Tier I EIS and Record of Decision. The DC2RVA Project is the second part of a two-tiered environmental process. In October 2002, FRA, in coordination with DRPT and the North Carolina Department of Transportation (NCDOT), completed a first-level Tier I EIS and Record of Decision (ROD) for the Southeast High Speed Rail (SEHSR) corridor between Washington, D.C. and Charlotte, NC (hereinafter referred to as the 2002 Tier I EIS).[2] The 2002 Tier I EIS defined the physical limits for passenger rail improvements in the 500-mile corridor between the endpoint cities, from which subsequent Tier II studies (e.g., this DC2RVA Project) would define the specific alignment and infrastructure improvements and service plan for a section within the larger corridor. The 2002 Tier I EIS also determined programmatic-level environmental decisions that are the basis of this Project, which are summarized in Section 1.2.

Consistency with the Tier II Draft EIS. Pursuant to NEPA, this Final EIS is being published subsequent to the public review of and comments received on the Draft EIS,[3] which are incorporated and addressed herein. A comparison of the Draft and Final EIS documents, and details on how comments on the Draft EIS were addressed, are provided in the following sections. Chapter 7 describes the future steps in the Project process following publication of this Final EIS.

---

[1] Title 23 of the Code of Federal Regulations applies to the Federal Highway Administration. FRA can, however, use Title 23 as guidance for preparation of FRA's NEPA documents.

[2] The 2002 Tier I EIS and ROD is available at: https://www.fra.dot.gov/Page/P0427

[3] The Draft EIS for the DC2RVA Project was published on September 8, 2017, and is available on the Project website: http://dc2rvarail.com/draft/

1.1.2 How to Use this Document

In accordance with CEQ guidance promulgated in 40 CFR 1502.14(e) and 23 CFR 771.125(a), a Final EIS should:

- Reference and summarize Draft EIS information
- Identify the Preferred Alternative, the basis for its selection, and document any changes or ongoing activities since the publication of the Draft EIS
- Describe coordination efforts and include public and agency comments, and responses to these comments
- Present any required findings or determinations, such as mitigations and the Final Section 4(f) evaluation

Additionally, Section 1304 of the FAST Act "Efficient Environmental Reviews for Project Decision Making" and Section 1319 of the Moving Ahead for Progress in the 21st Century (MAP-21) "Accelerated Decision-making in Environmental Reviews" allow for an approach that does not require republishing the entirety of the Draft EIS content.

In accordance with these directives, this Final EIS is presented in a "condensed" format that avoids duplication with content previously presented in the Draft EIS[4] that remains unchanged and does not affect the NEPA decisions to be made. This Final EIS does not republish all data and analyses at the same level of detail as the Draft EIS and its technical appendices; rather, each chapter of this condensed Final EIS focuses on the Preferred Alternative by referencing the corresponding section(s) of the Draft EIS and presenting any noteworthy changes that may have occurred since the publication of the Draft EIS. The condensed document format is intended to allow the reader to focus on the reasons for selecting the Preferred Alternative and the potential environmental impacts and avoidance and mitigation measures associated with the Preferred Alternative.

The key elements of the Draft EIS are provided below, with a comparison to this Final EIS.

- **Purpose and Need.** Chapter 1 of the Draft EIS provided the full detail of the Purpose and Need of the Project. There are no changes to the Purpose and Need between the Draft and Final EIS. Refer to Section 1.3.1 in this chapter for a summary of the Purpose and Need of the Project, which includes additional clarification regarding the consistency between the Tier I and Tier II Purpose and Need statements.
- **Alternatives.** The Draft EIS summarized the alternatives development process and provided details on the six alternative areas of the corridor and the 23 Build Alternatives within those areas (refer to Section 1.3.3 of this chapter for a summary, and Chapter 2 and Appendix A of the Draft EIS for full details). This Final EIS evaluates the Preferred Alternative; it connects a Build Alternative from each of the six alternative areas evaluated in the Draft EIS to form the 123-mile Preferred Alternative route through the Project corridor. Any conceptual design modifications that occurred between the Draft and Final EIS are noted within this document (refer to Chapter 4 of this Final EIS for details).

---

[4] As previously mentioned, the Draft EIS is available on the Project website and is incorporated herein by reference: http://dc2rvarail.com/draft/

- **Affected Environment.** Chapter 3 of the Draft EIS presented a full description of the affected environment of the DC2RVA corridor. There have been no noteworthy changes to the existing conditions since the completion of the Draft EIS; therefore, there is no corresponding chapter in this Final EIS.
- **Environmental Consequences.** Chapter 4 of the Draft EIS presented the potential effects on the environment of all 23 Build Alternatives. This Final EIS presents potential impacts of only the Preferred Alternative in Chapter 5. Both Draft and Final EIS impact evaluations are based on conceptual engineering design; refinements to the conceptual engineering resulted in design changes to Project infrastructure—and therefore changes to the anticipated environmental impacts—between the Draft and Final EIS, which are fully detailed in this Final EIS.
- **Section 4(f) Evaluation.** There are no changes to the Section 4(f) evaluation process between the Draft and Final EIS. The Draft EIS presented a Draft Section 4(f) evaluation in accordance with the US Department of Transportation Act of 1966, and this Final EIS presents the Final Section 4(f) evaluation in the same format as the Draft. In addition, the Final EIS includes updates to and documentation on any additional coordination and analyses conducted for the final evaluation. FRA's Final Section 4(f) determination will be included with the Record of Decision.
- **Public Involvement and Agency Coordination.** The Draft EIS summarized the agency coordination and public outreach efforts during the development of the Draft EIS. This Final EIS expands upon that information by summarizing all outreach activities that have occurred since the FRA's Notice of Intent to prepare a Tier II EIS for the DC2RVA corridor and documents the responses to public and agency comments that were received on the Draft EIS.
- **Corrections to the Draft EIS.** The content of this Final EIS presents up-to-date analysis and conditions of the Preferred Alternative. Any minor clarifications to content of the Draft EIS that are not fully republished as part of this Final EIS are presented as errata to the Draft EIS, as detailed in Section 1.1.4 below.

1.1.3 How Comments on the Draft EIS Were Addressed

The Draft EIS was made available for public review and comment, and was distributed to agencies and stakeholders with jurisdiction, expertise, or interest in the issues involved in the Project (see Chapter 2 of this Final EIS for details). DRPT and FRA have reviewed and taken into consideration all comments received on the Draft EIS during the decision-making process, which led to the selection of the Preferred Alternative in this Final EIS. DRPT and FRA do not view the public comment process as a "vote counting" exercise but rather one seeking substantive comments that benefit the final decision-making process. The public comment process is also an opportunity for the public to inform FRA or DRPT of potential concerns or conditions that were not identified during the preparation of the Draft EIS.

The following types of comments were received:

- Overall position or opinion for or against the Project
- Preference for or opposition to a specific Build Alternative or element that was evaluated in the Draft EIS, both in general as well as with specific concerns

- Suggestion of additional alternatives to consider, most of which were considered but dismissed during the 2002 Tier I EIS, or do not align with the implementing actions that were the outcome of the 2002 Tier I EIS and ROD
- Request for detailed information or data that is beyond the scope of an environmental document and would be developed during future phases of design and permitting

Responses to substantive comments are incorporated and addressed by way of providing additional or revised information and analyses, as needed, in the appropriate sections of this Final EIS. Substantive comments are those that question, with reasonable basis, the accuracy of information and methodology in the Draft EIS or present new information not considered in the Draft EIS, and cause changes or revisions in one or more alternative or environmental resource.

Detailed responses to comments from federal, state, and local agencies, organizations, and the general public are provided in appendices to this Final EIS:

- Appendix B of this Final EIS provides specific detailed responses to each agency and organization letter.
- Appendix C of this Final EIS provides responses by topic to substantive comments that appeared in individual comments and form letters from the public, either in writing or at the public hearings.

Where appropriate, the responses in these appendices indicate the section(s) in this Final EIS where additional/revised information is provided, including the errata table for the Draft EIS, which is Appendix A of this Final EIS.

1.1.4 Use of the Errata Table for the Draft EIS

Pursuant to Section 1304 of the FAST Act "Efficient Environmental Reviews for Project Decision Making" and Section 1319 of MAP-21 "Accelerated Decision-making in Environmental Reviews," Appendix A of this Final EIS provides an errata table for the Draft EIS in lieu of rewriting the Draft EIS documentation in its entirety.

As previously explained, this Final EIS is presented in a format that allows the reader to readily focus on the Preferred Alternative, and does not republish all data and analyses at the same level of detail as the Draft EIS such as: re-documentation of existing conditions or all 23 Build Alternatives that were developed and evaluated in the Draft EIS. The purpose of the Appendix A errata table, therefore, is to document factual corrections and/or minor clarifications to the portions of the Draft EIS that were not fully re-issued as part of this Final EIS. It is not intended to provide a summary of substantive comments received, which are separately addressed in this Final EIS in Appendix B; any modifications as a result of substantive comments received are incorporated into the appropriate chapters of this Final EIS and are not part of the errata table.

Each errata entry includes references to relevant page, table, and/or figure numbers from the Draft EIS and presents the original Draft EIS text next to the revised or replacement text. The factual corrections and/or minor clarifications and updates that are itemized within the errata table were identified from agency and public comments as well as ongoing coordination and documentation that has occurred since the publication of the Draft EIS. This approach is appropriate as comments received specific to the Draft EIS content were minor and do not affect the decisions made or the selection of the Preferred Alternative.

1.1.5 Contents of this Document

The chapters of this Final EIS are arranged in chronological order, representing the sequential order of events since the publication of the Draft EIS. The content focuses on the presentation of the Preferred Alternative and its potential effects.

- **Final EIS Chapter 2: Overview of Public Involvement and Agency Coordination**. This chapter describes the public involvement and agency outreach that has occurred since the initiation of the Project. It includes a summary of comments received on the Draft EIS; a complete compilation of comments and responses are included as Appendices B and C to this Final EIS.
- **Final EIS Chapter 3: Additional Information**. This chapter presents additional material that provides the reader with a better understanding of various Project elements and potential impacts to human and natural resources, in response to comments received on the Draft EIS. FRA and DRPT developed this additional material to document ongoing activities and coordination efforts that extended beyond the Draft EIS.
- **Final EIS Chapter 4: Selection of the Preferred Alternative**. This chapter presents the elements of the Preferred Alternative in each of the six alternative areas in the Project corridor, and the reason for the selection of each. It also describes any modifications to the Preferred Alternative since publication of the Draft EIS.
- **Final EIS Chapter 5: Environmental Consequences of the Preferred Alternative**. This chapter documents the potential impacts of the Preferred Alternative to each of the environmental resources presented in the Draft EIS. The quantitative range of impacts of the other Build Alternatives from the Draft EIS are provided for comparison purposes only, and efforts to further minimize and mitigate impacts are described.
- **Final EIS Chapter 6: Final Section 4(f) Evaluation**. This chapter presents the Final Section 4(f) evaluation, which includes updates since the Draft Section 4(f) evaluation, results of agency coordination, a summary of all Section 4(f) comments, a least harm analysis, and the basis for a finding that there are no feasible or prudent alternatives to the use of any Section 4(f) properties, when applicable.
- **Final EIS Chapter 7: Overview of Future Steps**. This chapter describes the anticipated sequence of events following the publication of this Final EIS.
- **Final EIS Appendices.** The text and figures that comprise this Final EIS are supported by a series of detailed appendices that contain material too lengthy to include in the body of the document[5] and include: errata for the Draft EIS (Appendix A); detailed responses to agency and public comments (Appendix B and Appendix C, respectively); detailed cultural resources documentation (Appendix D); documentation of agency coordination and consultation for Section 106 and Section 4(f) (Appendix E); detailed rail operations simulation modeling since the Draft EIS (Appendix F); documentation of relevant agency resolutions, agreements, and reports (Appendices G through I, and Appendix K) and detailed design information, including mapbooks, of the Preferred Alternative (Appendix J, Appendix L, and Appendix M).

---

[5] As stated in CEQ's NEPA regulations, an EIS should be kept concise and be no longer than necessary to comply with NEPA and its implementing regulations.

1.2 PROJECT BACKGROUND

The DC2RVA Project is one part of a larger series of rail improvement projects throughout the state, region, and eastern portion of the U.S. intended to improve passenger rail service and make rail a competitive choice for travelers within intercity corridors of 100 to 600 miles. Studies of the SEHSR corridor and its extensions, collectively referred to as the SEHSR program, have been ongoing since the early 1990s and have called for developing a range of improved intercity passenger rail speeds, from 79 mph to 110 mph on shared track (freight and passenger service), and possibly up to 150 mph on dedicated track (passenger service only).

- In 1991, the Intermodal Surface Transportation Efficiency Act (ISTEA) became law, under which Section 1036 authorized a program of high speed rail corridors in the United States.
- In 1992, the U.S. Department of Transportation (DOT) designated the SEHSR corridor from Washington, D.C. to Charlotte, NC as one of the original national high speed rail corridors. In 1996, U.S. DOT administratively designated an extension of the SEHSR corridor from Richmond to Hampton Roads.
- In 1998, the Transportation Equity Act for the 21st Century (TEA-21) became law, under which Section 7201 authorized the designation of additional high speed rail corridors and extensions of existing corridors. Later that same year, U.S. DOT extended the SEHSR corridor into South Carolina, Georgia, and Florida. In 2000, further extensions added connections in Georgia and Florida.

The SEHSR program has evolved since its inception in 1992 to reflect additional studies and planning, national and state transportation priorities and funding, and demand for intercity passenger rail services. This evolution of the SEHSR program and its relation to the DC2RVA Project is exhibited in the following key documents, each of which is described below:

- The 2002 SEHSR Tier I EIS and ROD[6]
- The 2012 SEHSR Tier I EIS and ROD for the Richmond to Hampton Roads (R2HR) project[7]
- The FRA Vision for Higher Speed Rail in America[8]
- The Virginia Interstate 95 (I-95) High Speed Rail Corridor & Service Development Plan[9]
- The Commonwealth's 2017 Statewide Rail Plan[10]

1.2.1 2002 SEHSR Tier I EIS

In 2002, FRA and the Federal Highway Administration (FHWA) completed a Tier I EIS and ROD for the original SEHSR corridor from Washington, D.C. to Charlotte, NC that established the overall Purpose and Need and defined the route for providing a competitive transportation

---

[6] The 2002 Tier I EIS and ROD documents are available on the Project website at: http://dc2rvarail.com/resources/documents/

[7] Project documents related to the R2HR project are available at: https://www.fra.dot.gov/Page/P0481

[8] The FRA Vision for Higher Speed Rail in America document is available at: https://www.fra.dot.gov/Elib/Document/1468

[9] The Virginia I-95 High Speed Rail Corridor & Service Development Plan is available on the Project website at: http://dc2rvarail.com/resources/documents/

[10] The Virginia Statewide Rail Plan (2017) is available at: http://www.drpt.virginia.gov/rail/reference-materials/virginia-state-rail-plan/

choice for travelers with the corridor. The 2002 Tier I EIS selected an incremental approach to develop the rail corridor with upgraded intercity passenger rail service between Washington, D.C. and Charlotte, NC, including using existing fossil fuel locomotive technology, upgrading existing rail corridors instead of developing new corridors, and building the corridor in incremental sections as funds became available. The incremental approach selected in Tier I sought to minimize cost and potential impacts to the environment by utilizing existing railroad tracks and rail rights-of-way as much as possible. Refer to Draft EIS Section 1.6 for full discussion of the 2002 Tier I EIS and its effect on the DC2RVA Project segment of the 500-mile corridor.

The 2002 Tier I EIS assumed a maximum speed of 110 mph with an average speed of approximately 70 mph along the full length of the SEHSR corridor between Washington, D.C. and Charlotte, NC. The 2002 Tier I EIS concluded that additional track would be required along sections of the CSX Transportation (CSXT) rail corridor between Alexandria and Richmond to accommodate the freight and passenger growth needs of all rail users and institute higher speed passenger service; however, the Tier I EIS did not specify the extent of additional track required or the possible higher speed that could be accommodated between Alexandria and Richmond.

The 2002 Tier I EIS proposed up to eight new roundtrips per day along portions of the corridor, and that these trains would serve all stations where Amtrak already provided service (but not every train would stop at all stations). Four of these new daily round trips were proposed to be interstate service between Washington, D.C. and Charlotte, NC (and are included in the DC2RVA Project service plan, as summarized in Section 1.3.2), with four additional round trips per day between Raleigh and Charlotte in North Carolina only.

1.2.2 2012 SEHSR Richmond to Hampton Roads Tier I EIS and ROD

Subsequent to the 2002 Tier I EIS, the SEHSR corridor was extended south and east to Hampton Roads (to destinations in Norfolk and Newport News). In 2012, FRA and DRPT completed a Tier I EIS and ROD for the Richmond to Hampton Roads project, which defined the route and proposed up to nine daily round trips, consisting of existing and new frequencies, to and from Hampton Roads. The service plan for the DC2RVA Project, which is summarized in Section 1.3.2, includes five new daily round trips between Washington, D.C. and Virginia, of which four extend to Hampton Roads to complete the service plan defined in the R2HR project.

1.2.3 FRA Vision for Higher Speed Rail in America

In 2009, FRA released its strategic plan for higher speed rail in America. FRA’s plan envisioned a combination of express and regional high-speed rail corridors developing from upgraded, reliable intercity passenger rail systems in key travel corridors. The 2009 Plan called for a long-term strategy to build an efficient higher-speed passenger rail network of 100- to 600-mile intercity corridors, as one element of a modernized transportation system. The American Recovery and Reinvestment Act (ARRA) and a high-speed rail grant program were applied to strategic investments in intercity rail infrastructure, equipment, and performance, including within the expanded SEHSR corridor. FRA’s near-term investment strategy was to:

- Upgrade reliability and service on conventional intercity rail services (operating speeds up to 79 to 90 mph on shared track), with the intent of providing travel options and developing the passenger rail market.
- Develop emerging and regional higher-speed corridor services (operating speeds up to 90 to 110 mph on shared track and 110 to 150 mph on dedicated track) in corridors of 100 to

500 miles, with the intent of developing the passenger rail market and providing some relief to other travel modes.

- Advance new express high-speed corridor services (operating speeds above 150 mph on primarily dedicated track) in select dedicated corridors of 200 to 600 miles), intended to relieve air and highway capacity constraints.

The DC2RVA Project was designed to fit the near-term strategy of upgrading reliability and service of conventional intercity rail services at speeds up to 90 mph in a corridor shared with commuter and freight services. The DC2RVA Project also provides a critical link between Amtrak's heavily traveled Northeast Corridor (NEC) and the developing SEHSR corridor.

1.2.4 Virginia I-95 High Speed Rail Corridor & Service Development Plan

DRPT's September 2009 Corridor & Service Development Plan (Plan) details the Commonwealth of Virginia's vision for the Virginia I-95 High Speed Rail Corridor and lays out a detailed series of projects that would create a 90-mph corridor between Petersburg, Richmond, and Washington, D.C. (i.e., the DC2RVA corridor is contained within the limits of this plan). The proposed projects described in the Plan are designed to improve passenger rail service and "…ensure the preservation of existing freight capacity, and to protect future capacity to allow the continued growth of freight traffic and operations in the corridor." The Plan is based on co-mingled freight, commuter, and intercity passenger operations, and envisions a program of infrastructure improvements to reliably accommodate the mix and volume of intercity passenger, commuter, and freight services projected through 2030. This Plan envisions incremental improvements to the corridor yielding improvements to reliability, on-time performance, and reductions in scheduled running times. New intercity service starts to Hampton Roads and Raleigh, NC would be implemented after completion of the off-corridor improvements. The Plan notes that CSXT, the owner and operator of the corridor, has concurred with the Commonwealth's approach to a 90 mph corridor with commingled freight, commuter, and intercity passenger rail operations. The 2009 Corridor & Service Development Plan provides an update and compilation of two previous reports submitted to FRA by DRPT: "Potential Improvements to the Washington, D.C.–Richmond Railroad Corridor," dated May 1999[11], and "Technical Monograph: Transportation Planning for the Richmond-Charlotte Railroad Corridor," dated January 2004[12].

1.2.5 2017 Virginia Statewide Rail Plan and Related Projects

Virginia's 2017 Statewide Rail Plan recognizes the rail network as an asset for the Commonwealth. The state rail network provides an efficient means of moving passengers and freight both within and through the state. The Commonwealth recognizes the privately-owned rail network as part of a multimodal system with public benefits and growing economic impacts. By diverting passenger and freight traffic from road to rail, Virginia's rail network relieves congestion, saves lives, improves air quality, helps grow the economy, and complements the Virginia highway network while reducing capital and maintenance expenditures. In addition, railroads provide a direct revenue benefit by contributing to the local tax base, creating jobs and supporting tourism. The Commonwealth also recognizes that the state rail network is a critical link in a larger rail system within the eastern U.S.; it connects the state's ports, businesses, and communities to other major population centers, customers, and manufacturing regions throughout the nation and the world.

---

[11] Copies of the 1999 report (Volumes I and II) are available at: https://www.fra.dot.gov/Elib/Document/17466 and https://www.fra.dot.gov/Elib/Document/2757.

[12] Copies of the 2004 report (Volumes I and II) are available at: http://www.fra.dot.gov/Elib/Document/1308 and https://www.fra.dot.gov/Elib/Document/2755.

Virginia's 2017 Statewide Rail Plan supports FRA's initiative to improve passenger rail in the Southeast. As such, the Commonwealth plans to continue to engage in the following initiatives to advance passenger rail projects in this region and to supplement the DC2RVA Project:

- Virginia-North Carolina High Speed Rail Compact
- SEHSR Richmond to Raleigh (R2R) Final Design and Implementation
- SEHSR Richmond to Hampton Roads (R2HR) Tier II Study
- Atlantic Gateway Program
- Long Bridge Capacity Expansion

Virginia-North Carolina High Speed Rail Compact. The Virginia-North Carolina High Speed Rail Compact (Compact) was authorized by Congress[13] and established through legislation enacted by the Virginia and North Carolina General Assemblies in May 2010. The purpose of the Compact is to examine and discuss strategies to advance multi-state high-speed rail initiatives. Through the Atlantic Gateway Program, Virginia has also planned for the acquisition of CSXT's abandoned S-line between the Petersburg area and Norlina, NC, which is slated to be used for dedicated, higher speed (110 mph) intercity passenger rail service.

SEHSR Richmond to Raleigh (SEHSR R2R Project) Final Design and Implementation. In 2015, FRA and NCDOT completed a Tier II EIS, and in 2017 FRA signed a ROD for the SEHSR R2R project.[14] The study covered the 162-mile segment of the SEHSR corridor between Main Street Station in Richmond, VA and Raleigh, NC and called for reactivation of 76 miles of CSXT's abandoned S-line running southwest from Petersburg, VA to Norlina, NC. The SEHSR R2R project proposed operating four daily Interstate Corridor round trips between New York and Raleigh via Richmond and the DC2RVA corridor.

As part of the Atlantic Gateway suite of projects, the Commonwealth of Virginia and CSXT intend to enter into an agreement to establish a process for transferring ownership of the abandoned S-Line right-of-way to continue advancing work on this segment of the SEHSR corridor. A similar agreement between the State of North Carolina and CSXT will be required for that portion of the S-Line in North Carolina. For the purposes of NEPA, the DC2RVA Project overlaps and supersedes the R2R SEHSR project for the segment between Main Street Station and Centralia, VA; all track and roadway improvements and the effects of additional train frequencies between Main Street Station and Centralia are evaluated as part of DC2RVA, which is detailed in Chapter 4 of this Final EIS.

SEHSR Richmond to Hampton Roads Tier II Study. DRPT is in the process of identifying funding sources to initiate a Tier II environmental study within the next six years for the Richmond-Hampton Roads segment of the SEHSR corridor. As described in Section 1.2.2 above, in 2012 FRA and DRPT completed a Tier I EIS and FRA signed a ROD for the R2HR project for the extension of the SEHSR corridor from Richmond south and east to Hampton Roads; the R2HR project will expand upon existing passenger rail service to Hampton Roads at a maximum authorized speed of 79 mph and to Norfolk at a maximum authorized speed of 90 mph.

---

[13] 49 U.S.C. § 24101, Interstate Compacts

[14] Project documents related to the R2R project are available at: https://www.fra.dot.gov/Page/P0482

Atlantic Gateway Program. Virginia is also continuing to advance the Atlantic Gateway Program. In 2016, U.S. DOT selected Virginia to receive an award of $165 million from the FASTLANE grant program to expand rail and highway capacity in Northern Virginia as part of the Atlantic Gateway Program. The Atlantic Gateway suite of projects includes a $1.4 billion package of rail and highway expansion projects intended to address some of the worst freight and passenger transportation bottlenecks on the I-95 corridor. The Atlantic Gateway Program contains five distinct rail capacity and engineering projects:

- Construct 6 miles of fourth mainline track from the bank of the Potomac River in Arlington to the AF interlocking in Alexandria, where passenger and commuter trains bound for Manassas diverge from the DC2RVA corridor.[15]
- Construct 8 miles of third mainline track from the Franconia-Springfield Virginia Railway Express (VRE) station to a location just north of the Occoquan River.
- Construct two interlockings south of Fredericksburg to improve operational flexibility and network fluidity just south of the VRE commuter territory.[16]
- Long Bridge development funding to advance engineering, stakeholder agreements, and outreach in support of the long-term, multi-agency initiative to increase rail capacity across the Potomac River through the expansion or replacement of the Long Bridge.
- S-Line transfer mechanism to allow for the transfer from CSXT to public ownership of an abandoned portion of the S-Line that runs from Petersburg, VA to Norlina, NC.

Long Bridge Capacity Expansion. The Long Bridge is a double-track railroad bridge built in 1904 and owned by CSXT, which crosses the Potomac River between Washington, D.C. and Arlington, VA. The bridge is used by all Amtrak intercity passenger trains, VRE commuter trains, and CSXT freight trains entering or passing through the Washington, D.C. area from Virginia. Intercity passenger and commuter trains now comprise more than two-thirds of the train traffic crossing Long Bridge. The increasing train traffic on the two-track bridge has created the most significant rail network bottleneck for Virginia.

The Washington, D.C. District Department of Transportation (DDOT) is studying the expansion of capacity on the Long Bridge in coordination with DRPT, VRE, CSXT, and FRA, which is a separate project from DC2RVA. In June 2018, DDOT and FRA released an Alternatives Report[17] identifying the two Long Bridge project build alternatives, each of which consists of a total of four tracks across the Potomac River composed of a new two-track bridge immediately upstream (west) of the existing bridge, and either a rehabilitated or new two-track bridge where the existing bridge stands. A Final EIS and ROD for the Long Bridge Capacity Expansion Study are anticipated in 2020.

---

[15] Note that these 6 miles of track are included as a component of the Preferred Alternative for the DC2RVA Project in Areas 1 and 2; refer to Chapter 4 of this Final EIS for details.

[16] Note that these two interlockings are components of the Preferred Alternative for the DC2RVA Project in Area 4; refer to Chapter 4 of this Final EIS for details.

[17] Study documents for the Long Bridge project are available at: http://longbridgeproject.com/study-documents/

1.3 PROJECT OVERVIEW

The purpose of this section is to provide the reader a concise synopsis of the basis of the DC2RVA Project's Purpose and Need and summary of the Project service plan, alternatives development process, and Draft EIS documentation.

1.3.1 Summary of Project Purpose & Need

This section summarizes the Purpose and Need of the DC2RVA Project—both of which are based upon the Purpose and Need of the 2002 Tier I EIS—and provides additional clarification on the unique needs of the DC2RVA corridor, as well as developments since the 2002 Tier I EIS. Refer to Draft EIS Section 1.4 and 1.5 for full details.

The DC2RVA Project will increase railroad capacity between Washington, D.C. and Richmond to deliver higher speed passenger rail service, while also supporting the planned expansion of VRE commuter rail service and accommodating the forecasted growth of freight rail service by developing an efficient and reliable multimodal rail corridor. This DC2RVA Tier II EIS carries forward the Purpose and Need of the 2002 Tier I EIS within the specific Washington, D.C. to Richmond segment of the larger corridor:

- The 2002 Tier I EIS established the overall Purpose and Need for the 500-mile SEHSR corridor between Washington, D.C. and Charlotte, NC: to provide a competitive transportation choice to travelers within the Washington, D.C. to Richmond, Raleigh, and Charlotte travel corridor.
- The 2002 Tier I EIS established the needs for the overall SEHSR program, including this Project. The following needs for the SEHSR program were identified in the 2002 Tier I EIS and remain current for the SEHSR corridor, including the 123-mile DC2RVA Project corridor: population growth; freight growth; congestion in the I-95 travel corridor; air travel congestion; rail capacity in the corridor; reliable and convenient movement of people and goods; air quality; safety; and energy efficiency.

However, the Purpose and Need of the Tier I and Tier II documents, while similar, address different actions: the 2002 Tier I Purpose and Need addressed the larger corridor and associated program-level decisions whereas the DC2RVA Tier II addresses the infrastructure improvements necessary to implement the Tier I decisions within the specific Washington, D.C. to Richmond rail corridor. Accordingly, the Tier II Purpose and Need builds upon the Tier I Purpose and Need by recognizing and incorporating several key items that are unique to the DC2RVA corridor:

- Existing rail infrastructure and right-of-way is privately owned by CSXT and serves CSXT's I-95 and National Gateway[18] freight rail corridors. CSXT's I-95 Corridor spans the entire Eastern U.S., linking cities, ports, and manufacturing regions. CSXT's National Gateway Corridor diverges from the I-95 Corridor in Washington, D.C. to link the Port of Virginia and other mid-Atlantic ports with cities and markets in the U.S. Midwest.
- Amtrak's intercity passenger rail service and VRE's commuter service operate on CSXT property through a series of negotiated agreements. The majority of Virginia's Amtrak intercity passenger services rely on CSXT's rail infrastructure in the DC2RVA corridor.

---

[18] Information on CSXT's National Freight Gateway is available at: https://www.csx.com/index.cfm/about-us/projects-and-partnerships/national-gateway/

- Several major studies of rail capacity improvements in the corridor have been conducted by FRA, DRPT, VRE, Amtrak, and CSXT all of which identified the need for additional track capacity to provide frequent and reliable passenger rail service.
- DRPT's 2009 Virginia I-95 High Speed Rail Corridor & Service Development Plan, with CSXT concurrence, establishes a service goal of 90-mph maximum achievable speed for intercity passenger service, plans for co-mingled freight, commuter and passenger service on the corridor, and proposes intercity and high speed rail improvements that would preserve existing freight capacity, and protect future capacity to allow the continued growth of freight traffic and operations in the corridor.
- The Passenger Rail Investment and Improvement Act of 2008 (PRIIA), which was enacted subsequent to the 2002 Tier I EIS, required the development of metrics for on-time performance of intercity passenger rail service. In response, FRA, working with Amtrak, the Surface Transportation Board, host railroads, and other stakeholders, developed on-time performance goals for most intercity passenger service of 90 percent or greater, with an 85 percent on-time performance goal for long-distance passenger service.[19] DRPT has applied these FRA on-time performance goals to the DC2RVA Project, in keeping with the Project's Purpose and Need to improve the reliability of passenger rail operation, and has applied a 90 percent on-time performance metric as the DC2RVA goal for all intercity passenger trains operating in the DC2RVA corridor. DRPT applied a higher standard of 95 percent for commuter trains to reflect VRE's service performance goal.
- The DC2RVA Purpose and Need also requires the Project to accommodate freight rail service operations, in accordance with PRIIA and the 2009 Corridor & Service Plan, including accommodation and allowance for future growth of existing and projected intercity, commuter, and freight rail service. Accommodation of existing and projected freight, commuter and intercity passenger service is critical to meet the needs of the corridor's owners and operator and support the Commonwealth's goals for its overall multimodal transportation system.

While the DC2RVA Project accommodates the future growth of these types of trains, the infrastructure and service proposed for the DC2RVA Project are not expected to create freight or VRE volume. Additionally, neither FRA nor DRPT anticipate that the addition of the 9 new daily intercity passenger round trips (18 total trains per day) proposed by the Project will change either the types or quantities of freight shipped on the corridor, which respond to economic demands created by commercial activities and independent market forces, separate from this Project.

In addition, in its 2017 Statewide Rail Plan, the Commonwealth of Virginia recognizes the privately-owned rail network as part of a multimodal system with public benefits and growing economic impacts. Since the 2000s, state investments have leveraged private and federal funds to improve freight and passenger rail transportation and support the overall transportation system.

1.3.2 Summary of Project Service Plan

The Project includes a service plan to improve the reliability of the intercity passenger service while adding 9 new daily intercity passenger round trips (18 total trains per day). As described in Section 1.2.1 and Section 1.2.2 above, the Project service plan expands on eight new daily intercity passenger round trips recommended in the 2002 Tier I EIS and the 2012 R2HR Tier I EIS by adding a ninth train originating in Richmond at Main Street Station. This ninth train was added to the Project to provide an early morning departure north to Washington, D.C. and the NEC and a corresponding late evening return trip.

---

[19] FRA published proposed "Metrics and Standards for Intercity Passenger Rail Service" in the Federal Register on May 12, 2010, which is available at: https://www.fra.dot.gov/eLib/Details/L02875

From Washington, D.C. to the north, DRPT intends for all of the new trains to continue on to Philadelphia, New York, and Boston, subject to available capacity and future operating schedules on the NEC. The service plan also includes a maximum authorized passenger train speed for the corridor of 90 mph, with improved trip reliability and improved on-time performance of the intercity passenger train service.

Section 4.2 of this Final EIS provides full details of the service plan for the Preferred Alternative for the Project.

1.3.3 Summary of Project Alternatives Development Process

For evaluation in the Draft EIS for the DC2RVA Project, DRPT identified six alternative areas in the corridor, each with unique existing conditions, constraints, and/or needs. The Draft EIS evaluated 23 Build Alternatives within those six alternative areas, as well as the No Build Alternative throughout the corridor. In the course of preparing the 2002 Tier I EIS and ROD, FRA and FHWA determined that the No Build Alternative did not meet Purpose and Need but the No Build was carried forward in the Tier II DC2RVA Project for purposes of comparison.

Alternatives were designed to increase rail capacity, improve frequency of service and performance, and accommodate higher passenger train speeds where practical, while minimizing potential impacts to natural and cultural resources and preserving the ability to meet the DC2RVA Project's Purpose and Need. DRPT considered a wide range of options during the alternatives development process, which included the following elements:

- Addition of main track along most of the corridor, and additional controlled sidings, crossovers, yard bypasses and leads, and other improvements at certain locations.
- Upgrades to existing track and signal systems to achieve higher operating speeds, including curve realignments, higher-speed crossovers between tracks, passing sidings, and at-grade crossing improvements.
- Station, platform, and parking improvements for intercity passenger rail stations and rail alignments, including accommodation of additional and/or extended VRE platforms and/or other improvements.
- Improvements to highway and rail crossing infrastructure, including safety improvements to at-grade roadway crossings.

Developing the location and configuration of the main line track was an iterative process. DRPT relied on previous studies and public scoping comments as the initial starting point; modifications were made to avoid or minimize potential adverse effects on environmental resources and existing infrastructure and to minimize the need for additional new infrastructure.

Most of the CSXT-owned corridor has sufficient existing right-of-way available to accommodate an additional main track. In Fredericksburg and Ashland, right-of-way limitations and potential impacts to the local communities led to consideration of additional alternatives outside the existing right-of-way (however, DRPT did not select these alternatives as part of the Preferred Alternative; refer to Chapter 4 of this Final EIS for details).

In Richmond, where there are multiple potential rail routes through the city, alternative development was driven by potential routing options through the Richmond area, which were based on combinations of service at four potential station locations: Staples Mill Road Station, Boulevard Station, Broad Street Station, and Main Street Station as well as capacity limitations on the CSXT A-Line currently used by all through freight and passenger trains.

The final screening evaluation to determine the Build Alternatives to be carried forward for evaluation in the Draft EIS focused on each rail alignment's ability to meet the Project's Purpose and Need by increasing the frequency and reliability of intercity passenger rail operations based upon added capacity, with the least potential environmental impact and consideration of cost to construct.

Refer to Chapter 2 and Appendix A of the Draft EIS for full details on all Build Alternatives that were evaluated in the Draft EIS, including the process that was used to evaluate and dismiss the less feasible alternatives.

1.3.4 Summary of Tier II Draft EIS

FRA approved the Tier II Draft EIS for the Project on August 30, 2017, and it was subsequently published for public review on September 8, 2017. The Draft EIS for the DC2RVA Project:

- Established the Purpose and Need for the Project.
- Considered all significant issues related to the Project identified during scoping.
- Disclosed the alternatives considered but dismissed from consideration.
- Disclosed all environmental impacts potentially associated with the Project's 23 Build Alternatives, either adverse or beneficial, and evaluated those build alternatives against the Purpose and Need and in comparison to the No Build Alternative.
- Identified DRPT's Recommended Preferred Alternative for the corridor based on the Purpose and Need for the Project and with consideration for potential environmental impacts.
- Established a public and agency review and comment period on the document, including public hearings.

The appendices of the Draft EIS presented detailed technical documentation and relevant coordination materials that supported the information and findings presented in the Draft EIS chapters. Chapter 8 of the Draft EIS detailed the distribution of the document, including agency distribution and public review locations.

1.3.5 Project Roles and Responsibilities

As sponsoring agencies for the Project, FRA and DRPT have maintained close coordination with the major stakeholders in the corridor, including rail operators Amtrak, VRE, and CSXT. FRA and DRPT have engaged federal and state agencies that have jurisdiction by law and/or special expertise to serve as Cooperating Agencies, including FHWA, Federal Transit Administration (FTA), U.S. Army Corps of Engineers (USACE), U.S. Coast Guard (USCG), U.S. Environmental Protection Agency (EPA), and the Virginia Department of Transportation (VDOT). FRA and DRPT have also coordinated Project development with DDOT, NCDOT, and affected Virginia localities along the corridor.

1.3.6 Tier II EIS Planning Dates

For purposes of this Project, FRA and DRPT established two important planning dates. The first planning date is 2025, which is FRA and DRPT's current best estimate of when construction of the DC2RVA infrastructure could be completed and the new DC2RVA service would be placed in operation. FRA and DRPT's estimate of the year 2025 as the "opening day" is dependent on many factors, not the least of which is finalizing the NEPA process. The date also assumes that federal funding in addition to other funding sources will be available at the level required to build all the proposed infrastructure improvements and acquire the necessary equipment and train-sets. DRPT based this date on an aggressive but potentially achievable schedule assumption that all necessary permits, approvals, agreements, and funding could be finalized by 2020, final design would take one year (2021), right-of-way acquisition (if needed) would take one year (2022), and construction would take three years (2023–2025). FRA and DRPT also used 2025 as the latest date when the physical impacts associated with DC2RVA Project construction would take place. Thus, all the physical impact analyses presented in the Draft EIS on man-made and natural resources are estimated for 2025 and compared to the No Build Alternative conditions projected for that same year. The physical impacts reported for the Preferred Alternative in this Final EIS are also estimated for 2025.

The second key planning date established by FRA and DRPT is the planning horizon date of 2045, 20 years after the projected implementation of the new rail service in 2025. Both PRIIA and FRA guidance require that DRPT demonstrate that the proposed Project is sufficient to deliver the proposed passenger rail benefits and an efficient and reliable multimodal rail corridor over a 20-year time horizon following the completion of the Project's construction. DRPT uses operational simulations analysis, as discussed in Section 3.2 of this Final EIS, to test the proposed alternatives to determine if the rail capacity is adequate for both the opening day (2025) levels of projected passenger, commuter and freight rail traffic and to determine if the infrastructure remains adequate over the 20-year planning horizon of 2045. DRPT also used the 2045 planning horizon date to estimate the longer-term effects of the proposed service such as ridership, energy use, and effects on air quality, as well as indirect and cumulative effects.

CHAPTER 2

OVERVIEW OF PUBLIC INVOLVEMENT AND AGENCY COORDINATION

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

2 OVERVIEW OF PUBLIC INVOLVEMENT AND AGENCY COORDINATION

This chapter describes the public involvement and agency coordination activities for the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Tier II Environmental Impact Statement (EIS). The Virginia Department of Rail and Public Transportation (DRPT) and the Federal Railroad Administration (FRA) employed many forms of public outreach to engage diverse audiences, inform them of the Draft and Final EIS, and offer a variety of ways to contribute their input. DRPT and FRA have also coordinated extensively with local, state, and federal agencies and jurisdictions throughout the environmental review process. The public, agency, and elected official comments received in response to these coordination efforts were instrumental in defining the scope of the Project, in preparing the Draft EIS and this Final EIS, and in defining the Preferred Alternative.

2.1 PUBLIC INVOLVEMENT

Based on the geographic extent of the Project, DRPT implemented an extensive public involvement process to keep the public informed of the latest Project information and to provide opportunities to ask questions and inform the development of the EIS. Chapter 6 of the Draft EIS included detailed descriptions of the various communication methods employed for the Project. Application of these same communication tools was continued after the publication of the Draft EIS and the associated public hearings. A brief summary of each is provided below:

Newspaper and Online Advertising. DRPT placed multiple advertisements in local, regional, and specialty newspapers along the Project corridor prior to each round of public meetings held prior to publication of the Draft EIS: Scoping (four meetings), Alternatives Development (three meetings), and Alternatives Review (three meetings). Similar advertisements were placed for the five public hearings which were held subsequent to publishing of the Draft EIS. DRPT also placed Spanish-language ads in newspapers which target Hispanic communities. In conjunction with the print ads, DRPT also placed electronic, interactive ads in the Fredericksburg Free-Lance Star and Richmond Times Dispatch websites and also through the Washington Post Digital advertising to reach people through news sites and other partner websites in the Project area.

Targeted Title VI Outreach. DRPT identified Title VI audiences throughout the corridor for targeted outreach during the course of the Project. Email notifications were sent to Title VI groups and organizations, and outreach materials were distributed at transit agencies, community centers, libraries, and Hispanic and faith-based organizations in areas with higher populations of low-income residents and areas with higher populations with limited English proficiency (LEP). For all public involvement and agency outreach materials and events, targeted communication options were available to assist Title VI audiences, and DRPT translated all broad outreach media—such as meeting handouts and comment forms, newspaper ads, flyers, and press releases—to Spanish. Any remaining handouts, including the Spanish versions, were distributed after each meeting to libraries in areas with higher concentrations of Hispanic populations to encourage their understanding and participation.

Project Contact Mailing List. DRPT created and maintained a Project mailing list for stakeholder groups and members of the public. Requests to be added to the mailing list could be made at any time, including through the Project website and at all public meetings. DRPT delivered Project updates, newsletters, and public meeting invitations to those on the mailing list via email, and printed and mailed materials for individuals not readily reachable by email. All flyers, rack cards, bookmarks, meeting handouts, and emails were also translated to Spanish. At the time of publication of the Draft EIS in September 2017, there was a maximum of approximately 4,225 organizations, agencies, and individuals listed on the Project Contact Mailing List.

Property Owner Notifications. In accordance with Section 33.2-1011 of the Code of Virginia, DRPT mailed property owner notification letters to allow access to properties for Project field surveys. In advance of the June 2015 Alternatives Development Public Meetings and the October 2017 Public Hearings, DRPT sent postcards to these same property owners and any property owners located within 500 feet in each direction from the centerline of the existing tracks.

E-Newsletters. DRPT distributed E-newsletters at key milestones throughout the Project to highlight details and outcomes of public meetings, explain the study process, provide updates on alternatives and recommendations, remind readers how and where to comment, and provide other timely insight. Spanish-speaking audiences were encouraged to request assistance if needed; however, no requests were received during the course of the Project.

Project Website. On October 6, 2014, DRPT launched the Project website: http://www.DC2RVArail.com. It serves as key reference for all public information, and DRPT continually updates the website with current and relevant information. The website also accepts comments and includes translation and font enlargement features.

Project Press Releases and Media Advisories. DRPT issued press releases at Project kick-off and prior to public meetings, and also made them available on the Project website. DRPT also issued media advisories prior to the public meetings to invite the media to attend and provide meeting coverage. To garner more media attention, DRPT contacted key media outlets to follow up on releases and offered to provide other information to inform news stories. These efforts resulted in over 188 news stories published during the announcement of each phase of public meetings held on the Project, ranging from the Scoping meeting in 2014 through the most recent Public Hearings for the Draft EIS in 2017 (see Section 2.1.1 below for details).

Project Brochure. DRPT prepared two Project brochures—one at the onset of the Project and an updated version in fall 2016. DRPT mailed the first brochure to 553 elected officials, libraries, faith groups, and chambers of commerce and disseminated the second brochure at key stakeholder and public meetings. Electronic versions of the brochures are available on the Project website.

Social Media. The purpose of the Project's social media efforts is to broaden outreach, increase awareness of the Project, and provide engagement opportunities to stakeholders who might not otherwise participate. DRPT summarized the content of social media posts to check for the most discussed topics and potential new issues not identified through traditional means and used social media to perform real-time evaluation of Project information and locate geographic areas with higher or lower levels of stakeholder participation. As of July 2018, Social Media profiles included 522 followers on Twitter (@dc2rvail) and 504 followers on Facebook (dc2rvarail).

2.1.1 Project Launch to Public Hearings

On October 6, 2014, 30 days in advance of the first Scoping public meeting, DRPT initiated the Project's public outreach to alert the public, agencies, and media of the Project's inception. The Project launch included formal publication by FRA of a Notice of Intent (NOI) for the Project in the *Federal Register* on October 23, 2014.[1]

Public outreach announcements for the launch were developed in conjunction with public outreach announcements for the Scoping public meetings and included a group of web "splash" pages; an electronic survey; social media posts; an email message to contacts in the Project database; an initial press release to key local and regional print and electronic media—including a Spanish version to limited English proficiency media outlets; and a Project brochure that was distributed to regional libraries, faith groups, transportation agencies, chambers of commerce, and elected officials encouraging them to share Project information with their communities and customers.

Public involvement throughout the remainder of the Project was based on several key milestones, which are summarized below and described in detail in Chapter 6 of the Draft EIS.

- **Scoping.** The purpose of scoping is to introduce the Project and to provide an early and open forum for identifying public concerns and clearly defining the environmental issues and alternatives to be examined in the EIS. DRPT and FRA held four open house style public Scoping meetings for the Project on November 5, 6, 12, and 13, 2014. Scoping meetings were held along the corridor in Alexandria, Quantico, Ashland, and Richmond. An online meeting launched on October 27, 2014 was also hosted on the Project website.
- **Alternatives Development.** DRPT held a second round of three public meetings on June 1, 2, and 3, 2015. Alternatives Development meetings were held in Alexandria, Fredericksburg, and Richmond. The topics covered at these open house meetings included the Draft Purpose and Need Statement, alternatives development process, and preliminary rail alignment options.
- **Alternatives Review**. DRPT held another round of three public information meetings on December 8, 9, and 10, 2015, again in an informal open house format. The Alternatives Review meetings were held in Springfield, Fredericksburg, and Richmond. At these meetings, DRPT presented updated information on alternatives development, and topics covered included the review of alternatives and preliminary information and methodology for rail operations, modeling, engineering, and environmental analyses.
- **Draft EIS.** The public hearings are described in Section 2.1.2 below.

All comments received during the public meetings were reviewed, documented, and included in the Project's administrative record. Outreach materials included reference to several methods by which people could submit comments and questions regarding the Project. These methods included:

  - Submission of comment form at in-person meetings
  - Mailing the hardcopy comment form to the Project office

---

[1] https://www.federalregister.gov/documents/2014/10/23/2014-25219/environmental-impact-statement-for-the-southeast-high-speed-rail-project-from-washington-dc-to

- Submission via the electronic comment form on the Project website
- Emailing the Project email address, info@dc2rvarail.com
- Calling the toll-free Project hotline (information in English and Spanish)

Comments received during specific comment periods informed decision making for that specified milestone. Comments submitted outside of the comment periods informed DRPT's understanding of public sentiment regarding the Project and, in some cases, provided unique information, like property and historic resource details that helped guide alternatives development efforts. DRPT responded to comments that included information requests (e.g., specific landowner concerns or general Project information questions) by email, unless otherwise requested. DRPT also hosted meetings, made phone calls, and provided information by mail.

2.1.2 Public Hearings for the Draft EIS

After publishing the Draft EIS, DRPT held five public hearings along the corridor on October 10, 11, 17, 18, and 19, 2017 to solicit public comments on the Draft EIS. The hearings were held from 6:00 p.m. to 9:00 p.m. in Richmond and Ashland and from 7:00 p.m. to 10:00 p.m. in Alexandria, Fredericksburg, and Quantico. The public hearings consisted of two parts: an informal open house, during which the public could review Project information and talk to subject matter experts; and a formal comment period during which the public could speak for the record. Table 2.1-1 provides the meeting date, location, and number of attendees at each public hearing.

Table 2.1-1: Public Hearings

Meeting Date	Meeting Location	Meeting Attendance[1]
October 10, 2017	Main Street Station 1500 East Main Street, Richmond, VA	94
October 11, 2017	Patrick Henry High School 12449 W. Patrick Henry Road, Ashland, VA	169
October 17, 2017	Hilton Alexandria Old Town 1767 King Street, Alexandria, VA	77
October 18, 2017	James Monroe High School 2300 Washington Avenue, Fredericksburg, VA	43
October 19, 2017	National Museum of the Marine Corps 18900 Jefferson Davis Highway, Triangle, VA	27

Note: 1. Attendance numbers based on DC2RVA sign-in sheets.

Upon arrival at the hearings, attendees were asked to sign in and were given a comment form and a public hearing handout that provided background on the study (materials were produced in English and Spanish). The open house portion of the hearings included 19 staffed informational boards that included the following:

- Review of alternatives
- Socioeconomics
- Property Acquisition Process
- Historic and Archaeological Resources
- Natural Resources
- Air, Noise, and Vibration
- Transportation
- Train Frequency

Detailed maps and map books were also presented, and Project subject matter experts were available to answer questions. The open house remained staffed during the formal comment portion of the public hearings.

The formal comment portion of the hearings were held in a separate space from the open house areas and began at 6:30 p.m. in Richmond and Ashland and 7:30 p.m. in Alexandria, Fredericksburg, and Quantico. DRPT opened the formal comment portion of the hearings and allotted each speaker three minutes to state their comments. Comments and questions provided during the public hearings were documented for the Project record, and DRPT did not provide responses to questions and comments during this hearing. After those who had signed up to speak gave their comments, the Hearing Officer opened the floor to any additional speakers who wished to come to the microphone and provide their name and comment for the record. Once all comments were provided, the Hearing Officer concluded the public hearing and let attendees know that the Project team was available in the open house area to answer any additional questions. Attendees were invited to submit a written comment during the meeting, by mail, or online to be included in the record.

A self-guided online meeting was also made available through the duration of the Draft EIS comment period (September 8, 2017 to November 7, 2017) and included a review of the Draft EIS and the same display information as the in-person meetings. All public hearing materials were posted on the Project website.

The public was invited to provide comments about the Project during and after each hearing through various formats. The last two options below applied to the public hearings only, whereas the first five were offered during the first three sets of public meetings for the Project as well.

- Submission of comment form at in-person meetings
- Mailing the hardcopy comment form to the Project office
- Submission via the electronic comment form on the Project website
- Emailing the Project email address, info@dc2rvarail.com
- Calling the toll-free Project hotline (information in English and Spanish)
- Submission via the online meeting
- Verbally via the Court Reporter

DRPT prepared a Draft EIS Public Hearing Summary Report[2] that describes the format and content of the public hearings, documents public outreach efforts before, after, and during the Draft EIS comment period, and summarizes comments received from agencies, organizations, and the general public.

2.1.3 Public Comment on the Draft EIS

The 60-day comment period for the Draft EIS ran from September 8, 2017 to November 7, 2017. During this time, DRPT received more than 14,000 comments from 4,247 individual commenters, with most citizens commenting on several topics or issues. All comments received were fully considered; DRPT reviewed each comment, categorized and appropriately grouped them by topic. Table 2.1-2 provides a summary of the 4,247 individual commenters, and Table 2.1-3 provides a summary of the 14,170 comments, indicating the number of times a particular topic, or issue, was mentioned. The top ten primary issues that were commented on were:

---

[2] Available on the Project website: http://dc2rvarail.com/resources/public-meeting-archive/

- Alignments through the Ashland Area
- Specific Landowner Issues (such as property-specific impacts from the Project, including property access or property acquisition)
- Alignments through the Richmond Area
- General support of Project
- Alignments through the Northern Virginia Area
- Economics impacts
- Farmland impacts
- Road/bridge impacts
- Emergency response impacts
- Safety

Note that petitions that were sent in as form letters were captured as separate comments for the purposes of the count in Table 2.1-2 and Table 2.1-3. Refer to Section 2.4.2 of this Final EIS for summary of public comment and DRPT's detailed responses, which are included as Appendix C of this Final EIS.

2.1.4 Additional Public Outreach

This section describes the public outreach for the Project, in addition to the public meetings, hearings, and comment periods.

2.1.4.1 Public Meetings Hosted by Outside Organizations

In addition to the public meetings hosted by DRPT, DRPT was also asked to present at three public meetings held by outside organizations. These meetings were requested by local jurisdictions, citizens, and non-governmental organizations (NGOs) to discuss proposed alternatives in their areas. Table 2.1-4 provides the meeting host, date, location, and number of attendees at each meeting. During these meetings, DRPT gave a brief Project update presentation and answered questions from the audience. Topics raised during the question and answer sessions included the study process, property impacts, passenger and freight rail service, Project cost, rail within the I-95 corridor, noise and vibration, eliminated alternatives, safety, economics, Purpose and Need, Project outreach, and train speeds. Comment forms were available at these meetings, collected, reviewed, and logged in the Project database. Additionally, DRPT collected sign-in sheets and added attendees to the Project contact mailing list.

Table 2.1-4: Outside Organization Hosted Meetings

Meeting Host	Meeting Date	Meeting Location	Meeting Attendance[1]
Virginians for High Speed Rail; Town of Ashland	February 4, 2016 (6:30 – 8:30 p.m.)	Ashland Town Hall 101 Thompson Street Ashland, VA 23005	17
Hanover County	April 4, 2016 (6:30 – 8:30 p.m.)	Patrick Henry High School 12449 W. Patrick Henry Road Ashland, VA 23005	402
Spotsylvania County	July 11, 2016 (6:30 – 8:30 p.m.)	Fredericksburg Christian High School 9400 Thornton Rolling Road Fredericksburg, VA 22408	233

Note: 1. Attendance numbers based on DC2RVA sign-in sheets.

2.1.4.2 Small Group Informational Meetings

As shown in Table 2.1-5, DRPT participated in more than 45 small group informational meetings with interested organizations throughout the corridor, in many cases at the request of the organizations themselves. Notifications about these meetings were issued from the requesting agency/organization, and all meetings were open to the public. Feedback received at these meetings focused on ways that DRPT could collaborate to improve Project communication.

Table 2.1-5: Small Group Informational Meetings

Meeting Date	Meeting Type / Attendees	Topics
November 3, 2014	Richmond Regional Planning District Commission, GWRideConnect, Arlington Transit, Dinwiddie County, Federal Railroad Administration	▪ Public Information Officer Update Regarding Upcoming Public Meetings
March 12, 2015	Virginia Hispanic Chamber of Commerce	▪ Project Activities and Schedule ▪ Hispanic Community Outreach Strategy
March 12, 2015	Ridefinders	▪ Project Activities and Schedule ▪ Public Outreach Strategy
March 12, 2015	AAA Seniors	▪ Project Activities and Schedule ▪ Senior Citizens Outreach Strategy

Meeting Date	Meeting Type / Attendees	Topics
October 24, 2017	Alexandria City Council	▪ Resolution to comments on Draft EIS
November 9, 2017	Special Commonwealth Transportation Board Meeting - Ashland	▪ Project Concerns
March 15, 2018	Woodbridge Potomac Communities Civic Association	▪ Project Update and Schedule
April 4, 2018	Virginia Department of Historic Resources	▪ Project Update ▪ AH Phase I in LOD
May 16, 2018	City of Richmond	▪ Project Update and Schedule
August 7, 2018	Virginia Department of Historic Resources	▪ Potential Impacts to Cultural Resources in Shockoe Valley
September 10, 2018	National Trust for Historic Preservation, Preservation Virginia, Advisory Council on Historic Preservation, Virginia Department of Historic Resources	▪ Potential Impacts to Cultural Resources in Shockoe Valley
October 15, 2018	Historic Richmond	▪ Project Update ▪ Potential Impacts
October 24, 2018	Town of Ashland Museum	▪ Project Update and Schedule
November 2, 2018	Elegba Folklore Society	▪ Project Update and Schedule
December 3, 2018	National Trust for Historic Preservation, Preservation Virginia, Historic Richmond	▪ Potential Impacts to Cultural Resources in Shockoe Valley

Note: Rows highlighted in gray denote meeting that was held subsequent to the release of the Draft EIS in September 2017.

2.1.4.3 Town of Ashland/Hanover County Community Advisory Committee

Through the alternatives development process and related community meetings, DRPT recognized the unique nature of the Town of Ashland and Hanover County, and that many of the alternatives for greater rail capacity in this area generated community concerns. As a result, DRPT implemented a community-based effort to supplement the corridor-wide DC2RVA public involvement activities described above and to help inform DRPT's recommendation for a Preferred Alternative that provides the required rail capacity through the Town of Ashland/Hanover County area.

As part of this community-based effort, DRPT established a Community Advisory Committee (CAC) to take a more intense look at all previous options, identify any potential new options to meet the Purpose and Need of the DC2RVA Project, and suggest mitigation strategies to address Project impacts. The CAC was specifically requested to:

- Review all alternatives studied during the preparation of the Draft EIS, including those considered but already dismissed during the alternatives development process
- Recommend alternative(s), including new alternatives or modifications to alternatives, to meet the Project Purpose and Need
- Identify and represent the concerns of members' communities
- Apply a structured and transparent approach seeking consensus

The CAC consisted of 14 members from the below organizations. Each organization nominated individuals to participate in the committee. CAC member organizations are listed below in alphabetical order:

- Town of Ashland
- CSX Transportation
- Hanover County
- Randolph-Macon College
- Richmond Regional Transportation Planning Organization

DRPT Director Jennifer Mitchell acted as chairperson of the committee and technical subject matter experts for the Project presented findings and answered questions at the meetings.

The CAC met monthly from May through September 2017 for a total of five meetings. The CAC members were notified by email and were encouraged to share the meeting details with the public. All meetings were open to the public, with specific meeting times set aside specifically for verbal comment by the public, with a limit of 2 minutes per citizen. The comment period was open until all individual commenters were able to provide their input at each meeting. Each of the CAC meetings included a full video recording available after the meeting on the Project website. The video offered the public who were unable to attend the opportunity to view the same information when it was most convenient for them. All public comments and questions were reviewed by the DRPT staff, and responses were prepared and shared with the CAC as part of the decision-making process.

Table 2.1-6 provides the meeting date, location, and number of attendees at each CAC meeting.

Table 2.1-6: CAC Meetings

Meeting Date	Meeting Type	Meeting Location	Meeting Attendance[1]
May 22, 2017	CAC Meeting	Hanover County Administration Building Board of Supervisors	90
June 26, 2017	CAC Meeting	Randolph-Macon College	60
July 25, 2017	CAC Meeting	Randolph-Macon College	280
August 28, 2017	CAC Meeting	Randolph-Macon College	80
September 11, 2017	CAC Meeting	Randolph-Macon College	60

Notes: 1. Attendance numbers are based on DC2RVA sign-in sheets.
Row highlighted in gray denotes meeting that was held subsequent to the release of the Draft EIS in September 2017.

It is important to note that the CAC process was not meant to replace the Draft EIS public hearings and public comment period. Members of the public were encouraged to also provide comments on the Draft EIS once the document was made publicly available on September 8, 2017.

Refer to Section 3.3 of this Final EIS for a description of the CAC recommendations as they pertain to selection of the Preferred Alternative. Refer to Appendix G of this Final EIS for the final summary report on all CAC activities, which was published in October 2017.

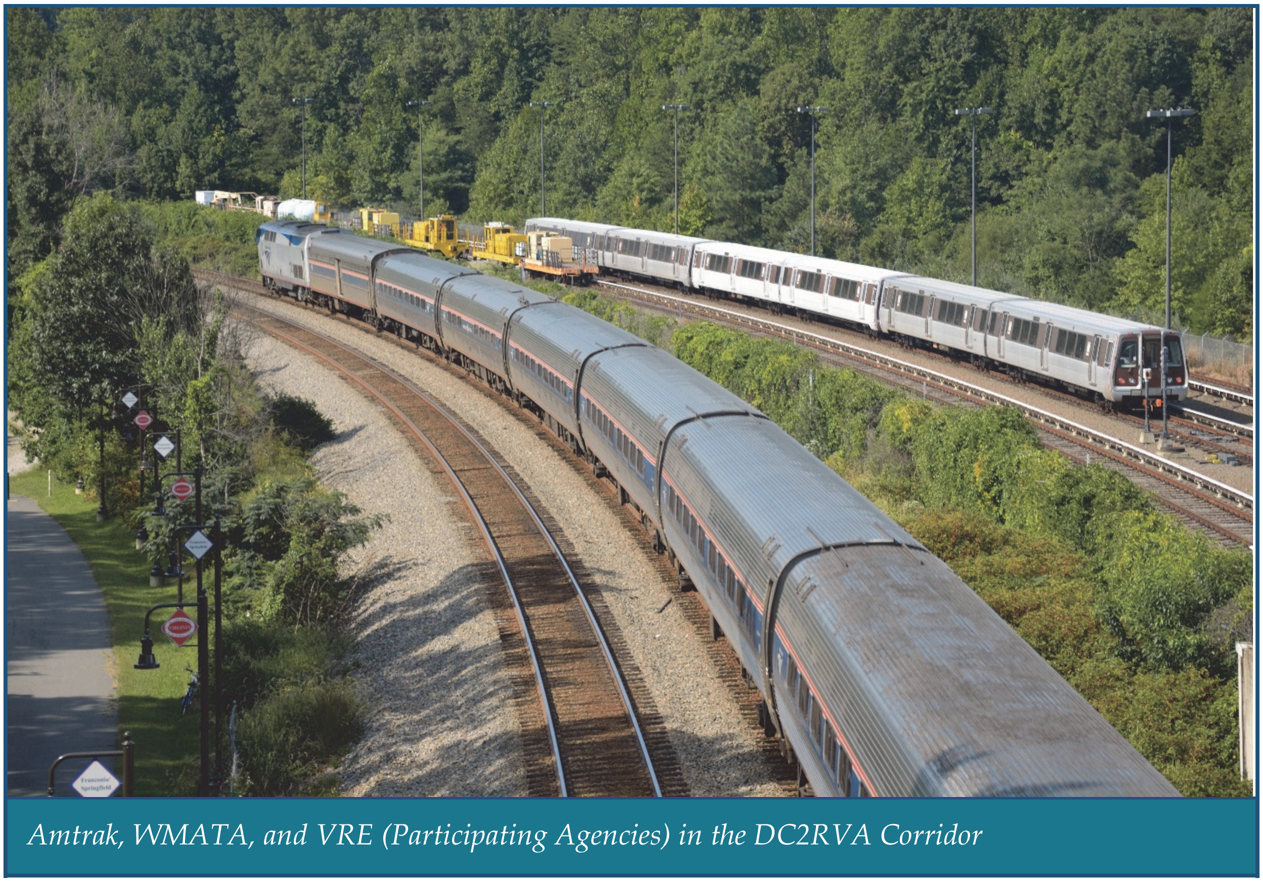
2.2 AGENCY COORDINATION

DRPT and FRA conducted extensive agency coordination throughout the course of the Draft EIS. More than 35 agencies were invited to be Cooperating or Participating Agencies. Cooperating Agencies include those agencies that have jurisdiction by law or special expertise and typically:

- Participate in scoping
- Provide staff support
- Assist with analyses, field reviews, and public meetings
- Review documentation

The Draft and Final EIS are meant to assist Cooperating Agencies in fulfilling their jurisdictional and NEPA responsibilities. Table 2.2-1 presents the Cooperating Agencies[3] for the DC2RVA Project.

Participating Agencies also have an interest and remain involved throughout the Project, but they typically do not have as active a role as Cooperating Agencies. The Participating Agencies for the DC2RVA Project are also presented in Table 2.2-1.



Amtrak, WMATA, and VRE (Participating Agencies) in the DC2RVA Corridor

---

[3] USFWS was also invited to be a cooperating agency but did not respond. Although USFWS is not a cooperating agency, they did participate in a phone conference with the cooperating agencies on August 31, 2015. USFWS requested information regarding proposed Project alignments. DRPT worked with USFWS to provide this information and respond to other USFWS comments.

Table 2.2-1: Cooperating and Participating Agencies

Cooperating Agencies	
Federal Highway Administration (FHWA)	U.S. Coast Guard (USCG)
Federal Transit Administration (FTA)	U.S. Environmental Protection Agency (EPA)
U.S. Army Corps of Engineers (USACE)	Virginia Department of Transportation (VDOT)
Participating Agencies	
Advisory Council on Historic Preservation (ACHP)	Marine Corps Base (MCB) Quantico
Amtrak	Metropolitan Washington Council of Governments (MWCOG)/National Capital Region Transportation Planning Board
Arlington County	Northern Virginia Regional Commission (NVRC)
Caroline County	Northern Virginia Regional Park Authority (NVRPA)
Chesterfield County	Northern Virginia Transportation Commission (NVTC)
City of Alexandria	Potomac and Rappahannock Transportation Commission (PRTC)
City of Colonial Heights	Prince William County
City of Fairfax	Richmond Regional Planning District Commission/Richmond Regional Transportation Planning Organization (RRTPO)
City of Fredericksburg	Spotsylvania County
City of Richmond	Stafford County
Crater Planning District Commission/Tri-Cities Metropolitan Planning Organization (MPO)	Town of Ashland
Dinwiddie County	Town of Dumfries
District of Columbia Department of Transportation (DDOT)	Town of Quantico
Fairfax County	Virginia Department of Historic Resources (DHR)
Fredericksburg Area Metropolitan Planning Organization (FAMPO)	Virginia Port Authority
George Washington Regional Commission (GWRC)	Virginia Railway Express (VRE)
Hanover County	Washington Metropolitan Area Transit Authority (WMATA)
Henrico County	

2.2.1 Agency Meetings

Early and continuous agency coordination provides support for Project development. The first agency meeting was the agency scoping meeting for federal, state, and local agencies conducted on November 3, 2014. The intent of the meeting was to introduce the Project; explain the study process; refine the Purpose and Need; review concerns and comments; and begin to identify alternatives for consideration. Comments and input from the agencies attending were welcomed. DRPT also held agency meetings on June 25, 2015 and March 31, 2016, to update the federal, state, and local agencies on Project activities and receive feedback. Table 2.2-2 provides a summary of the inter-agency meetings held to date.

Table 2.2-2: Interagency Meetings

Meeting Date	Meeting Attendees	Topics
November 3, 2014	16 attendees, representing FRA, USACE, U.S. Department of Housing and Urban Development (HUD), VDOT, MWCOG, RRTPO, Stafford County, Spotsylvania County, Henrico County, Chesterfield County, and the City of Richmond	▪ Served as Agency Scoping Meeting ▪ Project Introduction ▪ Study Process Explanation ▪ Purpose and Need Refinement ▪ Identify Alternatives for Consideration ▪ Concerns and Comments on the Project from Attendees
June 25, 2015	20 attendees, representing FRA, USACE, EPA, FHWA, and VDOT	▪ Project Overview ▪ Update on Project Activities to Date ▪ Ongoing and Upcoming Project Deliverables ▪ Concerns and Comments on the Project from Attendees
March 31, 2016	24 attendees, representing FRA, USACE, EPA, Amtrak, VDOT, VRE, WMATA, MWCOG, RRTPO, Stafford County, Hanover County, Chesterfield County, City of Fredericksburg, and MCB Quantico	▪ Update on Project Activities to Date ▪ Ongoing and Upcoming Project Deliverables ▪ Concerns and Comments on the Project from Attendees
February 9. 2017	Attendees representing VDOT	▪ Project Update and Schedule
February 22, 2017	Attendees representing VRE and FRA	▪ Project Update and Schedule
January 4, 2018	24 attendees representing Amtrak, DRPT	▪ Project Update and Schedule
January 17, 2018	2 Attendees representing FRA and DRPT	▪ Project Concerns and Schedule
March 6, 2018	Attendees representing NCDOT, VRE, Amtrak, FRA, CSX, DDOT	▪ Service Development Plan Kickoff
March 6, 2018	Attendees representing NCDOT	▪ Scheduling

Note: Rows highlighted in gray denote meetings that were held subsequent to the release of the Draft EIS in September 2017.

In addition to the larger agency meetings, DRPT scheduled smaller agency-specific meetings as needed to discuss particular resources and topics in greater detail. Table 2.2-3 lists these agency-specific meetings and includes a brief summary of the discussion topics.

Table 2.2-3: Agency Meetings

Meeting Date	Meeting Attendees	Topics
September 3, 2015	USACE–Norfolk District, Virginia Department of Environmental Quality (DEQ)	▪ Wetlands Methodology ▪ Permit Requirements
September 16, 2015	EPA	▪ Project Overview ▪ Climate Change and Resiliency ▪ Wetlands ▪ Environmental Justice, Relocations, and Public Outreach ▪ Air Quality ▪ Secondary and Cumulative Impacts ▪ Stormwater
November 30, 2015	USACE–Norfolk District, DEQ	▪ Streams and Wetlands Field Review Meeting–Segments 6, 7, and 8[1]
December 16, 2015	USACE–Norfolk District, DEQ	▪ Streams and Wetlands Field Review Meeting–Segments 10 and 11[1]
February 3, 2016	USACE–Norfolk District, DEQ	▪ Streams and Wetland Field Review Meeting–Segments 11 and 12[1]
May 19, 2016	United States Fish and Wildlife Service (USFWS)	▪ Project Overview ▪ Threatened and Endangered Species Inventories and Survey
July 21, 2016	USACE–Norfolk District, DEQ	▪ Streams and Wetland Field Review–Segment 21[1]
May 11, 2018	USACE- Norfolk District	▪ James River Floodwalls
May 24, 2018	USACE – Norfolk District Regulatory Branch, EPA	▪ Draft EIS Comments and Responses; Permit Coordination; Mitigations
June 6, 2018	EPA	▪ Draft EIS Comments and Responses

Note: 1. See Section 2.3 of the Draft EIS for a description of DC2RVA corridor segments.
Rows highlighted in gray denote meetings that were held subsequent to the release of the Draft EIS in September 2017.

2.2.2 Distribution of the Draft EIS

On September 8, 2017, the EPA published in the Federal Register EPA's weekly Notice of Availability (NOA) that included the Draft EIS. Publication of the NOA initiated the 60-day public involvement period. DRPT distributed the Draft EIS to 325 federal, regional, state, and local agencies, elected officials, and other interested parties for their review and comments. The document was also made available for public viewing at public libraries and government centers along the corridor, as well as on the Project website (www.DC2RVArail.com). The complete distribution list is included in Chapter 8 of the Draft EIS.

2.2.3 Additional Agency/Stakeholder Coordination

This section describes DRPT's additional coordination efforts, including task force meetings, coordination with local agency and officials, and Section 106 and Section 4(f) coordination.

2.2.3.1 Task Force Meetings

Because the Project involves rail infrastructure owned by CSX Transportation (CSXT) and utilized by multiple operators, DRPT formed a task force of the transportation providers in the corridor to ensure effective communication and coordination of Project information. DRPT hosted task force meetings quarterly, or as needed at Project milestones, beginning in August 2014. Participants at the task force meetings typically included FRA, DRPT, VDOT, CSXT, Amtrak, VRE, Virginia's Office of the Attorney General (OAG), and DDOT. The task force meetings began with an initial kick-off meeting followed by a series of updates on Project activities and the schedule. There have been 15 meetings held between the Project's conception and July 2018. The meetings have served as an important tool for coordination amongst the primary Project stakeholders.

The main objectives of the task force were:

- To serve as the "Core Project Team"
- To be briefed on major Project milestones and to keep appropriate staff informed of the Project progress
- To serve as advisors to the lead agency for the EIS
- To provide technical review and input to complete certain parts of the study

Table 2.2-4 provides a summary of the task force meetings to date.

Table 2.2-4: Task Force Meetings

Meeting Date	Meeting Attendees	Topics
August 18, 2014	FRA, DRPT, VDOT, CSXT, VRE	▪ Project Introduction ▪ Early Project Concerns
January 8, 2015	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, OAG	▪ General Update of Project Activities ▪ FRA Agreement with DRPT ▪ Freight Growth and Modeling ▪ Freight and Passenger Rail Capacity ▪ VRE Station Planning and Development ▪ Long Bridge ▪ Basis of Design
April 8, 2015	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, Virginia Office of the Attorney General (OAG)	▪ Purpose and Need ▪ Service Goals ▪ Alternatives Development ▪ Public Involvement
May 19, 2015	FRA, DRPT, VDOT, CSXT, Amtrak, VRE	▪ Purpose of June Public Meetings ▪ Materials to be Presented at June Public Meetings ▪ Issues that arose during Locality Meetings ▪ Key Provisions of Basis of Design
June 29, 2015	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, OAG	▪ Project Update and Schedule ▪ Service Goals ▪ Engineering Options Overview

Table 2.2-4: Task Force Meetings

Meeting Date	Meeting Attendees	Topics
September 30, 2015	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, OAG	▪ Project Update and Schedule ▪ Alternatives Development ▪ Screening Results: Potomac to Staples Mill ▪ Screening Status: Richmond ▪ Ridership Model Development ▪ Preliminary Service Plan ▪ Streamlining Projects
January 27, 2016	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, DDOT, OAG	▪ Project Update and Schedule ▪ Operations Modeling Methodology ▪ Alternatives Review ▪ Draft EIS Content
May 11, 2016	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, DDOT, OAG	▪ Project Update and Schedule ▪ Locality Update ▪ Build Alternatives and No Build Alternative ▪ Ridership Forecasting ▪ FASTLANE Grant Application
August 16, 2016	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, OAG	▪ Project Update and Schedule ▪ Build Alternatives and No Build Alternative ▪ Preliminary Ridership Estimates
November 2, 2016	FRA, DRPT, VDOT, CSXT, Amtrak, VRE	▪ Project Update and Schedule ▪ Alternatives Review ▪ Community Outreach ▪ Ridership Modeling Update ▪ Atlantic Gateway
February 2, 2017	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, DDOT	▪ Project Update and Schedule ▪ Alternatives Review ▪ Ridership Modeling Update ▪ Preliminary Engineering Update ▪ Atlantic Gateway ▪ Long Bridge
July 12, 2017	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, DDOT	▪ Project Update and Schedule ▪ Summary of Alternatives Review ▪ Public Hearing Schedule and Timeline ▪ Town of Ashland and Hanover County Area Community Advisory Committee Update
February 8, 2018	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, DDOT	▪ Project Update and Schedule ▪ CTB Decision on Recommended Preferred Alternative ▪ Preliminary Engineering Update ▪ Service Development Planning
July 10, 2018	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, DDOT	▪ Preliminary Engineering ▪ Service Development Plan ▪ Final EIS format and documentation, including Draft EIS comment responses
November 7, 2018	FRA, DRPT, VDOT, CSXT, Amtrak, VRE, DDOT	▪ Service Development Plan ▪ Final EIS Update and Timeline ▪ Section 106 Coordination ▪ Network-wide Modeling Results

Note: Rows highlighted in gray denote meetings that were held subsequent to the release of the Draft EIS in September 2017.

2.2.3.2 Local Agencies and Officials Coordination

Beyond agency coordination with departments within localities, DRPT also specifically engaged local officials during the Project's development. In total, DRPT conducted over 60 meetings with local agencies and officials to provide Project briefings and updates, gather feedback on alternatives, and answer questions. The organizations and meeting dates are listed in Table 2.2-5.

Table 2.2-5: Local Agency and Official Meetings

Meeting Date	Meeting Attendees	Topics
December 3, 2014	City of Richmond Mayor's Staff, DRPT	▪ Project Activities and Schedule ▪ Richmond Station Locations ▪ Relation to Bus Rapid Transit (BRT)

Note: Rows highlighted in gray denote meetings that were held subsequent to the release of the Draft EIS in September 2017.

In addition to the meetings with local officials listed in Table 2.2.5, DRPT also met with members of Virginia's Congressional delegation on May 19, 2016 in Cannon House Office Building, Room Cannon 5C. Representatives from the offices of Senator Tim Kaine, Senator Mark R. Warner, Representative Don Beyer, Representative Gerald Connolly, Representative Robert J. Wittman, Representative Dave Brat, and Representative Robert C. Scott all participated in the meeting. Attendees discussed the various area-specific options along the corridor, as well as FASTLANE funding and how the Project could complement DRPT's Atlantic Gateway suite of projects.[4]

DRPT provided additional outreach to elected officials during key Project milestones, as shown in Table 2.2-6. More than 300 elected officials were contacted and included on the Project's email database to receive newsletters and other Project updates.

Table 2.2-6: Elected Official Targeted Outreach

Date	Format	Content
October 22, 2014	Direct Mailing #1	Project notification providing notice that FRA and DRPT were initiating preparation of a Tier II EIS for the Washington, D.C. to Richmond, VA, rail corridor.
May 18, 2015	Direct Mailing #2	Project update providing schedule information on public meetings to take place in early June. The update also shared that the Project's Purpose and Need statement was completed, preliminary rail alignment options had been developed, and alternative screening criteria had been identified.
November 10, 2015	Email #1	Project update that early stages of the alternatives screening process were completed and input from the June 2015 public meetings was incorporated to develop a range of viable alternative improvements for detailed evaluation.
September 12, 2017	Email #2	Project notification providing notice of the Draft EIS document release.
September 27, 2017	Email #3	Project notification providing notice of the Draft EIS Public Hearing times, dates, and locations.
September 27, 2017	Email #4	Project invitation to attend Draft EIS Public Hearing.
October 10, 2017	Email #5	Project notification to inform officials about Draft EIS Public Hearing meeting materials.
November 2, 2017	Email #6	Project notification indicating that the Draft EIS Public Hearing Comment Period closes soon.

Note: Rows highlighted in gray denote communications distributed subsequent to the release of the Draft EIS in September 2017.

---

[4] The Atlantic Gateway is a $1.4 billion partnership that focuses on the I-95 corridor between Washington, D.C. and Fredericksburg, VA. Partially funded by a federal FASTLANE grant, the program utilizes an innovative public/private partnership to leverage a suite of multi-modal improvements along one of the nation's busiest corridors. The FASTLANE, or Fostering Advancements In Shipping And Transportation For The Long-Term Achievement Of National Efficiencies, grants are part of the Fixing America's Surface Transportation (FAST) Act § 1105; 23 U.S.C. 117. The competitive FASTLANE grants provide financial assistance to nationally and regionally significant freight and highway projects that meet the program's goals of improving safety, reducing congestion, generate economic benefits, improve connectivity, enhance resiliency, improve roadways vital to national energy security, and address the impacts of population growth on the movement of people and freight (www.fhwa.dot.gov/fastact/).

2.2.3.3 Section 106 Coordination and Consultation

DRPT coordinated with numerous property owners and officials with jurisdiction over resources protected under Section 106 of the National Historic Preservation Act (NHPA), with particular focus on resources where the Project alternatives would likely result in an adverse effect to cultural or historic properties.

Agencies involved in this dialogue included ACHP, Virginia Department of Historic Resources (DHR), USACE, American Battlefield Protection Program (ABPP), and United States DOI. Complete details on Section 106 coordination and consultation are included in Appendix E of this Final EIS.

2.2.3.4 Section 4(f) Coordination

DRPT coordinated with the owners of parkland resources protected under Section 4(f) of the *U.S. Department of Transportation (U.S. DOT) Act of 1966* (23 U.S.C. 138). Letters were sent in summer 2017 to owners of all Section 4(f) parkland resources that could potentially be affected by the Project. Based on comments received, design revisions were made to reduce the Project's limits of disturbance (LOD) in areas adjacent to parks. Based on the revised LOD, letters were sent in Fall 2018 to all resource owners for resources with permanent impacts or temporary occupancy.

Temporary and permanent impacts of the Preferred Alternative to the Section 4(f) resources are quantified in Chapter 6 of this Final EIS, which also includes complete details of Section 4(f) coordination. Concurrence of Section 4(f) use(s) have been received from the respective resource owners, copies of which are provided in Appendix E of this Final EIS.

National Park Service–Stonewall Jackson Shrine (Area 4, Central Virginia)

2.3 COMMONWEALTH TRANSPORTATION BOARD

Virginia's Commonwealth Transportation Board (CTB) establishes the administrative policies and oversees transportation projects and initiatives for the Commonwealth's transportation system. The CTB is made up of 17 members appointed by the governor, and typically meets on a monthly schedule. The CTB allocates transportation funding to specific projects, locates routes, and provides funding for highways, rail, and public transportation projects. The CTB Rail Committee, a subgroup of the CTB, meets separately and works with DRPT staff on policies, procedures, special projects, and reports related to rail.

2.3.1 CTB Coordination – Scoping through Draft EIS

Because of the scale of the DC2RVA Project, DRPT began briefing the CTB on DC2RVA in advance of procurement for this Project at the CTB Workshop on July 16, 2014. DRPT updated the Rail Committee informally through the scoping and alternatives development process as the Draft EIS was developed. DRPT provided formal updates at the September 20, 2016, Rail Committee and Workshop. DRPT presented its preliminary recommendations for the DC2RVA Project at the CTB Workshop on December 6, 2016, while the Draft EIS was in review by FRA. The recommendations presented in December 2016 were identical to those documented in the Recommendation Report (Appendix I of this Final EIS) with the deferral of a recommendation of a Preferred Alternative for Area 5 in the Town of Ashland/Hanover County Area. As described above in Section 2.1.4.3, Ashland/Hanover CAC, comments from local officials and citizens in this area requested that DRPT review its alternatives development process with greater public involvement. DRPT and community members engaged the CTB through updates and public comments at CTB workshops and Rail Committee meetings, as well as a CTB tour of the Town of Ashland and Hanover County on November 1, 2016. The tour served as a fact-finding mission for the CTB so that they could view the scale of potential rail alignments in relation to the existing landscape and receive an update on the overall Project.

DRPT made formal presentations to the full CTB and CTB Rail Committee throughout 2017 (after publication of the Draft EIS):

- February 15, 2017 CTB Rail Committee
  - Reported on status of FRA's Draft EIS review and DRPT's request to conduct a separate NEPA effort for the Ashland/Hanover area due to unique land use conditions and longer-range need.
- April 18, 2017 CTB Rail Committee
  - Reported that DRPT was preparing refined operations analysis to confirm that the infrastructure proposed in the Draft EIS will meet the Purpose and Need of the full DC2RVA Project, particularly with regard to the proposal to retain a two-track railroad through the Town of Ashland.
  - Reported that FRA could not separate the section for Area 5 through Ashland from the DC2RVA Project for further analysis in a separate NEPA effort, since the EIS for the DC2RVA Project provides an FRA Record of Decision for a contiguous corridor-wide service improvement from Washington, D.C. through Richmond, VA.
  - Conveyed that the CAC will be convened for the Ashland/Hanover area, and FRA supports the CAC process as additional community involvement to inform the development of the alternatives presented in the EIS.

  - Reviewed DRPT recommendations for Areas 1–6 and reported that the Draft EIS would not contain a DRPT recommendation of a Preferred Alternative for Arlington (Area 1) and Ashland/Hanover (Area 5).
- September 19, 2017 CTB Rail Committee and CTB Workshop
  - Presented results of the CAC, in collaboration with CAC Member Barbara Nelson of the Richmond Regional Transportation Planning Organization.
  - CSXT expressed its concern that a 3-2-3 option would result in freight delays.
- October 23, 2017 CTB Rail Committee
  - Reported results of refined operations analysis modeling, which showed that most freight delays outside of the Project corridor are caused by forecasted freight growth through 2045 and are not attributable infrastructure constructed or service improvements implemented under the DC2RVA Project, particularly with a two-track railroad through Ashland in Alternative 5A.
  - Recommended phased implementation and coordination with the railroads and operators to address potential future delays both inside and outside the corridor.
- October 23, 2017 CTB Workshop
  - Reviewed previous DRPT recommendations for each area of the DC2RVA corridor.
  - Reported on the Draft EIS Public Hearings and presented a draft comment summary.
- November 9, 2017 CTB Rail Committee
  - Held in Ashland. The Virginia Secretary of Transportation encouraged participation by all CTB members, not just CTB Rail Committee Members. Ten out of 17 CTB Members attended.
  - Presented results of the DC2RVA Public Hearing process and Draft EIS comment period.
  - Announced DRPT's Recommended Preferred Alternative as Alternative 5A, as defined in the Draft EIS, also known as "3-2-3," for the Town of Ashland/Hanover County area (Area 5).
  - Reviewed DRPT's rationale for both the Ashland/Hanover area and Richmond area recommendations.
  - Presented Draft CTB Resolution for the December CTB action.
- December 5, 2017 CTB Rail Committee
  - Reported on status of DC2RVA developments, noting the many comments and letters received on the Draft EIS.
  - Noted that a Project Recommendation Report will be distributed to CTB members at the end of the month reflecting the CTB vote on the alternatives selected.
  - The proposed DC2RVA resolution was to be voted on during the action meeting on the following Wednesday.

In addition to DRPT's presentations, members of the CTB had the opportunity to discuss issues and ask questions. Public comment periods were provided at each CTB Rail Committee and each CTB Action Meeting. Meeting minutes and video recordings of these meetings are available online at www.ctb.virginia.gov/public_meetings.

2.3.2 CTB Resolution on Recommended Preferred Alternative

CTB voted to adopt a resolution regarding DRPT's Recommended Preferred Alternative for DC2RVA at its December 6, 2017 CTB Action Meeting. Refer to Section 3.4 of this Final EIS for a description of the resolution, and Appendix H of this Final EIS for a copy of the resolution.

2.4 SUMMARY OF COMMENTS AND RESPONSES ON THE DRAFT EIS

FRA and DRPT received comments on the Draft EIS from agencies and organizations (summarized in Section 2.4.1) and the general public (summarized in Section 2.4.2). DRPT provided responses to substantive comments in Appendix B (agency and organization) and Appendix C (public) of this Final EIS. In general, substantive comments are those that question, with reasonable basis, the accuracy of information and methodology in the Draft EIS or present new information not considered in the Draft EIS, and cause changes or revisions in one or more alternative or environmental resource.

2.4.1 Agencies and Organizations

Thirty-four agencies and organizations provided comments on the Draft EIS during the 60-day comment period. DRPT carefully reviewed each letter and provided detailed responses and explanations to each comment, concern, and request. Refer to Appendix B of this Final EIS for copies of the original comment letters along with DRPT's and FRA's detailed responses to each. These detailed responses include reference to information provided in both the Draft EIS and this Final EIS, and are the outcome of ongoing agency coordination that has occurred since the publication of the Draft EIS and receipt of the agency comment letters.

The following sections summarize the substantive comments from each agency or organization to which DRPT provided a response. Responses to substantive comments are incorporated by way of minor corrections, clarifying explanations, or supplemental documentation, as needed, into the content of the appropriate sections of this Final EIS.

Many agency and organization comments included the following topics, which did not warrant changes to the methodologies or information provided in the Draft EIS. Notwithstanding, DRPT provided responses to these topics within the detailed responses provided in Appendix B of this Final EIS.

- Overall position/opinion for or against the Project.
- Preference for and/or opposition to a specific alignment or Build Alternative that was evaluated in the Draft EIS.
- Suggestion of additional alternatives to consider, most of which were considered but dismissed during the 2002 Tier II EIS or do not align with the implementing actions that were the outcome of the 2002 Tier II EIS and ROD.
- Request for detailed information or data that is beyond the scope of the NEPA document and would be developed during the final design and permitting process, which would occur in the future after Project funding becomes available and incremental improvements are scheduled. To address these requests, DRPT has added Chapter 7 to this Final EIS to describe future steps of the Project.
- Requests for ongoing coordination beyond the NEPA phase of the Project; refer to Section 7.8 of this Final EIS for details of Project regulatory actions, approvals, and commitments.

2.4.1.1 Federal Agencies

Refer to Appendix B1 of this Final EIS for detailed responses to Federal agency letters (which are presented in the same order as below).

U.S. Environmental Protection Agency (EPA), Region III. EPA provided technical comments on the Project's Purpose and Need, alternatives, and several environmental resources including: aquatic resources, stormwater management, noise, environmental justice, children's health, indirect and cumulative effects (ICE), and air quality. In response to these comments, this Final EIS incorporates the following:

- Minor text modifications, for clarification or correction, within environmental resources.
- Clarifications to: freight movement as a Project need; definition of temporary/permanent impacts; safety of hazardous materials transport; weather resiliency design; and noise and additional considerations as part of the ICE evaluation.
- Addition of: compliance with Executive Order 13045 *Protection of Children from Environmental Health Risks and Safety Risks*; and updated Information, Planning, and Conservation (IPaC) information for threatened and endangered species.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

U.S. Army Corps of Engineers (USACE). USACE commented on the Project's Purpose and Need, alternatives, and aquatic resources, particularly regarding analysis methodology and mitigation. In response to these comments, this Final EIS incorporates clarifications to: freight movement as a Project need; definition of temporary/permanent impacts; potential mitigation for invasive species; functionality of tidally-affected wetlands; and reduced environmental impacts from Preferred Alternative 5A infrastructure. This Final EIS also incorporates Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Department of the Interior (DOI). DOI commented directly on the Draft Section 4(f) evaluation. In response to these comments, the Final Section 4(f) Evaluation (Chapter 6 of this Final EIS) includes clarification to address potential impacts to smaller park units as well as the overall park for the two units of Fredericksburg and Spotsylvania National Military Park (Stonewall Jackson Shrine and the area near Prospect Hill). This Final EIS also incorporates Project commitments, including agency coordination, permitting/regulatory compliance, final design features and/or mitigation measures.

Additionally, DOI submitted comments on the Draft EIS on behalf of: the National Park Service (NPS)/National Capital Planning Commission (NCPC); the Captain John Smith Chesapeake National Historic Trail; the Fredericksburg & Spotsylvania National Military Park and Richmond National Battlefield Park; and the American Battlefield Protection Program. In response to these comments, this Final EIS incorporates the following:

- Minor text modifications, for clarification or correction, within environmental resources.
- Updates to: potential impact to the George Washington Memorial Parkway, Roaches Run Waterfowl Sanctuary, Mount Vernon Memorial Highway, and archaeological surveys.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Federal Aviation Administration (FAA). The FAA determined that it had no federal action or approval with regard to the Project.

2.4.1.2 State Agencies

Refer to Appendix B2 of this Final EIS for detailed responses to state agency letters (which are presented in the same order as below).

Virginia Department of Environmental Quality (DEQ). DEQ is responsible for coordinating the Commonwealth of Virginia's review of federal environmental documents submitted under NEPA and as such, included the following additional reviewing agencies, localities, and planning district commissions in their comments on the Draft EIS:

- Department of Conservation and Recreation (DCR)
- Department of Health (VDH)
- Department of Historic Resources (DHR)
- Richmond Regional PDC
- Crater PDC
- Virginia Outdoors Foundation
- Town of Ashland
- City of Fredericksburg
- Fairfax County

DEQ summarized all comments received and provided recommendations and requirements for minimizing potential impacts from the Project and for compliance with applicable legal requirements for the following resources and activities: water quality and wetlands; subaqueous lands and tidal wetlands; erosion and sediment control; stormwater management; air pollution control; solid and hazardous wastes and hazardous materials; natural heritage resources; recreational resources, scenic rivers and byways; state parks; historic resources; public water supplies; septic tanks and drainfields; open space; Chesapeake Bay Preservation Areas; local participation; pollution prevention; water conservation; and energy conservation. DEQ also provided regulatory and coordination needs for each of these topics. In addition, DEQ provided the complete comments from the reviewing agencies as an appendix to their comments.

In response to these comments in their entirety, this Final EIS incorporates the following:

- Minor text modifications, for clarification or correction, within environmental resources.
- Updates to: surface water intakes; archeological surveys; rail operations modeling (specifically in regard to testing infrastructure through the Ashland Area); and reduced environmental impacts from Preferred Alternative 5A infrastructure.
- Addition of: an expanded discussion of public health and safety; updated Information, Planning, and Conservation (IPaC) information for threatened and endangered species; and discussion of the Rusty patched bumble bee (a protected species).
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Virginia Department of Historic Resources (DHR). DHR confirmed that it did not have any additional comments on the Draft EIS, beyond comments provided per the Section 106 process (refer to Appendix E of this Final EIS for details on agency comment and coordination per Section 106).

2.4.1.3 Local Agencies

Refer to Appendix B3 of this Final EIS for detailed responses to local agency letters (which are presented in the same order as below).

Arlington County. Arlington County provided detailed comments on natural resources, specifically within Roaches Run Waterfowl Sanctuary and Long Bridge Park, as well as on potential Project impacts to planned infrastructure at Long Bridge Park. In response to these comments, this Final EIS incorporates the following:

- Minimization of the Project footprint in Area 1, as described in Section 4.3.1 of this Final EIS.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Arlington County–Department of Parks and Recreation. The Department of Parks and Recreation provided comments primarily in response to FRA's request for the County's concurrence in FRA's preliminary Section 4(f) determination, prior to the publication of the Draft EIS document. This Final EIS incorporates the County's comments into the Final 4(f) Evaluation (included as Chapter 6 of this Final EIS).

City of Alexandria. The City of Alexandria provided a detailed list of comments and questions on the following topics: planned future projects; property acquisition; construction impacts and timeframe; population growth; noise and vibration; roadway network and traffic impacts; parkland resources; Section 4(f) evaluation; visual assessment; station parking facilities; proposed wall locations; air quality; potential contamination; stormwater; energy; land use; stakeholder coordination; and water quality. In response to these comments, this Final EIS incorporates the following:

- Minor text modifications, for clarification or correction, within a variety of environmental resources, as requested by the City.
- Updates to: GIS information, specifically in regard to park boundaries and associated Project impacts; and Section 6(f) resources.
- Minimization of the Project footprint in Area 2, as described in Section 4.3.2 of this Final EIS.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Fairfax County. Fairfax County provided comments on water quality (specifically in regard to the Pohick Seeps conservation area) and park resources under their jurisdiction, including Old Colchester and Mason Neck West parks. In response to these comments, this Final EIS incorporates Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Prince William County. Prince William County provided comments in regard to: train service/station stops; crossing treatments (at-grade and grade-separated); transit connectivity; visual impacts; noise impacts, specifically in residential areas; and cultural resources, specifically visual impacts to Neabsco Creek from Rippon Lodge, and Cockpit Point Civil War Park. In response to these comments, this Final EIS incorporates the following:

- Minor text modifications, for clarification or correction, within document text, as requested by the County.
- Addition of: an analysis of the potential impacts on Rippon Lodge and its viewshed.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

City of Fredericksburg. The City of Fredericksburg requested additions to the Project scope of work, based on a resolution that was passed by unanimous resolution by the City Council, in regard to: viaducts/overpasses; bicycle/pedestrian access; station infrastructure; and sound mitigation. The City also noted consistency of the Project with their Comprehensive Plan. In response to these comments, this Final EIS incorporates the following:

- Minor text modifications, for clarification or correction, within document text.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Spotsylvania County. The Spotsylvania County Planning Department provided comments in regard to: emergency management and commerce considerations for the East Coast and international trade; bicycle and pedestrian considerations; consistency with County comprehensive planning; and safety concerns of at-grade crossings. In response to these comments, this Final EIS incorporates the following:

- Minor text modifications, for clarification or correction, within document text.
- Addition of an expanded discussion of bicycle and pedestrian facilities/public safety.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Hanover County. Hanover County provided the resolution that their Board of Supervisors adopted, which expressed support for Draft EIS Build Alternative 5A. The County also summarized and compared potential impacts to the natural, cultural, and socioeconomic resources of the Ashland-Hanover County area. These data are consistent with the evaluations prepared by DRPT that resulted in the recommendation and approval of Alternative 5A as the Preferred Alternative, as detailed within Chapter 4 of this Final EIS.

Henrico County. Henrico County provided comments in regard to: Staples Mill Road Station improvements; prioritization of improvements; overpasses/bridges; cultural resources; parcel acquisition; noise impact, specifically in residential areas; stormwater management; and bicycle/pedestrian connectivity, specifically in regard to U.S. Bike Route 1. In response to these comments, this Final EIS incorporates the following:

- Updates to archeological surveys.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

City of Richmond. The City of Richmond noted their support for Draft EIS Build Alternative 6F and provided detailed comments on the following topics: platform length, checked baggage service, and crew change infrastructure at Main Street Station; cultural and historic resources in the Main Street Station/Shockoe Bottom area; service development planning; property impacts; new wye track location; project phasing; flood walls; roadway crossings (at-grade and grade-separated); traffic impacts; bicycle and pedestrian crossings; and consistency with the City's comprehensive plan. In response to these comments, this Final EIS incorporates the following:

- Minor text modifications, for clarification or correction, within document text.
- Addition of: an expanded discussion of bicycle and pedestrian facilities/public safety; community/historical context of the Richmond Main Street Station/Shockoe Bottom area; a revised location of the turning wye and service yard in Richmond; and justification for Preferred Alternative selection, including Main Street Station infrastructure as part of Alternative 6F.
- Updates to archeological survey and architectural study in the Main Street Station/Shockoe Bottom area.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

2.4.1.4 Section 106 Consulting Parties

DRPT received comments on the Draft EIS from the following Section 106 Consulting Parties:

- National Trust for Historic Preservation
- Civil War Trust
- Hanover County Historical Commission
- Historic Richmond
- City of Alexandria – Planning and Zoning

Comments from these Consulting Parties were in regard to historic and archaeological resources along the corridor and the continuation of the Section 106 consultation process for the Project. Appendix E of this Final EIS details the comments and coordination for Section 106. Additionally, refer to Appendix B4 of this Final EIS for detailed responses to Consulting Party letters.

2.4.1.5 Operators

Refer to Appendix B5 of this Final EIS for detailed responses to Operator letters (which are presented in the same order as below).

CSXT. CSXT, the operator of the railroad in the Project corridor, submitted comments accompanied by a report performed by Cambridge Systematics that analyzed results of the preliminary operations modeling presented in the Draft EIS. CSXT's primary comment was that the proposed infrastructure improvements are insufficient to support contemplated increases in passenger traffic. The following themes were prevalent throughout CSXT comments:

- Draft EIS is consistent with FRA requirements, however, the capacity analysis does not show the following:
  - Proposed infrastructure improvements are not sufficient to enable reliable operations of projected train schedules.
  - The burden of extended running times and freight delays fall on CSXT's freight traffic
  - Modeling does not "follow best practices."
- Passenger trains will hinder CSXT's future use of any available capacity.
- Draft EIS Build Alternative 5A (the "3-2-3" option) in Ashland will be a major bottleneck for freight operations.

- DRPT's Recommended Preferred Alternative (as presented in Chapter 7 of the Draft EIS) does not have significant freight benefits.
- Projected freight delays were expected to be much higher than base case delays.
- None of the original 2045 modeling cases "dispatched" to completion.
- DRPT should consider alternative capacity configurations, including:
  - Four tracks in parts of the corridor.
  - Use of the Buckingham Branch for some through-traffic and integrating the Buckingham Branch into full modeling, not just as a stand-alone analysis.
- In response to these comments, DRPT conducted refined operations modeling, in coordination with FRA, to test the Project infrastructure and additional scenarios, and modify certain assumptions. These efforts are summarized in Section 3.2 of this Final EIS and fully presented in Appendix F. Additionally, this Final EIS includes Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Norfolk Southern (NS). NS commented that the Draft EIS was limited in geographic and operational scope and had concerns regarding the No Build scenario. In response to the comments on operational scope, DRPT conducted refined operations modeling, in coordination with FRA, to validate the Project infrastructure, test additional scenarios, and modify certain assumptions; these analyses included an expanded geographic analysis area beyond the Project corridor. These efforts are summarized in Section 3.2 of this Final EIS and fully presented in Appendix F.

CSXT Freight Service in the DC2RVA Corridor

Amtrak. Amtrak commented on rail operations, specifically in regard to potential constraints and in relation to their own network modeling, and indicated preference for new right-of-way corridors to increase performance, particularly in the Ashland area. In response to these comments, this Final EIS includes a summary of the rationale for using the existing alignment through the Ashland area, and Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures. Note that while Amtrak is a Participating Agency for the Project (see Section 2.2), Amtrak is included as an "Operator" for the purposes of this comment-response discussion.

Virginia Railway Express. VRE supported the conclusions of the Draft EIS but expressed issues with design details of proposed additional tracks through VRE stations. VRE provided detailed comments on the following topics: Project timeline; design criteria; noise and vibration mitigation; alternatives / suggestions for the preferred alternative in the area of VRE operations; and impact of changes to major infrastructure on cost, schedules, and operations. In response to these comments, this Final EIS incorporates the following:

- Minor text modifications, for clarification or correction, within a variety of environmental resources, including the description of the No Build alternative.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Washington Metropolitan Area Transit Authority. WMATA provided comments on the following topics: construction impacts in relation to their "zone of influence" policy (a zone boundary that often falls outside of WMATA's right-of-way); impacts to their planned Metrorail station to be located at Potomac Yard (anticipated to be opened in late 2021 or early 2022); parcel ownership; and retaining walls and noise mitigation, specifically within the City of Alexandria. In response to these comments, this Final EIS includes Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures. Additionally, the planned Metrorail Station at Potomac Yard is included in the detailed mapbook of the Preferred Alternative (Appendix L of this Final EIS), and discussion of it was added the Cumulative Effects section (Section 5.20.2 of this Final EIS).

2.4.1.6 Other Organizations

Refer to Appendix B6 of this Final EIS for detailed responses to Other Organization letters (which are presented in the same order as below).

Randolph-Macon College. Randolph-Macon College provided a summary of its history, its economic/educational impacts, and its plan for growth, and provided comments on: opposition to a third rail at-grade through Ashland; safety concerns regarding Draft EIS Build Alternative 5A (the "3-2-3" option); and support for a western bypass option. As indicated by the CTB's resolution for the Project (included as Appendix H of this Final EIS), the Preferred Alternative for the Project is being advanced in such a manner that avoids and/or minimizes permanent property impacts to the College; refer to Section 4.3.5 of this Final EIS for description of the Preferred Alternative through the Ashland area, including description of changes that were made subsequent to the Draft EIS. Further, the Commonwealth of Virginia has recognized the need to improve pedestrian and vehicle crossing safety in Ashland, and has committed to working with the FRA, Town of Ashland, Randolph-Macon College, CSXT, and other stakeholders on improving crossing safety in the Town of Ashland independent of the DC2RVA Project, as indicated in the CTB Resolution for the Project on December 6, 2017.

Sierra Club. The Sierra Club (Falls of the James section) expressed support for the Project in general and specifically for a station location at Main Street in Richmond. The Sierra Club further advocated for toll money support and use of solar powered facilities for rail projects; indicated that construction should meet high standards for erosion and sedimentation control; promoted a proposed north-south bikeway along the rail corridor. In response to these comments, this Final EIS incorporates Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Southern Environmental Law Center (SELC). SELC expressed support for improving passenger and freight rail in Virginia and provided detailed comments on the following topics: identification of near- and immediate-term projects; support of use of existing right-of-way/opposition to bypass alignments; use of the CSXT S-Line in Richmond; cultural resources in the Main Street Station area; and coordination with CSXT. In response to these comments, this Final EIS incorporates the following:

- Minor text modifications, for clarification or correction, within document text.
- Addition of: community/historic context of the Main Street Station/Shockoe Bottom area, including updates to archeological surveys.
- Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Preservation Virginia. Preservation Virginia provided detailed comments regarding the evaluation of potential impacts to cultural resources in the Main Street Station/Shockoe Bottom area. In response to these comments, this Final EIS incorporates the addition of community/historic context of the Main Street Station/Shockoe Bottom area, including updates to archeological surveys and architectural studies, and Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

Hampton Roads Chamber, Virginia Chamber, and Virginia Maritime Association. These three organizations provided similar comments: indicating support for the goal of additional passenger service, but without negatively influencing Virginia's freight rail network (existing and future freight service demands) and access to the Port of Virginia. Section 1.2 of this Final EIS confirms accommodation of freight rail as a Project Purpose and Need.

Virginians for High Speed Rail (VHSR). VHSR indicated support of the goal of the Project and provided detailed comments for the Ashland and Richmond areas including: support of a trench option/opposition to a "3-2-3" option through Ashland; and support of use of the A-Line and routing of trains to Main Street Station, in Richmond.

VHSR additionally recommended identification of smaller near- and intermediate-term projects within the overall DC2RVA Project, to allow for prioritization of funding. In response to these comments, this Final EIS incorporates minor text modifications, for clarification or correction, within document text, and Project commitments, including agency coordination, permitting/regulatory compliance, final design features, and/or mitigation measures.

2.4.2 General Public

The general public submitted more than 14,000 comments (from 4,247 individual commenters) regarding the Project during the formal comment period and public hearing process that followed publication of the Draft EIS, as described in Section 2.1.2.1. Most comments came from individuals living, working, or having property interests in the Project area, particularly within Ashland and Richmond. DRPT carefully reviewed each comment, concern, and request and compiled them into broad subject matter categories, which generally parallel the chapter structure of the Draft and Final EIS documents:

- Study Process
  - Purpose and Need
  - Proposed Train Service/ Operations/Schedule
  - Public Involvement
  - Other Considerations
- Evaluation of Alternatives
  - Corridor Options Not Evaluated in the Draft EIS
  - Ashland Area Alternatives
  - Richmond Area Alternatives
  - Station Evaluation
- Environmental Impacts
  - General
  - Traffic/Transportation
  - Right-of-way/Displacements/ Property Value
  - Land Use
  - Community Facilities/Title VI/ Environmental Justice
  - Farmland
  - Bicycle and Pedestrian Facilities
  - Cultural Resources
  - Natural and Water Resources
  - Noise and Vibration
  - Air Quality
  - Visual / Aesthetic
  - Hazardous Materials
  - Indirect and Cumulative Effects
  - Safety
- Funding, Implementation, and Construction

Appendix C of this Final EIS identifies public comments within these categories from individual and form letters and provides DRPT's and FRA's detailed responses to address substantive comments within these topics. The comments presented in Appendix C convey the substance of the comments made, but do not necessarily quote comments verbatim and condense similar comments together into a single topic. The responses include reference to information provided in both the Draft EIS and this Final EIS and are the outcome of ongoing analyses and coordination that have occurred since the publication of the Draft EIS. Responses to substantive comments are incorporated by way of minor corrections, clarifying explanations, or supplemental documentation, as needed, into the content of the appropriate sections of this Final EIS.

Many citizens commented on topics that did not warrant changes to methodology or information provided in the Draft EIS. Notwithstanding, DRPT provided responses to these topics within the detailed responses provided in Appendix C:

- Suggestion of additional alternatives to consider, most of which were considered but dismissed during the 2002 Tier II EIS or do not align with the implementing actions that were the outcome of the 2002 Tier II EIS and ROD.
- Request for detailed information or data that is beyond the scope of an environmental document and would be developed during the final design and permitting process.
  - Environmental documentation for the Project is based on conceptual engineering, which is approximately a 10 percent design level. Chapter 5 of this Final EIS clarifies the use of temporary and permanent impacts. Temporary impacts at the conceptual design level are a fixed offset from the permanent impact limits; this is an allowance for possible construction means and methods that may exceed the permanent impact limits. Final design would clarify the potential construction means and methods that might be used to eliminate or mitigate temporary impacts.
  - Final design would occur in the future should Project funding becomes available and incremental improvements are scheduled. To address these requests, DRPT added Chapter 7 to this Final EIS to describe future steps of the Project.

DRPT did not provide individual responses to comments containing a general disposition to the Project, such as preference for or opposition to a specific alignment or Build Alternative that was evaluated in the Draft EIS. Notwithstanding, all comments received were considered as part of the selection process for the Preferred Alternative for this Final EIS. Additionally, DRPT addressed specific property questions directly with property owners.

CHAPTER 7

OVERVIEW OF FUTURE STEPS

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

7 OVERVIEW OF FUTURE STEPS

This chapter describes the anticipated sequence of events following the publication of this Final Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project. The events and their anticipated dates are provided in Table 7.0-1 and described in the sections in this chapter.

Table 7.0-1: Anticipated Dates of Future Steps

Project Development Event	Anticipated Date
Record of Decision (ROD)	Spring 2019
Preliminary Engineering Completion	Spring 2019
Corridor Service Development Plan Completion	Spring 2019
Design and construction of AF – RO 4th main track and two crossovers in Area 4 (funded through Atlantic Gateway program)[1]	2022
Funding for remainder of DC2RVA Project	Undetermined at this Time
Final Design and Permitting	Subject to Funding
Property Acquisition	Subject to Funding
Construction	Subject to Funding
DC2RVA New Passenger Service Starts	Undetermined (2025 used for planning purposes in Final EIS)

The anticipated dates provided above are intended for planning purposes and reflect what was assumed for the purposes of this environmental evaluation (see Section 1.3.6 of this Final EIS for full details on EIS planning dates). Actual dates for future Project development are dependent on obtaining a Record of Decision (ROD), identifying and securing construction funding, completing Project design, and finalizing all necessary approvals and permits, including agreements with Amtrak and CSX Transportation (CSXT). Further, the Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) understand that funding for construction—as well as the timelines of separate but related projects (summarized below and provided in detail in Section 7.7)—may require that the DC2RVA Project be constructed incrementally over the 20-year planning horizon from 2025 to 2045.

---

[1] The Commonwealth of Virginia received a $165 million FASTLANE grant award in 2016, leveraging additional public and private funding to implement a $1.4 billion program of highway and rail projects along the I-95 corridor (the Atlantic Gateway program). As part of this program, DRPT proposes expediting design, funding, and construction of approximately 6 miles of fourth main track between Rosslyn (RO – CFP 110.1) and Alexandria (AF – CFP 104.3), referred to as the RO to AF Fourth Track project. As of the publication of this Final EIS, DRPT has confirmed funding for the RO to AF project through Areas 1 and 2, with construction planned to commence in 2020; refer to Section 7.7.1 for more details on the project, which includes two new crossovers in Caroline County as well.

FRA and DRPT acknowledge that the full benefits of the proposed DC2RVA service are dependent upon completion of intercity passenger rail infrastructure projects outside the DC2RVA corridor in the Southeast High Speed Rail (SEHSR) corridor:

- A four-track Long Bridge with a four-track route north of Long Bridge through L'Enfant Plaza to CP Virginia in Washington, D.C. is required to connect the DC2RVA service to Union Station in Washington, D.C. and Amtrak's Northeast Corridor (NEC).
- The SEHSR Richmond to Raleigh project (SEHSR R2R project) included improvements/service between Raleigh, NC and Richmond, VA, and overlaps the DC2RVA Project between Main Street Station and Centralia, VA. The SESHR R2R project infrastructure improvements south of the overlap area are required to implement the four additional Interstate Corridor (SEHSR) trains originating in North Carolina and traveling through the DC2RVA corridor.
- The Richmond to Hampton Roads project (R2HR project) included improvements/service between Norfolk/Newport News and Richmond, VA, and overlaps the DC2RVA Project between Main Street Station and Centralia, VA. The SESHR R2HR project infrastructure improvements south of the overlap area are required to support the four additional Northeast Regional (SEHSR) trains originating in Newport News and Norfolk and also traveling through the DC2RVA corridor to the Northeast Corridor.

Additionally, construction of the infrastructure improvements that are part of the DC2RVA Preferred Alternative is not currently funded (other than the AF—RO 4th project, as shown in Table 7.0-1), and it is unlikely that funding for full construction will be available all at once. Therefore, DRPT has developed an approach to implement the DC2RVA Project in increments as funding becomes available and has prioritized the six areas for construction as shown below, with higher priority given to areas with greater rail corridor congestion:

- Areas 1, 2, and 3—Arlington through Fredericksburg
- Area 6—Richmond
- Area 4—Central Virginia
- Area 5—Ashland

These incremental infrastructure construction and service improvements address the Commonwealth's priorities for the DC2RVA Project and reasonable construction sequences, and link service improvements to infrastructure improvements in the DC2RVA, Long Bridge, SEHSR R2R project, and R2HR project corridors. The incremental approach is designed so that existing freight and passenger rail service can be maintained during the Project buildout. The Project's Corridor Service Development Plan (SDP), which DRPT is preparing concurrently with this Final EIS, provides additional detail on DRPT's anticipated approach to delivering the DC2RVA Project.

7.1 RECORD OF DECISION

FRA will prepare a ROD after the 30-day review period following the Federal Register Notice of Availability for this Final EIS. The ROD is a concise public record of FRA's decision on the Selected Alternative, which would either be the Preferred Alternative as described in this Final EIS or any variant of this alternative as determined by FRA based on any input received on the Final EIS.

The ROD is intended to document that the Selected Alternative:

1. Best satisfies Purpose and Need
2. Poses the least overall impacts to the natural and human environments
3. Has been selected based on processes in compliance with the National Environmental Policy Act (NEPA) and other applicable requirements
4. May be advanced for final design and construction

The ROD will discuss the range of alternatives and all factors considered by FRA in the decision-making for the Selected Alternative. In the ROD, FRA will also identify the measures to minimize harm and the mitigations required for unavoidable impacts. Mitigation and monitoring measures will be delineated in sufficient detail to constitute an enforceable commitment (or will incorporate by reference the portions of the Final EIS that constitute such a commitment).

7.2 PRELIMINARY ENGINEERING

DRPT developed each of the Build Alternatives presented in the Draft EIS and the Preferred Alternative presented in this Final EIS to an approximately 10 percent level of design (conceptual engineering), using readily available data. These conceptual-level designs were sufficient to determine infrastructure requirements to meet operational needs, perform the comparative impact analyses reported in the Draft and Final EIS, and support the decision-making for the Preferred Alternative.

To advance the Preferred Alternative to the next phase of development, DRPT is progressing the conceptual designs to a 30 percent level of design (preliminary engineering). The 30 percent infrastructure design plans take into consideration the operational requirements, adequacy of the infrastructure to improve reliability and resiliency, and environmental mitigations and commitments. The Basis of Design developed for conceptual engineering, which was included as Appendix B in the Draft EIS, serves as a guide for the preliminary engineering as well. In general, CSXT design standards govern the designs within railroad right-of-way. Amtrak and Virginia Railway Express (VRE) design standards govern the design of the intercity passenger and commuter rail station facilities, respectively. Virginia Department of Transportation (VDOT) design standards generally govern the designs within highway right-of-way. Additional standards used for other infrastructure are identified in the Basis of Design.

Advancing from conceptual engineering to preliminary engineering requires additional detailed data, including, but not limited to:

- Surveys for topography, property, drainage, utilities, traffic
- Investigations for geotechnical and environmental information
- Research for planned or proposed infrastructure projects within the design area

Although DRPT developed much of this information during the preparation of the Draft and Final EIS, circumstances can change such that updated information will be necessary when progressing to a more detailed level of design. For example, property and right-of-way lines move, stormwater and drainage regulations evolve, and wetland and stream boundaries as well as traffic patterns shift over time. As DRPT conducts structural and geotechnical surveys beyond preliminary engineering levels, the more precise information available at that time will be used to determine the final alignment of the facilities constructed as part of the Project. Because of these and other potential changes, along with the uncertainty of funding availability (see Section 7.4 for discussion of funding), DRPT has limited preliminary engineering to the level of existing data available through remote sensing (aerial photography), geographic information system (GIS), and other existing sources. As DC2RVA infrastructure is incrementally funded and moves to the next level of design, additional data will be obtained, and the resulting infrastructure design will be compared to the alignment and impacts identified in the Final EIS. The 30 percent design plans will serve as "bridging documents" to maintain compliance with the NEPA commitments established in the Final EIS and ROD as the Project progresses to final design and construction (see Sections 7.5 and 7.6, respectively). If the Project's final design or impacts exceed the NEPA commitments established in the Final EIS and ROD, then DRPT will re-evaluate the design and/or the NEPA documentation.

7.3 CORRIDOR SERVICE DEVELOPMENT PLANNING

DRPT is concurrently preparing a Corridor Service Development Plan for the DC2RVA Project that lays out the overall scope and approach to provide the proposed passenger rail service. The purpose of the SDP is to further refine the operating aspects, cost estimate, and schedule for development of the infrastructure and service improvements planned for the DC2RVA corridor to a greater level of detail than that provided in the Draft and Final EIS.[2] The service planning information provided in the Draft and Final EIS demonstrates the feasibility for the infrastructure to support the railroad operating plan presented in the EIS; however, DRPT will continue to refine this plan throughout the delivery of the DC2RVA Project to reflect additional detail provided from design, current railroad operating conditions, and the availability of funding to construct the Project. The Corridor SDP is the first step in laying out DRPT's initial vision to construct the improvements and implement the proposed DC2RVA service—a manual for DRPT and the Project stakeholders that will be continually updated over the life of the Project.

While not required as part of DC2RVA's process for obtaining a ROD, the SDP details the operational and financial feasibility of the Preferred Alternative:

- Operational feasibility considers network capacity, specific stopping patterns, and train schedules at several points in the future.
- Financial feasibility requires detailed analysis of the anticipated ridership and revenue from fares paid and any auxiliary revenue (for example, from on-board food and beverage sales) and a comparison of Project costs and benefits.

The SDP also defines the phased timeline for funding and construction of infrastructure necessary to deliver incremental increases in service planned by the DC2RVA Project. The SDP for the DC2RVA Project carries forward from the Final EIS two milestone projection years for operations modeling and ridership: 2025 and 2045. The year 2025 represents the assumed completion of all infrastructure improvements and the implementation year for the DC2RVA service (i.e., 9 new daily intercity passenger round trips (18 total trains per day)) and serves as the baseline for impact evaluations in the Final EIS. The year 2045 represents a 20-year planning horizon and is used to show the long-term sustainability and return on the investment of the Project, both financially and in terms of passenger, commuter, and freight service performance.

---

[2] Chapter 2 of the Draft EIS describes a proposed service plan for the DC2RVA Project and the associated operations analysis, which is further refined in Chapter 3 and Appendix F of this Final EIS.

The SDP does not represent a commitment of service; rather, it is a planning document, based on operating assumptions at a given point in time to define what the proposed DC2RVA service would look like, how it would operate, and the infrastructure necessary to support the incremental service improvements. It has some elements in common with the Final EIS; for example, confirming the Purpose and Need for the proposed higher speed rail service and describing alternatives that were considered. The SDP discusses the location of the stations to be served under the Preferred Alternative, how these stations will accommodate the proposed service (for example, with amenities such as checked baggage handling or parking), how passengers will access those stations, and how these stations will be integrated with connections to other modes of transportation. It also estimates potential equipment and train crew utilization requirements anticipated for the Project. The SDP also describes how the DC2RVA Project is likely to be implemented through a phased program over time, laying out the incremental improvements that would come on line in various years throughout the planning horizon.

The SDP will include the following elements:

- Purpose and Need
- Rationale
- Identification of Alternatives
- Planning Methodology
- Demand and Revenue Forecasts
- Operations Modeling
- Station and Access Analysis
- Preliminary Engineering and Capital Programming
- Operating and Maintenance Costs
- Public Benefits Analysis, including economic impacts
- Safety and Security
- Future Steps

The SDP will include construction priorities and timelines for funding, construction, and service implementation, as well as phased implementation of infrastructure improvements.

7.4 FUNDING

Funding to prepare the current DC2RVA Tier II EIS was provided through an FRA grant to DRPT for high performance intercity passenger rail development, with the Commonwealth of Virginia and CSXT providing a required non-federal match to the FRA grant funds.

DRPT anticipates that the DC2RVA Project would be implemented incrementally, as funding becomes available. DRPT has not secured funding for the full-build of the DC2RVA Project but has identified several possible sources of funds, including public and private sources. Potential federal sources for construction include: funding programs authorized under the Passenger Rail Reinvestment and Improvement Act of 2008 (PRIIA), such as the FRA high speed intercity passenger program; funding programs authorized under the Fixing America's Surface Transportation Act (FAST Act) of 2015, such as the Fostering Advancements in Shipping and Transportation for the Long-Term Achievement of National Efficiencies (FASTLANE) or

Infrastructure for Rebuilding America (INFRA) grant programs; annual appropriations, such as the U.S. Department of Transportation (U.S. DOT) Transportation Investment Generating Economic Recovery (TIGER) Discretionary Grant program (recently retitled Better Utilizing Investments to Leverage Development (BUILD)); and other discretionary sources. Non-federal funding sources include Commonwealth of Virginia, local governmental, and private sector funds. Operations and maintenance costs would be covered by a combination of passenger fare revenue recovery and federal, state, and/or local funds. As of the publication of this Final EIS, DRPT has secured funding from both the U.S. DOT FASTLANE program and state sources to construct a fourth mainline track for approximately 6 miles between the Potomac River and Alexandria plus two new crossovers in Caroline County as part of the Commonwealth's Atlantic Gateway Program, described in greater detail in Section 7.7.1.

Amtrak has sole fiscal responsibility for long-distance routes through Virginia. The Commonwealth is financially responsible for the capital and operating costs associated with Northeast Regional (Virginia) intercity passenger rail services originating and terminating in Virginia. Virginia's state-sponsored intercity passenger rail operations are funded through the Intercity Passenger Rail Operating and Capital (IPROC) Fund. Additionally, passenger fares and other revenues are used to defray a portion of passenger rail operating costs. Five of the nine new daily round-trip passenger trains to be added to the corridor under the DC2RVA Project will operate in a similar manner as Northeast Regional (Virginia) intercity passenger trains with extended service beyond Washington, D.C. into Amtrak's Northeast Corridor (NEC). State funding from the Commonwealth will be required to support the operation and maintenance of these five new Northeast Regional (SEHSR) trains. The remaining four new round-trip trains implemented under the DC2RVA Project will be Interstate Corridor (SEHSR) intercity passenger rail trains serving destinations in North Carolina and will operate in a similar manner as the Interstate Corridor (Carolinian) train within the DC2RVA Corridor. Other funding will be required to support the operation and maintenance of these trains. The current Interstate Corridor (Carolinian) train that operates through the DC2RVA corridor to North Carolina is supported by the State of North Carolina.

Virginia's capital and operating financing mechanisms for passenger rail are described in detail in its 2017 State Rail Plan.[3] All of Virginia's passenger rail services operate over the infrastructure of private freight rail carriers, allowing the state to combine funding from both public and private sources to deliver projects with joint passenger and freight rail benefits. Virginia uses the following funding sources for rail capital projects:

IPROC Fund. The IPROC Fund was created by the General Assembly in 2011 as a strategy to sustain Virginia's share of Amtrak Virginia's operating budget, pursuant to PRIIA guidelines, and can be found in Virginia Code §33.2-1602.50. The IPROC fund is used to fund four state-supported Amtrak routes consisting of six daily round-trip Amtrak trains. The PRIIA Act of 2008 required states with Amtrak services less than 750 miles to pay for the routes or cease operation, and the IPROC fund enables the Commonwealth to continue those services. The IPROC fund is also the source of funds for passenger rail equipment upgrades and capital improvements.

Rail Enhancement Fund (REF). Created by the Virginia General Assembly in 2005, REF provides for the retention, maintenance, improvement, and development of freight and passenger railways, which are essential to the Commonwealth's continued economic growth, vitality, and competitiveness in national and world markets. Projects undertaken using these funds must create public benefits within the Commonwealth that exceed the investment from the fund. Such benefits include the improvement of traffic congestion and environmental quality and the reduction in highway maintenance needs. This fund is the primary source for the implementation of large capital projects for rail improvements, and all projects receiving funds from REF must include a minimum of 30 percent cash or "in-kind" matching contribution from a non-state source, which may include a private source, a railroad, a regional authority, a local government source, or a combination of such sources.

---

[3] The Virginia 2017 State Rail Plan is available at: http://www.drpt.virginia.gov/rail/reference-materials/virginia-state-rail-plan

Private railroad funds. Private railroad funds are investments contributed by private railroads, such as CSXT or Norfolk Southern, working in partnership with the state to address system bottlenecks, access, or other infrastructure projects.

Other local or regional matching funds. These include funds contributed by localities or regional agencies to advance a project with local or regional significance, such as grade separations, improvements to safety, station access, or parking, etc.

Federally-administered rail funds. Federal transportation funding to states is periodically authorized through federal surface transportation acts. The FAST Act of 2015 is a five-year program to improve the nation's transportation infrastructure, including roads, bridges, transit systems, and the rail transportation network. The bill authorizes a total of $305 billion in funding from fiscal year (FY) 2016 through FY 2020.

The FAST Act places major emphasis on freight investments to be supported by the Highway Trust Fund by creating a new National Freight Program authorized for funding at an average of $1.2 billion per year, to be distributed to states by formula. Non-highway projects eligible to receive these funds include rail-highway grade separation and intermodal transfer and access projects.

Title XI of the FAST Act, also known as the Passenger Rail Reform and Investment Act of 2015 (PRRIA), authorizes for $5.5 billion to be spent on the national intercity rail network outside the NEC. Funding for this program, as well as another $2.2 billion for FRA grant programs, however, are dependent on annual Congressional budget appropriations. No passenger appropriations passed during the first year of the program.

7.5 FINAL DESIGN AND PERMITTING

Final design progresses the design from preliminary engineering through the preparation of construction documents. Design progress is guided by commitments in the DC2RVA Tier II EIS and ROD as well as the SDP. The DC2RVA Project is funded through the completion of preliminary engineering (as described in Section 7.2). Funding for final design, or to construct incremental portions of the corridor, will be identified in the future.

The final design will further develop preliminary engineering plans and documents into construction documents. This process varies depending on the procurement process selected by the sponsoring agency and on the agency in charge of producing the particular construction documents. It has not been determined at this time which agency will be responsible for future procurements, thus the following discussion is silent on specific agency responsibilities.

At this time, DRPT anticipates that the most likely procurement process will be through a Design-Bid-Build (DBB) procurement. The following paragraphs describe the typical final design process for DBB procurement.

Agency design processes are somewhat similar and generally require intermediate deliverables that are expressed in terms of the level of design as a percentage of the total design, e.g., 60 percent, 90 percent, and 100 percent. DBB procurement advances plans, specifications, and cost estimates (PS&E) through the 60-90-100 percent intermediate deliverables of final design to deliver construction documents used for bidding or letting the project.

Construction documents provide the foundation and framework for the construction activities. These documents may include, but are not limited to, construction plans, specifications, estimate of probable construction costs, project manual, bridging documents, and project schedule.

Construction plans graphically represent existing conditions, the proposed conditions, and the intermediate steps required to get from existing to proposed conditions. These plans may include notes and standards to be used during the removal of existing infrastructure or the construction of proposed infrastructure.

Project specifications are the written instruction manual for construction. Specifications provide the details for materials, storage, handling, fabrication, and construction of the components of the proposed infrastructure.

An estimate of probable construction costs checks the design against the project budget. Analysis of the items and unit costs in the estimate and in the budget may be needed if the budget exceeds the funding available for the project. Further value engineering may be applied if the estimate continues to exceed the budget for the project after conducting a cost analysis. An estimate is generally used for analysis of the bids and in preparing a bid recommendation.

A project manual may combine pre-bid materials, bid materials, addenda, general specifications, technical specifications, special provisions, proposed construction schedule, and/or the construction plans. Project manual contents and the need for a project manual vary by project.

If the project is procured through a Design-Build process instead of the Design-Bid-Build approach, then bridging documents may also be necessary at that time. Bridging documents provide the next steps required to “bridge” the transfer of responsibility from the owner’s engineer to the design-build team. These documents should clearly convey the owner’s objectives and goals, the design status, the basis of design, and the general specifications. Bridging documents should also clearly define the roles, responsibilities, and expectations of all parties to the design-build agreement.

A project schedule provides the agency/owner and the contractor with a clear expectation of when the project is to be complete. Schedules may be externally driven by dates to begin operations or internally driven by the infrastructure to be constructed. Once a contractor is selected, the construction schedule should conform to the project schedule.

Permitting will be required to progress from design to construction. The specific permits required will vary based on the proposed infrastructure and jurisdiction(s) through which the incremental portions of the corridor pass. Permit submittal and approval processes will also vary based on the same factors. Identification of the required permits and coordination with the permitting agency/agencies should be an early design task and should progress concurrently with the design to reduce potential construction delays.

7.6 CONSTRUCTION, PROPERTY ACQUISITION, AND IMPLEMENTATION

7.6.1 Construction Packaging

DRPT anticipates that the DC2RVA Project segments would be divided into construction packages. Construction packages would be further subdivided based on the types of infrastructure improvements and would be let to meet project schedules as developed during the incremental phases of the overall Project, which were presented at the beginning of this chapter:

- Areas 1, 2, and 3—Arlington through Fredericksburg
- Area 6—Richmond
- Area 4—Central Virginia
- Area 5—Ashland

All work within CSXT right-of-way will be performed under CSXT's *Contractors Handbook for CSXT Roadway Worker Protection*. Right-of-way acquisition will be a major factor in determining the overall segment construction packaging and scheduling. DRPT assumes that all rights-of-way for a particular segment will be acquired before construction activities commence for that segment.

Refer to Section 2.8 of the Draft EIS for a general description of the construction plan for the entire corridor and details for each of the four major construction activities: rail, bridge, road, and station construction.

7.6.2 Construction Phasing

Within the DC2RVA Project corridor, the construction of the additional track and infrastructure, modification to control points, station infrastructure with new and upgraded platforms, and speed-related modifications requires phased construction. Where additional tracks are proposed, or existing tracks are being shifted through curves, construction will be phased to maintain passenger and freight rail services to the extent practicable. Station improvements for platform additions and pedestrian access will be advanced early to support the new track when placed in operation. Construction phasing will be defined in the next phase of design and further refined during final design for each of the corridor construction packages.

7.6.3 Coordination with Railroad Operations

Implementation of multiple infrastructure projects along an active and highly congested rail corridor presents challenges. The construction of the various projects must be scheduled to minimize disruptions of passenger and freight service from temporary track outages (where a track is removed from service) and slow orders (delays to continuous train operations). The planning and staging of work to minimize adverse impacts to continuous rail operations will require a high level of coordination among the various construction stakeholders.

Coordinated scheduling and phasing of the segmental construction will be essential to timely Project delivery. Construction tasks that can be performed prior to impacting track removal, track shifts, or temporary outages from service changes will be early construction items. These early tasks include utility relocations; roadway relocations; bridge, retaining wall, grading, and track roadbed construction; offline railway bridges; special trackwork preassembly; and station improvements.

7.7 COORDINATION WITH OTHER STUDIES AND PROJECTS

The DC2RVA Project was designed to fit FRA's 2009 *Strategic Vision for Higher Speed Rail* near-term strategy of upgrading reliability and service of conventional intercity rail services at speeds up to 90 miles per hour (mph), where practical, in a corridor shared with commuter and freight services. In order to obtain the full benefit of the DC2RVA infrastructure and service improvements, several other ongoing rail improvement projects must also be completed in the DC2RVA corridor and corridors adjacent to the DC2RVA Project.

The DC2RVA Project provides a critical link between Amtrak's heavily traveled NEC and the developing Southeast Rail Corridor. The ability of the DC2RVA Project to improve intercity passenger rail is dependent upon the performance and capacity of these connecting corridors and completion of the related projects and their associated rail improvements. A summary of some of the key interrelated rail improvement projects and studies is presented below. Additional details on rail and related transit projects can be found in Chapter 4 of the Alternatives Technical Report (Appendix A of the Draft EIS), which provided an overview of some of the previous and ongoing rail planning studies in the DC2RVA corridor and adjacent sections of the larger Southeast and Northeast Rail Corridors and described the relationship of these other studies/projects to the DC2RVA Project.

7.7.1 Coordination with Local/Regional Rail Projects

The following rail projects are included in the No Build assumptions for the DC2RVA Project (refer to Draft EIS Section 2.5.1 for details); the ongoing and/or current coordination efforts and status are included for each project, which are presented in north to south order in the Project corridor. In addition, the Ashland Americans with Disabilities Act (ADA)-compliant platforms, which were proposed by Amtrak in 2017 after the publication of the Draft EIS, are described.

Washington Union Station Expansion Project. The Union Station Redevelopment Corporation (USRC), in coordination with Amtrak, is proposing to expand and modernize Washington Union Station in order to provide a more positive customer experience; support current and future rail service and operational needs; facilitate intermodal transportation; preserve and maintain the historic station and its features; sustain the economic viability of Washington Union Station; and integrate with the adjacent neighborhoods, businesses, and planned development. The proposed project includes reconstructing and realigning tracks and platforms, developing new passenger concourses, improving multimodal transportation facilities, and improving and expanding other supporting facilities.

The Washington Union Station Expansion project is currently in the planning process. Upon completion of the environmental review, USRC and Amtrak will pursue implementation of the project using all of the financing tools available, which may include federal grant and loan programs.

Virginia Avenue Tunnel Expansion. CSXT is nearing completion in Spring 2019 on the Virginia Avenue Tunnel expansion project. When complete, the project will provide CSXT with the ability to operate double-stack intermodal container freight trains on CSXT's National Gateway, and second, to eliminate a chokepoint caused by the Virginia Avenue Tunnel's single track. The DC2RVA Project assumes the Virginia Avenue Tunnel will be completed prior to implementation of the 2025 DC2RVA service plan and includes the tunnel in the No Build Alternative.

Atlantic Gateway Program. Virginia is continuing to advance the Atlantic Gateway Program. In 2016, U.S. DOT selected the Commonwealth of Virginia to receive an award of $165 million from the FASTLANE program to expand rail and highway capacity in Northern Virginia as part of the Atlantic Gateway suite of projects. The $165 million FASTLANE grant will leverage $565 million in private investments and $710 million in other transportation funds to fund a $1.4 billion package of rail and highway expansion projects intended to address some of the worst freight and passenger transportation bottlenecks on the Interstate 95 corridor.

Atlantic Gateway consists of five distinct rail capacity and engineering projects:

- Long Bridge Program development funding to advance engineering, stakeholder agreements, and outreach in support of the long-term, multi-agency initiative to increase rail capacity across the Potomac River through the expansion or replacement of the Long Bridge. This project is estimated at $30 million,[4] with $15 million provided by DRPT and $15 million being provided by CSXT. There are no federal funds on this portion of the Atlantic Gateway.
- Construction of 6 miles of fourth mainline track from the north bank of the Potomac River at Arlington to the AF interlocking in Alexandria, where passenger and commuter trains bound for Manassas diverge from the DC2RVA corridor. This piece of the DC2RVA Project is estimated at $225 million, with $45[4] million provided by the grant and the remainder being provided by the Commonwealth and other federal sources. Construction is planned to commence in 2020. DRPT did not include this project in the No Build Alternative.
- Construction of 8 miles of third mainline track from the Franconia-Springfield VRE station to a location just north of the Occoquan River. This project is estimated at $220 million and is being funded by the Commonwealth. DRPT included this project in the No Build Alternative.
- Construction of two interlockings in Caroline County south of Fredericksburg to improve operational flexibility and network fluidity just south of the VRE commuter territory. This piece of the DC2RVA Project is estimated at $30 million and is being funded by the Commonwealth.
- S-Line transfer mechanism (an agreement between the Commonwealth of Virginia, State of North Carolina, and CSXT) to allow for the transfer from CSXT to public ownership of an abandoned portion of the S-Line that runs from Petersburg, VA to Norlina, NC. The transferred S-Line will host the passenger service extending south from the DC2RVA corridor to the Richmond to Raleigh Southeast High Speed Rail (SEHSR) project. This project is estimated at $30 million and is being funded by the Commonwealth and CSXT. The S-Line transfer is part of the implementation of the SEHSR Richmond to Raleigh (SEHSR R2R project), described in greater detail in Section 7.7.2 below.

Long Bridge Capacity Expansion. The Long Bridge is a double-track railroad bridge built in 1904 and owned by CSXT that crosses the Potomac River between Washington, D.C. and Arlington, VA. The bridge provides the only Potomac River rail crossing between Washington, D.C. and

---

[4] Cost estimates are from the 2016 Atlantic Gateway FASTLANE application:: http://www.virginiadot.org/projects/resources/atlantic_gateway/Atlantic_Gateway_FASTLANEGrantApp2016.pdf

Northern Virginia and is used by all Amtrak intercity passenger trains, VRE commuter trains, and CSXT freight trains. Intercity passenger and commuter trains now comprise more than two-thirds of the train traffic crossing Long Bridge. The increasing train traffic on the two-track bridge has produced the most significant rail network bottleneck in Virginia.

Washington, D.C.'s Department of Transportation (DDOT) is managing an EIS to study an expansion of capacity on the Long Bridge in coordination with DRPT, VRE, CSXT, and FRA. The Final EIS and ROD for the Long Bridge Capacity Expansion Study are anticipated in 2020. In developing the service planning for DC2RVA, DRPT has assumed the Long Bridge Capacity Expansion would provide at least four main tracks across the Potomac River, past VRE's L'Enfant Plaza station, to CP Virginia in Washington, D.C., where Amtrak-owned tracks diverge from CSXT tracks to Union Station through the First Street Tunnel. DRPT has also assumed, based on the Long Bridge Alternatives Development Report (June 2018),[5] that the Long Bridge capacity expansion would add two tracks on a new structure immediately upstream and parallel to the existing two-track bridge, providing a total of four tracks across the river. DRPT included the Long Bridge Capacity Expansion in the No Build Alternative.

VRE Capital Improvements. VRE is conducting assessments for station improvements to several stations on the Fredericksburg line. The stations included in VRE's study are: Alexandria, Crystal City, Lorton, Rippon, Quantico, Brooke, and Leeland Road. Proposed improvements in the assessments include recommendations for: extending platforms, placing island platforms, providing for ADA and grade-separated access to the platforms, and ways to integrate the stations with existing or proposed development in the surrounding areas, and relocation of the Crystal City VRE platforms. DRPT and FRA have been coordinating the design of the DC2RVA track improvements with VRE's plans for platform and station improvements.

VRE is also developing recommendations for improvements to its L'Enfant station, as well as additional track and siding improvements between CP Virginia and CP L'Enfant in Washington, D.C. DRPT has included these VRE capital improvement projects in the No Build Alternative.

Potomac Yard Metro Station. Potomac Yard is a former Richmond, Fredericksburg and Potomac Railroad (RF&P) rail classification yard located in the northeast area of the City of Alexandria, VA, adjacent to the CSXT rail corridor. The City of Alexandria, working with federal, state, and local stakeholders and private developers, is redeveloping Potomac Yard as a multi-use commercial, office, and residential development, including a new WMATA station serving the Yellow and Blue Metrorail lines. WMATA's Potomac Yard Metrorail Station would be connected to additional residential and commercial development across the CSXT right-of-way by a pedestrian/bicycle bridge over the CSXT rail line. The Federal Transit Administration (FTA) and the National Park Service (NPS) issued their RODs for the Potomac Yard Metro Station in Fall 2016, and in September 2018, WMATA awarded a contract for design and construction of the metro station. The initial plans for Potomac Yard Metro Station called for two entrances, north and south, with each entrance linked to a separate pedestrian bridge over the rail corridor.

DRPT has been coordinating the design of the DC2RVA track improvements with the City of Alexandria and WMATA's plans for the Potomac Yard Metro Station, pedestrian/bicycle overpass, and related area development.

---

[5] The Long Bridge project Alternatives Development Report is available on their project website: http://longbridgeproject.com/study-documents/

Powells Creek to Arkendale Third Track. FRA awarded Virginia a $74.8 million grant to build up to 11 miles of third track and related improvements from Powells Creek in Prince William County to Arkendale in Stafford County, as well as improvements to the station at the Quantico Marine Base in Quantico. The third track is currently under construction between Possum Point and Arkendale; a distance of approximately 9 miles. The remaining 2 miles of third track, from Powells Creek to Possum Point, will be built in the future when additional funds are available. DRPT included the third track from Powells Creek to Arkendale in the No Build Alternative.

Ashland Station ADA-Compliant Platforms. In 2017, Amtrak proposed plans to rebuild the existing Ashland station platforms to improve accessibility and compliance with the ADA. The existing station platforms were described in detail in Section 8.3.5.11 of the DC2RVA Project Alternatives Technical Report (Appendix A of the Draft EIS). Currently, there are two side platforms at Ashland, surfaced with brick pavers with an elevation of approximately top of tie. The west side platform is approximately 500 feet in length and varies in width between approximately 4 feet on the south end and 12 feet on the center and north end. The east side platform is approximately 500 feet in length and is approximately 6 feet in width. The existing pedestrian grade crossing between the two platforms is approximately 3 feet in width. Amtrak's plans call for replacing the west side platform with an approximately 374-foot-long platform, 12 feet wide, raised to 8 inches above top of rail north and south of the existing Visitor Center building, where the platform would remain at top of tie. The east side platform would be approximately 487 feet in length, 12 feet wide, and raised to 8 inches above top of rail. A section of the east side platform across from the Visitor Center would be at approximately top of tie to facilitate ADA-compliant access to Railroad Avenue. There would be an area enclosed by a canopy on the east side platform, and both east and west platforms would be provided with mobile wheelchair lifts. A new passenger grade crossing approximately 30 feet wide would be installed between the platforms. The existing at-grade road/rail intersections at College Avenue and England Street (S.R. 54) would remain as the north and south boundaries of the platforms. Railroad Avenue on the east side of the station would be shifted easterly to accommodate the expanded width of the east side platform, resulting in the loss of some on-street parking. Construction is scheduled to begin in 2019.

Main Line Relocation Project at Acca Yard and Crossovers South of the James River. In 2019, CSXT completed a mainline relocation project at Acca Yard to relieve the current bottleneck. The reconfiguration of the switching yard incudes a two track mainline connection around the west side of Acca Yard, allowing through passenger and freight trains to bypass Acca Yard. The project includes addition of two crossovers on the A-Line south of the James River. DRPT included this project in the No Build Alternative.

7.7.2 Coordination with Southeast High Speed Rail Corridor Projects

In 1991, the Intermodal Surface Transportation Efficiency Act (ISTEA) became law, under which Section 1036 authorized a program of high speed rail corridors in the United States. In 1992, the U.S. DOT designated the SEHSR corridor from Washington, D.C. to Charlotte, NC as one of the original national high speed rail corridors, and in 1996, administratively designated an extension of the corridor from Richmond to Hampton Roads. In 1998, the Transportation Equity Act for the 21st Century (TEA-21) became law, under which Section 7201 authorized the designation of additional high speed rail corridors and extensions of existing corridors. That same year, the U.S. DOT extended the SEHSR corridor into South Carolina, Georgia, and Florida, with further connections added within Georgia and Florida in 2000. The SEHSR program calls for developing a range of improved intercity passenger rail speeds, from 79 to 110 mph on shared track (freight and passenger service), and possibly speeds above 110 mph, on dedicated track (passenger service only) on the Atlanta to Charlotte corridor only.

FRA and the Federal Highway Administration (FHWA), in partnership with Virginia and North Carolina, initiated a Tier I EIS for the section of the SEHSR corridor from Washington, D.C. to Charlotte, NC in 1999, for which FRA and FHWA completed a Final EIS and issued a ROD in 2002. The Tier I EIS selected an incremental approach to develop the SEHSR between Washington, D.C. and Charlotte, NC, which is inclusive of the DC2RVA corridor. Key elements of the selected incremental approach are:

- Upgrade existing rail corridors (instead of developing new corridors)
- Utilize fossil-fuel burning equipment rather than electric-powered equipment
- Add service as market demand increases and/or when funding is available

The incremental approach seeks to minimize cost and potential impacts to the environment by utilizing existing railroad tracks and rail rights-of-way as much as possible.

The components of the SEHSR corridor are in different stages of planning and NEPA clearance based on need and funding. The following summary identifies the status of the five major components of the SEHSR corridor:

Washington, D.C. to Charlotte, NC. Tier I Final EIS and ROD completed in 2002.

SEHSR Richmond to Raleigh (SEHSR R2R Project) Final Design and Implementation. FRA, North Carolina Department of Transportation (NCDOT), and DRPT completed a Tier II EIS in 2015 and signed a ROD for the SEHSR R2R project in 2017. The study covered the 162-mile segment of the SEHSR corridor between Richmond[6] and Raleigh, NC and called for reactivation of 76 miles of CSXT's abandoned S-Line. The SEHSR R2R project proposed operating four daily Interstate Corridor round trips between New York and Raleigh via Richmond, which are included in the DC2RVA service plan as Interstate Corridor SEHSR trains operating through Richmond to Washington, D.C. As part of the Atlantic Gateway suite of projects, DRPT and CSXT will enter into an agreement that will establish a process for transferring ownership of the abandoned S-Line right-of-way to continue advancing work on this segment of the SEHSR corridor.

Richmond to Hampton Roads Tier II Study. DRPT is in the process of identifying funding sources to initiate a Tier II environmental study within the next six years for the Richmond to Hampton Roads segment of the SEHSR corridor. In 2012, FRA and DRPT completed a Tier I EIS and ROD for the Richmond to Hampton Roads Passenger Rail project (R2HR project), which defined the route and service characteristics for the extension of the SEHSR corridor from Richmond south and east to Hampton Roads.

The Commonwealth of Virginia currently supports five daily round-trip Northeast Regional (Virginia) trains from Washington, D.C. and the NEC to or through Richmond, including: two daily round-trip trains terminating at Staples Mill Road Station in Richmond; one daily round-trip train extending south of Staples Mill Road Station to Norfolk; and two daily round-trip trains continuing east through Main Street Station to Newport News. DRPT plans to extend the two daily Northeast Regional (Virginia) round-trip trains that currently terminate in Richmond to Norfolk providing three round-trip trains per day south of Richmond; the second Norfolk round trip is planned to begin operations in Spring 2019, and the third round trip is planned to begin in 2021. DRPT included the extension of these existing passenger trains to Norfolk in the No Build Alternative. The R2HR project will expand upon the existing Northeast Regional (Virginia) service to Hampton Roads by adding one daily round-trip to Newport News (for three total) at a maximum authorized speed of 79 mph and three additional round trips to Norfolk (for six total) at a maximum authorized speed of 90 mph. DRPT did not include the R2HR expansion of intercity passenger service as part of the No Build Alternative.

---

[6] As previously detailed in Chapter 4, for purposes of NEPA, the DC2RVA Project overlaps and supersedes the SEHSR R2R project for the segment between Main Street Station and Centralia, VA; all track and roadway improvements and the effects of additional train frequencies between Main Street Station and Centralia are evaluated as part of DC2RVA.

Raleigh, NC to Charlotte, NC. FRA, in partnership with NCDOT, has completed multiple Tier II-level environmental reviews for individual projects along the section of the SEHSR corridor between Raleigh and Charlotte. In total, these projects will increase conventional speed passenger service to five daily round trips on this section of the corridor along with improved safety, reliability, and upgraded facilities. Although the primary purpose of these projects is to increase the frequency of conventional speed passenger trains, the NEPA documents also serve as Tier II clearances for SEHSR trains.

Charlotte, NC to Atlanta, GA to Jacksonville, FL. FRA and the Georgia Department of Transportation (GDOT) are working on a Tier I EIS studying the portion of the SEHSR corridor between Charlotte and Atlanta. In the Tier I EIS, FRA, and GDOT will identify potential corridor route alternatives, station locations, and levels of service. FRA anticipates publishing the Draft EIS in early 2019. FRA, in partnership with GDOT, completed a feasibility study for the Atlanta, GA to Macon, GA to Jacksonville, FL section of the corridor in 2012.

7.7.3 Coordination with Northeast Corridor Projects

Amtrak owns and operates 363 miles of the 457-mile mainline NEC, stretching from Boston to Washington, D.C. On a daily basis, approximately 820,000 trips are made on the NEC—either on Amtrak or one of the commuter railroads operating within the NEC. More than 2,100 passenger trains and 60 freight trains operate on some portion of the NEC every day.[7] In the context of such heavy daily use and recognizing the aging NEC infrastructure, much of the NEC is approaching the limits of its capacity and, at the same time, is in need of rehabilitation. Many NEC rail assets are in need of redesign and replacement to provide the capacity needed for a growing population and economy and to continue to provide safe, reliable, and convenient high-speed rail service into the next century.

Amtrak has created a vision and strategy to address these issues. *The Amtrak Vision for the Northeast Corridor* (which updates work first published in 2010) outlines a vision for a high-capacity, high-performance railroad featuring a major upgrade and expansion of the NEC. This effort would accommodate increased and improved commuter, intercity, and freight service using new, dedicated high-speed tracks on new and existing right-of-way and would allow Amtrak to increase frequencies and speeds while reducing trip times. *The Amtrak Vision for the Northeast Corridor* serves as one of the many inputs into FRA's NEC Future planning process, which will help determine the options for NEC service and infrastructure development in the decades to come.

---

[7] NEC passenger and train estimates are from: https://nec.amtrak.com/about-the-nec/

The DC2RVA Project includes a service plan that would improve the reliability of intercity passenger service while adding 9 new daily intercity passenger round trips (18 total trains per day). Four of these new round trips would provide expanded Northeast Regional service from Hampton Roads through Richmond to the NEC. One new round trip would originate at Richmond's Main Street Station. An additional four round trips would provide interstate service from North Carolina through Virginia, continuing on to Amtrak's NEC. From Washington, D.C., DRPT intends for all of the new trains to continue on to Philadelphia, New York, and Boston, subject to available capacity and future operating schedules on the NEC.

7.8 OTHER FEDERAL ACTIONS/PERMITS/REGULATORY APPROVALS

Throughout Project development, design, and construction, DRPT will continue to coordinate with appropriate federal, state, and local regulatory agencies to obtain the necessary permits and approvals, including the potential use of nationwide and/or regional permits, as presented in Table 7.8-1 below.

Table 7.8-1: Anticipated Future Necessary Permits and Approvals

Permit	Authorizing Regulation	Regulatory Agency
Section 401 Water Quality Permit	Clean Water Act	Virginia Department of Environmental Quality
Section 402 Discharge Permit	Clean Water Act	Virginia Department of Environmental Quality
Section 404 Dredge and Fill Permit	Clean Water Act	U.S. Army Corps of Engineers
Section 408	Clean Water Act	U.S. Army Corps of Engineers
Subaqueous Bed Permit	Code of Virginia Chapter 2, Title 62.1	Virginia Marine Resources Commission
National Pollutant Discharge Elimination System	Clean Water Act	U.S. Environmental Protection Agency
Municipal Separate Storm Sewer Systems (MS4) Permit	Virginia Stormwater Management Act	Virginia Department of Environmental Quality
Section 9 Bridge Permit	River and Harbors Act	U.S. Coast Guard
Section 10 Work in Navigable Waters Permit	River and Harbors Act	U.S. Army Corps of Engineers

There will be permit requirements for construction of the Preferred Alternative associated with the crossing and filling of water resources and wetlands. Section 404 permits will be needed from the U.S. Army Corps of Engineers (USACE) for wetlands where filling occurs. In addition, the DC2RVA Project will require a Section 401 water quality certification and Section 402 discharge permit from the Virginia Department of Environmental Quality (Virginia DEQ). A Subaqueous Bed permit will also be required from the Virginia Marine Resources Commission (VMRC). A

Joint Permit Application (JPA) will be submitted to USACE, VMRC, Virginia DEQ, and Local Wetlands Board, and will combine several of the above permits.

As part of the JPA review and approval process, a Section 408 permission will be required. Permission approval will be based on a letter of concurrence from the local sponsor, any real estate instruments needed for construction and/or operations, and final plans for construction. It is anticipated that a pre-application meeting will be held with USACE during the early stages of the next phase of design and that a JPA pre-submittal meeting will be held with the USACE Section 408 team. Section 408 permission is separate from and concurrent with the JPA approval.

DRPT anticipates that the DC2RVA Project will result in the disturbance of more than five acres of total land area. Therefore, the Project will require a National Pollutant Discharge Elimination System (NPDES) permit for stormwater discharges from the construction sites. Permit coverage for the Project will be obtained either under the Virginia DEQ General Permit for Stormwater Discharges from Construction Site Activities or under an individual NPDES permit. A Municipal Separate Storm Sewer System (MS4) permit for small municipal separate storm sewer systems will be secured, as required by states and/or local authorities.

Work involving the spanning of navigable waterways will require a Section 10 permit from the USACE and a Section 9 Bridge permit from the U.S. Coast Guard.

Finally, coordination with the U.S. Fish and Wildlife Service (USFWS), Virginia Department of Game and Inland Fisheries (VDGIF), and National Marine Fisheries Services (NMFS) pursuant to Section 7 of the Endangered Species Act of 1973 (ESA), as amended, for potential impacts to federally listed species will be conducted where required during final design and permitting, which would occur after funding becomes available and incremental improvements are scheduled.

CHAPTER 3

ADDITIONAL INFORMATION

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

3 ADDITIONAL INFORMATION

The additional information provided in this chapter summarizes the ongoing coordination and documentation that the Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) have conducted since the publication of the Draft Environmental Impact Statement (EIS), in support of the selection process for the Preferred Alternative. The Preferred Alternative is presented separately in Chapter 4 of this Final EIS.

Each section of this chapter covers a separate topic area that was relevant to the selection of the Preferred Alternative: clarifying historical context for communities within the corridor based on comments received on the Draft EIS and ongoing cultural resource coordination (Section 3.1); documentation of refined operations modeling performed after the publication of the Draft EIS (Section 3.2); and summary of community group, agency, and stakeholder considerations in the decision-making process (Sections 3.3 through 3.5).

Note that due to the numerous sources that are provided to the reader in this additional information section, detailed technical references to other data sources are provided as footnotes at the end of this chapter in lieu of standard page footnotes.

3.1 COMMUNITY/CORRIDOR HISTORICAL CONTEXT

This section presents expanded discussions of three areas within the Project corridor: Fredericksburg, Ashland, and Richmond. These discussions expand on the historical context of these areas and the relation of the history of these areas to the rail system and the DC2RVA Project. The discussions also demonstrate that full understanding of the historical context of these areas was taken into consideration in the selection of the Preferred Alternative, as detailed in Chapter 4 of this Final EIS.

Effects of the Preferred Alternative on historic properties are presented separately within this Final EIS: Section 5.13 for impacts to archaeological and above-ground cultural and historic resources, and Chapter 6 for Section 4(f) implications of the Preferred Alternative. Future work to mitigate unavoidable impacts is outlined in a Section 106 Memorandum of Agreement (MOA) for the Project, a draft of which is Appendix K of this Final EIS.

Background. The 123-mile long Project corridor traverses numerous localities, many of which have been thriving communities for centuries. This history has resulted in a densely populated corridor that also contains an extensive number of historic buildings, structures, objects, districts, and archaeological sites. Rail has been a distinct component in the establishment of "place" throughout this development—a backbone of the area economy and culture. The prominence of the rail in area heritage was at the forefront of the myriad of studies conducted as part of the environmental process for the DC2RVA Project. In addition to meeting state and federal requirements during the study process, additional work was completed beyond the legal requirements to ensure that areas of historical significance were taken into consideration during all phases of Project planning.

While every community along the corridor has a story, Fredericksburg, Ashland, and Richmond have a specific, unique tie to the rail system physically and socially. The rail corridor is located in the center of each of these urbanized areas. The establishment of the rail system was, in large part, a distinct component of the development of each of these areas, and the railway continues to be a notable factor in area planning and daily life. All aspects of the tangible and intangible historical fabric of these localities were taken into consideration during Project planning.

Content of this Section. The following information is presented for Fredericksburg (Section 3.1.1), Ashland (Section 3.1.2), and Richmond (Section 3.1.3):

1. An abbreviated history of each locale
2. Background review and summary of previous cultural resource studies that have been conducted within and adjacent to the rail corridor
3. Discussion of in-depth review and subsequent analysis of Project alternatives in relation to history of the area, recorded resources, and public concerns, including:
    a. The parameters of all Project construction alternatives under consideration
    b. Comments from those with a vested interest in each area regarding Project plans and their points of concerns
4. Summary of efforts to avoid areas of concern to assure preservation in place and, if avoidance was not possible, minimize any potential impacts to cultural resources
5. Potential future studies (i.e., separate from the DC2RVA Project) that can shed more light on the significant elements of each place

As previously stated, it is important to note that effects of the Preferred Alternative on historic properties are presented separately in Chapters 5 and 6 of this Final EIS.

Data Sources. The community and historic contexts presented in the following sections relied in part on the cultural resources studies conducted as part of the DC2RVA Project. DRPT has been conducting Phase I-level cultural resource studies for the entire 123-mile DC2RVA corridor since December 2014. These include Phase IA and Phase IB archaeological surveys, reconnaissance-level architectural studies, and intensive-level architectural investigations. The findings have been detailed in two Phase IA cultural resource reports,[1] three archaeology reports,[2] 15 architectural reports reconnaissance-level architectural reports,[3] and three intensive-level architectural reports.[4] These technical reports resulted in the recordation of over 3,000 resources, and the technical studies are presented in their entirely in Appendix R of the Draft EIS and Appendix D of this Final EIS.

3.1.1 Fredericksburg Area

3.1.1.1 Abbreviated History of Fredericksburg

The Fredericksburg portion of the DC2RVA corridor was highlighted as an area of ‘cultural resource sensitivity’. In order to understand the history of this region and lay a framework for further discussion of the resources present in the area, a brief history of Fredericksburg is presented here, including its connection with the railroad. This cursory synopsis of the town’s history is not meant to be comprehensive; more in-depth studies of the historical framework of Fredericksburg should be consulted for greater detail.[5]

The future site of Fredericksburg was granted to John Buckner and Thomas Royston in 1671. Upon granting, they immediately leased the land to William and Sukey Livingston, which is how the area became known as The Leaseland from the 1670s through the 1720s.[6] The community remained a small river enclave, situated at the falls along the Rappahannock River, through the first two decades of the eighteenth century. The county seat of Spotsylvania officially moved to Fredericksburg on October 1, 1732 for the convenience of citizens and county officials. A courthouse was built in town, as well as a church, prison, and other governmental and commercial structures.[7] The town wharfs also provided the first public river docks in the area. Numerous warehouses developed around the Fredericksburg waterfront in the mid-eighteenth century to accommodate the new business, most of which were concentrated around what are today Sophia and Wolfe Streets.

The period from the 1780s through the 1820s was marked by a dramatic increase in the shipping and milling industry in Fredericksburg and the nearby town of Falmouth. Whereas early shipping primarily concentrated on tobacco, by the end of the eighteenth century, soils in the area were depleted. Farmers turned to new crops to sustain the family plantations, primarily wheat. Grain mills and merchants' warehouses were erected along the Rappahannock River, and the Fredericksburg Canal carried the water necessary to propel the mills' waterwheels. The warehouses held flour, tobacco, and later cotton awaiting shipment as well as imported consumer and other goods, and farmers, haulers, and watermen took use of the town's inns and taverns.[8] Although flour export decreased after 1820, Fredericksburg continued to prosper as a port town. In 1822, it was made a postal center for distribution of all United States mail to five states, and goods from surrounding counties continued to be shipped from the busy wharves.[9]

Due to this growth and its proximity halfway between Richmond and Washington, D.C., Fredericksburg was selected as a stop along the new Richmond, Fredericksburg and Potomac Railroad (RF&P) when it was established in the mid-1830s. On January 23, 1837, the first passenger train stopped in Fredericksburg, ushering in a new age of transportation.[10] This was the temporary northern terminus of the RF&P, as the route north of Fredericksburg was not completed for five years. Although trains stopped in town, Fredericksburg did not have a depot at that time. Passengers waited on an open platform with no shelter for people or goods. A small, one-story wood-framed structure was eventually built in the mid-1850s to function as an anchor to the train service in this area. Rail traffic was soon disrupted, though, by one of the most significant events in our nation: the Civil War.

Numerous major Civil War battles occurred within and around Fredericksburg, including the First and Second Battles of Fredericksburg, as well as the Battle of Salem Church. The Civil War decimated the physical and cultural fabric of the Fredericksburg area. The rail bridge crossing the Rappahannock was destroyed, and large segments of tracks were pulled up. Despite the destruction, area inhabitants remained in town and were determined to rebuild their lives and their homes. Rail traffic was not fully restored until after 1870.

The population of Fredericksburg grew greatly in the years just after the war. Emancipated slaves moved into town looking for employment, and white farmers looked to the area factories and commercial businesses for jobs after their farms were destroyed by Federal and Confederate troops. The town grew rapidly, becoming the City of Fredericksburg in 1879.[11] Traffic along the

RF&P was prolific. A new rail station was erected in 1888, and commerce continued to increase throughout the remainder of the nineteenth century.

By 1900, Fredericksburg was a city of 5,068 people.[12] The community prospered as industrial businesses and schools were opened in the downtown area. This growth once again outpaced the antiquated rail facilities. A new station was built in 1910, approximately one block east and one block north of the old station, closer to the core of commercial development.

With the introduction of the automobile, Fredericksburg became an important stop along what became Route 1 when the north-south interstate roadway was established. The increase in road traffic, combined with a proliferation of rail service, led to numerous accidents and incidents along the at-grade tracks through town. It was determined that a raised system of rail tracks would expedite rail service and provide a safer environment for residents.[13]

Fredericksburg continued to thrive until the mid-1950s when Interstate 95 was built, bypassing downtown. The development of the Spotsylvania mall in the 1970s, as well as an increase in personal auto usage in the second half of the twentieth century, brought hardships to Fredericksburg. The train station closed, and stores were shuttered. It was not until the development of the Virginia Rail Express (VRE) in the early 1990s that downtown was once again populated. Travelers returned to the rail, and numerous buildings were rehabilitated in the downtown core.

3.1.1.2 Background Review/Summary of Previous Cultural Resource Studies

Given its unique geographic location along the Fall Line of a major river, the Fredericksburg area was an appealing location for both prehistoric and historic peoples. As such, the area is rich with above- and below-ground cultural resources. Studies of the above-ground resources that constitute Fredericksburg as well as formal and amateur archaeological excavations have been occurring in and around the downtown area for decades.

In 1970, the Fredericksburg Historic District (111-0132), located along the banks of the Rappahannock River, was nominated for NRHP listing. As noted on the NRHP form, the district "encompasses an important assemblage of eighteenth, nineteenth, and early-twentieth century architectural styles".[14] The district is a 200-acre area that comprises the city's downtown commercial area, adjacent industrial area, and some of the surrounding residential blocks. The Fredericksburg Historic District was listed in the Virginia Landmarks Register (VLR) on March 2, 1971 and the NRHP on September 22 of the same year; it currently has a period of significance of 1727 to 1927. Numerous buildings within the district are individually eligible for, or listed in, the NRHP.

Early investigations of Fredericksburg's archaeological resources were conducted by the prolific advocational archaeologist, Mr. Roy Butler. Mr. Butler recorded and excavated numerous historic sites in the Fredericksburg Historic District in the 1970s and 1980s. Unfortunately, few formal reports or project notes exist from his excavations, including details on excavation methodologies and artifact analysis from the numerous collections that he unearthed over his amateur career. Regardless, Mr. Butler was able to record several sites that were to be destroyed by development, thus saving at least the location and site typology data for future researchers.

Formal archaeological inquiries began in the city in the late 1970s. In 1979, Kimberly Snyder conducted a preliminary archaeological investigation of the "Chimneys" House in the Fredericksburg Historic District (111-0132). Although historic archaeological remains were recovered from the project area, no further cultural resources work was recommended, and the location was not recorded as an archaeological site with the Virginia Department of Historic Resources (DHR).[15]

In 1981, under contract from the City of Fredericksburg, Charles Troup conducted limited archival research and a pedestrian reconnaissance to ascertain the potential for intact archaeological sites along the Rappahannock River, notably within two areas referred to as the Riverfront and the City Dock.[16] The project's goal was to ascertain the amount of flooding and fill deposits in these areas and make recommendations on the need for additional archaeological study prior to any development. A total of 81 shovel tests and augurs were excavated in both areas, leading Mr. Troup to record the entire area bounded by Sophia Street and the Rappahannock River, between Charlotte Street on the south and Lewis Street on the North, as an archaeological site: 44SP0069. He suggested that historic remains may be present, but that fill was deep along the river's edge.

Subsequent archaeological work in Fredericksburg in the 1980s and 1990s was conducted and sponsored by four sources: Mary Washington College (now the University of Mary Washington [UMW]), the National Park Service (NPS), The George Washington Foundation (previously known as both The Kenmore Foundation and George Washington's Fredericksburg Foundation), and Harrison and Associates, a local Cultural Resource Management (CRM) group. The Center for Historic Preservation at UMW conducted excavations at numerous Fredericksburg locales prior to area improvements, including investigations surrounding the masonry wall at the Masonic Cemetery in 1992, limited research into the parking lot adjacent to the Visitor's Center on Caroline Street in the late-1980s, and excavations in Market Square and in the square alley on and off throughout the 1990s.

In 1992, UMW archaeologists and historians explored the historical and physical fabric of Blocks 48 and 49 just south of the railroad tracks in preparation for developments associated with parking areas for the new VRE service.[17] Recovered artifacts ranged from Archaic-period lithic tools to mid-twentieth century domestic debris. The two most prominent occupations were late-eighteenth century domestic and commercial activity and nineteenth century industrial occupation.[18] Like other large tracts of land in this area, the lots had been virtually abandoned by the 1950s when rail travel was on the decline in favor of the automobile.

From 1995 through 1997, archaeologists from Harrison and Associates, aided by numerous volunteers, excavated inside the basement of the Old Stone Warehouse on Sophia Street, however no formal report exists summarizing these investigations. The original purpose was to excavate soils in areas where new floor supports were to be installed. The archaeologists found that over 2 feet of silt had accumulated over the original flooring due to two hundred years of flooding along the Rappahannock River. Most of the vertical wood supports had completely rotted through. As such, the entire basement was excavated to create a stable surface upon which to rebuild the flooring supports in the building. Within the many micro-thin strata, archaeologists recovered thousands of artifacts that had been washed in with flood waters, including ceramics, glass, and metal such as barrel hoops.

Concurrently to these archaeological projects, the NPS has been sponsoring excavations at Chatham and throughout the Fredericksburg-Spotsylvania National Military Park. Excavations have been conducted by NPS staff, various CRM firms, and state universities on both large-scale research projects and smaller area development plans. For example, excavations at Willis Hill have been conducted by James Madison University, on and off since 2000. Led by archaeologist

Clarence Geier, students and professors from the University have been exploring the history and occupation of Willis Plantation and parts of Sunken Road, with a special emphasis on the place of the plantation and roadbed during the Civil War.[19] Other NPS-sponsored projects include limited archaeology on the Innis House on Sunken Road and several small, utility-based projects in the Chancellorsville, Wilderness, Salem Church and Fredericksburg battlefields.

In 1999, the Center for Historic Preservation at Mary Washington College completed archaeological excavations at the "Fielding Lewis Store" (111-0132-0033) at 1200 Caroline Street.[20] Investigations focused on determining the building's date of construction and understanding the sequence of alterations to the structure. No secure archaeological context was found that could firmly indicate the date of construction; however, artifacts and construction materials indicated it was built between 1740 and 1770. Various building features and materials recovered from excavations helped to understand the sequence of construction and provided clues as to the interpretation of the uses of the Fielding Lewis Store.

Cultural Resources, Inc. (CRI) conducted a Phase I survey of the 29.3-acre Cobblestone Square Apartments south of Lafayette Boulevard within the Fredericksburg Historic District (111-0009).[21] The investigation identified one archaeological site, 44SP0451, which was defined as an ephemeral lithic scatter and was recommended not eligible for NRHP listing.

In 2006, archaeologists from Dovetail Cultural Resource Group (Dovetail) conducted Phase I—Phase III large-scale investigations at the proposed Marriott hotel site at the corner of Caroline and Charlotte Streets. The work involved extensive archival research, historic map overlays, several months of archaeological fieldwork, and the production of a report on the investigations. In sum, the team uncovered the remains of Roger Dixon's store (mid-eighteenth century), the Indian Queen Tavern (1771–1832), a likely slave quarter (1830s), and post-1830s domestic residences. In addition, the group collected tens of thousands of artifacts that spanned Fredericksburg's entire occupation, from prehistoric inhabitants to today's residents.[22]

On behalf of DHR, Dovetail conducted a metal detector survey of the proposed UMW—Lee Hall addition site in Fredericksburg, Virginia in March 2006.[23] The survey included an examination of approximately 24,000 square feet through a pedestrian survey, surface observation and metal detecting. The metal detector survey did not locate any historic artifacts. In addition, no artifacts or features were noted on the surface.

The William and Mary Center for Archaeological Research (WMCAR) conducted a reconnaissance-level architectural, cost-share survey sponsored by the City of Fredericksburg in partnership with DHR in 2008.[24] The survey concentrated on the historic district and adjacent areas, and its purpose was to provide information and a NRHP eligibility recommendation for the existing listed historic district (Fredericksburg Historic District, 111-0132). Over a two-year period when the agreement between the City and DHR was established, a total of 1,000 resources were identified and surveyed. These resources included domestic, commercial, industrial, religious, social, governmental, and many more types of resources "related to the Settlement to Society Period through the New Dominion Period".[25] Nine hundred forty-two resources were recommended to be contributing to the Fredericksburg Historic District Extension (111-0009) under Criterion A for their overall contribution to the broad patterns of history and Criterion C for their contribution to the architectural integrity of the district. WMCAR recommended that a number of commercial blocks within the historic district expansion could benefit from state and federal rehabilitation tax credits.

In 2011, History Matters, LLC and Thunderbird Archeology conducted a Phase I cultural resource investigation of the 3.5-mile Virginia Central Railroad Trail project located within the City of Fredericksburg and Spotsylvania County.[26] During this survey, 23 historic resources were identified within the indirect APE, 11 of which are contributing resources to the historic and architectural integrity of the Fredericksburg Historic District Extension (111-0009). Among these resources within the indirect and direct APE for this project was the Virginia Central Railroad Historic District (VCRHD) (088-5346), a potentially eligible historic district under NRHP Criterion A for contribution to the broad patterns of history within Fredericksburg. Ten historic resources were identified within the direct APE and are contributing resource to the VCRHD, including archaeological sites and several structures related to the railroad. Two of the four archaeological sites are historic, previously recorded sites (44SP0142 and 44SP0159) contain culverts and piers related to the rail bed and are considered potentially eligible for listing on the NRHP. One site (44SP0211) has no eligibility determination but also contains a portion of the extant rail bed. During this project, they also recorded one newly recorded archaeological site (44SP0639), a multi-component site that extends across the VCRHD.

Dovetail, HFFI, the City of Fredericksburg, Silver Companies, CRI, and the Fredericksburg Area Museum and Cultural Center joined together to perform a volunteer dig at the site of the Ellis-Bell Stoneware Kiln, which culminated in a 2014 report summarizing the results of the excavation.[27] Based on archaeological work done by Dovetail in 2007 at the Fredericksburg Hardware Site, archaeologists conducted salvage archaeology in a previously inaccessible area of the hardware store lot to uncover the remains of an 1820s stoneware kiln. Although it was discovered that the kiln itself had been destroyed when a warehouse was built on the lot in 1849, the team gathered thousands of waster fragments of stoneware to highlight the antebellum ceramic industry in Fredericksburg.[28]

Over the course of three separate investigations carried out on behalf of the City of Fredericksburg from 2013 to 2017, Dovetail conducted archival research and archaeological investigations on a portion of the former Prince Hall Lodge site (44SP0069-0001), located within the proposed Riverfront Park in Fredericksburg. In August 2013, the City commenced cultural resource studies of the entire proposed Riverfront Park, located along Sophia Street in downtown Fredericksburg.[29] As part of this work, Dovetail conducted archival research and an intensive Phase I-level survey of the 3.5-acre park area, including the Prince Hall Lodge site. During the archaeological survey, 12 backhoe trenches and four test units were excavated within the project area to ascertain the integrity of subsurface deposits. The results proved that the project area contains numerous sections that are highly archaeologically sensitive, as well as several areas that are disturbed or covered in extensive fill. In 2015, Fredericksburg City Council approved demolition of the Prince Hall Masonic Lodge at 609 Sophia Street, the only extant building within the proposed Riverfront Park. The Lodge, constructed in 1921, sat atop a mound. The mound was once located in the rear yard of the Rowe-Goolrick House, which became the site of 609 Sophia Street. The mound was a natural landscape feature and was utilized by historic residents (and Civil War soldiers) for its topographic vantage point. Demolition of the building in September 2015 resulted in a void in the earthen mound left by the building’s basement. Construction activities associated with the building demolition and filling of the basement resulted in the unexpected removal of a substantial portion of the earthen mound itself—an area partially deemed archaeologically sensitive during the Phase I survey and containing numerous archaeological features. Salvage archaeology was thus conducted on the site, where the team identified eight truncated archaeological features and recovered over 5,000 artifacts spanning all periods of the site's occupation from prehistoric times through the late-nineteenth century.[30]

Finally, as aforementioned, DRPT conducted Phase I and Phase II cultural resource studies in the Fredericksburg area as part of the current rail Project. Archaeological studies included Phase IA and Phase IB surveys of the DC2RVA corridor, which included background review, historic research, GIS-based predictive modelling, and field investigations.[31] These studies noted the presence of three previously recorded resources within the APE within Fredericksburg: 44SP0187, 44SP0687, and 44SP0688.[32] DC2RVA architectural studies in Fredericksburg included a Phase I investigation that encompassed a portion of the corridor from Dahlgren to Fredericksburg.[33] In this portion of the APE, the team surveyed 271 historic architectural resources, of which 146 were previously recorded and 125 were newly recorded historic resources. These resources included battlefields, historic districts, sites, and individual properties. Based on this Phase I study and updates to the APE following the Draft EIS, Phase II architectural evaluations were completed and included 12 resources within Fredericksburg.[34]

3.1.1.3 Discussion of In-Depth Review and Subsequent Analysis of Project Alternatives in Relation to History of the Area, Recorded Resources, and Public Concerns

Potential impacts to cultural resources were considered at various stages in the alternatives development and selection process for the DC2RVA Project. Starting at the inception of the environmental study in 2014, cultural resources were at the forefront of the Project dialogue. The Project was initiated with DHR in November 2014 through a formal letter and a kick-off meeting. Since that time, almost 20 in-person meetings and dozens of phone calls have occurred between DHR, Advisory Council on Historic Preservation (ACHP), FRA, and DRPT. All aspects of the Project design have been through thorough review to assure that cultural resources have been recorded and considered during Project planning through open and ongoing dialogues between cultural resource specialists and engineers to ensure that design plans accommodate cultural resource concerns.

Details on the Project have also been shared repeatedly with the public through a series of general Project public meetings and articles (refer to Appendix E for documentation). Specific to cultural resources, numerous consulting parties in the area were invited to participate in the process: NPS (Fredericksburg), City of Fredericksburg, Historic Fredericksburg Foundation, Inc., and Central Virginia Battlefield Trust, as well as groups whose interests span the Commonwealth like American Battlefield Protection Program, Civil War Trust, National Trust for Historic Preservation, and Preservation Virginia. Adjacent localities were also invited to participate as the rail ties these communities together. The goal of this outreach was to collect information on significant historic properties in the area to assure they were considered during Project design.

Beyond formal consulting party coordination, DRPT has also given several public talks specifically associated with the Project to inform residents of the Project and learn about issues they consider important (refer to Appendix E for specific documentation). This includes a 2015 meeting in Mayfield, a 2016 presentation at the annual meeting of the Historic Fredericksburg Foundation, Inc., and several presentations on area archaeology focusing on the history of Sophia Street and the rail corridor in 2016 and 2017. These meetings allowed DRPT to garner details from the public on the resources the community considered most important.

Based on this coordination, DRPT conducted the following technical studies in Fredericksburg to aid in the analysis of alternatives in relation to the history of the area, recorded resources, and public concerns:

- Archaeological predictive modelling on the corridor to identify locations with the high potential to un-recorded archaeological resources;[35]
- In-depth historic document and map review with georeferenced overlays to identify potential historic resources;[36]
- Phase I cultural resource surveys to identify above- and below-ground resources within the Preferred Alternative (see previous section for citations) resulting in the recordation of over 100 architectural resources and a dozen archaeological sites in the area of potential effect in Fredericksburg;
- Intensive-level architectural studies on 20 resources within the city including archival research, architectural analysis, and evaluation of NRHP eligibility with determinations on resource boundaries; and
- Integrated Project mapping and analysis to allow cultural resource specialists to provide input into engineering design based on the results of survey and historic map/document review to avoid and minimize impacts.

3.1.1.4 Summary of Efforts to Avoid Areas of Concern to Assure Preservation in Place and, if Avoidance Was Not Possible, Minimize Any Potential Impacts to Cultural Resources

Care was taken by DRPT to avoid areas of historic sensitivity in the Fredericksburg area as identified through cultural resource studies, historic document/map analysis, and public comment. The Phase IA archaeological study of the Project corridor aimed to predict areas of archaeological sensitivity and areas to be avoided based on a variety of cultural and environmental factors.[37] This study was used to guide two Phase IB archaeological studies that included on the ground testing of areas within the archaeological APE to identify archaeological sites. Boundaries were created for each site and approved by DHR; these site boundaries were then shared with the environmental and engineering teams to determine potential avoidance and minimization of impacts in these areas.

Phase I and II architectural studies identified and evaluated above-ground resources within the architectural APE. Studies included determinations on the boundaries of each resource as well as noting significant viewsheds that contribute to the eligibility of the resource. Upon approval by DHR, numerous in-person meetings were held between involved agencies and DRPT to compare the locations, character-defining elements of each resource, key viewsheds, and Project plans including side-by-side comparisons of the property and plans (see Appendix E for roster of meetings). As possible, plans were altered to avoid and minimize impacts on resources that were both individually eligible for the NRHP and contribute to the Fredericksburg Historic District, Fredericksburg District Expansion, and Civil War battlefields. Combined, these studies identified numerous cultural resources within Fredericksburg (see Figure 3.1-1 and 3.1-2 for historic overlap maps). The locations/boundaries of these resources were taken into consideration at various stages of the design/engineering process and each resource was examined to assure avoidance, as possible. In areas where avoidance in its entirety could not be achieved, DRPT and agencies worked together to minimize impacts that would adversely affect each resource. Additional details on Project effect can be found in Chapter 5.

3.1.1.5 Additional Studies Separate from the DC2RVA Project

In places where resources could not be avoided and impacts minimized, mitigation measures have been outlined in the Section 106 Draft MOA for the Project (see Appendix K of this Final EIS) that include additional studies including research, architectural analysis, archeological excavations, public outreach and more.

In addition to the mitigation measures identified in the Section 106 Draft MOA, the research conducted by DRPT and concerns noted during the various public comment and consultation periods highlighted opportunities for future historic research avenues outside the scope of the DC2RVA Project. One such topic for future research born out of research/work completed in both Fredericksburg and the Shockoe Bottom area of Richmond was the need for a historic context of the Virginia slave trade as related to the rail networks linking the major cities throughout the state. This concept is discussed more in Section 3.1.3.5 below.

The depth of prehistory and history within the downtown Fredericksburg area provides ample opportunities for additional research in this area. Although the Project will have an adverse effect on resources in the Fredericksburg area, as discussed in Section 5.13 of this Final EIS, many NRHP-eligible individual properties are located in Fredericksburg that will not be impacted by the Project. Future studies could include NRHP nominations for these resources as well as interpretive signage and public talks to assure that information on these important resources is disseminated to residents and visitors of the area.

While the Fredericksburg Historic District was listed on the NRHP in 1972, the Fredericksburg Historic District Expansion (111-0009), located to the west of the original district, was found to be NRHP eligible as part of the Project. As a general recommendation, outside the scope of the DC2RVA Project, a more comprehensive survey of this district should be completed, perhaps in conjunction with the City of Fredericksburg, to assure that character-defining features of the district are maintained and out-of-scale development is curtailed. This may include not only a formal NRHP catalogue and nomination, but also evaluating a potential overlay district to instill preservation guidelines.

Beyond the built environment, archaeological sites in the corridor abound. This includes the sites of the 1850s and 1888 train stations once located on the south side of the tracks, numerous warehouses and factories once extant on the streets surrounding the rail, and many other now-gone resources. Particularly relevant to this study, an archaeological dig outside the scope of this Project could be completed around the duplex at 314-316 Frederick Street, which was used as a slave jail in the 1830s through the 1850s. A companion dig could occur in the yard at 300 Caroline Street, to the south of the tracks, which was another slave jail and pen. This data would be extremely informative when creating an archaeological context of the slave trade along the RF&P.

3.1.2 Ashland Area

3.1.2.1 Abbreviated History of Ashland

During consulting party and public consultation leading to the publication of the Draft EIS, the portion of the DC2RVA corridor within Ashland was highlighted as an area of cultural resource sensitivity. Various private citizens, organizations, and consulting parties voiced concerns about rail expansion in Ashland and how it may impact various historic resources. A brief history of the area is provided here to lay a framework for later discussions of these resources; however, the history of Ashland has been extensively documented and this cursory summary should not be viewed as comprehensive.[38]

The Town of Ashland was founded as a small mid-nineteenth century summer resort called 'Slash Cottage.'[39] Located only 12 miles north of the Virginia capital, the growth of Ashland as a resort community was possible in the mid-nineteenth century because of a well-constructed network of roads. The development of the town was further aided by the increasing rail system, which extended into Hanover County in the 1830s and led to greater accessibility. The RF&P opened in 1836, quickly opening this area to those from Fredericksburg to the north and Richmond to the south. Due to increasing tourism and economic prosperity, the town of Ashland was established in the late 1840s as a mineral springs resort and grew rapidly.[40]

Shortly after its formation as a town, the country was thrust into Civil War. During the war, the town of Ashland was frequently occupied by troops. The local racecourse served as a training field for Confederate troops and many prominent buildings were converted into hospitals and quarters. After the conflict, America temporarily entered a recession and the town's resort experienced financial trouble. It was sold in 1868 to Randolph-Macon College, an all-male Methodist college then situated in Boydton, Virginia.[41] The relocation of Randolph-Macon College to Ashland in the late 1860s and construction of new buildings on campus in the 1870s and 1880s fueled economic growth in town and facilitated better educational opportunities throughout Hanover County.[42] This growth was supported by improvements to the RF&P rail system and the construction of the Richmond electric railway in the late-nineteenth century, which further connected Richmond and Ashland. As the economy was rebuilt and strengthened, Hanover County's population increased substantially. Though it had dipped to 16,455 in 1870, the county population increased to 18,588 by 1880.[43]

Economic growth in the town of Ashland gave rise to a significant building boom in the last quarter of the nineteenth century. By 1890, the population in town was six times that of 1860.[44] In that year, a new rail station was built to help shelter passengers traveling on the RF&P. The community continued to thrive with support of the railroad, functioning as a resting place for many travelers between Washington, D.C. and Richmond, with much activity taking place at the Georgian-Revival-styled Henry Clay hotel that was constructed in 1906.[45]

In the years after World War I, the town of Ashland experienced another building boom as improvements were made to the local water facilities, new houses constructed, a tobacco warehouse built near the edge of town, and a new fairgrounds laid out. Prominent brick buildings were also constructed downtown at this time, including the Hanover National Bank and several church buildings.[46] A devastating fire swept through downtown in the early 1920s, destroying the train station and several other buildings. During the rebuilding, the Town recognized that they needed a rail station that befitted their status as a primary stop along the RF&P. Located west of the tracks in the center of town, the new station, completed in in 1923, embraced Colonial

Revival tenets seen at other stations along the corridor, such as Alexandria, Fredericksburg, and Doswell.

The formal establishment of Route 1 to the east of downtown also brought additional people to the area in the first half of the twentieth century. Like many small towns in central Virginia, though, the establishment of I-95 in the 1950s brought a notable decrease in activity. Population growth stalled. Rail service ceased in 1967, and the train station shut its doors. It was not until 1985 that intercity passenger services were restored in Ashland; the train station, however, was not reactivated for passenger use at that time. It was reopened as the Visitor's Center in the early 2000s.

As defined in NHRP forms for the Ashland Historic District, currently the town includes a collection of late nineteenth- through mid-twentieth century residential and commercial architecture. These forms further define the oldest resources as "revival-style wood and brick structures, decorated with fanciful trim, that evoke the town's resort origins and its early-twentieth-century residential and commercial boom" and note "the residential neighborhoods that cluster around downtown, characterized by their large frame dwellings on spacious shaded lots, maintain Ashland's image as a nineteenth-century suburban community."[47]

3.1.2.2 Background Review/Summary of Previous Cultural Resource Studies

Numerous cultural resource studies have been conducted in Ashland. These primarily consist of studies aimed at recording the town's above-ground resources. The following summary of these research efforts focuses on compliance-based reporting that has been completed in the Ashland area. This discussion aims to better recognize the existing body of research and known resources; it also serves to frame a discussion of what factors informed DRPT's initial fatal flaw review and subsequent analysis of alternatives in relation to the history of the area, recorded resources, and public concerns.

The Ashland Historic District (166-0001) was defined, nominated, and listed in the Virginia Landmarks Register (VLR) in 1982 and in the NRHP in 1983.[48] Based on the 1982 NRHP nomination, the district encompasses nearly 250 resources (201 of which were identified as contributing) and features a mix of residential, commercial, civic, educational, religious, and light industrial resources. Significant historic themes identified in its nomination included architecture, commerce, education, government, religion, transportation, residential and community development. At this time, few changes appear to have substantially impacted the built environment within the district. In 2017 the Ashland Historic District was resurveyed and the NRHP was updated to reflect changes in the district from its original recording in 1982.[49] The 2017 survey and expansion of the district resulted in the addition of 111 contributing resources to the original 201 identified in 1982. Additionally, the 2017 update outlined 170 noncontributing resources.

The Randolph-Macon College Complex Historic District (166-0002), recorded in 1978, highlights a few of the oldest buildings at the core of this college campus, located in the historic town of Ashland.[50] Three, late-nineteenth-century buildings were initially included in the district and two other early-twentieth-century buildings have since been surveyed in association with the original historic core. These resources and the district retain a high level of historic integrity and possess the same architectural characteristics that merited listing in the NRHP in 1979 under Criteria A and C.[51]

In 1988, DHR awarded a matching grant to the Hanover County Board of Supervisors for a reconnaissance-level survey of Hanover County's historic resources conducted by Land and Community Associates.[52] This grant was specifically for the documentation and evaluation of 450 historic architectural resources located in Hanover County. A second phase of survey commenced in June 1991 to document an additional 400 architectural resources.[53] A combined report detailed the results of the Phase I survey for 950 properties, specifying exemplary and representative examples of several types of historic resources that existed in the county. Eligibility recommendations were made for all of the properties surveyed and of the 950 total, approximately 155 resources were recommended as potentially eligible for listing in the NRHP.

An archaeological investigation, led by staff at the Virginia Commonwealth University Archaeological Research Center, examined a 14-acre parcel of land at the southeastern end of the town of Ashland.[54] This Phase I archaeological survey was conducted in advance of the construction of a swimming pool at Carter Park and indicated that much of the property had been previously disturbed, no archaeological sites were identified as part of the investigation.

A Phase I archaeological investigation in the yard surrounding the Hanover Tavern (042-0035/042-0086-0005) was completed in 1998.[55] The investigation consisted of shovel testing and backhoe monitoring in advance on construction activities including buried utility installation, landscaping improvements, and curb installation. Numerous nineteenth-century artifacts were collected, and seven features were identified. Both identified features consisted of brick and mortar, presumed to be intact portions of brick foundations or walls related to no longer extant buildings on the property. Additional Phase II archaeological testing was recommended for portions of the Tavern property.

Ashley Neville and Brenda Pennington, of Ashley Neville LLC, completed an update of Hanover County's historic resources, which included an architectural survey of approximately 72,897 acres in western Hanover County in 2012.[56] 79 properties were recorded, and of those Neville recommended 10 for additional research to determine their NRHP potential: 042-5325, 042-5326, 042-5347, 042-5353, 042-5362, 042-5370, 042-5374, 042-5376, 042-5378, and 042-5387. Neville and Pennington recommended that the Beaverdam village be studied as a potential district and a Multiple Property Documents investigation of rural stores in Hanover County be conducted.

The DC2RVA Team conducted Phase I and Phase II studies in the Ashland vicinity. Archaeological studies included Phase IA and Phase IB surveys of the DC2RVA corridor, which included background review, historic research, GIS-based predictive modelling, and field investigations.[57] These studies noted a great deal of near surface disturbance in the corridor, and did not result in the identification of any new archaeological sites within the archaeological APE in Ashland. DC2RVA architectural studies in Ashland included a Phase I investigation that encompassed a portion of the corridor from North Doswell to Elmont, south of Ashland.[58] In this portion of the APE the team surveyed 264 historic architectural resources, 142 of which were previously recorded and 122 were newly recorded historic resources. These included the NHRP listed Ashland Historic District (166-0001) and Randolph-Macon College Complex Historic District (166-0002) in Ashland, and many individual properties within these districts. Based on this Phase I study and updates to the APE following the Draft EIS, Phase II studies were completed. Because changes to the APE eliminated Project-related improvements in Ashland, no Phase II investigation within the town were completed. However, Phase II investigations of nearby properties, including the Berkleytown Historic District (166-5073), were undertaken as part of this additional work.[59]

Beyond compliance studies, an abundance of work on the town's history has been done by local historians and volunteers. In particular, individuals associated with the Ashland Museum have compiled an abundance of data on area history and Ashland's built environment. This information can be found on site at the Museum and it is often used to create a rotating set of displays highlighting key moments in Ashland's past.

3.1.2.3 Discussion of In-Depth Review and Subsequent Analysis of Project Alternatives in Relation to History of the Area, Recorded Resources, and Public Concerns

Throughout the alternatives development, screening, and selection process for the Project, impacts to cultural resources were considered throughout the corridor. In Ashland particular concern was paid to existing above- and below-ground resources and to predicting the locations of yet un-identified areas of cultural sensitivity. Early in this review, the public raised concern about the impact rail infrastructure improvements would have on the known historic resources in Ashland, as much of the town and college historic districts are directly adjacent to the existing rail corridor. As such, DRPT took various steps to review and analyze alternatives in Ashland and their potential effect on cultural and historic resources.

Cultural resources were at the forefront of the Project design as the extant rail line traverses through the center of Town. Through scores of meetings, telephone calls, and emails between agencies, consulting parties, interested parties, and DRPT, all aspects of the Project design have been through thorough review to assure that cultural resources have been recorded and considered during Project planning. Details on the Project have also been shared repeatedly with the public through a series of general Project public meetings and articles in the local paper (refer to Appendix E for detailed information). The concerns of the impacts of the rail in this area resulted in the formation of a community-based committee to advise and inform DRPT on DC2RVA alternatives and issues in the Town of Ashland/Hanover County area.

The Town of Ashland, Ashland Museum, Hanover County, and Hanover County Historical Society, as well as statewide groups like American Battlefield Protection Program, Civil War Trust, National Trust for Historic Preservation, and Preservation Virginia have all been involved in the cultural resource process. Information on the history of Ashland, its built environment, and resource significance at the local level was garnered through this outreach, including tours of the Ashland Museum and other on-site meetings to carefully consider the rail in relation to historic properties. This data was then presented to DHR to solicit feedback on resource eligibility and Project effect to assure that all concerns were thoroughly vetted. These meetings, calls, and other communication efforts allowed DRPT to listen to the public and understand the resources they considered the most important to the area and place them within the Project context.

The coordination that occurred during this Project, along with guiding principles of the Section 106 legislative process, guided the Project-based technical studies completed in Ashland. This work included:

- Archaeological predictive modelling on the corridor to identify locations with the high potential to include unrecorded archaeological resources;[60]
- In-depth historic document and map review to create georeferenced overlays and identify potential historic resources;[61]

- Phase I and IA cultural resource surveys to identify above- and below-ground resources along all Project alternatives (see previous section for citations);
- Intensive-level architectural studies on five resources in the Ashland area including archival research, architectural analysis, and evaluation of NRHP eligibility with determinations on resource boundaries; and
- Integrated Project mapping and analysis to allow cultural resource specialists' input and agency in engineering design based on the results of survey and historic map/document review.

The technical studies were modified in 2017 and 2018 once a Preferred Alternative was selected (refer to Chapter 4 for details) and it was decided to not add a third track through downtown Ashland. This action reduced the area of potential effects for cultural resources through the downtown core. Information on this change was disseminated to all consulting parties and other interested groups, and additional meetings and coordination were held to discuss what this action meant for Ashland's historic properties. Details on the ensuing analysis can be found in Chapters 5 and 6 of this Final EIS.

3.1.2.4 Summary of Efforts to Avoid Areas of Concern to Assure Preservation in Place and, if Avoidance Was Not Possible, Minimize Any Potential Impacts to Cultural Resources

As a result of the analysis and public concern, FRA and DRPT selected a Preferred Alternative that does not include any rail infrastructure improvements between Vaughan Road and Ashcake Road, which includes the corporate limits of the Town of Ashland. The Ashland bypass alternatives were not selected. Refer to Chapter 4 of this Final EIS for details of the selection process. As such, the DC2RVA Project will avoid construction in all areas of concern regarding historic resources within the downtown Ashland core – refer to Chapter 5 for details.

Due to the proposed Vaughan Road overpass, DRPT met repeatedly with town representatives and cultural resource consulting parties to review Project plans and the boundaries of the Berkleytown Historic District (166-5073), which is situated at the north end of the Town of Ashland (see Appendix E for list of meetings). To the greatest degree possible, impacts to the district were minimized and building demolition was avoided through careful planning efforts. Additional information on the impacts of the overpass to this district can be found in Chapter 5 and 6 of this Final EIS.

3.1.2.5 Additional Studies Separate from the DC2RVA Project

Mitigation measures for resources that could not be avoided have been outlined in the Section 106 Draft MOA for the Project (see Appendix K of this Final EIS). They include additional studies including research, architectural analysis, archeological excavations, public outreach and other tasks. Beyond these mitigation measures, information shared by agencies and the public, combined with the research conducted by DRPT, reveal many future historic research projects outside the scope of the DC2RVA Project that may be completed by the locality or others with a vested interest in the area history. While no resources specifically associated with the slave trade were identified during this study in Ashland, the community was in existence as a thriving resort town during the antebellum period.

The extensive history of this area leads to numerous other avenues for historical inquiry. Future studies on individual resources that are not adversely affected by the Project could include NRHP nominations as well as interpretive signage. Work on the districts could involve working with the Town to use the 2017 Project survey data to expand their NRHP boundaries and helping Randolph-Macon College get NRHP listing for their campus district expansion.

Archaeologically, the background review illustrates that few formal archaeological studies are on file with DHR and only a handful of Ashland archeological sites have been recorded in the area. The potential for intact, significant sites is moderate to high throughout town. Sites that may reveal data on Ashland's past include the site of the 1880 train station, the location of the original 1840s resort complex, and surrounding fields once occupied by Civil War soldiers.

Beyond technical studies, information derived from various stages of research can also be displayed at the Ashland Museum. The staff has a robust collection of rotating exhibits, and data on ongoing studies can be added to this roster to create new presentations to help teach the public about the important history of this area.

3.1.3 Richmond Main Street Station/Shockoe Bottom Area

3.1.3.1 Abbreviated History of Richmond and Shockoe Bottom

As noted above, the portion of the DC2RVA Preferred Alternative within the Shockoe Bottom portion of Richmond was highlighted as an area of cultural resource sensitivity. As such, a brief history of the area is provided here, however, the history of Richmond and Shockoe Bottom has been extensively documented.[62] Richmond was founded at the falls of the James River by William Byrd II in 1733 and was laid out by Major William Mayo in 1737.[63] The main focus of economic and governmental activity in newly established Richmond was concentrated in the eastern portion of the city, along the banks of Shockoe Creek and adjacent Church Hill. Shockoe, also known as Rock Landing, a granite outcropping at the confluence of Shockoe Creek and the James River, marked the upper limit of navigation on the James. Given its geography and physiographic location this landing, and others, made Richmond an important port city that served to connect the fertile Virginia Piedmont with the James River and eventually ocean ports.[64] As such, the area surrounding this historic location of Shockoe Creek (including Shockoe Valley, Shockoe Slip, and Shockoe Bottom) encompasses some of Richmond's earliest residential, commercial, and manufacturing activity.

The Virginia General Assembly voted to move the state capital from Williamsburg to Richmond in 1799, as Richmond was considered more secure from British invasion and more centrally located.[65] During the first half of the nineteenth century, with the aid of slave labor, Richmond continued to grow as a city by expanding trade, manufacturing, and transportation infrastructure. The James River served as the epicenter for economic and commercial development; as such, warehouses were constructed along the waterfront to house materials that moved through the docks.[66] The construction of the James River and Kanawha Canals, along with the 1834 completion of the first railroad lines in the city, continued to make Richmond an essential node in the regional transportation system. Trade goods primarily included agricultural products of sugar and tobacco, but also encompassed the buying and selling of enslaved individuals. As noted by Chen and Collins, "the presence of slavery and the business of buying and selling bondsmen was an essential element in Richmond's development as one of the preeminent cities in the south during the antebellum period."[67] By the turn of the nineteenth century the center of the slave trade in Richmond was concentrated along the north bank of the James River, in the vicinity of Shockoe Bottom. This trend continued through the first half of the nineteenth century, with the most prolific activity occurring in the 1830s and 1840s.

During the mid-nineteenth century, Richmond "played a unique role in the Civil War, serving not only as the Confederate capital, but also as the chief manufacturer for the Southern war effort."[68] Richmond's population swelled as government officials and politicians of the newly established Confederacy and their families relocated.[69] Capturing the capital was a main objective of the Union Army, and the Peninsula and Petersburg Campaigns were fought largely with that goal in mind. After repelling the Federals during the 1862 Peninsula Campaign, the Confederates constructed a ring of fortifications around the city. Despite the defenses, repeated pounding from northern artillery erased large stretches of Richmond. In 1865, the City was on the verge of falling. Just prior to the Union capture of the City, fires were set by Richmonders in many of the riverside warehouses to prevent the Union Army from taking possession of the contents. Fires ignited to destroy the tobacco warehoused along the James spread west beyond Shockoe Bottom into the business district. Explosions demolished the powder magazine and fire destroyed over 900 buildings, three bridges, several tobacco warehouses and two railroad depots.[70]

At the close of the Civil War, the rebuilding of Richmond, with a concentration on the scorched business district, began in earnest. By 1870, the riverfront was up and running again, with the tobacco industry once again returning as the mainstay of Richmond's economy. The railroad lines were also quickly repaired, helping to slowly revive Richmond's post-war economy.[71] As the nineteenth century drew to a close, Richmond's presence as a prominent southern port city began to decline. The decline of the port combined with local politics and competition between the various rail lines serving Richmond shifted the focus from water-based to rail-based transportation of goods. The improvements in the rail system had a notable effect on the physical fabric of the Shockoe Bottom area. The Seaboard Air Line Railroad selected this area as the site of their new Richmond station. Construction of the station, associated train shed, rail lines, warehouses, and other facilities required extensive reworking of the landscape, including channeling Shockoe Creek through concrete culverts and bringing in 40 to 50 feet of fill to level the landscape. This activity buried the remaining historic and prehistoric deposits in this area below many feet of earth. Buildings were demolished, and archaeological sites were destroyed. The new station, completed in 1901, changed the Shockoe Bottom area, bringing many passengers to this part of town and elevating the economy and enriching the building stock.

During the twentieth century, Richmond's geographical extent expanded. The retail and office district downtown continued to grow, with Jackson Ward, a neighborhood directly northwest of the downtown core, becoming a center of African-American commerce and culture. Similarly, construction of both houses and apartments rose east of Shockoe Bottom in the Oakwood-Chimborazo district during the 1920s, notably in Glenwood Park.[72] The Shockoe Bottom area was notably impacted in the mid-twentieth century through the construction of I-95, which bisected the city and required the demolition of numerous buildings. Lying east of I-95, the Shockoe Bottom area was, in essence, cut off from the remainder of the downtown core to the west of I-95. Partially as a result of this new highway, there was a resurgence of building in the downtown area, though the residential population continued to move westward, as more and more of the western "suburbs" became part of the City. In the 1970s and 1980s, downtown became less and less the center of Richmond's commercial life, as strip malls and office parks were built farther out into the counties of Henrico, Hanover, Chesterfield, Powhatan and Goochland. In the 1990s, however, developers began once again to focus on the historic downtown area, gradually expanding north and east to Church Hill and Shockoe Bottom.

3.1.3.2 Background Review/Summary of Previous Cultural Resource Studies

Given its location, just east of the heart of downtown Richmond, and its rich history, the Shockoe Bottom area has been the subject of numerous cultural resource studies. As such, the area consists of a myriad of overlapping historic districts, known above-ground resources, and recorded archaeological sites. For the purposes of this discussion, efforts will focus on the robust body of research and compliance-based reporting that has been completed in the general vicinity of Main Street Station and the greater Shockoe Bottom area. This discussion aims to better recognize the existing body of research, the known resources, and frame a discussion for understanding what factors informed DRPT's initial fatal flaw review and subsequent analysis of alternatives in relation to the history of the area, recorded resources, and public concerns.

Main Street Station (127-0172; 127-0344-0117), at times referred to as the Seaboard Airline Station, Chesapeake & Ohio Station, or Main Street Station and Trainshed, was listed in the VLR in 1970 and the NRHP places in 1976.[73] As recorded, the resource includes the terminal building of Main Street Station and a trainshed to the north of the terminal. As noted in significance statement in the NRHP form, the resource is "one of Richmond's most renowned buildings" and "symbolizes the importance of the rail terminal as an entrance gateway to the city". Its style is a significant example of the influence of the French Ecole des Beaux Arts on American architecture. The trainshed is one of the earliest examples of rigid truss construction, which has become standard in modern trussed structures of all types. The facility ceased being used as a rail stop in the 1970s. It was briefly used as a shopping mall and to house the public health department in the 1980s prior to a commitment from the City to reuse the building in its original transportation capacity. In 1997 a historic structures report was completed for Main Street Station in support of multimodal transportation center renovations/upgrades related to expanded passenger service.[74] This study found that the Main Street Station and the Trainshed retain the character and essence of their original design. Phased renovations were proposed in an effort to revitalize the building and spur economic activity within the larger Shockoe Bottom area.

The Shockoe Valley and Tobacco Row Historic District (127-0344) was defined, nominated, and listed in the VLR in 1981 and in the NRHP in 1983.[75] Based on the NRHP nomination, the district encompasses nearly 129 acres inclusive of 400 resources, within the low-lying area surrounding Shockoe Creek along the James River, including portions of Union and Church Hill. In 2008 and 2015, the building inventory of the Shockoe Valley and Tobacco Row Historic District was updated through a windshield survey of all extant resources in the district.[76] This 2015 update concluded that there are 244 resources that contribute to the district's NRHP eligibility, while there are 140 resources that do not contribute to the NRHP eligibility. The DC2RVA Preferred Alternative is within the viewshed of several contributing resources within the district and within the district itself.

In the early 1990s, a number of archaeological sites were identified, evaluated, and monitored in association with the Richmond Floodwall project and in support of U.S. Army Corps of Engineers permitting of the project. Project construction was completed in 1994, however, various archaeological studies were completed in support of the construction efforts in the late-1980s and early 1990s. Unfortunately, archaeological reports were never completed in association with the Richmond Floodwall project, so little is known about parameters of the investigations or their detailed results. DHR site records do indicate that there are three archaeological sites (44HE1094, 44HE1097 and 44SHE1098) associated with this project recorded within the footprint of the DC2RVA Preferred Alternative. Site 44HE1094 is recorded in DHR site files as a nineteenth-century Commissary Warehouse, site 44HE1097 is recorded as a railroad warehouse dating to the nineteenth century, and site 44HE1098 is classified as a railroad site.

The Southeast High Speed Rail corridor between Richmond and Raleigh was the subject of several cultural resource investigations. These included the APE surrounding the rail corridor itself as well as the APE of all road modification areas surrounding the rail line. Work was conducted between 2004 and 2012 by Mattson, Alexander and Associates, Inc., Louis Berger Group, Inc. (Berger), and Dovetail.[77] The results of these studies have been individually coordinated with DHR, including the submission of reports and Digital Sharing Service (DSS)/ Virginia Cultural Resource Information System (V-CRIS) forms to the agency as well as formal resource eligibility recommendations for listing in the NRHP. Project effect determinations, on individual historic properties as well as the Richmond to Raleigh (R2R) segment of the SEHSR project as a whole, were acquired in 2009 and 2013. A total of 74 historic properties listed in or eligible for the NRHP were identified within the DC2RVA Project APE. Specifically, in the City of Richmond, these studies identified 10 historic properties, of which one is an archaeological site and nine are above-ground resources. A Memorandum of Agreement associated with the R2R project to outline stipulations to mitigate adverse effects to these resources and the larger project was completed in 2017.

In 2006 and 2008, the James River Institute for Archaeology conducted archaeological investigations at the Lumpkins Slave Jail site (44HE1053).[78] The larger Lumpkins Jail project was initiated in 2005 when DHR and the Alliance to Conserve Old Richmond Neighborhoods embarked in a partnership to locate the site, known only at that time by historical accounts and records. The site, which was located using georeferenced historic maps and targeted archaeological investigations, is located approximately 130 feet west of the DC2RVA Preferred Alternative limits of disturbance (LOD). The archaeological investigations at site 44HE1053, which included preliminary investigations (2006) and subsequent data recovery investigations (2008), documented a portion of the former Lumpkins Slave Jail property (including a kitchen, the jail building, several outbuildings and landscape features) and unearthed over 16,000 artifacts related to the occupation of the property from the 1830s through the twentieth century. Archaeological investigations at the Lumpkins Slave Jail site documented the presence of intact nineteenth century deposits almost 15 feet beneath the modern ground surface.

In 2006 and 2007 the Johannas Design Group compiled a draft multiple property documentation form for what they termed the “Slave Trade as a Commercial Enterprise in Richmond, Virginia” (127-6196).[79] The property form establishes a historic context for the commercial industry of slave trade in Shockoe Bottom and along Shockoe Creek. It additionally defines property types characteristic of the slave trade in Richmond including residences, hotels and meeting halls, jails, auction houses, and offices. Given the nature of the multiple property listing and the lack of above-ground components, no geographic footprint is represented in DHR geospatial dataset available online or in the archives. As such there is no physical resource recorded at DHR or any other repository that is associated with this topic. The form concludes that extant above-ground resources associated with the commercial enterprise of the slave trade within the geographic area are extremely limited due to historic fires and modern development. The form also highlights that the potential for yet-undiscovered archaeological sites associated with this context are high.

Work at the Lumpkins Slave Jail/Devil’s Half-Acre site (44HE1053) and research associated with the Slave Trade as a Commercial Enterprise NRHP form brought to light the presence of the former Richmond free black and slave burial ground known as the “Burial Ground for

Negroes" and associated gallows, reported in the historical record to be located just north of the Lumpkins Slave Jail site, some 350 feet from the DC2RVA Preferred Alternative LOD. In 2007 and 2008, the presumed general location of the burial ground was at least partially on a lot owned by Virginia Commonwealth University (VCU), at 1554 East Broad Street and 1520 East Marshall Street. In 2007, VCU hired Draper Aden Associates to conduct an environmental assessment of the parcel, which was at that time in use as a parking lot.[80] As part of this environmental work a series of soil cores were extracted to examine the structure of the deposits underlying the asphalt parking area. At least three of these cores (recorded as MW-1, MW-4, and MW-5) were excavated within 100 to 150 feet of the presumed burial ground. All three cores showed the presence of 8 to 9 feet of dark fill below the asphalt. In one core, MW-1, the fill deposits capped 1.5 feet of clay, beneath which was 1 foot of black organic deposits that rested on sand. The remaining two cores showed fill resting immediately on basal sand deposits. Interpretations of the organic deposits in MW-1 suggested an intact and preserved historic layer underneath twentieth century fill. The assessment of thick deposits of fill capping historic deposits is consistent with the conclusions drawn at Lumpkins Slave Jail site.

In 2008, DHR gathered a variety of historical maps and documents in an effort to better locate the former "Burial Ground for Negroes" (ca. 1750-1816).[81] This work resulted in the verification of the past presence of the resource, the location of its assumed boundaries on the modern landscape, and recommendations about the potential integrity and treatment of the resource. Also as a result of this work, the Burial Ground for Negroes was assigned an archaeological site number, 44HE1089. Based on historic map projections, archival research, and informant interviews, Stephenson concluded that the majority of the site lies underneath I-95, however, it is possible that the site extends approximately 50 feet to the east into an adjacent parcel (at the time of the Stephenson report the adjacent parcel was a paved parking lot owned by VCU, however it has since transferred ownership to the City of Richmond and has been converted into a green space with interpretative signage). Stephenson used soil core samples (see discussion above pertaining to the Draper Aden Associates 2007 report) from the site and compared the landform of 44HE1089 to that of Lumpkins Slave Jail site (44HE1053), concluding that both locations likely underwent similar filling episodes as a result of the infill of Shockoe Creek in 1900 as well as the 1950s construction of I-95. As such, it is assumed that burials may still be intact within the mapped site boundaries beneath a minimum of 15 to 20 feet of historic fill; however, no archaeological investigations were undertaken to confirm the presence of interments. Site 44HE1089 is located approximately 350 feet from the DC2RVA Preferred Alternative.

In response to Stephenson's 2008 validation and assessment of the Burial Ground for Negroes, the Institute for Historical Biology at the College of William and Mary reviewed DHR's and Stephenson's findings.[82] Although this review agreed with many key findings of Stephenson's report, the review took issue with the eastern boundary previously established and contended that given the ambiguity of the historic record, there is insubstantial documentary evidence to conclude that the burial ground only extends 50 feet outside of the I-95 footprint. Instead, Blakey concluded that the primary resource data, or lack of clear data, points clearly to the need to archaeological testing to determine the extent of the burial ground east of I-95.

Based on the 2008 work completed by Stephenson and Blakey, Cultural Resource Analysts, Inc. (CRA), completed archaeological monitoring of the asphalt removal overlying the potential Burial Ground for Negroes (44HE1089).[83] The project involved the removal of asphalt from the approximately 2.5-acre former VCU parking lot located at North 16th and E. Broad Streets. Archaeological monitoring was undertaken as the former parking lot was converted into a greenspace, this conversion required the removal of approximately 10 inches of the asphalt and gravel. As noted by Laird and by Draper Aden Associates, Simpson concluded that the historic site 44HE1089 is likely buried under 15 to 20 feet of fill, deposited during former occupations and the construction of I-95. As such, no archaeological features or deposits were noted during the work, which reached a maximum depth of 10 inches below the modern surface.

In April of 2008, Archaeological Consultants of the Carolinas, Inc. (ACC) conducted a Phase I archaeological survey of an entire city block in the Shockoe Bottom area.[84] The block, bound by Marshall, East Broad, 18th, and 19th Streets, is situated approximately 1,000 feet northeast of Main Street Station. The objective of this survey was to determine the presence and integrity of any archaeological deposits within the block. To this end, extensive archival research was completed and was followed with trench excavation to expose and assess deposits within the project area. Three trenches were excavated, exposing 0.05 percent of the project area. All three showed evidence of cultural features and buried ground surfaces, intact beneath the modern surface. Cultural deposits were noted 1.2 to 1.33 feet beneath the asphalt covering the block.

In 2010 Dovetail conducted a Phase I cultural resource survey of the Broad Street Bus Rapid Transit (BRT) project area in the City of Richmond and Henrico County, Virginia.[85] This undertaking included an architectural survey of the 7-mile project corridor along Broad Street and archaeological survey in areas with the potential for intact soils. The project corridor was split into nine areas (A through I) with each area representing a geographical segment of the larger project APE. The segment spanning the Shockoe Bottom area was identified as Area I and included a survey of all above-ground resources in the vicinity. Dovetail surveyed 145 architectural resources within the APE of the Broad Street corridor in Area I, all of which had been previously recorded. Of these 145 properties, Dovetail recommended 133 as not eligible for individual listing on the NHRP. Two previously recorded properties were determined eligible by DHR, but are recommended not eligible as a result of that survey (043-0306 and 127-0413). Furthermore, it was recommended that eight previously determined eligible resources remain eligible for NRHP listing: 127-0100, 127-0172, 127-0192, 127-0219, 127-0344/127-6169, 127-0257, 127-0854, and 127-6271 and that four resources be considered potentially eligible for NRHP listing: 127-0192-0322, 127-0219-0059, 127-0282, and 127-0344-0123. DHR concurred with these recommendations in a letter dated January 20, 2011. The BRT project corridor was revisited in 2015, based on the selection of BRT station locations which expanded the APE.[86] The APE expansion included the location of a BRT station at the intersection of E. Main Street and 24th Street within the vicinity of Shockoe Bottom. The 2015 architectural survey in support of this station location identified three industrial properties: the Tobacco Factory (127-0018; 127-0192-0279), Cameron Building (12-0344-0039), and Leaf Storage Building (127-0344-0393), all of which were recommended not eligible for inclusion in the NRHP as individual resources.

In advance of the proposed widening of Interstate 64, Dovetail and CRA completed archaeological investigations and a geoarchaeological assessment of the purported “Slave and Free Black Burying Ground” (44HE1203), a second interment area used after the “Burial Ground for Negros” was closed.[87] The archaeological investigation, completed on behalf of VDOT, included the excavation of a series of backhoe trenches used to assess the stratigraphy and presence of archaeological features within the 0.68-acre project area. The project area was situated immediately underneath the I-64 overpass over Shockoe Valley, north of Hospital Street. This project area lies partially within the DC2RVA archaeological APE and thus the footprint of the Preferred Alternative. Extensive documentary, map, and background research as to the location and extent of the purported “Slave and Free Black Burying Ground” was conducted by VDOT in advance of the archaeological investigation.[88] Despite overwhelming documentary evidence of the "Slave and Free Black Burying Ground," no physical archaeological evidence was documented in the project area. Instead, the geoarchaeological assessment indicated that the project area stratigraphy consisted of varying degrees of modern fill deposited on top of truncated ancient marine soils. No interment features or nineteenth century artifacts were noted in the project area, and the authors concluded that the documentary and geoarchaeological analysis indicated the cemetery was likely located outside the project area, at the crest of the valley slope immediately to the west of the project area and east of the extant Shockoe Hill Cemetery (127-0389) and Hebrew Cemetery (127-6166). This location, as proposed by Calhoun, is currently recorded as Talley's Auto Service Center, located at 1305 N 5th Street (127-6660).

In 2014 Dutton + Associates completed a cultural context and thematic study in association with the Revitalize RVA project.[89] This research defined a study area in Shockoe Bottom to the east and outside of the current DC2RVA Preferred Alternative and aimed to establish a comprehensive history of the area. Beyond the background review data assembled, the study identified slave trade sites, ethnic/cultural heritage sites, commerce sites, and railroad sites within the study area. These identified locations were then synthesized into areas of archaeological interest, which were areas thought to potentially represent significant and yet undiscovered archaeological resources.

As a part of DC2RVA, DRPT conducted Phase I and Phase II studies in Shockoe Bottom and vicinity. Archaeological studies included Phase IA and Phase IB surveys of the DC2RVA corridor, which included background review, historic research, GIS-based predictive modelling, and field investigations.[90] These studies noted a great deal of near-surface disturbance in the corridor, yet resulted in the identification of four previously recorded archaeological sites (44HE0357, 44HE1097, 44HE1098, and 44HE1094) and two newly recorded archaeological sites (44HE1203 and 44HE1204) within the archaeological APE in the Shockoe Bottom area. DC2RVA architectural studies in the Shockoe Bottom area included a Phase I investigations.[91] This Phase I study resulted in the recordation 96 historic architectural resources and of these, 9 previously recorded and 87 newly recorded historic resources were identified. Based on the results and recommendations put forth during this Phase I investigation, a Phase II architectural evaluation was completed on five resources (127-0197, 127-0344-0102, 127-0344-0123, 127-6129, and 127-6793).[92]

The most recent studies separate from the DC2RVA Project have included investigations to ascertain the potential for a memorial park in this area. The City of Richmond and numerous private interest groups have sponsored studies to identify components to include in a park highlighting the significance of the slave trade in this area and general African-American history.[93] Studies are ongoing.

3.1.3.3 Discussion of In-Depth Review and Subsequent Analysis of Project Alternatives in Relation to History of the Area, Recorded Resources, and Public Concerns

Potential impacts to cultural resources were considered at numerous stages in the alternatives development, screening, and selection process starting at the inception of the environmental document in 2014. Over the past four years, almost 20 in-person meetings and dozens of phone calls have occurred between DHR, ACHP, FRA, and DRPT. All aspects of the Project design have been reviewed to assure that cultural resources have been studied and taken into consideration during Project planning. This includes constant dialogues between cultural resource specialists and engineers to ensure that design plans take cultural resources into account during planning. Additional details on evaluation of all alternatives can be found in Chapter 4 of this Final EIS.

Information on the Project has also been shared with the public through a series of general Project public meetings and area-specific meetings. Specific to cultural resources, numerous consulting parties with an interest in this area have been participating in the process including: NPS (Richmond), City of Richmond, and Historic Richmond Foundation, as well as groups whose interests span the Commonwealth like American Battlefield Protection Program, Civil War Trust, National Trust for Historic Preservation, and Preservation Virginia. In addition, numerous other groups were invited to share their comments on the significance of the area and provide ideas on mitigation to impacts, including the Shockoe Bottom Neighborhood Association, Historic Shockoe Partnership, Elegba Folklore Society, Sacred Ground project, Black History Museum Virginia, Untold RVA, Virginia African American Cultural Resources Task Force, Southern Environmental Law Center, Community Unity in Action, Richmond Branch of the NAACP, Wesley Memorial United Methodist Church, VCU Department African American Studies, Richmond Crusade for Voters, First Unitarian Universalist Church, and Sacred Ground Historical Reclamation project. The goal of this outreach was to harness information on significant historic properties in the area to assure it was adequately considered during Project design.

Beyond formal consulting party coordination, DRPT has attended numerous meetings with local groups and localities to understand the public’s interest in this area. Meetings with the City of Richmond have focused on an understanding of their ongoing preservation initiatives in this area and establishment of archaeological easements and protection zones. DRPT also sought to understand their initiatives for other improvements in the Shockoe Bottom area to place the current Project in context, including upcoming road modification projects, new parking areas, improvements to the 17th Street Market, and the recently completed Pulse Bus Rapid Transit system. VDOT was also consulted to understand future plans regarding I-95 access ramp upgrades. Beyond these, DRPT participated in the Urban Land Institute/Rose Center forum initiated by the mayor of Richmond to help organize future planning initiatives in this area, attended meetings with Richmond Archaeology, and others.

Based on the known history of this area and extensive coordination, DRPT conducted the following technical studies in Richmond to aid in the analysis of alternatives in relation to the historic context, recorded resources, and public concerns:

- Archaeological predictive modelling on the corridor to identify locations with the high potential for un-recorded archaeological resources;[94]
- In-depth historic document and map review with georeferenced overlays to identify potential historic resources;[95]
- Phase I cultural resource surveys to identify above- and below-ground resources within the Preferred Alternative (see previous section for citations) resulting in the recordation of over 100 architectural resources and half a dozen archaeological sites in the area of potential effect in the Shockoe Bottom area;
- Intensive-level architectural studies on over 20 resources within the city including archival research, architectural analysis, and evaluation of NRHP eligibility with determinations on resource boundaries; and
- Integrated Project mapping and analysis to allow cultural resource specialists to provide input in engineering design based on the results of survey and historic map/document review to avoid and minimize impacts.

3.1.3.4 Summary of Efforts to Avoid Areas of Concern to Assure Preservation in Place and, if Avoidance Was Not Possible, Minimize Any Potential Impacts to Cultural Resources

Great care was taken by DRPT to avoid areas of historic sensitivity unidentified via cultural resource studies, historic document/map analysis, and public comments. The Phase IA archaeological study of the Project corridor aimed to predict areas of archaeological sensitivity based on a variety of cultural and environmental factors.[96] This study was used to guide two Phase IB archaeological studies that included on the ground testing of areas within the archaeological APE to identify archaeological sites. Phase I and II architectural studies identified and evaluated above-ground resources within the architectural APE. Combined, these studies identified numerous cultural resources within the Shockoe Bottom area. The locations/boundaries of these resources were taken into consideration at various stages of the design/engineering process and the Project's footprint was minimized to the greatest degree possible to avoid archaeological sites and potential impacts to above-ground resources.

During the course of the above-mentioned cultural resource studies, historic documents and maps were consulted and analyzed to understand the complex history of the Shockoe Bottom area. To this end, GIS software was employed to georeference these historic documents to the modern landscape, in an effort to further identify yet undiscovered archaeological sites within the archaeological APE. Based on this mapping exercise, the locations of historic buildings, which are no longer visible above ground, were identified and additional archaeological sites were recorded. Maps from various time periods were consulted and georeferenced to the modern landscape in an effort to capture yet unrecorded archaeological resources throughout the historic use of the Shockoe Bottom area, as shown in Figure 3.1-3, 3.1-4, and 3.1-5.[97] The results of this historic document analysis were closely coordinated with engineering/design and, where possible, were used to reconfigure Project design to minimize Project impacts on identified resources. For example, historic maps and overlays were carefully analyzed in association with Project plans near the early-nineteenth century "Slave and Free Black Burying Ground" (44HE1203) located near Hospital Street. Through this dialogue, the Project design was altered to reduce the footprint to ensure that no potential portions of the cemetery would be touched during the Project (see Figures 3.1-3 through 3.1-5).

Additional avoidance measures were taken based on comments from the Project consulting parties and the general public. Dozens of in-person meetings, conference calls, letters, and emails were exchanged to thoroughly understand public concerns in the Shockoe Bottom area, culminating in an on-site meeting with vested groups on October 12, 2018. Through these dialogues, the Area of Potential Effects was expanded as appropriate to include the study of a wider geographic area and an expanded definition of the Area of Potential Effects within the Shockoe Bottom area. In particular, the Lumpkins Jail/Devil's Half Acre archaeological site (44HE1053), the Slave and Free Black Burying Ground site mentioned above (44HE1203), and Masons Hall (127-0019) were added to the roster of historic properties. In addition, several additional resources are being considered as contributing elements to the Shockoe Valley and Tobacco Row Historic District (127-0344), which includes most of the Shockoe Bottom area. All of these resources were evaluated for both Section 106 effect and 4(f) use as part of the Project to minimize impacts.

3.1.3.5 Additional Studies Separate from the DC2RVA Project

In places where resources could not be avoided and impacts minimized, mitigation measures have been outlined in the Section 106 Draft MOA for the Project (see Appendix K of this Final EIS) that include additional studies including research, architectural analysis, archeological excavations, public outreach and more. Beyond these mitigation measures, the public comment and consultation process as part of the DC2RVA Project highlighted the need for future/additional historical studies of the Shockoe Bottom area that may be completed by the City or others with a vested interest in area history. Although beyond the scope of the DC2RVA studies, it is important to recognize and explore the significant history of Shockoe Bottom and especially the lives of enslaved individuals. To this end, four areas of additional studies have been identified: research, archaeological studies, public interpretation, and planning initiatives, which are outlined in Table 3.1-1.

Table 3.1-1: Summary of Additional Studies Separate from the DC2RVA Project

Research
Propose, delineate, and evaluate a Shockoe Valley Slave Trade District Evaluation to record the locations of potential sites with DHR; to be done in concert with existing City of Richmond research and preliminary draft multiple property documentation on file with DHR, done by Johannas Design Group in 2007.
If the district listed above is determined to be eligible for the NRHP and pending City and property owner approval, the Shockoe Slave Trade Historic District would be nominated to the NRHP.
Creation of a compendium of literature, including diaries, letters, quotes, imagery, maps, oral histories, etc., on the experience of the enslaved individual in Richmond.
Creation of historic context of the RF&P Railroad and its association with the Virginia slave trade, linking locations including Richmond, Fredericksburg, and Alexandria.
Archaeological Studies
Investigations, including additional archival research, at the "Slave and Free Black Burying Ground" (44HE1203) near Hospital Street to identify the location of potentially intact interments.
Additional archaeological studies on known sites, including Devil's Half Acre/Lumpkins Jail (44HE1053) and "Burial Ground for Negroes" (44HE1089).
Archaeological excavations (Phase I, II, and III as appropriate) on areas identified during the Shockoe Slave Trade Historic District evaluation study to potentially contain sites.
Public Interpretation
Work with James River Institute for Archaeology, RVA Archaeology, Dutton+Associates, and others with knowledge of this area to create an interactive webpage on the history and significance of this area.
Use the data gathered during the webpage development to create a booklet on the history and significance of this area.
Work with the City of Richmond, Richmond City Council Slave Trail Commission, Historic Richmond, RVA Archaeology and others to add to the existing Richmond Slave Trail walking tour and interpretative signage on the history of this area inclusive of historic overlay maps to recreate the antebellum landscape.
To accompany the walking tour listed above, creation of a mobile application with map overlays to allow the visitor to experience the landscape in a digital medium.
Creation of additional interpretive signage on the history of this area.
Area Planning Initiatives
Work with the City on a continued holistic preservation and interpretive plan for the Shockoe Bottom area.

3.2 REFINED OPERATIONS ANALYSIS MODELING

DRPT conducted computer-based operations simulations (also known as operations modeling) to estimate rail performance in the corridor in order to estimate if Build Alternatives defined in the Draft EIS might be anticipated to provide the infrastructure capacity and service performance necessary to meet the Purpose and Need of the DC2RVA Project. This work was conducted using Rail Traffic Controller (RTC) simulation software.

This section summarizes the results of that analysis, both within the DC2RVA corridor as well as in the larger CSX Transportation (CSXT) network, to inform the selection of a Preferred Alternative. It builds on previous operations simulation modeling conducted during preparation of the Draft EIS and incorporates subsequent revisions to the infrastructure and operating plans that were developed to improve operational consistency and reduce delays associated with schedule conflicts within the DC2RVA corridor.

Full details of the refined operations analysis modeling are provided in the technical memos in Appendix F of this Final EIS; description of how the refined operations analysis modeling led to the selection of a Preferred Alternative is provided in the DC2RVA Recommendation Report, which is Appendix I of this Final EIS.

3.2.1 Overview of Preliminary Operations Modeling Conducted in the Draft EIS

During the preparation of the Draft EIS, DRPT conducted several preliminary operations simulations that evaluated multiple infrastructure alternatives, including alternatives with two tracks and three tracks, potential two track bypasses in Fredericksburg and Ashland, and alternate routes through Richmond. DRPT evaluated these preliminary operations simulations against the Project's Purpose and Need to: accommodate 9 new daily intercity passenger round trips (18 total trains per day); accommodate projected CSXT freight growth; accommodate planned and funded Virginia Railway Express (VRE) commuter rail growth; and meet the federal passenger and freight train on-time performance targets through 2045 as set forth in the Passenger Rail Investment and Improvement Act (PRIIA).[98]

The train performance estimates derived by DRPT from this preliminary comparison of alternatives suggested that either a third main track through Fredericksburg and/or Ashland or a two-track bypass around Fredericksburg and/or Ashland would provide the highest likelihood that trains throughout the Project corridor would meet their performance goals under the service level and schedule projected. The train performance estimates also informed the selection of the Richmond-area Build Alternative 6F, Staples Mill Road Station and Main Street Station (Full Service) as the Recommended Preferred Alternative for the Draft EIS, which by having both a downtown station and a suburban station was determined to best meet the Purpose and Need. These preliminary modeling results are presented in Chapter 2.6 of the Draft EIS and its Appendix I.

3.2.2 Refined Operations Analysis Modeling Methodology

After submission of the Draft EIS, DRPT followed its preliminary operations simulation efforts with two phases of refined operations analysis modeling to help inform the selection of a Preferred Alternative for the entire corridor, each of which are summarized below.

3.2.2.1 Two Phases of Refined Operations Modeling

The two phases of refined operations modeling encompassed the following work:

Phase 1: Refined Operations Analysis. The purpose of the refined operations analysis was to improve the performance results of all trains operating on the corridor by applying modifications to the proposed infrastructure and operating plan based on assessments of the preliminary operations modeling assumptions and results from the Tier II Draft EIS. The levels of service for all trains were not changed from the preliminary analysis, which are summarized in Section 4.2.2 of this Final EIS. The refined operations analysis simulations had the following objectives and characteristics:

- Measure passenger and freight train performance focused on performance within the DC2RVA corridor, and not include analysis of contiguous sections of shared-use track north and south of the corridor.
- Review and revise the configuration of the proposed infrastructure to improve operational consistency and performance along the corridor, including
  - Changes to the Project's proposed track infrastructure, in particular reconfigured crossovers, sidings, and station platforms, including:
    - Changes to interlocking configurations to provide full universal access to all tracks at certain locations.
    - Infrastructure changes and additional infrastructure to allow for the staging of full-length freight trains at various locations in the corridor.
- Review and revise the operating characteristics and assumptions applied to the model to reduce delays associated with schedule conflicts:
  - Incorporation of a platform assignment plan for intercity passenger and commuter trains operating within the corridor. The platform priority assignment was applied to all intercity passenger and commuter trains along the DC2RVA corridor from Washington, D.C. to Centralia, VA to represent a "typical" operating condition with minimal passenger-commuter train interference; however, the operations analysis allowed intercity passenger trains in certain sections of the corridor to use another track or serve a different station platform if required due to capacity constraints or interference with commuter trains.
  - Revision of intercity passenger train schedules between Washington and Richmond, where feasible, to capture changes in passenger train running times and recovery times made to enable trains to achieve PRIIA-mandated (see Section 3.2.1) and Project-specific on-time performance goals in normal real-world operation under the revised corridor infrastructure and platform assignment plan described above.

Phase 2: Network-Wide Analysis. The work in this phase consisted of running operations simulations to estimate potential effects to passenger, freight, and commuter train performance within a larger territory of the CSXT and connecting Buckingham Branch (BBRR) networks in the Mid-Atlantic and Northeastern United States, to estimate the potential effects of the Project on rail operations in territory adjacent to the DC2RVA corridor. The Network-Wide Analysis simulations had the following characteristics:

- The revised infrastructure, operating, and train schedule modifications made for the Phase 1 modeling were applied in the Phase 2 modeling.

- Passenger and freight train performance were measured across a larger portion of the shared-use rail network, which included contiguous sections of the CSXT and BBRR networks in the Mid-Atlantic and Northeastern United States programmed into the simulation software that constituted the DC2RVA Modeling Limits.
  - Performance was measured on a shared-use network of track from Philadelphia, PA, and Cumberland, MD, to Newport News, VA, and Rocky Mount, NC.
- Additional freight train performance outputs were generated.

3.2.2.2 Modeling Scenarios for Phases 1 and 2

The modeling scenarios simulated by DRPT were identical for Phases 1 and 2 and consisted of the following four Build cases and one No Build case.

- **2045 No Build.** This case measured performance on the DC2RVA corridor with the No Build infrastructure and no-build train operations (without adding 18 new intercity passenger trains) identified in the DC2RVA Draft EIS, including freight traffic levels forecasted for the year 2045. This case did not include maintenance-of-way outages.
- **2045 Build.** This Build case measured performance on the DC2RVA corridor with infrastructure that reflects the Preferred Alternative for the DC2RVA corridor, with a test of the three-track alternatives in Area 5 (i.e., Build Alternatives 5B and 5D-Ashcake as analyzed in the Draft EIS) through Ashland. This case included 9 new daily intercity passenger round trips (18 total trains per day) in addition to the No Build train operations. This case did not include maintenance-of-way outages.
- **2045 Build, 2 Tracks Ashland.** This Build case measured performance on the DC2RVA corridor with infrastructure that reflects the Preferred Alternative for the DC2RVA corridor, with a test of the two-track alternative in Area 5 (i.e., Build Alternative 5A, also known as “3-2-3,” as analyzed in the Draft EIS) through the Town of Ashland. This case included 9 new daily intercity passenger round trips (18 total trains per day) in addition to the No Build train operations. This case did not include maintenance-of-way outages.
- **2045 Build, 2 Tracks Ashland + Track Out of Service North (Maintenance-Of-Way Outage).** This Build case measured performance on the DC2RVA corridor with infrastructure that reflects the Preferred Alternative for the DC2RVA corridor, with a test of the two-track alternative in Area 5 (i.e., Build Alternative 5A, also known as “3-2-3,” as analyzed in the Draft EIS). This case included a randomly selected segment of approximately 10 miles in length between Alexandria and Crossroads that would be taken out of service in order to test the response of the network to a daytime maintenance-of-way (i.e., rail upkeep and repair) outage. This case included 18 new daily intercity passenger trains (9 round-trip) in addition to the No Build train operations. For comparison to the other four scenarios listed, this is the only scenario that included maintenance-of-way outages.
- **2045 Build, 2 Tracks South of Crossroads.** This Build case measured performance on the DC2RVA corridor with infrastructure that reflects a modification to the Preferred Alternative with three main tracks from Alexandria to Crossroads and reduced to two main tracks from Crossroads to Richmond Staples Mill Road. This case included 18 new daily intercity passenger trains (9 round-trip) in addition to the No Build train operations. This case did not include maintenance-of-way outages.

In all cases described above, the infrastructure alternatives were tested for proposed operations in the year 2045, which represents the concluding year of a 20-year horizon for the Project, based on the Project's proposed implementation year of 2025 (refer to Section 1.3.6 for details on Project planning dates). Refer to Appendix F of this Final EIS for full details on modeling scenarios.

3.2.3 Refined Operations Modeling Results

The performance estimates generated during the refined operations analysis simulations were benchmarked against performance goals for freight and passenger trains that were established by DRPT for the DC2RVA Project and by FRA under PRIIA.

In the corridor-wide modeling simulation testing the Preferred Alternative for the full length of the DC2RVA corridor with three main tracks from Alexandria to Richmond Staples Mill Road except for a constrained two-track alignment in Area 5 through Ashland (i.e., Alternative 5A, also known as "3-2-3") without maintenance-of-way outages ("2045 Build, 2 Tracks Ashland"), passenger trains exceeded the Project's endpoint station and all-stations performance goal of 90 percent on-time performance. Comparative to the No Build 2045 freight operating condition without maintenance-of-way outages ("2045 No Build"), the estimated cumulative freight train performance with two tracks through Ashland (measured in delay minutes per 100 train-miles) had a reduction of 2.4 minutes.

In the network-wide modeling case testing the Preferred Alternative for the full length of the DC2RVA corridor with three main tracks from Alexandria to Richmond Staples Mill Road except for a constrained two-track alignment in Area 5 through Ashland (i.e., Alternative 5A, also known as "3-2-3") without maintenance-of-way outages ("2045 Build, 2 Tracks Ashland"), passenger exceeded the Project's endpoint station performance goal of 90 percent on-time performance. The network-wide simulation estimated that two tracks through Ashland could increase freight delay per 100 train-miles by 0.5 minutes from the No Build 2045 freight operating condition without maintenance-of-way outages.

Based on the refined operations analysis, DRPT and FRA have determined that the Build Case with two tracks through Ashland under 2045 freight traffic, and with 9 new daily intercity passenger round trips (18 total trains per day) from the DC2RVA Project ("2045 Build, 2 Tracks Ashland" without maintenance-of-way outages), provides the infrastructure required to meet the Purpose and Need of the Project while not unduly impacting CSXT's forecasted future freight operations in the No Build case ("2045 No Build" without maintenance-of-way outages).

Passenger Service Operating in the DC2RVA Corridor

3.3 TOWN OF ASHLAND/HANOVER COUNTY COMMUNITY ADVISORY COMMITTEE RECOMMENDATIONS

The purpose of this section is to report the recommendations of the Town of Ashland/Hanover County Community Advisory Committee (CAC) that supported the selection of the Preferred Alternative. The Preferred Alternative is presented separately in Chapter 4 of this Final EIS. For summary of the CAC and its activities, refer to Section 2.1.4.3 of this Final EIS. Additionally, Appendix G of this Final EIS provides full detail of CAC purpose and approach, members, meeting dates, and review of alternatives that were considered by the CAC.

Shortly before the publication of the Draft EIS, DRPT established the CAC to advise and inform DRPT on DC2RVA alternatives and issues in the Ashland/Hanover County area. Over the course of five months, the CAC reviewed and fully evaluated over 30 different alternatives for the Town of Ashland/Hanover County area, including alternatives suggested by the public and alternatives developed by the CAC, in addition to alternatives and options that were considered in the Draft EIS (refer to Appendix G). During this time, DRPT continued to refine the operations analysis modeling of alternatives (as described in Section 3.2 above), and a qualitative presentation of draft preliminary passenger train performance estimates from the corridor-only simulations was made to the CAC. The CAC determined that many of the alternatives were not practical and also recognized that all of the alternatives would have substantial adverse impacts to residents, commercial interests, and communities, and would be objectionable to one or more groups of stakeholders.

Passenger Service through Downtown Ashland, Virginia (Area 5)

After careful and deliberate consideration of the options for increased rail capacity in the Ashland/Hanover area, the CAC chose not to endorse any specific alternative and instead provided recommendations for three "least objectionable" alternatives:

- **Modified Alternative 5A.** The "3-2-3" option (i.e., maintaining two tracks through Town) was determined by the CAC to be the least objectionable option for adding rail capacity through the Town of Ashland at-grade. In this option, a third track would be added to the existing CSXT right-of-way north and south of the Town of Ashland, while the existing two tracks would remain in service through Ashland. If necessary to meet passenger and performance goals, the downtown Ashland station could be closed, based on analysis at the time of that decision. Road overpasses would be added at Vaughan Road and Ashcake Road. The crossing at England Street would remain at-grade. *[This option is similar to Build Alternative 5A that was evaluated in the Draft EIS, with further minimization of infrastructure and associated potential impacts within downtown Ashland.]*
- **Three-Track Trench.** A three-track trench through the Town of Ashland was determined by the CAC to be the least objectionable option for adding capacity below-grade. A trench would be constructed through Ashland approximately 50 feet wide and 33 feet deep, extending from north of Vaughan Road to south of Ashcake Road. The two existing tracks through the Town of Ashland, along with a third new track, would pass through Ashland within the trench. The trench would be provided with strategically placed covers interspersed with open areas, allowing for motor vehicle and pedestrian crossings, landscaping, and other amenities. Details associated with the placement and length of covered spaces would be determined in final design. The downtown Ashland station would be closed. *[This below-grade option followed a through-town alignment similar to Build Alternatives 5B or 5D as evaluated in the Draft EIS, but was considered and dismissed in the Draft EIS alternatives development process.]*
- **Modified Alternative 5C and 5C-Ashcake.** The western bypass closest to the Town of Ashland, identified as AWB 1 in the Draft EIS alternatives development process, was determined by the CAC to be the least objectionable option for adding rail capacity outside the Town of Ashland—with the provision that the alignment would be adjusted to avoid directly impacting a children's daycare facility on State Route 54, and to minimize impacts to residential properties. In this option, a two-track bypass approximately seven miles long would extend around the Town of Ashland to the west, along the town/county border. Roads bisecting the new bypass alignment would be re-routed or grade-separated to avoid creating any new at-grade road/rail crossings. The Ashland station could remain in service. *[This bypass alignment is reflective of Build Alternative 5C as evaluated in the Draft EIS, but with a modified alignment. The AWB1 alignment was considered and dismissed in the Draft EIS alternatives development process.]*

The CAC also recognized that regardless of the alternative ultimately recommended, mitigation for the adverse impacts would need to be considered, and the CAC members committed to working with DRPT and other stakeholders on the mitigation.

Refer to Section 3.4 below for summary of selection of the Preferred Alternative by the Commonwealth.

3.4 COMMONWEALTH TRANSPORTATION BOARD RESOLUTION

The Commonwealth Transportation Board (CTB) passed a resolution for the recommendation of a Preferred Alternative for the DC2RVA Tier II EIS on December 6, 2017, referred to as the Commonwealth's Recommended Preferred Alternative, as presented in Table 3.4-1 below. The resolution is included in this Final EIS as Appendix H. The CTB issued the resolution following review of the Draft EIS and agency, stakeholder, and public comments on the Draft EIS received during the public comment period, plus ongoing coordination with DRPT and other stakeholders and the public (refer to Section 2.3 of this Final EIS for details). The CTB resolution aligned with DRPT's Recommended Preferred Alternative as presented in the Draft EIS. Additionally, the CTB resolution aligned with the CAC Recommendation (as described in previous Section 3.3): Alternative 5A meets the Purpose and Need for the DC2RVA Project with the least amount of impacts in the Ashland/Hanover area, and would have no Section 106 or Section 4(f) impacts (where all other alternatives considered or developed by the CAC included at least some impacts to cultural or historic resources). Per Section 4(f) of the U.S. DOT Act of 1966, unless the use of such a property is determined to have a *de minimis* impact, FRA must determine that no feasible and prudent avoidance alternative exists before approving the use of such land (see Chapter 6 of this Final EIS for further details).

Table 3.4-1: CTB Recommended Preferred Alternative

Alternative Area 1: Arlington (Long Bridge Approach) *	
1A	Add Two Main Tracks on the East
1B*	Add Two Main Tracks on the West
1C	Add One Main Track East and One Main Track West
Alternative Area 2: Northern Virginia	
2A	Add a Third or Fourth Main Track
Alternative Area 3: Fredericksburg	
3B	Add a Third Main Track Through City
Alternative Area 4: Central Virginia	
4A	Add a Third Main Track
Alternative Area 5: Ashland	
5A	Maintain Two Tracks Through Town (No Station Improvements), Add a Third Main Track North and South of Town
Alternative Area 6: Richmond	
6F	Staples Mill Road Station and Main Street Station Full Service with S-Line Improvements

* The CTB recommended selection of the Preferred Alternative to be based on compatibility with the Long Bridge EIS alternatives. Subsequent to the CTB resolution, FRA selected Alternative 1B as the Preferred Alternative, to align with the Long Bridge alternatives – refer to Section 4.1 of this Final EIS for details.

Further, the CTB resolved the following directives to DRPT in regard to future rail improvements in Alternative Area 5:

- If DRPT determines that additional rail capacity is needed in Alternative Area 5 to meet the performance standards required for additional passenger trains, DRPT shall conduct a new study based on updated information.
- DRPT shall avoid and/or minimize any permanent property acquisitions, to the extent practicable, in areas where only two mainline tracks on the current alignment are recommended, and to avoid any permanent property acquisitions related to the DC2RVA Project that would affect the operations of Randolph-Macon College.
- DRPT shall explore the need for other potential improvements in downtown Ashland (Alternative Area 5) that will help protect the safety of motorized and non-motorized roadway users, and to facilitate emergency access, separate from the DC2RVA Project.

3.5 DC2RVA RECOMMENDATION REPORT

DRPT prepared a Recommendation Report to present the Commonwealth's Recommended Preferred Alternative for the Project to FRA for inclusion in this Final EIS. The Recommendation Report is Appendix I of this Final EIS and includes an acceptance letter of the report from FRA. The purpose of the report was to summarize the Commonwealth's Recommended Preferred Alternative and rationale leading to the selection of the Preferred Alternative for each area. The Recommendation Report includes a summary of comments received on the Draft EIS, other public involvement, and additional refined operations analysis modeling that provided input into the selection process. The content of the Recommendation Report is presented in Chapter 4 (Selection of the Preferred Alternative) of this Final ES.

CHAPTER 6

FINAL SECTION 4(f) EVALUATION

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

6 FINAL SECTION 4(f) EVALUATION

6.1 INTRODUCTION

This Final Section 4(f) Evaluation follows the procedures for implementing Section 4(f) as outlined in 23 CFR 774 (March 12, 2008), which apply to the Federal Highway Administration (FHWA) and Federal Transit Administration (FTA). Although the Federal Railroad Administration (FRA) is not directly subject to this rule, FRA has determined that these procedures are appropriate for use for the proposed rail infrastructure improvements collectively known as the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project.[1]

The Draft Section 4(f) Evaluation was included as Chapter 5 of the Draft EIS[2] and analyzed the potential impacts of the 23 Build Alternatives that were evaluated in that document. This Final Section 4(f) Evaluation considers the Preferred Alternative for the DC2RVA Project, which includes design modifications, additional data collected on cultural resources, and updates to parkland resources subsequent to the publication of the Draft EIS and its Draft Section 4(f) Evaluation. Refer to Chapter 4 of this Final EIS for details on the Preferred Alternative; additional data and updates to parkland resources since the Draft EIS are detailed within this chapter.

This Final Section 4(f) Evaluation presents the following:

- Summary of types of Section 4(f) properties, uses, and methodology (see Section 6.2)
- Description of the Project and its Preferred Alternative (see Section 6.3)
- Description of Section 4(f) properties that are within the Project limits (see Section 6.4)
- Determination of Section 4(f) property uses (see Section 6.5)
- Description of avoidance alternatives (see Section 6.6)
- Description of measures to minimize harm (see Section 6.7)
- Section 4(f) coordination and correspondence (see Section 6.8)

Maps of Section 4(f) resources are provided in this chapter for the properties that were determined to have a Section 4(f) use; refer to Section 6.5.

---

[1] On November 28, 2018, a final rule went into effect that revised 23 CFR Parts 771 and 774 to include FRA under those regulations. However, that rule only applies to projects initiated after November 28, 2018; therefore, for the DC2RVA Project, FRA will continue to follow 23 CFRA Part 774 as guidance.

[2] The Draft EIS included the Draft Section 4(f) Evaluation for the DC2RVA Project and was published on September 8, 2017. It is available on the Project website: http://dc2rvarail.com/draft/

6.2 SECTION 4(f) TERMINOLOGY AND METHODOLOGY

6.2.1 Types of Section 4(f) Properties

Section 4(f) of the U.S. Department of Transportation (U.S. DOT) Act of 1966[3] provides for consideration of park and recreation lands, wildlife or waterfowl refuges, and historic sites during development of transportation projects. Specifically, Section 4(f) applies to the following types of properties:

- Publicly-owned parks, recreation areas, and wildlife or waterfowl refuges, including those that are part of a publicly-published plan but that may not yet be built
- Historic sites[4], i.e., public or private buildings, districts, objects, structures, or sites listed in or eligible for listing in the National Register of Historic Places (NRHP)

Privately-owned parks or recreation areas that are not open to the general public are not considered Section 4(f) resources for this Project.

6.2.2 Types of Section 4(f) Uses

Section 4(f) applies to protected resources when a "use" occurs as a result of the proposed action. There are three different types of potential Section 4(f) uses and one additional determination that may be made for each Section 4(f) property, as described below. Any "use" is an impact for the purposes of the DC2RVA Project, as described in Section 6.2.4.

Permanent Incorporation. A permanent incorporation occurs if a Section 4(f) property or portion of a Section 4(f) property is permanently acquired (as fee simple or permanent easement right-of-way) such that the use of the acquired Section 4(f) property is incorporated in the transportation facility, thereby changing its use from a Section 4(f) property to "transportation use."

Temporary Occupancy. A temporary occupancy occurs when the Section 4(f) property or a portion of the Section 4(f) property is impacted or used only during a portion of the construction of the project such that the Section 4(f) property is not permanently incorporated into the transportation facility. A temporary occupancy is considered a Section 4(f) use if it is considered adverse in terms of the statute's preservation purpose. A temporary occupancy is not considered a Section 4(f) use if the following conditions are met:

- The land use is of short duration (defined as less than the time needed for construction)
- There is no change in ownership of the land
- The scope of the work must be minor
- There are no temporary or permanent adverse changes to the activities, features, or attributes of the property
- The land must be fully restored to a condition at least as good as prior to a project (i.e., regrading or revegetating the area)
- There must be documented agreement from the official(s) with jurisdiction over the property with the above conditions

---

[3] 23 United States Code (U.S.C.) 138

[4] Note that this term parallels the term "historic property" used during the Section 106 evaluations, which is a separate process from Section 4(f). Refer to Section 6.2.3 for details.

Constructive Use. A constructive use occurs when there is an indirect impact to the Section 4(f) property of such magnitude as to effectively act as a permanent incorporation. In the case of a constructive use, while the proposed action does not physically incorporate the resource, it is determined to be close enough to severely impact important features, activities, or attributes associated with the Section 4(f) property to substantially impair it. Constructive use is generally rare; examples of impacts that may be considered constructive use include noise, vibration, air quality, and visual impacts. Note that FRA has determined that there are no constructive uses associated with the Final Section 4(f) Evaluation for the DC2RVA Project.

***De Minimis* Determination**. FRA may make a *de minimis* determination (or finding) if a use of a Section 4(f) property is generally minor enough in nature as to not elevate to one of the three primary uses as described above. A *de minimis* impact is one that, after taking into account avoidance, minimization, mitigation, and enhancement measures, results in no adverse effect to the activities, features, or attributes qualifying a resource for protection under Section 4(f).

A determination of *de minimis* impact for public parks, recreation areas, and wildlife or waterfowl refuges may be made when all three of the following criteria are met:

- The transportation use of the Section 4(f) resource, together with any impact avoidance, minimization, and mitigation or enhancement measures incorporated into a project, does not adversely affect the activities, features, and attributes that qualify the resource for protection under Section 4(f);
- The public has been afforded an opportunity to review and comment on the effects of a project on the protected activities, features, and attributes of the Section 4(f) resource; and
- The official(s) with jurisdiction over the property is informed of U.S. DOT's intent to make the *de minimis* impact finding based on their written concurrence that a project will not adversely affect the activities, features, and attributes that qualify the property for protection under Section 4(f).

A determination of *de minimis* impact for a historic site may be made when all three of the following criteria are met:

- The process required by Section 106 of the National Historic Preservation Act (NHPA) results in the determination of "no adverse effect" or "no historic properties affected" with the concurrence of the State Historic Preservation Officer (SHPO) and/or Tribal Historic Preservation Officer (THPO), and Advisory Council on Historic Preservation (ACHP), if the ACHP is participating in the Section 106 consultation;
- The SHPO and/or THPO, and ACHP, if the ACHP is participating in the Section 106 consultation, is informed of U.S. DOT's intent to make a *de minimis* impact determination based on their written concurrence in the Section 106 determination; and
- U.S. DOT has considered the views of any consulting parties participating in the Section 106 consultation.

6.2.3 Relationship Between Section 4(f) and Section 106

Section 106 of the NHPA and Section 4(f) are separate laws that both mandate consideration of historic properties in planning a federal undertaking. Section 4(f), which applies only to the U. S. Department of Transportation, stipulates that in order for a historic site to be granted protection, it must be considered significant, and the Section 106 process is the method by which a historic site's significance is determined. The Section 106 process, which is conducted separately from and prior to Section 4(f) evaluations, informs the Section 4(f) determinations, by indicating which historic sites are relevant for Section 4(f) consideration. Further, while the Section 106 process is integral to the Section 4(f) process when historic sites are involved, the Section 4(f) process is not integral to the Section 106 process (i.e., the Section 4(f) uses do not inform the separate Section 106 process).

An important terminology difference between the two is that Section 106 considers "effects" to historic properties, whereas Section 4(f) considers whether there is a "use" of Section 4(f) properties. Any historic property that is considered during the Section 106 process is considered during Section 4(f). The Section 106 effect determinations[5] listed in this chapter are presented for informational purposes only with regard to Section 4(f) and were determined separately from the Section 4(f) process. This Final Section 4(f) Evaluation, therefore, indicates the Section 106 historic property effect and then separately determines the appropriate use under Section 4(f).

6.2.4 How Section 4(f) Properties and Uses were Determined for this Project

Parks, Recreation Areas, and Wildlife/Waterfowl Refuges. For public parks, recreation areas, and wildlife or waterfowl refuges, the resource boundaries were compared with the Project's permanent and temporary limits of disturbance (LOD),[6] which are defined as the boundary within which all construction, materials storage, grading, landscaping, and related activities will occur.

- A Section 4(f) use of "permanent incorporation" was identified where resource boundaries overlapped the permanent LOD, which are areas where infrastructure associated with the Preferred Alternative will physically replace existing conditions. A *de minimis* determination was made for Section 4(f) use when the *de minimis* criteria discussed in Section 6.2.2 were met.
- A Section 4(f) "temporary occupancy" was identified where resource boundaries overlapped the temporary LOD, which are areas required for construction of the Preferred Alternative, such as for staging and storage of equipment. As stated in Section 6.2.2, temporary occupancies may or may not result in a Section 4(f) use depending on whether the occupancy is adverse in terms of the statute's preservation purpose. For each resource, the conditions discussed in Section 6.2.2 were considered to determine if the temporary occupancy results in a Section 4(f) use.
- A Section 4(f) "constructive use" determination would be made through considering the level of magnitude of indirect impacts on the Section 4(f) resources; however, no constructive uses were identified for the DC2RVA Project.

---

[5] Refer to Section 5.13 of this Final EIS for details on the Section 106 process and effect determinations.

[6] The environmental consequences for the DC2RVA Project, which are presented in Chapter 5 of this Final EIS and document the potential effects on the human, physical, and natural environments that may result from the construction and operation of the Preferred Alternative, are also based on the permanent and temporary LOD. Detailed mapbooks of the Preferred Alternative that show the locations of the permanent and temporary LOD throughout the 123-mile Project corridor are provided in Appendix L of this Final EIS. In general, permanent LOD are 0 to 40 feet outside of existing railroad right-of-way with a maximum offset of 650 feet for station improvements. Temporary LOD are generally 10 to 15 feet outside of permanent LOD with a maximum offset of 50 feet.

Historic Properties. The historic property limits presented herein and used to determine effects of the DC2RVA Project are those on record at the Virginia Department of Historic Resources (DHR, the Virginia SHPO) for the identified historic resources as of November 20, 2018. As described in Section 6.2.3 above, any historic property that is considered during the separate Section 106 process is also considered under Section 4(f); the Virginia Department of Rail and Public Transportation (DRPT) identified 120 historic properties within the Project Area of Potential Effect (APE).[7]

During the Section 4(f) evaluation of historic properties, DRPT examined all 120 resources to evaluate use.

- For above-ground resources (buildings, districts, objects, and structures):
    - There is a Section 4(f) use (permanent incorporation) on a historic property when the undertaking would physically encroach on the NRHP-eligible boundaries of a historic property and/or the Project would permanently alter the integrity and function of the resource, resulting in an adverse effect determination under Section 106.
    - There is a Section 4(f) *de minimis* use if the NRHP-eligible boundaries are within the Project encroachment area, but the undertaking will not alter the integrity and function of a resource, resulting in either a no adverse effect or no effect determination under Section 106.
    - There is no Section 4(f) use if there is no encroachment and there are no impacts to a historic property.
- For archaeological sites, determination of use depends on whether the resource meets one or more NRHP eligibility criterion:[8]
    - There is no use regardless of encroachment if the site is chiefly important for the data that can be obtained from archaeological excavation and preservation in place is not warranted (e.g., if a site is only eligible for the NRHP under Criterion D).
    - If an archaeological site is eligible under Criterion D as well as any other criterion/criteria consideration and preservation in place is required to maintain eligibility, then the definitions of Section 4(f) use and no use as stated for above-ground resources apply.

6.2.5 Section 4(f) Avoidance and Minimization Measures

Projects funded by the U.S. DOT must comply with Section 4(f), which includes mandatory requirements for avoidance alternatives, minimization measures, and possible mitigation of any use of Section 4(f) resources. Specifically, under Section 4(f) of the U.S. DOT Act of 1966 (49 U.S.C. 303(c)), as amended by Section 6009 of the Safe, Accountable, Flexible, Efficient, Transportation Equity Act: a Legacy for Users (SAFETEA-LU), FRA may approve a transportation project requiring the use of a publicly owned park, recreation area, wildlife and waterfowl refuge, or a historic site only if:

---

[7] The APE is defined before the identification of any historic properties and includes areas where the Project would impact character-defining features of a resource, directly or indirectly. Whereas the Project Limits of Disturbance are the physical boundary of Project-related construction and construction-related activities, the APE considers all locations where the Project may result in ground disturbances, visible or audible disturbances, or changes in public access, traffic patterns, or land use. As such, the APE comprises the LOD for archaeological resources due to the potential for subsurface impacts but is larger for aboveground resources to account for indirect effects.

[8] NRHP eligibility criterion are discussed in Section 5.13 of this Final EIS and its Appendix D6, and are available at: https://www.nps.gov/nr/publications/bulletins/nrb15/nrb15_2.htm

(1) there is no prudent and feasible alternative to using that land; and

(2) the project includes all possible planning to minimize harm to the Section 4(f) resource resulting from the use, unless the criteria for *de minimis* Section 4(f) involvement can be met (refer to Section 6.2.2 above for descriptions of use and *de minimis* determination).

Accordingly, as part of this Final Section 4(f) evaluation, FRA considered all feasible and prudent alternatives to avoid the Section 4(f) resources (refer to Section 6.6) and ensured the proposed Project included all possible planning to minimize harm (refer to Section 6.7).

6.3 DESCRIPTION OF THE PROPOSED ACTION

FRA and DRPT propose increased passenger rail service and rail infrastructure improvements between Washington, D.C. and Richmond, VA, as further described below.

6.3.1 Project Background and Approach

The DC2RVA Project is the second level of a two-tiered environmental process. In October 2002, FRA and the Federal Highway Administration (FHWA), in coordination with DRPT and the North Carolina Department of Transportation, completed a first-level Tier I EIS and Record of Decision (ROD) for the Southeast High Speed Rail (SEHSR) corridor between Washington, D.C. and Charlotte, NC (hereinafter referred to as the 2002 Tier I EIS).[9]

The 2002 Tier I EIS defined the physical limits for passenger rail improvements in the 500-mile corridor between the endpoint cities, from which subsequent Tier II studies (e.g., this DC2RVA Project) would define the actual alignment and specific infrastructure improvements and service plan for an independent section within the larger corridor. This DC2RVA Project Tier II EIS is focused on the northernmost portion of the larger SEHSR corridor from the 2002 Tier I EIS that operates on existing CSX Transportation (CSXT) right-of-way and in which existing freight, conventional passenger rail, and commuter trains operate. Specifically, this is the 123-mile portion of the route between Washington D.C. (with analysis starting on the south bank of the Potomac River) and Richmond, VA (with analysis continuing to Centralia, VA). In the 2002 Tier I EIS, FRA and FHWA made programmatic-level environmental decisions that are the basis of this Project.

The 2002 Tier I EIS identified an incremental approach to develop the rail corridor with upgraded intercity passenger rail service between Washington, D.C. and Charlotte, NC, including using locomotives using existing fossil fuel technology, upgrading existing rail corridors instead of developing new corridors, and building the corridor in incremental sections as funds became available. The incremental approach selected in Tier I sought to minimize cost and potential impacts to the environment by utilizing existing railroad tracks and rail rights-of-way as much as possible. The 2002 Tier I EIS concluded that additional track would be required along sections of the CSXT rail corridor between Alexandria and Richmond to accommodate the freight and passenger growth needs of all rail users and institute higher speed passenger service; however, the Tier I EIS did not specify the extent of additional track required or the possible higher speed that could be accommodated specifically between Alexandria and Richmond.

---

[9] https://www.fra.dot.gov/Page/P0427

The 2002 Tier I EIS also considered the No Build scenario. FRA and FHWA determined that the No Build did not meet the Purpose and Need of the SEHSR corridor because it would not improve air quality or reduce net energy per passenger mile traveled in the corridor, nor would it offer additional transportation choices, address congestion, or improve overall transportation system safety and effectiveness. Notwithstanding, the No Build was included in the DC2RVA Project Tier II analysis to provide a baseline for quantitative analyses.

6.3.2 Purpose and Need for the Project

The 2002 Tier I EIS established the overall purpose for the 500-mile SEHSR corridor between Washington, D.C. and Charlotte, NC: to provide a competitive transportation choice to travelers within the Washington, D.C. to Richmond, Raleigh, and Charlotte travel corridor. This DC2RVA Tier II EIS carries forward the purpose of the 2002 Tier I EIS within the specific Washington, D.C. to Richmond segment of the larger corridor, and further builds upon it by recognizing and incorporating several key corridor-specific items that are unique to the Project corridor including: establishment of a 90 mph maximum achievable speed for intercity passenger trains; accommodation of Virginia Railway Express (VRE) commuter trains; and accommodation of CSXT's freight service, plus the recognition that the corridor is owned and operated by CSXT.

The DC2RVA Project's stated Purpose is to increase the capacity of the railroad between Washington, D.C. and Richmond to deliver higher speed passenger rail service, while also supporting the planned expansion of VRE commuter rail service and accommodating the forecasted growth of freight rail service by developing an efficient and reliable multimodal rail corridor. The 2002 Tier I EIS for the SEHSR corridor between Washington, D.C. and Charlotte established the needs for the overall SEHSR program, including this Project. The following needs for the SEHSR program were identified in the 2002 Tier I EIS, and remain current for the SEHSR corridor, including the 123-mile DC2RVA Project corridor:

- Population Growth
- Freight Growth
- Congestion in the I-95 Corridor
- Air Travel Congestion
- Rail Capacity in the Corridor
- Reliable and Convenient Movement of People and Goods
- Air Quality
- Safety
- Energy Efficiency

The DC2RVA corridor is a critical link between Amtrak's heavily traveled Northeast Corridor (NEC) and the developing SEHSR corridor extending south of Richmond.

6.3.3 Project Alternatives

Developing Project alternatives was an iterative process. DRPT relied on previous studies, including the 2002 Tier I EIS, and public scoping comments as the starting point for developing potential rail alignments.

In general, the DC2RVA Project proposes to increase capacity by adding one additional main track. The determination of the location of the new track on the east or west of existing trackage varied by location within the corridor based on physical constraints and minimization of impacts. For each alternative, DRPT also evaluated the potential to realign the tracks to improve speeds. The proposed infrastructure sought to avoid or minimize potential adverse effects on environmental resources and existing infrastructure, and to minimize the need for additional new infrastructure, while preserving the ability of that alignment to meet the Project's Purpose and Need. The final screening evaluation—to determine the Build Alternatives to be carried forward in the Draft EIS—focused on each alternative's ability to reduce trip times based on increased track design speed and to increase the reliability of rail operations based upon added capacity, with the least potential environmental impact and consideration of cost to construct.

In the Draft EIS, DRPT evaluated rail alignment Build Alternatives in six areas along the DC2RVA corridor from north to south: each of the six alternative areas contained one or more Build Alternatives that include rail alignment and associated roadway and station work. From a wide range of options that were considered during the alternatives development process, 23 Build Alternatives, which vary within each alternative area, were evaluated in the Draft EIS and included build-alternative-specific improvements to features such as stations and at-grade roadway crossings.

DRPT selected the Preferred Alternative, as evaluated in the Final EIS, as a combination of one Build Alternative from each of the six alternative areas to form a contiguous "best-fit" alternative for the 123-mile Project corridor, as shown in Figure 6.3-1 below. A discussion of the selection process, as well as detailed descriptions of the Preferred Alternative and modifications between the Draft and Final EIS based on agency and public comment, is provided in Chapter 4 of this Final EIS.

A summary of the 23 Build Alternatives which DRPT evaluated in the Draft EIS, as well as an indication of which was selected as the Preferred Alternative in each of the six areas, are presented in Table 6.3-1 below.

The Preferred Alternative meets the Project Purpose and Need and includes the following proposed improvements:

- Construct additional main line tracks and track crossovers.
- Straighten curves in existing tracks to allow for higher speeds up to a maximum authorized passenger train speed for the corridor of 90 mph.
- Improve intercity passenger rail stations and station areas, including new or replacement station, platform, and parking improvements.
- Improve sidings and signals.
- Implement roadway crossing safety improvements to include median treatment, grade separations, and/or closure of existing at-grade crossings of the rail corridor.
- Add 9 new daily intercity passenger round trips (18 total trains per day):
  - Four new daily round trips would provide regional service from Hampton Roads through Richmond to Amtrak's NEC.
  - One new daily round trip would originate at Richmond's Main Street Station.
  - Four new daily round trips would provide interstate service from North Carolina through Virginia, continuing on to Amtrak's NEC.

ALTERNATIVE AREA 1: ARLINGTON (LONG BRIDGE APPROACH)

Alternative 1B

Add Two Main Tracks on the West

Location: CFP 110 – CFP 109.3

Approximate Length: 1 Mile

ALTERNATIVE AREA 2: NORTHERN VIRGINIA

Alternative 2A

Add a Third or Fourth Main Track

Location: CFP 109.3 – CFP 062

Approximate Length: 47 Miles

ALTERNATIVE AREA 3: FREDERICKSBURG

Alternative 3B

Add a Third Main Track Through City, Add a Third Main Track North and South of the City

Location: CFP 062 - CFP 048

Approximate Length: 14 Miles

ALTERNATIVE AREA 4: CENTRAL VIRGINIA

Alternative 4A

Add a Third Main Track

Location: CFP 048 - CFP 019

Approximate Length: 29 Miles

ALTERNATIVE AREA 5: ASHLAND

Alternative 5A

Maintain Two Tracks Through Town (No Station Improvements), Add a Third Main Track North and South of Town

Location: CFP 019 - CFP 009

Approximate Length: 10 Miles

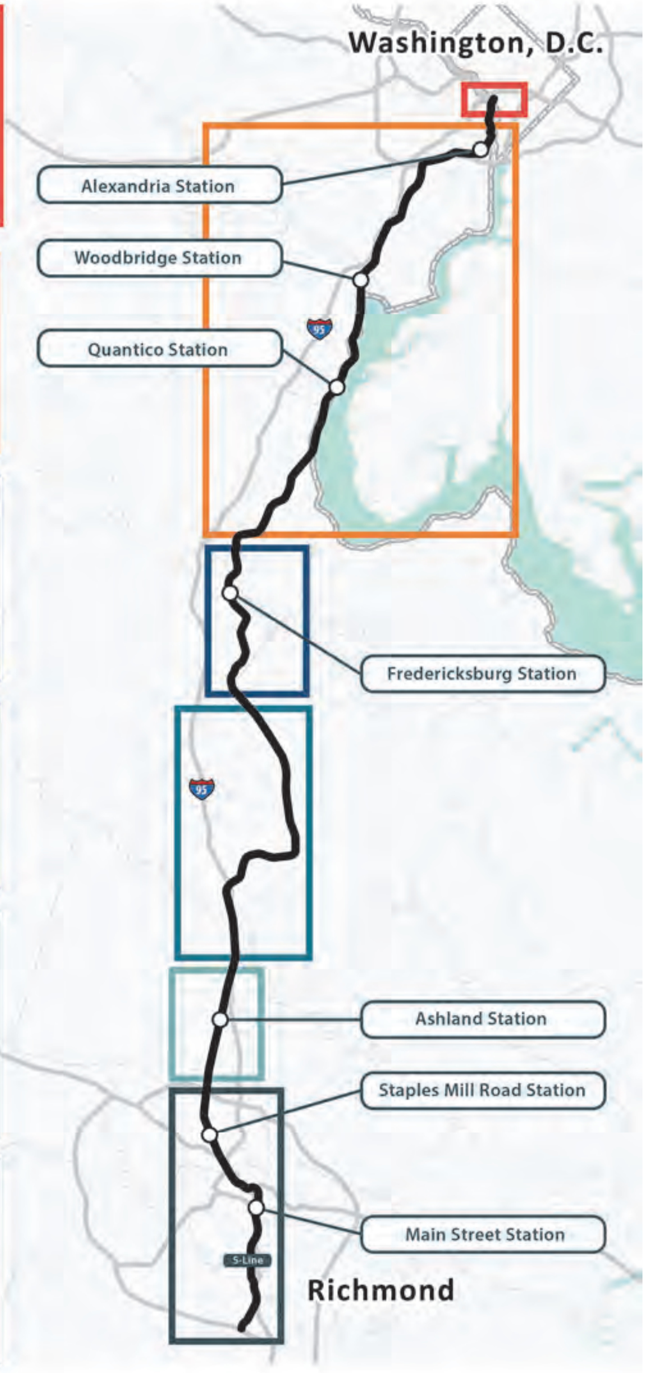
ALTERNATIVE AREA 6: RICHMOND

Alternative 6F

Staples Mill Road Station and Main Street Station Full Service with S-Line Improvements

Location: CFP 009 - A011 Centrailia

Approximate Length: 23 Miles



Washington, D.C.
Alexandria Station
Woodbridge Station
95
Quantico Station
Fredericksburg Station
95
Ashland Station
Staples Mill Road Station
Main Street Station
S-Line
Richmond

Figure 6.3-1: Preferred Alternative for the DC2RVA Project

Table 6.3-1: Summary of Build Alternatives Evaluated in Draft EIS

Draft EIS Alternative		Description
Area 1: Arlington: *Three Build Alternatives were evaluated in Area 1, the major difference being which side of the existing track the new track would be added (as indicated in the Build Alternative names). There are no intercity passenger rail stations in this area.*		
1A	Add Two Tracks on the East	Within the Arlington Bridge approach, two tracks would be added to the east side of the existing tracks.
1B	Add Two Tracks on the West	**Selected as the Preferred Alternative.** This alternative aligns with both alternatives identified in the Alternatives Development Report for the separate Long Bridge Study. Refer to Final EIS Section 4.3.1.
1C	Add One Track East and One Track West	Within the Arlington Bridge approach, one track would be added to the east side of the existing tracks and one track would be added to the west side of the existing tracks.
Area 2: Northern Virginia: *The sole Build Alternative evaluated in Area 2 adds one main track within the existing railroad right-of-way. There are three intercity passenger rail stations in the area: Alexandria, Woodbridge, and Quantico.*		
2A	Add One Track / Improve Existing Track	**Selected as the Preferred Alternative.** This alternative adds a third or fourth main track, mostly within existing right-of-way, through the area. Refer to Final EIS Section 4.3.2.
Area 3: Fredericksburg: *Three Build Alternatives were evaluated in Area 3, including both two- and three-track options on the existing alignment through the city and a two-track bypass alignment around the city. The Fredericksburg Station is within this area.*		
3A	Maintain Two Tracks Through City	Within Fredericksburg, there would be no construction of new track / no additional rail capacity, and train operations would continue through the city similar to existing conditions, with station improvements. North and south of the city, there would be construction of one additional track within the existing railroad right-of-way.
3B	Add One Track Through City East of Existing	**Selected as the Preferred Alternative.** This alternative adds a third main track through the city, and adds a third or fourth main track north and south of the city, mostly within existing right-of-way. Refer to Final EIS Section 4.3.3.
3C	Add Two-Track Bypass East of City	A new two-track bypass east of Fredericksburg would be constructed to serve freight and passenger trains that do not stop in the city, which would require additional right-of-way. The existing rail corridor would be maintained in the city and the station would be improved. North and south of the city, there would be construction of one additional track within the existing railroad right-of-way.
Area 4: Central Virginia: *The sole Build Alternative evaluated in Area 4 adds one main track within existing railroad right-of-way. There are no intercity passenger rail stations in this area.*		
4A	Add One Track/Improve Existing Track	**Selected as the Preferred Alternative.** This alternative adds a third main track, mostly within existing right-of-way. Refer to Final EIS Section 4.3.4.
Area 5: Ashland: *Seven Build Alternatives were evaluated in Area 5, varying from track alignment options through town to a new bypass. The alternatives include two different location options for the Ashland Station: a Downtown Station (which would maintain the existing station location with improvements) and an Ashcake Station location (which would close the existing station location and relocate service to a new station south of Ashcake Road). North and south of the town, all Build Alternatives would include construction of one additional track within the existing railroad right-of-way.*		
5A	Maintain Two Tracks Through Town	**Selected as the Preferred Alternative.** This alternative maintains the existing two-track corridor through downtown, with no improvements to the existing station location, and adds a third main track north and south of town, mostly within existing right-of-way. Refer to Final EIS Section 4.3.5.
5A–Ashcake	Maintain Two Tracks Through Town (Relocate Station to Ashcake)	This alternative is the same as 5A (the Preferred Alternative), but would relocate the station to Ashcake Road.

▶ *Continued.*

Table 6.3-1: Summary of Build Alternatives Evaluated in Draft EIS

Draft EIS Alternative		Description
5B	Add One Track Through Town East of Existing	Within town, one track would be added adjacent to the east side of the existing tracks, which would require additional right-of-way and closure of an existing at-grade crossing within town. The existing station would be improved.
5B–Ashcake	Add One Track Through Town East of Existing (Relocate Station to Ashcake)	This alternative is the same as 5B (as summarized above), but would relocate the station to Ashcake Road.
5C	Add Two-Track Western Bypass	A new two-track bypass west of Ashland would be constructed to serve freight and passenger trains that do not stop in town, which would require additional right-of-way. The existing rail corridor would be maintained in the city and the station would be improved.
5C–Ashcake	Add Two-Track Western Bypass (Relocate Station to Ashcake)	This alternative is the same as 5C (as summarized above), but would relocate the station to Ashcake Road.
5D–Ashcake	Three Tracks Centered Through Town (Add One Track, Relocate Station to Ashcake)	Within town, one track would be added with centering of all three tracks on the existing alignment. This would require additional right-of-way and preclude use of the existing station in town. The station would be relocated to Ashcake Road.
Area 6: Richmond: *Eight Build Alternatives were evaluated in Area 6: five single-station options (which would consolidate all service to a single station location) and three two-station options (which would divide service between two stations). Use of the A-Line or S-Line varied by alternative, based primarily on the ability to serve station locations and optimize passenger and freight routes.*		
6A	Staples Mill Road Station Only	The existing Staples Mill Road Station would be improved to become the single passenger station to serve Richmond, and existing Main Street Station would be closed to service. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6B–A-Line	Boulevard Station Only, A-Line	A new Boulevard Station would be constructed to become the single passenger station to serve Richmond, and existing Staples Mill Road and Main Street Stations would be closed to service. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6B–S-Line	Boulevard Station Only, S-Line	This alternative is similar to 6B–A-Line (as summarized above), but would add one main track on the S-Line (through the city).
6C	Broad Street Station Only	A new Broad Street Station would be constructed to become the single passenger station to serve Richmond, and existing Staples Mill Road and Main Street Stations would be closed to service. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6D	Main Street Station Only	The existing Main Street Station would be improved to become the single passenger station to serve Richmond, and existing Staples Mill Road Station would be closed to service. One main track would be added along the RF&P Line (north of the city) and the S-Line (through the city).
6E	Split Service, Staples Mill Road/Main Street Stations	Both existing Staples Mill Road and Main Street Stations would be improved and remain operational, with the majority of intercity passenger trains stopping only at Staples Mill Road. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6F	Full Service, Staples Mill Road/Main Street Stations	**Selected as the Preferred Alternative.** This alternative improves the S-Line through Richmond and allows for all intercity passenger trains that stop in Richmond to serve both stations. Refer to Final EIS Section 4.3.6.
6G	Shared Service, Staples Mill Road/Main Street Stations	Both existing Staples Mill Road and Main Street Stations would be improved and remain operational, with the majority of intercity passenger trains stopping at both stations, but some trains following the A-Line to bypass downtown Richmond and only serve Staples Mill Road Station. One main track would be added along the RF&P Line (north of the city) and the S-Line (through the city).

6.4 DESCRIPTION OF THE 4(F) RESOURCES

This section describes the following Section 4(f) resources:

- The Section 4(f) parks, recreation areas, and wildlife or waterfowl refuges resources that are within the LOD of the Preferred Alternative are presented in Section 6.4.1 below; note that resources that are near to, but not within, the Project LOD are not presented herein.
- The Section 4(f) historic sites that are within the Project's APE as determined during the Section 106 process are presented in Section 6.4.2.

Maps of the resources and the potential use of these Section 4(f) resources are presented separately in Section 6.5.

6.4.1 Parks and Recreation Areas

There are 12 public parks and recreation areas located within the permanent and/or temporary LOD of the Preferred Alternative; each is described in detail below.

Since the publication of the Draft Section 4(f) Evaluation, the Project LOD was refined as the Preferred Alternative was selected as part of this Final EIS (i.e., the LOD was revised since the publication of the Draft EIS). Accordingly, one park (Maggie Walker Governor's School Fields) is no longer included in this discussion because the revised LOD of the Preferred Alternative avoids the resource. Additionally, three parks and a trail are located within the Preferred Alternative LOD of Area 2 that were not within the LOD at the time of the Draft EIS, as discussed below:

- Potomac Yard Park—Park boundaries were expanded since the Draft Section 4(f) Evaluation and now extend within the temporary LOD of the Preferred Alternative
- Four Mile Run Trail—The revised temporary LOD of the Preferred Alternative now extends into the park boundaries
- Potomac Yard Landbay N—Newly designated parkland is located within the temporary LOD of the Preferred Alternative
- Rail Park—Newly designated parkland is located within the temporary LOD of the Preferred Alternative

Long Bridge Park (Area 1: Arlington). Long Bridge Park is a 29-acre local park constructed in 2011 that is owned and operated by Arlington County. The park is located between Long Bridge Drive and the western edge of the rail alignment and includes additional land east of the rail alignment adjacent to Roaches Run Waterfowl Sanctuary (which the Preferred Alternative does not encroach upon). Long Bridge Park includes multi-sport, lighted athletic fields, as well as walkways, greenspace, and playgrounds. The park facilities are located west of the rail alignment.

Dog Run Park at Carlyle (Area 2: Northern Virginia). This 3-acre facility consists of a fenced dog exercise area and tennis courts. The park is owned by the City of Alexandria.

George Washington Memorial Parkway (Area 2: Northern Virginia). The Parkway encompasses 1,105 acres and is operated by the National Park Service (NPS). The facility is utilized for transportation and recreational driving, but it also includes several walking/biking trails. The Parkway runs parallel to the DC2RVA corridor throughout much of Arlington. Note that while the George Washington Memorial Parkway is also located in Area 1: Arlington, it is not within the LOD in that area.

Mount Vernon Trail (Area 2: Northern Virginia). The Mount Vernon Trail is an 18-mile-long trail that connects Theodore Roosevelt Island Park with George Washington's Estate at Mount Vernon. It is a very popular trail in the Washington, D.C. area with heavy use by bikers and pedestrians. Most of the trail is paved with some portions on boardwalk. This trail also connects with several other local and regional trails, including the Woodrow Wilson Bridge Trail, the Four Mile Run Trail, and the Custis Trail. The trail crosses the DC2RVA corridor near Long Bridge Park. While portions of the trail are located within property owned by the NPS, for purposes of this Section 4(f) evaluation, the trail was treated as a separate resource.

Four Mile Run Trail (Area 2: Northern Virginia). The Four Mile Run Trail, located in Arlington County, traverses the Four Mile Run stream valley. At its eastern end, it connects with the Mount Vernon Trail near Ronald Reagan Washington National Airport. At its westernmost point, it connects with the Bluemont Junction Trail. The trail is 7 miles long and the majority is paved.

Potomac Yard Park (Area 2: Northern Virginia). This 21.6-acre park is owned by the City of Alexandria and includes playground equipment, interactive fountain for water play, and walking/biking trails.

Potomac Yard Park
Alexandria

Potomac Yard Park (Area 2, Northern Virginia)

Potomac Yard Landbay N (Area 2: Northern Virginia). This 5.21-acre parcel is owned by the City of Alexandria and designated as parkland on City of Alexandria parkland maps. It is currently an open space area, and is part of the Potomac Yard Development Plan.

Rail Park (Area 2: Northern Virginia). This 4.17-acre parcel is owned by the City of Alexandria and designated as parkland on City of Alexandria parkland maps. It is currently a vacant area, and is part of the Potomac Yard Development Plan.

Veterans Memorial Park (Area 2: Northern Virginia). This 110-acre park in Prince William County includes a recreation center and several outdoor athletic fields, pavilions, a skate park, horseshoe pits, and walking trails.

Fredericksburg and Spotsylvania National Military Park (Area 3: Fredericksburg and Area 4: Central Virginia). This park is operated by NPS. The park is 8,374 acres total in size and encompasses four major Civil War battlefields, and also preserves four historic buildings associated with them. The Prospect Hill area of the park located in Area 3 is 1,100 acres. The Stonewall Jackson Shrine area located in Area 4 near Guinea, VA is 70 acres.

Laurel Recreation Area (Area 6: Richmond). This 9.6-acre park is owned and operated by Henrico County and includes a picnic shelter, a skate park, and athletic fields.

Walker's Creek Retention Basin Park (Area 6: Richmond). This 6.4-acre park is owned by the City of Richmond Public Works and the City of Richmond, Parks, Recreation and Community Facilities. The park provides access to the walk along the floodwall south of the James River.

6.4.2 Wildlife Refuges/Waterfowl Sanctuary

Only one wildlife refuge, the Mattaponi State Wildlife Management Area, is within the LOD of the Preferred Alternative, and it is located in Area 4: Central Virginia. This wildlife refuge was also identified as a resource in the Draft Section 4(f) Evaluation.

Mattaponi State Wildlife Management Area. This state wildlife management area is 2,652 acres and is owned and operated by the Virginia Department of Game and Inland Fisheries (VDGIF).

6.4.3 Historic Properties

During the separate Section 106 process[10] for the Project, DRPT determined that there are 120 historic properties (buildings, districts, objects, structures, and sites)[11] within the Project APE: 2 resources in Area 1; 11 in Area 2; 23 in Area 3; 14 in Area 4; 18 in Area 5; and 51 in Area 6.

These historic properties are listed in Table 6.4-1 in north-to-south order within the Project corridor and include:

- 13 archaeological sites,
- 96 above ground resources,
- 1 resource with an above ground and below ground component, and
- 10 battlefields.

One property, the historic RF&P Railroad, spans the majority of the Project corridor. The resources are described in full in the associated Project cultural resource reports, which are Appendix R of the Draft EIS and Appendix D of the Final EIS. All 120 Section 106 resources were evaluated for Section 4(f) use, the results of which are presented in Section 6.5.3.

---

[10] Refer to Section 5.13 and Appendix D of this Final EIS for details on the Section 106 process.

[11] For reference, historic resources are listed by DHR identification number throughout the Final EIS documentation.

Table 6.4-1: Summary of Section 106 Historic Properties

Site Name (DHR ID)	
Archaeological Sites	
Civil War Campsite (44ST1223)	Main Street Station Parking Lot/Railroad (44HE1098)
Bridge/Marye's Mill (44SP0187)	Lumpkins Jail/Devil's Half Acre Site (44HE1053)
Block 49 (44SP0688)	Railroad, Warehouse (44HE1097)
Block 48 (44SP0687)	Warehouse (44HE1094)
Fredericksburg Gun Manufactory (111-0145)	Falling Creek Ironworks Archaeological Site (020-0063)
Earthwork/Jackson's Earthwork (44SP0468)	Fort Darling Earthworks/Centralia Earthworks (44CF0680)
Grave Yard for Free People of Color and Slaves (44HE1203)	
Multicomponent (both archaeological sites and above-ground resources)	
Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive (111-0147)	
Above Ground Resource (Buildings, Districts, Objects, Structures)	
Richmond, Fredericksburg, and Potomac Railroad (500-0001)	MacMurdo House (166-0036)
Mount Vernon Memorial Highway (029-0218)	Hugo House/Lefebvre House (166-0037)
Washington National Airport (000-0045)	House, 1005 S. Center Street (166-0001-0077)
George Washington Junior High School (100-0160)	Charles Gwathmey House (042-0113)
Parker-Gray Historic District/Uptown (100-0133)	Hunton Treasures (043-0694)
Rosemont Historic District (100-0137)	Lewis-McLeod House (043-0690)
Alexandria Union Station (100-0124)	Laurel Industrial School Historic District (043-0292)
George Washington National Masonic Memorial (100-0128)	Main Building/Robert Stiles Building (043-0292-0001)
Phoenix Mill (100-0277)	Scott's Addition Historic District (127-6136)
Old Colchester Road, Potomac Path, King's Highway (029-0953)	Movieland Bowtie Cinema (127-6188)
Colchester Arms, Fairfax Arms (029-0043)	Hermitage Road Warehouse Historic District (127-6730)
RF&P Bridge over Occoquan River (500-0001-0022)	Todd Lofts (127-5978)
Rippon Lodge (076-0023)	Southern Stove Works (127-6145)
Rappahannock River Railroad Bridge and Associated Structures/Platform (111-0132-0025)	Governor's School (127-0414)
Fredericksburg Historic District (111-0132)	Virginia Union University Historic District (127-0354)
Dr. Charles Mortimer House (111-0067/111-0132-0505)	Carver Residential Historic District (127-0822)
Robert Adams Residence (111-0132-0458)	George W. Carver Elementary School (127-0428)
Shiloh Baptist Church New Site (111-0132-0147)	Richmond and Chesapeake Bay Railway Barn (127-6171)
Fredericksburg Train Station (111-0132-0704)	Gilpin Court Apartment Complex (127-6883)
The 1770 House (111-0132-0126)	Barton Heights Cemetery (127-5679)
Purina Tower (111-0132-0020)	Richmond Nursing Home (127-0353)
House, 314–316 Frederick Street (111-0132-0522)	Hebrew Cemetery, 320 Hospital Street (127-6166)

Table 6.4-1: Summary of Section 106 Historic Properties

Site Name (DHR ID)	
Pulliam's Service Station (111-0009-0795)	Shockoe Valley & Tobacco Row Historic District (127-0344)
Fredericksburg Historic District Extension (111-0009)	Winfree Cottage (127-6129)
Virginia Central Railway Historic District (088-5364)	Main Street Station and Trainshed (127-0172)
La Vue (088-0039)	Seaboard Air Line Railroad Corridor (127-6271)
Fairfield Plantation Office, Jackson Shrine (016-0092)	Masons' Hall (127-0019)
House, 12096 Guinea Drive (016-0208)	Railroad Y.M.C.A. (127-0344-0123)
Excelsior Industry of Caroline County MPD (016-5165)	Shockoe Slip Historic District and Expansions (127-0219)
First Woodford Post Office (016-0223)	Chesapeake & Ohio (C&O) Railroad Segment (127-6793)
Woodford Freight & Passenger Depot, Woodford Road (016-0222)	James River and Kanawha Canal Historic District (127-0171)
Carolina Mansion, 11146 Woodford Road (016-0220)	Bridge #1857, North 14th Street; Mayo Bridge North (127-5809)
Milford Historic District (016-5136)	Southern Railway (127-6792)
Milford State Bank (016-0270)	Manchester Warehouse Historic District (127-0457)
Coghill-Jeter Store (016-0286)	J.P. Taylor Leaf Tobacco, Southern Stove Works (127-6193)
Doswell Historic District (042-5448)	Williams Bridge Company, Emergency Fleet Corporation Factory (127-6245)
Doswell Depot and Tower (042-0093)	Pure Oil Company, Transmontaigne (127-6248)
Taylorsville Road Historic District (042-5307)	Davee Gardens Historic District (127-6213)
Hoopers, 11108 McConnell Lane (042-0556)	Philip Morris Operations Complex (127-5818)
Berkleytown Historic District (166-5073)	DuPont Spruance (020-5474)
Ashland Historic District (166-0001)	The Bellwood-Richmond Quartermaster Depot Historic District (020-5336)
Business Office, Randolph-Macon (166-0001-0015)	Bellwood, Sheffields, Auburn Chase, Building 42, Defense Supply Center Richmond (020-0007)
Randolph-Macon College Historic District Expansion (166-5072)	Richmond & Petersburg Electric Railway (020-5351)
Randolph-Macon College Historic District (166-0002)	House, 3619 Thurston Road (020-0013)
Ashland Station Depot, 112 N. Railroad Avenue (166-0001-0008)	Atlantic Coast Line Railroad Corridor, Richmond and Petersburg Railroad (127-6251)
Priddy House (166-5041)	VEPCo Power Transmission Line (020-5378)
Emily Gray House (166-0001-0055)	Circle Oaks (020-0140)
Fleming Fox House (166-0001-0060)	Centralia Post Office (020-0552)
Battlefields	
Battle of Fredericksburg I (111-5295)	Yellow Tavern Battlefield (043-5108)
Battle of Fredericksburg II (111-5296)	Battle of Chaffin's Farm (New Market Heights) (043-0307)
Salem Church Battlefield (Banks Ford Battlefield) (088-5181)	Proctor's Creek Battlefield (020-5320)
Slaughter Pen Farm (088-0254)	Drewry's Bluff Battlefield (Fort Darling) (020-0147)
North Anna Battlefield (042-0123)	Assault on Petersburg (Petersburg Battlefield II) (123-5025)

6.5 DETERMINATION OF SECTION 4(F) USES

This section describes the uses of Section 4(f)-protected resources by the Preferred Alternative. Section 4(f) uses are described in Section 6.2.2 above, and Section 4(f) properties are described in Section 6.4 above. Refer to Section 6.8 for details of coordination with property owners throughout the Section 4(f) process.

6.5.1 Section 4(f) Use of Parks and Recreation Areas

Table 6.5-1 provides a summary of the permanent incorporation and temporary occupancy of lands at 12 parks and recreational trail resources. The determination of effect within each resource is described in detail after the table. Maps of each of the 12 resources in relation to the Project can be found in Figures 6.5-1 through 6.5-13 at the end of this section.

As shown in the table, the Preferred Alternative will have a 0.21-acre permanent incorporation of Walker's Creek Retention Basin Park that is unavoidable in Area 6 (Richmond). All other uses of park and recreation areas are temporary occupancy. Note that changes to eligible park and recreation area resources since the Draft Section 4(f) Evaluation are discussed in Section 6.4.1 above; additionally, there were minor changes to the type of use (i.e., change from permanent incorporation to temporary occupancy within the same resource) shown in Table 6.5-1.

Based on the criteria discussed in Section 6.2, FRA determined that the Preferred Alternative will have one Section 4(f) *de minimis* use to Walker's Creek Retention Basin Park due to permanent incorporation. FRA has also determined that the remaining 11 park, recreation, and wildlife and waterfowl refuge resources are only within the temporary LOD and result in temporary occupancy but not a Section 4(f) use based on the conditions of the occupancy as discussed in Section 6.2.2. FRA has determined that the Project will not result in any constructive uses.

Detailed descriptions of how FRA determined these uses are provided for each resource after the table. The officials with jurisdiction over these parklands have provided concurrence with FRA's determinations regarding the single *de minimis* use and the temporary occupancies; see Section 6.8.1 for additional information on this coordination and Appendix E of this Final EIS for copies of the concurrence letters.

Walker's Creek Retention Basin Park (Area 6, Richmond)

Table 6.5-1: Permanent Incorporation and Temporary Occupancy of Parks and Recreation Areas of the Preferred Alternative

Park Name	Area within LOD (Parks in acres; Trails in feet)	Use Determination
Alternative 1B: Add Two Main Tracks on the West		
Long Bridge Park	P: 0.00 T: 0.67	Temporary Occupancy but No Section 4(f) Use
Alternative 2A: Add a Third or Fourth Main Track		
Dog Run Park at Carlyle	P: 0.00 T: 0.18	Temporary Occupancy but No Section 4(f) Use
George Washington Memorial Parkway	P: 0.00 T: 1.20	Temporary Occupancy but No Section 4(f) Use[2]
Mount Vernon Trail	P: 0.00 feet T: 20 feet	Temporary Occupancy but No Section 4(f) Use
Four Mile Run Trail	P: 0.00 feet T: 43 feet	Temporary Occupancy but No Section 4(f) Use
Potomac Yard Park	P: 0.00 T: 0.48	Temporary Occupancy but No Section 4(f) Use
Potomac Yard Landbay N	P: 0.00 T: 1.41	Temporary Occupancy but No Section 4(f) Use
Rail Park	P: 0.00 T: 0.60	Temporary Occupancy but No Section 4(f) Use
Veterans Memorial Park	P: 0.00 T: 0.07	Temporary Occupancy but No Section 4(f) Use
Alternative 3B: Add a Third Main Track Through City		
Fredericksburg and Spotsylvania National Military Park[1] (Prospect Hill Area)	P: 0.00 T: 0.19	Temporary Occupancy but No Section 4(f) Use[2]
Alternative 4A: Add a Third Main Track		
Fredericksburg and Spotsylvania National Military Park[1] (Stonewall Jackson Shrine Area)	P: 0.00 T: 1.10	Temporary Occupancy but No Section 4(f) Use[2]
Alternative 6F: Full Service, Staples Mill Road / Main Street Stations		
Laurel Recreation Area	P: 0.00 T: 0.01	Temporary Occupancy but No Section 4(f) Use
Walker's Creek Retention Basin Park	P: 0.21 T: 0.27	*de minimis*
Total for the Preferred Alternative:	**P: 0.21 T: 6.18 / 63 feet of trail**	**1 *de minimis* Use**

Notes: P: Permanent Incorporation; T: Temporary Occupancy

1. Fredericksburg and Spotsylvania National Military Park is located in both Area 3 and Area 4.
2. George Washington Memorial Parkway and Fredericksburg and Spotsylvania National Military Park are also addressed under historic resources and may have a different use determination as a historic resource. See Table 6.5.3.

There are no impacts from the Preferred Alternative in Area 5, so it is not included in the table.

Long Bridge Park (Area 1). The Preferred Alternative will expand the railroad infrastructure on the west side of the railroad, but within the CSXT-owned right-of-way, approaching Long Bridge from the south. However, the Preferred Alternative will result in 0.67 acres of temporary occupancy outside of the right-of-way (less than three percent of the 29-acre facility). As shown in Figure 6.5-1, the temporary occupancy consists of narrow areas needed for construction access, erosion control, and material placement. Subsequent to the Draft EIS, the permanent LOD was minimized and permanent incorporation of this resource was avoided. FRA has determined that the temporary impacts will not result in a Section 4(f) use because upon completion of construction, the land outside of the CSXT right-of-way will be restored to its prior condition, and the activities of the park will not be affected during the timeframe of the temporary occupancy. By letter dated December 18, 2018, Arlington County Department of Parks and Recreation agreed with FRA's determination that this is not a Section 4(f) use (see Appendix E of this Final EIS).

Dog Run Park at Carlyle (Area 2). The Preferred Alternative will result in 0.18 acres of temporary occupancy, totaling less than 5 percent of this 3-acre dog park. As shown in Figure 6.5-2, temporary occupancy will be in the areas needed for access, erosion control, and material placement during construction, and are located in a narrow strip of natural vegetation extending approximately 10 feet from the existing right-of-way. The adjacent dog run area and tennis courts will not be impacted. Subsequent to the Draft EIS, the permanent LOD was minimized in this area and permanent incorporation of this resource was avoided; temporary occupancy increased slightly as the previous area of permanent incorporation identified in the Draft EIS is now located within the temporary LOD. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because upon completion of construction, the land outside of the CSXT right-of-way will be restored to its prior condition. The activities of the park will not be affected during construction. By letter dated December 13, 2018, the City of Alexandria agreed with FRA's determination that this is not a Section 4(f) use (see Appendix E of this Final EIS).

George Washington Memorial Parkway (Area 2). As shown in Figure 6.5-3, the Preferred Alternative will result in temporary occupancy of an approximately 10-foot-wide strip of vacant forested land on the east side of the existing railroad totaling 1.20 acres, or approximately 0.1 percent of the 1,105-acre facility. Temporary occupancy will be in the area needed for access, erosion control, and material placement during construction. Impacts to mature trees will be avoided and minimized. Design refinements after the Draft EIS resulted in a slight increase in temporary occupancy of this resource. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because upon completion of construction, the land outside of the CSXT right-of-way will be restored to its prior condition, and the activities of the park will not be affected during the timeframe of the temporary occupancy. By letter dated December 12, 2018, the National Park Service George Washington Memorial Parkway Headquarters agreed with FRA's determination that this is not a Section 4(f) use (see Appendix E of this Final EIS). This property is also listed as a historic resource under Section 106 (see Section 6.5.3).

Mount Vernon Trail (Area 2). The Preferred Alternative will result in temporary occupancy to 20 feet of this trail facility for access and erosion control during construction, as shown in Figure 6.5-4. Trail connectivity will be maintained during construction. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because upon completion of construction, trail connectivity will be maintained, and the land outside of the CSXT right-of-way will be restored to its prior condition. The activities of the trail will not be affected during the timeframe of the temporary occupancy. By letter dated December 12, 2018, NPS agreed with FRA's determination that this is not a Section 4(f) use (see Appendix E of this Final EIS).

Four Mile Run Trail (Area 2). The Preferred Alternative will result in temporary occupancy to 43 feet of this trail facility for access and erosion control during construction, as shown in Figure 6.5-5. Trail connectivity will be maintained during construction. Design refinements subsequent to the Draft EIS resulted in a temporary occupancy of this resource which was previously not within the LOD. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because upon completion of construction, trail connectivity will be maintained, and the land outside of the CSXT right-of-way will be restored to its prior condition. The activities of the trail will not be affected during the timeframe of the temporary occupancy. By letter dated December 13, 2018, the City of Alexandria agreed with FRA’s determination that this is not a Section 4(f) use (see Appendix E of this Final EIS).

Potomac Yard Park (Area 2). The Preferred Alternative will result in 0.48 acres of temporary occupancy (less than 2 percent of the 21.6-acre park). Temporary occupancy in the area needed for access, erosion control, and material placement during construction is located in a narrow strip adjacent to the existing right-of-way, as shown in Figure 6.5-6. Park boundary expansion subsequent to the Draft EIS resulted in temporary occupancy of this resource that was previously not located within the LOD. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because after construction, the land outside of the CSXT right-of-way will be restored to its prior condition, and park activities will not be affected during the timeframe of the temporary occupancy. By letter dated December 13, 2018, the City of Alexandria agreed with FRA’s determination that this is not a Section 4(f) use (see Appendix E of this Final EIS).

Potomac Yard Landbay N (Area 2). The Preferred Alternative will result in 1.41 acres of temporary occupancy totaling approximately 27 percent of this 5.21-acre park. Temporary occupancy is needed for access, erosion control, and material placement during construction. There are two separate areas of temporary occupancy within the greater Potomac Yard Landbay N limits, located in narrow, non-continuous strips immediately adjacent to the tracks, as shown in Figure 6.5-7 (0.66 acres of temporary occupancy in the area shown on sheet 1, and 0.75 acres of temporary occupancy in the area shown on sheet 2). The City of Alexandria provided comments identifying this park resource as a new park subsequent to the Draft EIS. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because upon completion of construction, the land outside of the CSXT right-of-way will be restored to its prior condition. Currently, the affected area is open space. DRPT will continue to coordinate with the City of Alexandria to ensure that the activities of the park will not be affected during the timeframe of the temporary occupancy. By letter dated December 13, 2018, the City of Alexandria agreed with FRA’s determination that this is not a Section 4(f) use (see Appendix E of this Final EIS).

Rail Park (Area 2). The Preferred Alternative will result in 0.60 acres of temporary occupancy (less than 15 percent of the 4.17-acre park). Temporary occupancy is in areas needed for access, erosion control, and material placement during construction, and are located in a narrow strip immediately adjacent to the tracks, as shown in Figure 6.5-8. The City of Alexandria provided comments identifying this park as a new resource subsequent to the Draft EIS. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because upon completion of construction, the land outside of the CSXT right-of-way will be restored to its prior condition. Currently, the affected area is open space. DRPT will continue to coordinate with the City of Alexandria to ensure that the activities of the park will not be affected during the timeframe of the temporary occupancy. By letter dated December 13, 2018, the City of Alexandria agreed with FRA’s determination that this is not a Section 4(f) use (see Appendix E of this Final EIS).

Veterans Memorial Park (Area 2). The Preferred Alternative will result in temporary occupancy of 0.07 acres of this 110-acre facility, or less than 0.1 percent of the total parkland acreage. The temporary occupancy is located in a narrow strip of land, less than 5 feet in width adjacent to the existing right-of-way, as shown in Figure 6.5-9. Temporary impacts result from area needed for access, erosion control, and material placement during construction. The area consists of natural vegetation. Design refinements subsequent to the Draft EIS resulted in an increased area of temporary occupancy of this resource. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because upon completion of construction, the land outside of the CSXT right-of-way will be restored to its prior condition, and the activities of the park will not be affected during the timeframe of the temporary occupancy. By letter dated November 2, 2018, Prince William County Parks and Recreation Department agreed with FRA's determination that this is not Section 4(f) use as documented on November 2, 2018 (see Appendix E of this Final EIS).

Fredericksburg and Spotsylvania National Military Park (Area 3, Prospect Hill Area). The Preferred Alternative in Area 3 will result in temporary occupancy to this facility at the Prospect Hill/Lee Drive site. The temporary occupancy at this location is 0.19 acres, approximately 0.01 percent of this approximately 1,100-acre portion of the National Military Park. The temporarily occupied area is a small rectangular-shaped piece of land that is vacant, as shown in Figure 6.5-10. Temporary occupancy will be in areas needed for access, erosion control, and material placement during construction. Design refinements and parcel boundary adjustments subsequent to the Draft EIS resulted in an increased temporary occupancy of this resource. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because upon completion of construction, the land outside of the CSXT right-of-way will be restored to its prior condition and the activities of the park will not be affected during the timeframe of the temporary occupancy. By letter dated December 7, 2018, the National Park Service Fredericksburg and Spotsylvania National Military Park agreed with FRA's determination that this is not a Section 4(f) use (see Appendix E of this Final EIS). This property is also listed as a historic resource under Section 106, as described in Section 6.5.3 of this chapter.

Fredericksburg and Spotsylvania National Military Park (Area 3, Fredericksburg)

Fredericksburg and Spotsylvania National Military Park (Area 4, Stonewall Jackson Shrine Area). The Preferred Alternative in Area 4 will have temporary occupancy of 1.10 acres at the Stonewall Jackson Shrine, or less than 2 percent of this approximately 70-acre portion of the National Military Park. The temporary occupancy consists of an approximately 20-foot-wide strip that is made up of forest and agricultural lands, as shown in Figure 6.5-11. Temporary occupancy will be in areas needed for access, erosion control, and material placement during construction. Design refinements subsequent to the Draft EIS resulted in an increased temporary occupancy of this resource. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because upon completion of construction, the land outside of the CSXT right-of-way will be restored to its prior condition, and the activities of the park will not be affected during the timeframe of the temporary occupancy. By letter dated December 7, 2018, the NPS-Fredericksburg and Spotsylvania National Military Park agreed with FRA’s determination that this is not a Section 4(f) use (see Appendix E of this Final EIS). This property is also listed as a historic resource under Section 106, as described in Section 6.5.3 of this chapter.

Laurel Recreation Area (Area 6). The Preferred Alternative will result in 0.01 acres of temporary occupancy, approximately 0.1 percent of this 9.6-acre facility. The temporary occupancy is located in the upper northeast corner of the parcel, as shown in Figure 6.5-12. Temporary occupancy will be in areas needed for access, erosion control, and material placement during construction. Design refinements subsequent to the Draft EIS resulted in a temporary occupancy of this resource which was previously not within the LOD. FRA has determined that the temporary occupancy will not result in a Section 4(f) use because the land outside of the CSXT right-of-way will be restored to its prior condition and the activities of the park will not be affected during construction. By letter dated October 31, 2018, Henrico County Recreation and Parks agreed with FRA’s determination that this is not a Section 4(f) use (see Appendix E of this Final EIS).

Walker’s Creek Retention Basin Park (Area 6). The Preferred Alternative will require permanent right-of-way from, and result in temporary occupancy to, Walker’s Creek Retention Basin Park. Permanent impacts will be 0.21 acres, and temporary impacts will be 0.27 acres, for a total affected percentage of less than 8 percent of the 6.4-acre park. The affected area is a vacant grassed area with a multi-use trail that currently crosses under the existing tracks, as shown in Figure 6.5-13. The width ranges up to 70 feet for temporary and permanent impacts combined. Design refinements subsequent to the Draft EIS resulted in an increase in both temporary occupancy and permanent incorporation of this resource. FRA has determined that the use is *de minimis*[12] as the transportation use of this additional right-of-way does not adversely affect the activities, features, and attributes that qualify the resource for protection under Section 4(f). Temporary occupancy will be in areas needed for access, erosion control, and material placement during construction. FRA does not anticipate the temporary occupancy will result in a Section 4(f) use because upon completion of construction, the land outside of the CSXT right-of-way will be restored to its prior condition, trail connectivity will be maintained, and the other activities of the park will not be affected during the timeframe of the temporary occupancy. By letter dated November 16, 2018, the City of Richmond Department of Public Works in consultation with the Department of Parks and Recreation agreed with FRA’s determination of Section 4(f) de *minimis* use and that the temporary occupancy is not a use (see Appendix E of this Final EIS).

---

[12] This resource was within the scope of the previous SEHSR Richmond to Raleigh (R2R) project; however, no impacts were identified as part of that project. The DC2RVA determinations of effect are based on the Project limits of disturbance and proposed infrastructure per the Basis of Design for the Project; refer to Chapter 4 of this Final EIS for details.

6.5.2 Section 4(f) Use of Wildlife Refuges/Waterfowl Sanctuaries

There is no permanent incorporation of wildlife refuges or waterfowl sanctuaries, as shown in Table 6.5-2, which remains unchanged since the Draft Section 4(f) Evaluation. The Preferred Alternative will have temporary occupancy of 2.54 acres, or 0.1 percent, of the 2,652-acre Mattaponi Wildlife Management Area in Area 4. The occupied area consists of forest in a narrow strip of land, approximately 15 feet wide on the west side of the existing right-of-way (see Figure 6.5-14). Temporary occupancy will be from areas needed for access, erosion control, and material placement during construction. Impacts to mature trees will be avoided and minimized.

FRA has determined that the temporary occupancy will not result in a Section 4(f) use because the land outside of the CSXT right-of-way will be restored and stabilized through revegetation to as near to its prior condition as possible and the activities of the park will not be affected during construction. By letter dated October 12, 2017, the Virginia Department of Game and Inland Fisheries agreed with FRA's determination that this is not a Section 4(f) use (see Appendix E of this Final EIS).

Table 6.5-2: Permanent Incorporation and Temporary Occupancy of Wildlife Refuges/Waterfowl Sanctuaries of the Preferred Alternative

Park Name	Area within LOD (Parks in acres; Trails in feet)	Use Determination
	Alternative 4A: Add a Third Main Track	
Mattaponi Wildlife Management Area	P: 0.00 T: 2.54	Temporary Occupancy but No Section 4(f) Use
Total for the Preferred Alternative:	**P: 0.00** **T: 2.54**	**No Section 4(f) Uses**

6.5.3 Section 4(f) Use of Historic Properties

As previously stated, FRA's determinations of effect as part of the separate Section 106 process for the Project, as presented in Chapter 5 and Appendix D of this Final EIS, informed the determinations of Section 4(f) use; FRA and DRPT examined all 120 of the Section 106 resources to evaluate potential Section 4(f) use of historic properties. Table 6.5-3 summarizes the Section 4(f) determinations for historic properties within the DC2RVA corridor by area. Table 6.5-4 presents those same determinations of use by individual resource of the 120 historic properties.

Table 6.5-3: Summary of Section 4(f) Determinations for Section 106 Historic Properties

Alternative Area	Preferred Alternative	Section 4(f) Determinations		
		Use (Permanent Incorporation)	*de minimis*	No Use

Table 6.5-4: Preferred Alternative Section 4(f) Determinations for All Historic Properties

DHR ID	Name/Description	Section 4(f) Determination
020-5378	VEPCo Power Transmission Line	No Use
020-0140	Circle Oaks/4510 Centralia Road	No Use
020-0552	Centralia Post Office	No Use
	Total for the Preferred Alternative:	**Use (Permanent Incorporation): 17** ***de minimis:* 33** **No Use: 70**

Note: Section 4(f) use determinations presented here for resources located between Richmond and Centralia may not parallel the determinations rendered for the previous SEHSR Richmond to Raleigh (R2R) project as the DC2RVA Project limits of disturbance are based on infrastructure per the Basis of Design for the Project; refer to Chapter 4 of this Final EIS for details.

As presented in Chapter 5 of this Final EIS, FRA determined during the Section 106 process, and DHR concurred,[13] that the Project will have an adverse effect on 21 historic properties and no adverse effect/no effect on 99 historic properties. The bullets below describe the Section 4(f) uses (as presented in Table 6.5-3 and Table 6.5-4 above) by the Section 106 determinations.

- Of the 21 historic properties with an adverse effect under Section 106:
  - The FRA determined that the Project will have a Section 4(f) use (permanent incorporation)[14] in 17 of these instances, and the DHR was notified of these determinations by letter dated January 4, 2019 (see Appendix E of this Final EIS). The 17 historic properties with a Section 106 adverse effect and a Section 4(f) use are explained in detail for each resource in Section 6.5.3.1.
  - FRA also determined that the remaining 4 of 21 adversely effected Section 106 resources will have no Section 4(f) use. These four resources are discussed in Section 6.5.3.2 to provide contextual data for the no use determination. In these instances, the adverse effect is the result of a viewshed modification wherein there is no physical encroachment or the resource is an archaeological site that is only eligible under NRHP Criterion D, thus preservation in place is not warranted and a no use determination is appropriate. No further action is required on these four resources, and these results were presented to DHR to inform DHR of FRA's determinations.
- Of the 99 historic properties with no adverse effect/no effect under Section 106, FRA also determined that the Project will have no use or a *de minimis*[15] under Section 4(f), and the DHR was notified of these determinations by letter dated January 4, 2019 (see Appendix E of this Final EIS). Resources with no Section 4(f) use are summarized in Section 6.5.3.2.

---

[13] Preliminary dialogues with DHR on effect took place on August 10, 2016. Follow-up meetings were held on June 19, 2018, July 2, 2018, and August 8, 2018. The results of these meetings helped to inform FRA's Section 4(f) use determinations. Refer to Appendix E of this Final EIS for Section 106 and Section 4(f) coordination details.

[14] As previously presented in Section 6.2.4, a use (permanent incorporation) to a historic property occurs when the undertaking physically encroaches on the NRHP-eligible boundaries of a historic property and the Project will permanently alter the physical integrity of a character-defining feature or function of the resource. For archaeological sites, there is a use if the site is eligible for the NRHP for reasons other than the data it contains, namely that it has an association with an important event, individual, or architectural style.

[15] As previously presented in Section 6.2.4, a *de minimis* use occurs if the NRHP-eligible boundaries are within the encroachment area but the undertaking will not alter the physical integrity and function of the resource. For example, if the Project is requiring the slight widening of a roadway within the NRHP boundaries of a dwelling that is significant for its architectural styling, the use of the land for road widening will not impact the physical integrity or importance of the dwelling's architectural style.

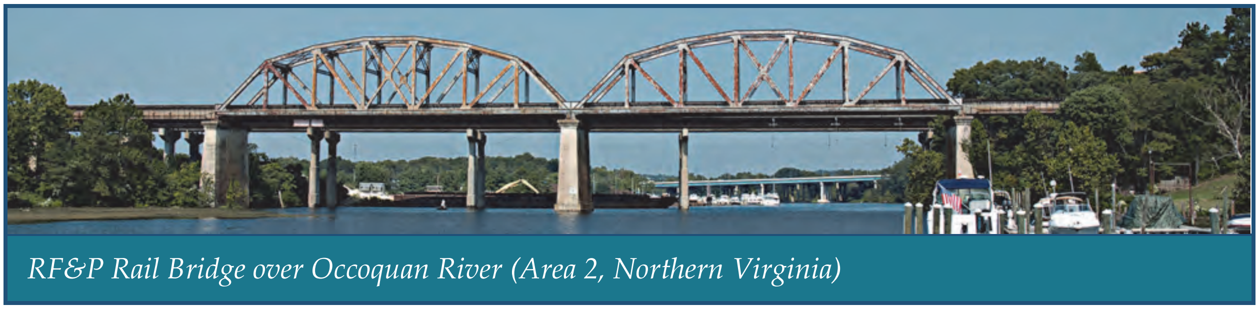
It is important to note that the Section 4(f) use determinations presented herein may not mirror FRA's preliminary determinations presented in the Draft Section 4(f) Evaluation, as additional cultural resource studies were completed between the completion of the Draft EIS and this Final EIS and, in addition, the Project LOD was refined as the Preferred Alternative was selected as part of this Final EIS. In any instance where the Section 4(f) determination varies between the Draft EIS and Final EIS, a comment on this change is provided in the sections below. Appendix D of this Final EIS provides a full listing of resources that have changed since the Draft EIS.

6.5.3.1 Historic Properties with a Section 4(f) Use

As previously stated, of the 21 historic properties that FRA determined, and DHR concurred, would have an adverse effect as part of the separate Section 106 process, FRA also determined that the Project will have a Section 4(f) use (permanent incorporation) on 17 of these same resources. By letter dated January 4, 2019, the DHR was notified of the Section 4(f) use determinations (see Appendix E of this Final EIS). These 17 resources, which are listed above in Table 6.5-4, are described in detail below in north to south order. Maps showing the location of architectural resources[16] with a Section 4(f) use (permanent incorporation) in relation to the Preferred Alternative are provided at the end of this section.

Richmond, Fredericksburg, and Potomac Railroad (500-0001). The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-15. Construction associated with the Preferred Alternative will result in removal or large-scale modifications to several contributing elements to the railroad district, including the Doswell Tower in the Doswell Historic District (042-5448), Main Street Station (127-0172) and adjacent properties in Richmond, and several bridges along the corridor. As such, the Preferred Alternative will have a Section 4(f) use (permanent incorporation) on this historic property.

RF&P Bridge over Occoquan River (500-0001-0022). The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-16. The NRHP boundaries of the resource were modified after completion of the Draft EIS based on additional archival and architectural studies. As such, the Section 4(f) use was reevaluated from its preliminary determination of no use. The Preferred Alternative includes constructing a second bridge directly east of the existing span, thus introducing a new element adjacent to the current bridge. The approach to the bridge, which is included in the NRHP boundaries of this resource and is a contributing feature, will also be physically modified. The Preferred Alternative has the potential to diminish the property's integrity through the introduction of a large new element and physical modifications to the rail design. The revised NRHP boundaries of this historic property are encroached by the Preferred Alternative; as such, it will have a Section 4(f) use (permanent incorporation) of this resource.



RF&P Rail Bridge over Occoquan River (Area 2, Northern Virginia)

---

[16] Locations for archaeological resources are not provided per guidelines set forth in the Archeological Resources Protection Act of 1979 and other applicable legislation (contact DRPT for details).

Archaeological Site 44ST1223 (Civil War Campsite). This archaeological site is eligible under both Criteria A and D, so preservation in place is warranted. The site was recorded after issuance of the Draft EIS during archaeological studies completed in areas where the LOD was expanded; thus, it was not included in the Draft Section 4(f) Evaluation. The Preferred Alternative modifies the rail corridor in this area to add an additional rail track along the existing corridor. The new track will partially overlap this archaeological site and physically destroy data-bearing deposits. Since this action will diminish the data potential of this site, the Preferred Alternative will result in a Section 4(f) use (permanent incorporation) of this historic property.

Rappahannock River Railroad Bridge and Associated Structures/Platform (111-0132-0025). The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-17. During the Draft EIS evaluation, FRA's preliminary determination was that the Project would have no use on this resource. Since completion of the Draft EIS, the NRHP boundaries of the resource have been expanded to include both the bridge and associated set of platforms and structures in downtown Fredericksburg, thus requiring a Section 4(f) reevaluation. The resource is both individually eligible and a contributing element to the Fredericksburg Historic District (111-0132) and the RF&P Railroad (500-0001). Addition of a third track to the east of the existing alignment as part of Preferred Alternative will require construction of a new bridge adjacent to the old structure, thus diminishing its integrity. In addition, portions of the platform and structural system will be removed and rebuilt during the work, thus physically impacting character-defining elements of this resource. As such, the Preferred Alternative will have a Section 4(f) use (permanent incorporation) of the historic property.

Rappahannock River Railroad Bridge (Area 3, Fredericksburg)

Fredericksburg Historic District (111-0132): The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-18. Installation of the third track associated with the Preferred Alternative would be constructed in the existing rail right-of-way, but it would entail building a multi-story parking deck to the east (south) of the tracks in an existing parking lot. This new structure would impact the viewshed of the district. It would also physically impact numerous contributing elements to the district, including the existing rail structures and platforms, as well as a potential new rail station. Because work encroaches on the NRHP boundaries of the district and there are physical impacts, the Preferred Alternative will have a Section 4(f) use (permanent incorporation) of the district.

Archaeological Sites 44SP0187 (Marye's Mill), 44SP0688 (Block 49), and 44SP0687 (Block 48). These three archaeological sites are eligible under both Criteria A and D, so preservation in place is warranted. While Site 44SP0187 was included in the Draft EIS, sites 44SP0688 and 44SP0687 were recorded with the DHR after issuance of the Draft EIS and therefore were not included in that document. Construction of a new bridge across the Rappahannock River to accommodate a third track for Preferred Alternative will physically impact the subsurface archaeological deposits in this area, thus diminishing the data potential of these three sites. The Preferred Alternative will have a Section 4(f) use (permanent incorporation) of these sites.

Archaeological Site 44SP0468 (Earthworks/Jackson's Earthworks). This archaeological site is eligible under both Criteria A and D, so preservation in place is warranted. Changes to the LOD after completion of the Draft EIS resulted in additional archaeological studies, which led to an expansion of the boundaries of this site. As such, the Section 4(f) impacts were reevaluated during the Final EIS analysis. Modifications to the rail corridor associated with the Preferred Alternative in this area to aid in rail performance will result in physical impacts to this archaeological site. It is possible that small portions of intact earthworks may also be altered. Since this action will diminish the data potential of this resource, the Preferred Alternative will have a Section 4(f) use (permanent incorporation) of this historic property.

Doswell Historic District (042-5448). The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-19. Although the community was founded along the rail lines, the Preferred Alternative will adversely affect one contributing element to the district, the Doswell Depot and Tower (042-0093), as listed below. This includes physically moving the tower and taking land from the parcel, thus diminishing the characteristics that render it eligible for the NRHP. In addition, roads within the district will also be physically modified during the Project, thus altering its historic road plan. Because of the adverse physical effects to a contributing element and other physical changes, the Preferred Alternative will have a Section 4(f) use (permanent incorporation) of this historic property.

Doswell Historic District (Area 4, Central Virginia)

Doswell Depot and Tower (042-0093). The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-20. The Doswell Depot is located on the west of a Y intersection of two railroads; the tower is located just south of the depot on the east side of the active rail corridor. Both are contributing elements to the Doswell Historic District (042-5448). The LOD of the Preferred Alternative in this area was refined after the publication of the Draft EIS. The modified LOD encroaches on the NRHP boundaries of this resource and requires changes to the physical matrix of the Doswell Tower. In particular, adding the third track associated with the Preferred Alternative east of the extant tracks in this area will result in permanent impacts on the tower, which will be moved as a result of this action. This activity compromises the integrity of this resource, including its design, workmanship, and materials. As such, the Preferred Alternative will have a Section 4(f) use (permanent incorporation) of this historic property.

Berkleytown Historic District (166-5073). The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-21. While this resource was presented in the Draft Section 4(f) Evaluation, additional research and architectural survey completed after the issuance of the Draft EIS resulted in the expansion of the property's NRHP-eligible boundaries. Concurrently, the LOD was refined in this area during the selection of the Preferred Alterative after the publication of the Draft EIS. Together, these actions required a reevaluation of the Section 4(f) use of this resource.

Construction of an overpass carrying Vaughan Road over the rail tracks associated with the Preferred Alternative will require physical alterations to the historic road pattern within the district and require a new bridge structure within the viewshed of the district and several contributing elements. Because the Preferred Alternative encroaches on the district boundaries and results in a physical impact, the Preferred Alternative will have a Section 4(f) use (permanent incorporation) of the district.

Laurel Industrial School Historic District (043-0292) and Main Building/Robert Stiles Building/Bluford Office Building (043-0292-0001). The location of these resources in relation to the Preferred Alternative are shown in Figures 6.5-22 and 6.5-23. These resources were presented in the Draft Section 4(f) Evaluation, but additional research and architectural survey completed after issuance of the Draft EIS refined resource boundaries. In addition, the LOD was modified in this area as the Preferred Alterative was refined. These actions resulted in a reevaluation of the Section 4(f) use of these resources. The Preferred Alternative includes grade-separating (i.e., raising) Hungary Road over the rail corridor. This action will result in the construction of a new road overpass structure and physical modifications of the road system and parking areas. It will also result in a modified physical relationship between the Main Building and the surrounding landscape/streetscape, which are contributing elements to the Main Building. These actions will impact the physical integrity both the historic district and the main building, and the Preferred Alternative will result in a Section 4(f) use (permanent incorporation) of both resources.

Shockoe Valley & Tobacco Row Historic District (127-0344). The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-24. The Preferred Alternative includes several physical changes to the existing rail infrastructure, including lengthening the passenger platforms at Main Street Station and creating new structural elements (piers) to support the platforms. In addition, the district contains numerous archaeological sites associated with the early history and prehistory of the Shockoe Bottom area, including pre-Civil War sites associated with the slave trade, such as the "Burial Ground for Negros" (44HE1089) and Lumpkins Jail/Devil's Half Acre (44HE1053). The Project will not physically impact these resources, but a new platform will be added within the viewshed of the Devil's Half Acre site and other potential, unknown slave-trade-related sites (see below for minimization and mitigation efforts associated with these potential resources). As such, the Preferred Alternative will have a Section 4(f) use (permanent incorporation) of the Shockoe Valley & Tobacco Row Historic District.

Main Street Station and Trainshed (127-0172). The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-25. The building is a National Historic Landmark (NHL) and is also a contributing element to both RF&P Railroad (500-0001), which is listed above) and the Seaboard Air Line Railroad (127-6271), listed below.

Construction of the Preferred Alternative will alter physical elements of the property including the addition of a new passenger platform on both sides of the train shed, installation of new support piers, and construction of a new maintenance platform southeast of the station. The Preferred Alternative will result in a permanent Section 4(f) use (permanent incorporation) of this resource due to physical modifications..

Seaboard Air Line Railroad Corridor (127-6271). The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-26. Work associated with improvements to the Preferred Alternative will include physical modifications to contributing elements to this resource, such as Main Street Station, the S-Line bridge over the James River, and other road and rail structures south of Richmond. As such, the Preferred Alternative will result in a Section 4(f) use (permanent incorporation) of the historic property.

6.5.3.2 Historic Properties with No Section 4(f) Use or *de minimis* Use

As stated at the beginning of this section, FRA determined, and DHR concurred, that there are 103 historic properties that will have no use (70 properties) or *de minimis* use (33 properties) under Section 4(f), as previously listed in Table 6.5-3 and Table 6.5-4. Of the 70 properties with no use, there are 4 resources for which the Preferred Alternative will also have a Section 106 adverse effect; these 4 resources with Section 106 adverse effect are discussed below separately from the remaining 99 resources with no Section 106 adverse effect, to provide additional contextual data for the determination.

Historic Properties with a Section 106 Adverse Effect but No Section 4(f) Use

Rippon Lodge (076-0023). The location of this resource in relation to the Preferred Alternative is shown in Figure 6.5-27. The vista from Rippon Lodge looking down Neabsco Creek (and current site of the railroad and associated bridge) was documented by Benjamin Latrobe in the late-eighteenth century, and the waterway viewshed is a character-defining feature. A new railroad bridge across Neabsco Creek will be built as part of this Preferred Alternative. The new bridge will be west of the existing span and will be a new primary element within the viewshed from Rippon Lodge, thus impacting a significant element of the property. This historic property is located over 5,000 feet west of the Project corridor. As such, the Preferred Alternative will have no Section 4(f) use as the action will not result in a substantial impairment to the resource.

Rippon Lodge (Area 2, Northern Virginia)

Archaeological Sites 44HE1098, 44HE1097, and 44HE1094. The Preferred Alternative includes installation of new piers to support expanded tracks near Main Street Station. Installation of the piers will result in subsurface disturbances within these three recorded archaeological sites. However, all three sites are only eligible under Criterion D (which has been determined since the publication of the Draft EIS) for their data potential, and they do not require preservation in place. Thus, the Preferred Alternative will have no Section 4(f) use of these resources.

Figure 6.5-27: No Section 4(f) Use of Rippon Lodge

Historic Properties with No Section 106 Adverse Effect and No Section 4(f) Use or *de minimis* Use

Of the 120 historic properties in the Project APE, 99 received a no adverse effect/no effect determination during the Section 106 evaluation. In evaluating the 99 properties for Section 4(f) use, FRA determined that the Project will have no use or a *de minimis* use on these resources as follows:

- For the 66 properties that received a Section 4(f) no use determination (as previously listed in Table 6.5-3 and Table 6.5-4 above), the Preferred Alternative will not encroach on the NRHP boundaries; thus, there is no use.
- In the 33 instances where the Preferred Alternative will encroach on the boundaries but there will be no physical impacts to character-defining features or changes in function, the Project will have a *de minimis* use on these resources; these properties were previously included in Table 6.5-4 above and are further detailed (north-to-south) in Table 6.5-5 below. The DHR was informed of these determinations in a letter dated December 4, 2018 and they acknowledged receipt on January 4, 2019.

Excelsior Industry of Caroline County MPD (Area 4, Central Virginia)

Table 6.5-5: Historic Properties with Section 4(f) *de minimis* Determination

DHR ID	Name/Description	Justification for *de minimis* Determination
Alternative 1B: Add Two Main Tracks on the West		
029-0218	Mount Vernon Memorial Highway (portion of George Washington Memorial Parkway)	Highway generally parallels Project area, but there are small areas of minor physical encroachment; however, the Project will not impact character-defining features or property function.
Alternative 2A: Add a Third or Fourth Main Track		
100-0137	Rosemont Historic District	Minor physical encroachment on the southeastern edge of the district as the railroad is the resource boundary, but the Project will not impact character-defining features or property function.
100-0124	Alexandria Union Station, 110 Callahan Drive	Physical encroachment along the rail tracks and within the parking lot but avoidance of physical changes to the historic station assure that the Project does not impact character-defining features or property function.
Area 3B: Add a Third Main Track Through the City		
111-0147	Fredericksburg & Spotsylvania Co. Battlefields National Military Park & Cemetery, Lee Drive	Minor physical encroachment along Lansdowne Road that does not impact character-defining features or property function.
111-5295	Battle of Fredericksburg I	Minor physical encroachment along extant rail corridor that does not impact character-defining features or property function.
111-5296	Battle of Fredericksburg II	Minor physical encroachment along rail corridor that does not impact character-defining features or property function.
111-0132-0704	Fredericksburg Train Station, 200 Lafayette Boulevard	Minor physical encroachment along the southern resource boundary where it abuts the extant platform and rail structures, but changes will not impact character-defining features or property function.
111-0009	Fredericksburg Historic District Extension	Minor physical encroachment in southern half of district along rail corridor that does not impact character-defining features or property function.
088-5181	Salem Church Battlefield (Banks Ford Battlefield)	Minor physical encroachment along rail corridor that does not impact character-defining features or property function.
088-0039	La Vue, 3232 LaVue Lane (Prospect View)	Minor physical encroachment along eastern edge of property boundary that does not impact character-defining features or property function.
Area 4A: Add a Third Main Track		
016-5165	Excelsior Industry of Caroline County MPD	Minor physical encroachment along extant rail corridor that does not impact character-defining features or property function.
016-0222	Woodford Freight & Passenger Depot, Woodford Road	Minor physical encroachment along eastern edge of property boundary that does not impact character-defining features or property function.
016-5136	Milford Historic District	Minor physical encroachment along rail tracks that does not impact character-defining features or property function.
042-0123	North Anna Battlefield	Minor physical encroachment along rail tracks that does not impact character-defining features or property function.
042-5307	Taylorsville Road Historic District	Minor physical encroachment along rail tracks that does not impact character-defining features or property function.
Area 5A: Maintain Two Tracks Through Town (No Station Improvements)		
043-5108	Yellow Tavern Battlefield	Minor physical encroachment along rail tracks that does not impact character-defining features or property function.

▶ *Continued.*

Table 6.5-5: Historic Properties with Section 4(f) *de minimis* Determination

DHR ID	Name/Description	Justification for *de minimis* Determination
Alternative 6F: Full Service, Staples Mill Road / Main Street Stations		
127-6136	Scott's Addition Historic District	Minor physical encroachment along northeastern edge of district that includes rail as property boundary, but Project will not impact character-defining features or property function.
127-6188	Movieland Bowtie Cinema, 1331 North Boulevard	Minor physical encroachment along northeastern edge of district that includes rail as property boundary, but Project will not impact character-defining features or property function.
44HE1203	Grave Yard for Free People of Color and Slaves	Per coordination with the FRA and DHR, the Project will have no adverse effect on this resource; however DRPT has agreed to three commitments upon final design: landscape study with boundary evaluation; archaeological testing; and archaeological monitoring.
127-0219	Shockoe Slip Historic District and Expansions	Minor physical encroachment along rail corridor that does not impact character-defining features or property function.
127-6793	Chesapeake & Ohio (C&O) Railroad Segment	Minor physical encroachment at crossing of C&O Railroad with Project corridor, just north of the James River in Richmond, that does not impact character-defining features or property function.
127-0171	James River and Kanawha Canal Historic District	Minor physical encroachment at crossing with rail corridor that does not impact character-defining features or property function.
127-6792	Southern Railway	Minor physical encroachment at crossing of Southern Railway and Project rail corridor that does not impact character-defining features or property function.
127-0457	Manchester Warehouse Historic District	Minor physical encroachment along rail corridor that does not impact character-defining features or property function.
127-6248	Pure Oil Company, 1314 Commerce Street, Transmontaigne	Minor physical encroachment along eastern resource boundary that does not impact character-defining features or property function.
127-5818	Philip Morris Operations Complex, 3601 Commerce Road	Minor physical encroachment along western resource boundary that does not impact character-defining features or property function.
043-0307	Battle of Chaffin's Farm (New Market Heights Battlefield), New Market Road	Minor physical encroachment along rail corridor that does not impact character-defining features or property function.
020-5320	Proctor's Creek Battlefield	Minor physical encroachment along rail corridor that does not impact character-defining features or property function.
020-0147	Drewry's Bluff Battlefield (Fort Darling, Fort Drewry), Fort Darling Road	Minor physical encroachment along rail corridor that does not impact character-defining features or property function.
123-5025	Assault on Petersburg (Petersburg Battlefield II), Bermuda Hundred Road (Alt Route 697)	Minor physical encroachment along rail corridor that does not impact character-defining features or property function.
44CF0680 / 020-0022	Fort Darling/Battlefield, Earthworks, Fort/Centralia Earthworks	Minor physical encroachment along rail corridor that does not impact character-defining features or property function.
020-5351	Richmond & Petersburg Electric Railway	Minor physical encroachment at intersections of Richmond & Petersburg Electric Railway and Project corridor, south of the James River, that does not impact character-defining features or property function.
127-6251	Atlantic Coast Line Railroad Corridor, Richmond and Petersburg Railroad	Minor physical encroachment at intersection of two rail corridors in Centralia that does not impact character-defining features or property function.

6.6 AVOIDANCE ALTERNATIVES

A feasible and prudent avoidance alternative avoids using Section 4(f) property and does not cause other effects of a magnitude that substantially outweigh the importance of protecting the Section 4(f) property. In assessing the importance of protecting the Section 4(f) property, it is appropriate to consider the relative value of the resource to the preservation purpose of the statute. An alternative is not feasible if it cannot be built as a matter of sound engineering judgment. An alternative is not prudent if:

- It compromises the project to a degree that it is unreasonable to proceed with the project in light of its stated purpose and need;
- It results in unacceptable safety or operational problems;
- After reasonable mitigation, it still causes:
  - Severe social, economic, or environmental impacts;
  - Severe disruption to established communities;
  - Severe disproportionate impacts to minority or low-income populations; or
  - Severe impacts to environmental resources protected under other Federal statutes;
- It results in additional construction, maintenance, or operational costs of an extraordinary magnitude;
- It causes other unique problems or unusual factors; or
- It involves multiple factors that, while individually minor, cumulatively cause unique problems or impacts of extraordinary magnitude.

If FRA concludes that there is no feasible and prudent alternative to the use of Section 4(f) property, then it may approve only the alternative that causes the least overall harm in light of the statute's preservation purpose. The least overall harm is determined by balancing the following factors:

- The ability to mitigate adverse impacts to each Section 4(f) property (including any measures that result in benefits to the property);
- The relative severity of the remaining harm, after mitigation, to the protected activities, attributes, or features that qualify each Section 4(f) property for protection;
- The relative significance of each Section 4(f) property;
- The views of the official(s) with jurisdiction over each Section 4(f) property;
- The degree to which each alternative meets the purpose and need for the project;
- After reasonable mitigation, the magnitude of any adverse impacts to resources not protected by Section 4(f); and
- Substantial differences in costs among the alternatives.

An avoidance alternative for an individual Section 4(f) resource used by the Project must be evaluated within the area of the Project where the resource is located. An avoidance alternative must not impact other Section 4(f) resources.

Avoidance alternatives are not required when a finding of *de minimis* use is made for Section 4(f) resources because Section 4(f) is satisfied once *de minimis* applies.

The following avoidance alternative sections discuss the resources for which FRA has determined that the Preferred Alternative would result in a 4(f) use, excluding *de minimis* use for the reason noted above. The resources are discussed by the overall corridor first and then by Alternative Areas 1 through 6. See Chapter 5 of the Draft EIS for a discussion of historic properties as they relate to all other alternatives previously under consideration, including whether any of the other alternatives would qualify as feasible and prudent avoidance alternatives under Section 4(f).

6.6.1 Summary of Section 4(f) Use Determinations

As presented in Section 6.5 above, FRA has determined that all impacts to parklands, recreational areas, and wildlife refuges will result in *de minimis* impacts; therefore, no avoidance alternatives analysis is required. FRA's determination is that there are 17 historic resources for which the Preferred Alternative will result in a permanent Section 4(f) use. One resource, the historic RF&P Railroad, traverses the Project corridor from the Potomac River to Main Street Station. There is no avoidance alternative for this resource other than the No Build Alternative, which does not meet the Project Purpose and Need.

No other Section 4(f) resources are located along the Preferred Alternative in Area 1 (Arlington). There are two historic properties along the Preferred Alternative in Area 2 (Northern Virginia) with a permanent Section 4(f) use, and there are six historic properties along the Preferred Alternative in Area 3 (Fredericksburg) with a permanent Section 4(f) use. There are no feasible and prudent avoidance alternatives in Areas 2 or 3. The No Build Alternative would be the avoidance alternative for resources in these areas, and it does not meet the Project Purpose and Need.

There are two historic resources with a permanent Section 4(f) use along the Preferred Alternative in Area 4 (Central Virginia). No avoidance alternatives were identified for the Preferred Alternative in this area; therefore, the No Build Alternative would be the avoidance alternative. The No Build Alternative does not meet the Project Purpose and Need. Three resources along the Preferred Alternative in Area 5 (Ashland) have a permanent Section 4(f) use. There is no avoidance alternative besides the No Build in this area. There are three resources along the Preferred Alternative in Area 6 (Richmond) with a permanent Section 4(f) use. Due to extensive resources in Area 6 (Richmond), there is no avoidance alternative that would avoid all potential Section 4(f) use other than the No Build Alternative. The No Build Alternative does not meet the Project Purpose and Need.

Each alternative area is discussed individually below.

6.6.2 Entire DC2RVA Corridor

One historic property is located throughout the majority of the Project corridor. Given that the historic RF&P Railroad (500-0001) traverses the Project corridor from the Potomac River on the north to Main Street Station on the south, FRA has determined that there is a permanent Section 4(f) use with the Preferred Alternative in all six of the alternative areas. The No Build is the only alternative that would avoid all Section 4(f) uses within the corridor, and this would not meet the Project Purpose and Need.

6.6.3 Preferred Alternative in Area 1

FRA determined that Preferred Alternative in Area 1 will not result in a Section 4(f) use for any resources.

6.6.4 Preferred Alternative in Area 2

FRA determined that the Preferred Alternative in Area 2 will result in a Section 4(f) use of two resources: the RF&P Bridge over the Occoquan River (500-0001-0022) and archaeological site 44ST1223, a Civil War campsite that abuts the railroad tracks. The only alternative that avoids these resources is the No Build, which does not meet the Project Purpose and Need.

6.6.5 Preferred Alternative in Area 3

FRA determined that the Preferred Alternative in Area 3 will result in a Section 4(f) use of six historic resources. Four of the six resources with a Section 4(f) use are archaeological sites that straddle the rail line: site 44SP0187 (Marye's Mill), site 44SP0688 (Block 49), site 44SP0687 (Block 48), and site 44SP0468 (Jackson's Earthwork). Because the archaeological sites straddle the extant rail corridor and the bridge/structures comprise the physical fabric of the elevated rail system in this area, there is no prudent and feasible avoidance to these resources except for the No Build Alternative.

The remaining two historic resources are the Rappahannock River Railroad Bridge and Associated Structures/Platform (111-0132-0025) and the Fredericksburg Historic District (111-0132). Impacts to both resources are the result of physical modifications to the built environment. The Project would necessitate changes to the extant rail structures and platforms in downtown Fredericksburg through the widening of the extant rail structural system, rebuilding piers, and redesigning the passenger waiting area. It will also require the construction of a new parking deck near the rail station. Use of both areas is required to achieve the Project goals, and reuse of the historic rail structural system rather than building a new system limit impacts on surrounding historic properties. The only alternative that avoids all impacts in this area is the No Build Alternative, which does not meet the Project Purpose and Need.

6.6.6 Preferred Alternative in Area 4

FRA determined that the Preferred Alternative in Area 4 will result in a Section 4(f) use of two historic resources along the existing tracks: the Doswell Depot and Tower (042-0093) and the Doswell Historic District (042-5448). The depot and tower are located on opposite sides of the tracks. With the addition of a third track, the depot will remain, but the tower will be moved to the east. This action will result in a 4(f) use of this resource. The only prudent and feasible alternative is the No Build Alternative, which would leave the extant track system intact. This does not meet the Project Purpose and Need. The Doswell Historic District is located on both sides of the existing tracks; as such there is no avoidance alternative other than the No Build Alternative which does not meet the Purpose and Need of the Project.

6.6.7 Preferred Alternative in Area 5

FRA determined that the Preferred Alternative in Area 5 will result in a Section 4(f) use of three historic resources along the existing tracks. Although the Preferred Alternative in Area 5 avoids the addition of a third track in this area, work requires the construction of road overpasses at Vaughan Road (Archie Cannon Drive) and Ashcake Road. The new overpass and associated road modifications at Vaughan Road (Archie Cannon Drive) will result in a 4(f) use of the Berkleytown Historic District (166-5073). The district is located east of the track, and the only avoidance alternative is to not modify the road. This does not meet the Project Purpose and Need.

The Preferred Alternative also includes grade-separating (i.e., raising) Hungary Road over the rail corridor. This action will result in the construction of a new road overpass structure and physical changes to the road system, which will result in a Section 4(f) use of the Laurel Industrial School Historic District (043-0292) and Main Building/Robert Stiles Building within the Laurel District (043-0292-0001). The only avoidance alternative is to not construct the overpass and not modify the road to accommodate the new bridge, both of which are part of the No Build Alternative. This does not meet the Project Purpose and Need.

6.6.8 Preferred Alternative in Area 6

FRA determined that the Preferred Alternative in Area 6 will result in a Section 4(f) use of three historic resources. The three resources with a 4(f) use include one historic district, one above ground resource, and one linear district. The Preferred Alternative includes several modifications in Shockoe Bottom. These include construction of new passenger platforms on new piers, installation of a new rail on existing viaducts on both the east and west sides of Main Street Station, and construction of a new rail maintenance access platform southwest of the station.

FRA has determined that the Preferred Alternative in Area 6 will result in a Section 4(f) use of Main Street Station and Trainshed (127-0172) and the surrounding Shockoe Valley and Tobacco Row Historic District (127-0344) due to these physical alterations. There is no prudent and feasible avoidance alternative for these resources with the exception of the No Build Alternative, which would not meet the Purpose and Need of the Project. The Station is also a contributing element to the Seaboard Air Line (SAL) Railroad Corridor (127-6271); thus, impacts to the station, the structures, and the rail line itself will result in a Section 4(f) use of the associated rail line as a historic property. There is no avoidance alternative.

Seaboard Air Line (SAL) Railroad Corridor (Area 6, Richmond)

6.7 MEASURES TO MINIMIZE HARM

Section 4(f), as applied by FRA and in this document, requires a description of the measures undertaken to minimize harm where the Preferred Alternative will result in a Section 4(f) use and where there is no feasible and prudent alternative to that use. Minimization measures are not required when a finding of *de minimis* use is made for Section 4(f) resources because Section 4(f) is satisfied once *de minimis* applies.

FRA has determined that all impacts to parklands, recreational areas, and wildlife refuges will result in *de minimis* impacts; therefore, no further minimization measures are required.

FRA has determined that the Preferred Alternative will result in a Section 4(f) use of 17 historic resources. For all 17 resources with Section 4(f) use, as presented below in north-to-south order, FRA and DRPT evaluated measures to minimize harm and identified mitigation measures for unavoidable impacts.[17] The following sections describe these measures for each of the 17 resources. Full details of mitigation measures are included in the Section 106 Draft Memorandum of Agreement (MOA), which is Appendix K of this Final EIS.

6.7.1 Richmond, Fredericksburg, and Potomac Railroad (500-0001)

The Preferred Alternative is parallel to, and in some instances overlaps, the historic RF&P Railroad, which extends from the Potomac River on the north to Main Street Station on the south. The design of the Project has minimized impacts on the extant rail corridor to the maximum extent practicable through retention of the general alignment, maintenance of existing tracks, and minimizing the LOD outside of the current right-of-way. Preferred Alternative impacts come through replacement of several contributing bridges and culverts—replacements that are required to bring the alignment in compliance with current safety standards and operational protocols—as well as modifications to the Doswell Tower and Main Street Station which are contributing elements to this resource. Measures to mitigate the adverse impacts are detailed in the Section 106 Draft MOA (Appendix K) and include the following:

- Architectural evaluation/Phase II-level study of bridges to be demolished as part of the Project that are contributing elements to the railroad district
- Oral histories of two individuals with an in-depth knowledge/long tenure working on structures along the historic RF&P
- Creation of an online Project map/story board to highlight historic properties along the corridor

6.7.2 RF&P Bridge over Occoquan River (500-001-0022)

The circa 1915 bridge carries the rail over the Occoquan River. Plans include the construction of a new bridge adjacent to the existing structure and physical modifications to the bridge approach. To minimize harm, the existing bridge will be left intact and the new bridge will be constructed to the east of the existing structure, with both bridges to be used for rail travel after the modifications. The new bridge will mirror the general configurations of the historic structure.

---

[17] In addition to the 17 resources with Section 4(f) use, FRA and DRPT evaluated measures to avoid and mitigate the remaining 4 adversely effected Section 106 resources with no Section 4(f) use, as part of the Section 106 process. Similarly, commitments have been made to conduct additional studies on the Grave Yard for Free People of Color and Slaves (44HE1203) outside of the Section 106 and 4(f) processes. Details on all commitments are included in the list of Project commitments, which is provided as a preface to the chapters in this Final EIS.

Changes to the rail system were also minimized to the greatest degree possible. However, the work still includes physical encroachment on the NRHP-eligible boundaries of this resource. Mitigation measures are detailed in the Section 106 Draft MOA (Appendix K) and include the following:

- Design review of new structure to assure historic resource compatibility
- Historic American Engineering Record (HAER) documentation of extant structure to include measured drawings, large-format photographs, archival research and production of HAER report

6.7.3 Site 44ST1223 (Civil War Campsite)

This resource includes the remains of a Civil War-era encampment used during the winter of 1862 through spring 1863. The camp was purposefully placed along the historic rail corridor for ease of access to both transportation and goods.

There is no avoidance alternative; however, revised designs of the Preferred Alternative have further minimized harm by reducing the LOD to the greatest degree possible in this area while still meeting all required safety and design components. Mitigation of impacts to this resource are detailed in the Section 106 Draft MOA (Appendix K) and includes the following:

- Archaeological data recovery on the portion of the site to be impacted by the Project
- Installation of interpretive sign on archaeology and camp life in a location deemed appropriate by NPS-Fredericksburg
- Scholarly article discussing the historical and archaeological importance of the site

6.7.4 Rappahannock River Railroad Bridge and Associated Structures/Platform (111-0132-0025) and Fredericksburg Historic District (111-0132)

These resources include the bridge that carries the railroad tracks across the Rappahannock River, the rail passenger platform, and a series of raised structures that bring the rail through Fredericksburg. All are contributing elements to the surrounding Fredericksburg Historic District. The bridge and the raised rail facility were constructed in 1927 when the rail was raised to avoid at-grade crossings in the city’s core. The resource only included the bridge during preliminary studies associated with the Draft EIS but the historic boundaries were expanded to include all rail structures during architectural evaluation studies completed in association with the Final EIS. The Preferred Alternative includes the construction of a new bridge adjacent to the extant structure, which will not in itself result in a 4(f) use, as well as the replacement and repair of some of the structural elements and the rail platform; these constitute a use.

The bridge, structural elements, and platform are contributing elements to the Fredericksburg Historic District. The changes associated with these elements will cause physical impacts to the district. In addition, the construction of a new parking deck, building a new rail station, and modifications to the roadways will cause additional physical impacts. For all of these resources, there is no avoiding these impacts. In an effort to minimize harm, Project engineers worked with cultural resource professionals to reduce the impacts to the greatest degree possible while still meeting the Project’s Purpose and Need as well as applicable rail standards.

Mitigation of impacts to these resources are detailed in the Section 106 Draft MOA (Appendix K). For the Rappahannock River Railroad Bridge and associated structures and platform (111-0132-0025), mitigation includes:

- Design review of new structure to assure historic resource compatibility
- HAER documentation of extant structure to include measured drawings, large-format photographs, archival research, and the production of HAER report
- Cultural landscape study of the Rappahannock River watershed and historic transportation crossings within the City of Fredericksburg

For the Fredericksburg Historic District (111-0132), mitigation includes:

- Design review of new parking deck and passenger train station to assure historic district compatibility
- Historic context on the evolution of the rail system in downtown Fredericksburg
- Lecture for the general public on the results of the contextual study on the evolution of the railroad in Fredericksburg
- Abbreviated narrative for use in developing a webpage on the history of the railroad in Fredericksburg, as well as details of the Project

6.7.5 Site 44SP0187 (Bridge/Marye's Mill), Site 44SP0688 (Block 49) and Site 44SP0687 (Block 48)

Site 44SP0187 comprises a set of stone piers located within and directly adjacent to the Rappahannock River, just east of the rail trestle, in Fredericksburg. The piers may represent a mill once located in this area or be associated with the pre-1927 rail bridge, but additional research is needed to determine their exact use. Sites 44SP0688 (Block 49) and 44SP0687 (Block 48) are newly recorded resources that were not presented in the Draft EIS. Modifications to the LOD in this area due to additional engineering associated with the Preferred Alternative resulted in their addition to the list of historic properties. These two sites represent two blocks of dense historic use straddling the rail corridor just west of the river. The footprints of all three sites overlap with the LOD for the new Rappahannock River rail bridge and associated structural/platform modifications. Construction of the bridge, and more specifically the approach to the structures and the construction of the structures/platform themselves, will physically impact significant archaeological deposits. DRPT evaluated alternatives to the currently designed bridge approach/structural changes of the Preferred Alternative in order to minimize harm to these archaeological sites; however, other approaches and new structural locations caused greater disturbances to nearby historic properties. The footprint of the Project was lessened to the greatest extent possible to minimize impacts on the site. Mitigation measures for the impacts to these resources are detailed in the Section 106 Draft MOA (Appendix K) and include the following:

- Archaeological data recovery on the portions of each site to be impacted by the Project
- Scholarly article discussing the historical and archaeological importance of the sites
- Lecture presented to the general public on the history and archaeology of the three sites
- Museum display in new Fredericksburg passenger station to highlight the sites and showcase artifacts retrieved during data recovery

- Interpretive sign to be placed within or near Fredericksburg passenger station describing the archaeology of the area

6.7.6 Site 44SP0468 (Earthworks/Jackson's Earthworks)

This set of earthworks is located on both sides of the railroad tracks south of Fredericksburg. They represent the intense occupation of the Fredericksburg area by both Union and Confederate armies throughout the duration of the Civil War. Additional archaeological studies completed after the publication of the Draft EIS associated with LOD modifications resulted in the expansion of this site. Proposed work in this area will include construction of a third railroad track, which will result in impacts to this archaeological site. Because the site straddles the track, there is no avoidance alternative. Impacts were minimized through design efforts of DRPT to reduce the LOD as much as possible while still achieving the Project goals. Mitigation of impacts to this resource are outlined in the Section 106 Draft MOA (Appendix K) and includes the following:

- Archaeological data recovery on the portion of the site to be impacted by the Project
- Installation of interpretive sign on archaeology and camp life in a location deemed appropriate by NPS-Fredericksburg
- Scholarly article discussing the historical and archaeological importance of the site

6.7.7 Doswell Historic District (042-5448) and Doswell Depot and Tower (042-0093)

The Doswell Historic District is located at the intersection of the main rail corridor (historic RF&P Railroad) and the Buckingham Branch Railroad, which was historically a main line of the Chesapeake and Ohio Railroad. The community developed around the two railroads, including a store, a bank, an inn, and numerous dwellings. The current rail station and associated tower were built in 1929. The district straddles the extant rail lines and, as such, the Project runs through the center of the district. Similarly, the depot is located on the west of the tracks while the associated tower is on the east side of the tracks, and the existing rail that is part of the DC2RVA Project corridor threads through the narrow space in between these two historic buildings.

DRPT carefully refined plans of the Preferred Alternative in this area to minimize impacts to the district. Original design concepts ranged from a rail bridge spanning the historic district to enlarging the intersection to accommodate additional rail traffic. DRPT conducted consulting party charrettes on the design of the rail in this location (see Appendix E of this Final EIS for additional details). The resulting plans are greatly reduced and minimize the footprint in this area to the maximum extent practicable. Plans for utilities were also minimized to limit impacts. Despite these efforts, the rail will be widened on the east side of the railroad right-of-way in the vicinity of the Doswell interlocking tower, a contributing element to the district, causing the tower to be moved from its original location to a new site to the east. While retention of the tower minimizes the Project impacts, moving the structure constitutes a 4(f) use. Mitigation measures for the adverse effects to these resources are detailed in the Section 106 Draft MOA (Appendix K), and include the following:

- NRHP nomination form for the Doswell Historic District
- Virginia state historical highway marker on the Doswell Historic District
- Abbreviated narrative for use in developing a webpage on the history of Doswell, as well as details of the Project

- Historic American Building Survey (HABS) Level II documentation of the tower to include measured drawings, large-format photography, archival research, and production of a HABS report
- Move tower from limits of disturbance to new site adjacent to tracks but outside Project limits
- Interpretive sign to be placed within or near depot or tower on the history of the resource

6.7.8 Berkleytown Historic District (166-5073)

This historic district is located southeast of the intersection of the railroad and Vaughan Road (Archie Cannon Drive). The area was settled by African-American residents of Ashland as a domestic enclave outside of town. The Preferred Alternative includes the construction of an overpass bringing the roadway over the rail in this area, thus requiring physical modifications to the road system inside the district boundaries and the construction of a new, large structure within the viewshed of the district. Project engineers have worked to refine Preferred Alternative plans in this area to minimize impacts to the district, including narrowing the LOD to the degree possible while still achieving the Project Purpose and Need. The footprint of the road has thus been minimized, but changes to the original road configuration are still required, as well as building the new overpass itself. Mitigation for these impacts is detailed in the Section 106 Draft MOA (Appendix K), and includes the following:

- Design review of new road structure (Vaughan Road) to assure historic district compatibility
- Oral histories of two individuals with long tenure living or working in district
- NRHP nomination form for the historic district
- Create text for historic walking tour of district in consultation with Town of Ashland and Ashland Museum
- Virginia state historical highway marker on the Berkleytown Historic District

6.7.9 Laurel Industrial School Historic District (043-0292) and Main Building/Robert Stiles Building (043-0292-0001)

The historic district and main building are located west of Hungary Road. The school was established in 1892 to educate wayward youth; the main building was constructed as the primary administrative center in 1985. The Preferred Alternative involves the construction of an overpass to bring Hungary Road over the railroad corridor. The new overpass will result in physical modifications to the road system within the district and surrounding the main building. It will also involve the construction of the overpass itself, a new visual element. Engineering associated with the Preferred Alternative was minimized to the greatest degree possible, including lowering the height of the overpass and narrowing the LOD to minimize road changes while meeting the Project Purpose and Need. Mitigation for the impacts to both resources is detailed in the Section 106 Draft MOA (Appendix K), and includes the following:

- Design review of new road structure (Hungary Road) to assure historic district compatibility
- Historic context on late-nineteenth/early-twentieth century reform schools in Central Virginia

- Series of georeferenced, GIS-based overlays to illustrate the evolution of the landscape and road system in this area
- Interpretive sign to be placed within or near Main Building/Robery Styles Building on the history of the resource

6.7.10 Shockoe Valley and Tobacco Row Historic District (127-0344) and Main Street Station Trainshed (127-0172)

The Shockoe Valley and Tobacco Row Historic District comprises the historic core of Shockoe Bottom and includes resources spanning the eighteenth through twentieth centuries. Main Street Station, located within the district, was built in 1901 as the main terminal for the Seaboard Air Line (SAL) Railroad and was a major station for the historic Chesapeake and Ohio Railroad. The property includes the Beaux Arts-style station as well as the associated trainshed, platform, and other landscape elements. The area within the district and around Main Street Station has been the subject of extensive coordination and consultation among FRA, DRPT, the City of Richmond, other cooperating agencies, consulting parties, ACHP, and the public. DRPT worked to minimize the extent of the changes to the District and its contributing elements by making the footprint of the Preferred Alternative as minimal as possible, reducing the size of the new platforms, and committing to include design review in the final designs to minimize harm to this resource. This includes avoiding recorded nearby archaeological sites associated with the slave trade, such as the "Burial Ground for Negros" (44HE1089) and Lumpkins Jail/Devil's Half Acre (44HE1053). In addition, DRPT will conduct archaeological studies in all pier locations within the historic district, regardless of the presence or absence of recorded sites to assure that any intact archaeological sites in the LOD are explored. The Section 106 Draft MOA (Appendix K) details all mitigation for the adverse effects to the Shockoe Valley and Tobacco Row Historic District and Main Street Station, and includes the following:

- Design review of platform and other station modifications to assure historic district compatibility
- Development of historic context on the association of the slave trade and the RF&P railroad/ the downtown Richmond segment of the Virginia Central Railroad and other precursors of the Chesapeake and Ohio/Seaboard Railroad
- Lecture presented to the general public on the association of the slave trade and the RF&P railroad/ the downtown Richmond segment of the Virginia Central Railroad and other precursors of the Chesapeake and Ohio/Seaboard Railroad
- Work with City of Richmond and others to create boundaries for a potential slave trade-related historic district in Shockoe Bottom
- Fabrication and installation of a Virginia state historical highway marker documenting the slave trade and nearby associated sites
- Design review of platform modifications and new structures to assure resource compatibility
- Development of historic context on the evolution of the rail system in downtown Richmond
- Creation of webpage documenting the evolution of the rail system in downtown Richmond

6.7.11 Seaboard Air Line (SAL) Railroad Corridor (127-6271)

The historic SAL Railroad was a competing company to the ACL. This operation also ran between Richmond and Florida, commencing at Main Street Station and crossing the James River, then running parallel to the ACL before veering west in Petersburg. Known today as the “S-Line,” this historic property is composed of the rail itself, stations, track houses, and structures. As with the RF&P, DRPT vigorously sought to minimize harm by narrowing the LOD where possible, maintaining historic bridges, and reusing the extant corridor. Despite these efforts, several structures—and Main Street Station itself—require modifications to meet ridership needs and safety features. As such, avoidance of all contributing elements is not possible. Due to the adverse effect/use of the property, the Section 106 Draft MOA (Appendix K) includes mitigation measures to address the adverse effects to the SAL, and includes the following:

- Design review of modifications to contributing elements to the district to assure resource compatibility
- Development of historic context on railroad depots along the SAL Railroad in Virginia
- Document stations and towers that are contributing elements to the Seaboard Air Line Railroad that have not been previously recorded with the Virginia SHPO

6.8 COORDINATION

This section describes the Section 4(f) coordination with the agencies with jurisdiction over the properties and the U.S. Department of the Interior (DOI), including correspondence and meetings:

- Section 6.8.1 describes the coordination related to parks, recreation areas, and wildlife and waterfowl refuges.
- Section 6.8.2 describes the coordination related to historic resources.
- Section 6.8.3 describes the coordination with the DOI.

6.8.1 Parks, Recreation Areas, Wildlife and Waterfowl Refuge Coordination

Throughout the Project, DRPT has coordinated with the Section 4(f) resource owners regarding permanent incorporation and temporary occupancy of park resources, as summarized in Table 6.8-1. Copies of letters and concurrence statements are included in Appendix U of the Draft EIS and Appendix E of the Final EIS.

National Park Service’s Fredericksburg and Spotsylvania National Military Park (Area 3)

Table 6.8-1: Parks, Recreation, Wildlife and Waterfowl Refuge Section 4(f) Coordination

Resource Owner	Type[1]	Date	Purpose
Arlington County Department of Parks and Recreation	Letter	June 16, 2017	Provided summary of preliminary impacts to Long Bridge Park and Mount Vernon Trail and requested concurrence with *de minimis* use and temporary occupancy

Resource Owner	Type[1]	Date	Purpose
Arlington County	Meeting	February 2, 2018	Review of Draft EIS comments
City of Richmond, Department of Public Works	Letter	October 22, 2018	Provided update of impacts, requested concurrence with *de minimis* use and temporary occupancy of Walker's Creek Retention Basin Park
City of Richmond, Department of Parks, Recreation, and Community Facilities	Letter	October 22, 2018	Provided update of impacts, requested concurrence with *de minimis* use and temporary occupancy of Walker's Creek Retention Basin Park
Arlington County Department of Parks and Recreation	Letter	October 29, 2018	Provided update of impacts to Long Bridge Park and Mount Vernon Trail, and requested concurrence with temporary occupancy for Long Bridge Park
NPS – George Washington Memorial Parkway Headquarters	Letter	October 29, 2018 and December 6, 2018	Provided update of impacts and requested concurrence regarding temporary occupancy of George Washington Memorial Parkway and Mount Vernon Trail
City of Alexandria	Letter	October 29, 2018	Provided update of impacts and requested concurrence with temporary occupancy of Dog Run Park at Carlyle, Four Mile Run Trail, Potomac Yard Park, Potomac Yard Landbay N., and Rail Park
NPS – Fredericksburg and Spotsylvania National Military Park	Letter	October 29, 2018	Provided update of impacts and requested concurrence regarding temporary occupancy of Fredericksburg and Spotsylvania National Military Park
Prince William County Parks and Recreation Department	Letter	October 29, 2018	Provided update of impacts and requested concurrence regarding temporary occupancy of Veterans Memorial Park
Henrico County Recreation and Parks	Letter	October 29, 2018	Provided impacts and requested concurrence regarding temporary occupancy of Laurel Recreation Area
Henrico County Recreation and Parks	Response Letter	October 31, 2018	Concurrence regarding temporary occupancy of Laurel Recreation Area
Prince William County Parks and Recreation Department	Response Letter	November 2, 2018	Concurrence regarding temporary occupancy of Veterans Memorial Park
City of Richmond, Department of Public Works	Response Letter	November 16, 2018	Concurrence regarding *de minimis* use and temporary occupancy of Walker's Creek Retention Basin Park
NPS – Fredericksburg and Spotsylvania National Military Park	Response Letter	December 7, 2018	Concurrence regarding temporary occupancy of Fredericksburg and Spotsylvania National Military Park
NPS – George Washington Memorial Parkway Headquarters	Response Letter	December 12, 2018	Concurrence regarding temporary occupancy of George Washington Memorial Parkway and Mount Vernon Trail
City of Alexandria	Response Letter	December 13, 2018	Concurrence regarding temporary occupancy of Dog Run Park at Carlyle, Four Mile Run Trail, Potomac Yard Park, Potomac Yard Landbay N., and Rail Park
Arlington County Department of Parks and Recreation	Response Letter	December 18, 2018	Concurrence regarding temporary occupancy of Long Bridge Park

Notes: 1. "Letter" denotes a letter from DRPT to the resource owner; "Response Letter" denotes a letter from the resource owner to DRPT.
Row highlighted in gray denotes meeting that was held or letter sent/received subsequent to the release of the Draft EIS in September 2017.

6.8.2 Historic Resources Section 4(f) Coordination

DRPT coordinated with numerous property owners and officials with jurisdiction over resources protected under Section 4(f), both before and after the issuance of the Draft EIS . Most of the coordination was done as part of the Section 106 process, but, when relevant, Section 4(f) was also discussed. In total, DRPT held over 50 meetings and formal conference calls with interested parties and sent over 75 formal emails and letters soliciting feedback from consulting parties, interested citizens, and involved agencies. In addition, by letter dated December 4, 2018, DRPT notified the DHR of FRA's 4(f) determinations, including all *de minimis* determinations. By letter dated January 4, 2019, DHR acknowledged FRA's 4(f) determinations. Full rosters of all coordination efforts and copies of all of the correspondence can be found in Appendix U of the Draft EIS and Appendix E of the Final FEIS.

6.8.3 U.S. Department of Interior

The Draft Section 4(f) Evaluation was included as Chapter 5 of the Draft EIS and submitted to the DOI for review in September 2017. Comments were received from several DOI agencies on both documents and are presented in Appendix B1 of this Final EIS.

This Final Section 4(f) Evaluation is being submitted to DOI for review and their concurrence will be provided in the Record of Decision.

6.9 FINAL SECTION 4(F) EVALUATION

FRA will issue its final Section 4(f) determination as part of the Record of Decision for the DC2RVA Project.

CHAPTER 4

SELECTION OF THE PREFERRED ALTERNATIVE

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

4 SELECTION OF THE PREFERRED ALTERNATIVE

The Preferred Alternative[1] for the Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) Project includes the following two elements:

- An intercity passenger rail service plan with increased passenger train frequency (i.e., more trains) and improved on-time performance of existing intercity passenger service. Refer to Section 4.2.
- A physical infrastructure modification plan to provide an additional track (i.e., to provide more capacity for more trains) as well as station area and roadway crossing improvements to provide better train performance. Refer to Section 4.3.

Appendix L of this Final Environmental Impact Statement (EIS) provides a detailed mapbook of the Preferred Alternative for the 123-mile Project corridor, including permanent and temporary Limits of Disturbance (LOD) from which the environmental impacts are evaluated. Appendix L presents the same elements as the mapbooks from Appendices C through H of the Draft EIS, but reflects the LOD of the Preferred Alternative, including any changes between the Draft and Final EIS. The LOD changes are the result of design refinements that were made subsequent to publication of the Draft EIS in response to public and agency comments on the Draft EIS or from refined data (i.e., new data and/or changes to the data that were previously available).

The Preferred Alternative is based on conceptual engineering, which is approximately a 10 percent level of design and is appropriate for decisions to be made during the National Environmental Policy Act (NEPA) process. The conceptual engineering will be further refined during future design phases of the Project, as described in Chapter 7 of this Final EIS. For the conceptual layouts of the intercity passenger rail stations described in this chapter, the Virginia Department of Rail and Public Transportation (DRPT) has applied Amtrak's Station Program and Planning Guidelines (2013) to determine the general footprint of each station in order to accommodate various crew, passenger, and service amenities based on the projected train service and ridership for the Project. However, the actual size, design, and layout of each station, and the staffing of station and service amenities (such as checked baggage service), will be determined by DRPT when service is initiated, in coordination with Amtrak, the station owner/operator, and other stakeholders, in accordance with the Intercity Passenger Rail Station Policy.[2]

---

[1] As described in Section 1.1.2, this chapter uses a condensed format that presents the Preferred Alternative only. Details of all Build Alternatives that were evaluated in the Draft EIS, as well as the process that was used to develop, evaluate, and eliminate them, were presented in Chapter 2 and Appendix A of the Draft EIS.

[2] The Intercity Passenger Rail Station Policy was approved by the Commonwealth Transportation Board (CTB) in January 2018, and is available at: http://drpt.virginia.gov/media/2372/station-stop-policy-final-010817.pdf

4.1 SUMMARY OF SELECTION PROCESS

The selection of the Preferred Alternative presented in this Final EIS includes the following considerations:

- Meeting the Project's Purpose and Need. The selected Preferred Alternative meets the DC2RVA Purpose and Need to increase railroad capacity between Washington, D.C., and Richmond to deliver higher speed passenger rail, expand commuter rail, and accommodate growth of freight rail service in an efficient and reliable multimodal rail corridor (refer to Section 1.3).
- Information and analyses disclosed in the Draft EIS, including impacts to the natural and human environment and intercity passenger rail ridership, rail operations, cost, and constructability of each alternative.
- Extensive outreach and communications undertaken with the public, stakeholders, and elected officials in the DC2RVA corridor (refer to Section 2.1 and 2.2).
- Comments from agencies, organizations, and the public that were received during the comment period on the Draft EIS (refer to Section 2.4).
- Ongoing coordination with regard to the historical context along the corridor, specifically with Consulting Parties in regard to the Section 106 process and minimization of impacts to historic properties (refer to Section 3.1).
- Additional rail operations simulation modeling to test proposed infrastructure sufficiency conducted in support of the Project (refer to Section 3.2).
- Recommendations from the Town of Ashland/Hanover County Community Advisory Committee (CAC) process (refer to Section 3.3).
- The CTB Resolution for the Project (refer to Section 3.4 and Appendix H of this Final EIS), and the subsequent Recommendation Report (refer to Appendix I of this Final EIS).
- The refinement of feasible alternatives for the construction of additional capacity as part of the Long Bridge project by the District of Columbia Department of Transportation (DDOT) (refer to section 4.3.1.2).

4.2 OVERVIEW OF SERVICE PLAN

This section summarizes the intercity passenger rail service that is proposed to be added as part of the Project, and the Virginia Railways Express (VRE) and freight service that operates in the corridor today and will continue to do so in the future. Refer to Section 2.2 of the Draft EIS and its Appendix I for full details of existing intercity passenger, VRE, and freight train service.

- The Project proposes to add 9 new daily intercity passenger round trips (18 total trains per day) by 2025. Under the proposed service plan, intercity passenger trains will operate between Washington, D.C. and Richmond every 1 to 2 hours in each direction during the day and early evening. See Section 4.2.1 and Figure 4.2-1.
- Regardless of whether the DC2RVA Project is implemented, DRPT estimates that there could be close to 100 total daily trains in the corridor by 2025 and close to 120 total daily trains in the corridor by 2045, compared to as many as 89 total daily trains today. These estimates include daily intercity passenger, VRE, and freight service. See Section 4.2.2.

Figure 4.2-1: Intercity Passenger Train Service for the Preferred Alternative

4.2.1 Intercity Passenger Rail Service

The Preferred Alternative will add 9 new daily intercity passenger round trips (18 total trains per day) to the DC2RVA corridor between Washington, D.C. and Richmond, VA. Figure 4.2-1 illustrates the proposed service patterns of the proposed intercity passenger rail services that will operate in the corridor and includes both existing service and the proposed Southeast High Speed Rail (SEHSR) service that will be implemented as part of this Project, each of which are described in detail separately below.

Existing Intercity Passenger Rail Service. Amtrak currently operates four types of intercity passenger service in the Project corridor, which will continue after implementation of the DC2RVA Project:

- Interstate Corridor (Carolinian) service operates between New York and North Carolina through Virginia, making fewer stops in the Project corridor than the Northeast Regional (Virginia) service. The Project will add new similar service, as described below.
- Northeast Regional (Virginia) service provides regional passenger rail service from Boston and New York and continues south to serve routes in Virginia. Trains make local station stops. The Project will add new similar trains, as described below.
- Long Distance service operates from New York and continues through Washington, D.C. and Virginia to other out-of-state locations. Long distance trains serve the fewest Amtrak station stops within the Project corridor. The Project will not affect the frequency of Long Distance trains in service, but will modify routing/scheduling of those trains within the corridor and improve their operating reliability within the corridor to meet Project goals. The Project will add one additional stop for these trains at Main Street Station in Richmond.
- Auto Train service is a daily nonstop, overnight train between dedicated station facilities in Lorton, VA and Sanford, FL, and carries passengers and their automobiles. The Project will not affect the frequency, routing, or scheduling of the Auto Train within the corridor, but will improve operating reliability within the corridor to meet Project goals.

Proposed Intercity Passenger Rail Service. The 9 new daily intercity passenger round trips (18 total trains per day) proposed by this Project will be incorporated into the existing passenger rail network, as follows (subject to available capacity and future operating schedule):

- 4 new daily Interstate Corridor (SEHSR) round trips (8 total trains per day) to North Carolina, with station stops in the DC2RVA corridor in: Alexandria, Fredericksburg, and Richmond.
  - This service will complement Amtrak’s current Interstate Corridor (Carolinian) service by providing additional frequencies to North Carolina; however, the new SEHSR trains will have slightly different service patterns in the DC2RVA corridor and use different routes south of the DC2RVA corridor, where SEHSR trains are expected to provide a faster and more direct route to Raleigh and Charlotte, NC.
  - This service aligns with the proposed intercity passenger trains between Washington, D.C. and Charlotte, NC from the 2002 Tier I EIS (refer to Section 1.2.1 for further details).

- 5 new daily Northeast Regional (SEHSR) round trips (10 total trains per day) to Virginia, with station stops in the DC2RVA corridor in: Alexandria, Woodbridge, Quantico, Fredericksburg, Ashland, and Richmond.
  - This service will provide additional frequencies on the same routes of existing Amtrak Northeast Regional (Virginia) services, originating/terminating within Virginia in Newport News (1 new daily round trip), Norfolk (3 new daily round trips), or Richmond (1 new daily round trip).
  - This service completes the service plan defined in the 2012 Richmond to Hampton Roads (R2HR) EIS (refer to Section 1.2.2 of this Final EIS for further details), and adds 1 new daily round trip originating in Richmond at Main Street Station, which was added to the Project to provide an early morning departure north to Washington, D.C. and a corresponding late evening train.

Main Street Station is unique in the Project corridor in that existing intercity passenger trains will be rerouted to it as part of the Preferred Alternative. Main Street Station is currently served by 2 daily round-trip (4 total per day) intercity passenger trains along the route to Newport News. The Project will rebuild the S-Line through Richmond, enabling all existing and proposed new intercity passenger trains stopping at Richmond to serve both Staples Mill Road and Main Street Stations. As a result, Main Street Station will see a total of 18 daily round-trip (36 total per day) intercity passenger trains, which is an increase of 16 daily round-trip (32 total per day) intercity passenger trains above the current service level at Main Street Station. Of those, the DC2RVA Project will add 9 new daily intercity passenger round trips (18 total trains per day) and also reroute 7 existing daily round trips (14 existing total trains per day).

As part of the Project, the maximum operating speed for all passenger trains on the DC2RVA corridor, except for the Auto Train, will be increased from the current 70 mph to a maximum authorized speed of 90 mph. However, due to localized speed restrictions, track curvature, track geometry and/or station proximity, there are certain portions of the DC2RVA Project corridor over which trains will not be able to operate at the 90 mph maximum authorized speed. Additional details on the specific station operations of the service plan and speeds within each portion of the corridor are provided in the alternative descriptions in Section 4.3 of this Final EIS.

Draft EIS Section 2.2 presented descriptions of existing Amtrak service and additional details on the proposed DC2RVA service plan for intercity passenger trains.

4.2.2 Other Service in the DC2RVA Corridor

The Project capacity improvements, as described in Section 4.3 of this chapter, provide the additional infrastructure necessary to meet the Purpose and Need, which includes additional capacity to accommodate both the planned expansion of VRE commuter rail service and the forecasted growth of freight rail service by CSXT, the host railroad. It is important to note that VRE and CSXT growth is independent of the DC2RVA Project and will occur regardless of whether or not the DC2RVA Project is implemented.

Separate from the Purpose and Need of the Project, DRPT and the Federal Railroad Administration (FRA) recognize that CSX Transportation (CSXT), VRE, or other stakeholders may pursue additional capital improvements in the Project corridor between Washington, D.C. and Centralia, or on the adjacent railroad network, that may impact Project corridor operations beyond what was assumed for this study. Subsequent iterations of rail operations analysis and infrastructure validation through the life of the Project will include any modifications to the railroad network constructed by others, as needed, to ensure that the proposed Project infrastructure and operations remains effective to meet the Purpose and Need of the Project.

VRE. The DC2RVA corridor hosts all VRE commuter rail service between CP Virginia in Washington, D.C. and AF interlocking in Alexandria, which is currently 34 trains (17 daily round trips). At AF Interlocking, approximately half of the VRE service leaves the corridor heading toward Manassas/Broad Run. The remaining VRE service continues on the DC2RVA corridor south of Alexandria to the VRE Spotsylvania station and Crossroads maintenance facility. The DC2RVA Project will accommodate the following planned future expansion of VRE service: two additional Fredericksburg Line trains (one daily roundtrip) that will operate in the DC2RVA corridor between Washington, D.C. and Spotsylvania; and two additional Manassas Line trains (one daily roundtrip) that will operate in the DC2RVA corridor only between Washington, D.C. and Alexandria. Any additional plans to expand VRE service beyond the aforementioned levels are beyond the scope of the DC2RVA Project and would require additional analysis, at that time.

Freight. Approximately 20 to 30 freight trains currently operate daily on the DC2RVA corridor between Washington, D.C. and Richmond. As part of the planning work to accommodate the forecasted growth of freight service, DRPT solicited input from CSXT about future increases in freight traffic in the corridor through the year 2045, which is the 20-year horizon beyond the Project's proposed implementation year of 2025. DRPT used the U.S. Department of Transportation's Freight Analysis Framework[3] to forecast how rail freight traffic in the DC2RVA Corridor will increase and change through the year 2045. Based on this estimation, DRPT anticipates that there will be 25 to 37 daily freight trains by 2025 (an increase of 5 to 7 trains) and 40 to 55 daily freight trains by 2045 (an increase of 20 to 25 trains); however, actual CSXT freight growth may vary based on market demands. For more information on how planned increases in freight rail traffic were taken into account, refer to Appendix I of the Draft EIS.

In certain segments of the Corridor, the new and upgraded infrastructure proposed by the Project could also allow for a potential increase in freight train speeds. The most significant increase in freight train speeds could occur between Richmond's Main Street Station and Centralia, where the Project proposes to rebuild a 25 mph freight line to track standards that could accommodate passenger trains with a maximum authorized speed of 79 mph and freight trains with a maximum authorized speed of 60 mph. Throughout the corridor north of Richmond, a number of curves will be rebuilt, which could result in potential freight train speed increases of 5 mph to 20 mph.

4.3 PREFERRED ALTERNATIVE BY AREA

The Draft EIS for the DC2RVA Project identified potential Build Alternatives in six alternative areas from north to south along the corridor, as described below. This Final EIS evaluates the Preferred Alternative, as presented in this section and summarized in Figure 4.3-1; it connects a Build Alternative from each of the 6 alternative areas to form a contiguous 123-mile route through the Project corridor. The Preferred Alternative consists of Build Alternatives 1B, 2A, 3B, 4A, 5A, and 6F as evaluated in the Draft EIS.

Alternative Area 1: Arlington. A 1-mile section in Arlington from the south side of the Potomac River to Crystal City that includes the approach to the existing two-track Long Bridge, which crosses the Potomac River between Washington, D.C. and Arlington, VA. The Long Bridge is the subject of a separate environmental study being led by DDOT to expand capacity of the crossing to four-tracks (see Section 1.4.2 for summary of that study). There are no intercity passenger rail stations located in Area 1.

---

[3] The Freight Analysis Framework is available at: https://ops.fhwa.dot.gov/freight/freight_analysis/faf/

Alternative Area 2: Northern Virginia. A 47-mile section from Crystal City in Arlington to the Dahlgren Spur just north of the Rappahannock River at Fredericksburg, which passes through developed urban areas and crosses several major waterways, including the Occoquan River, Neabsco Creek, Powells Creek, and Aquia Creek. It is the most congested area in the Project corridor with intercity passenger trains, VRE commuter trains, and CSXT freight trains operating on the existing tracks. There are three intercity passenger rail stations in Area 2: Alexandria, Woodbridge, and Quantico. VRE provides commuter service to these three stations as well as at six other stations in Area 2: Crystal City, Franconia/Springfield, Lorton, Rippon, Brooke, and Leeland Road. A new VRE station at Potomac Shores is scheduled to open in 2020.

Alternative Area 3: Fredericksburg. A 14-mile section through Fredericksburg, from the Dahlgren Spur just north of the Rappahannock River to Crossroads, VA. The corridor in this area crosses the Rappahannock River, passes through the City of Fredericksburg, and traverses several historic and cultural resources including the Fredericksburg National Military Park. The Fredericksburg Station in the City of Fredericksburg is served by both Amtrak and VRE. Additionally, VRE serves Spotsylvania Station at Crossroads in the southern end of Area 3, which is also the southern terminus of VRE service in the DC2RVA corridor.

Alternative Area 4: Central Virginia. A 29-mile section from Crossroads to Doswell, through a largely rural area with multiple small waterway crossings and extensive wetlands. This portion of the corridor represents the best opportunity for passenger trains to achieve and maintain the 90 mph maximum authorized speed identified for the Project. There are no intercity passenger rail stations located in Area 4.

Alternative Area 5: Ashland. A 10-mile section including the Town of Ashland and rural portions of Hanover County, extending from Doswell to I-295. There is one intercity passenger rail station in Area 5 at Ashland. Near the center of the area, the existing two-track main line runs at-grade for approximately two miles on narrow right-of-way through the center of Railroad Avenue/Center Street in the Town of Ashland.

Alternative Area 6: Richmond. A 23-mile section from I-295 to Centralia, VA, that includes Henrico County, the City of Richmond, and Chesterfield County. There are two intercity passenger rail stations in Area 6 at Staples Mill Road Station (in Henrico County) and Main Street Station (in downtown Richmond). Two rail routes diverge at Acca Yard, north of Richmond, and reconnect at Centralia (the southern terminus of the Project):

- The A-Line is the western rail line around Richmond, and is currently used by the majority of north-south passenger and freight trains. It is CSXT's principal freight route and is approximately 14.3 miles from the south end of Acca Yard to Centralia.
- The S-Line runs through the downtown center of Richmond, as shown in Figure 4.3-1, and is currently used primarily by local freight to serve industry and intercity passenger rail service to Newport News. It is approximately 15.6 miles from the south end of Acca Yard to Centralia.

ALTERNATIVE AREA 1: ARLINGTON (LONG BRIDGE APPROACH)
Alternative 1B
Add Two Main Tracks on the West
Location: CFP 110 – CFP 109.3
Approximate Length: 1 Mile

ALTERNATIVE AREA 2: NORTHERN VIRGINIA
Alternative 2A
Add a Third or Fourth Main Track
Location: CFP 109.3 – CFP 62
Approximate Length: 47 Miles

ALTERNATIVE AREA 3: FREDERICKSBURG
Alternative 3B
Add a Third Main Track Through the City,
Add a Third Main Track North and South of the City
Location: CFP 62 - CFP 48
Approximate Length: 14 Miles

ALTERNATIVE AREA 4: CENTRAL VIRGINIA
Alternative 4A
Add a Third Main Track
Location: CFP 48 - CFP 19
Approximate Length: 29 Miles

ALTERNATIVE AREA 5: ASHLAND
Alternative 5A
Maintain Two Tracks Through Town (No Station Improvements), Add a Third Main Track North and South of Town
Location: CFP 19 - CFP 9
Approximate Length: 10 Miles

ALTERNATIVE AREA 6: RICHMOND
Alternative 6F
Staples Mill Road Station and Main Street Station Full Service with S-Line Improvements
Location: CFP 9 - A 11 Centrailia
Approximate Length: 23 Miles

S-Line
Richmond

Figure 4.3-1: Preferred Alternative

Note that for the figures and tables in this chapter, CSXT uses prefixes to denote track mileposts within subdivisions: "CFP" is the milepost prefix designating the RF&P subdivision of CSXT, and "A" is the milepost prefix designating the North End (A-Line) subdivision of CSXT.

4.3.1 Area 1: Arlington (Long Bridge Approach)

4.3.1.1 Description of the Preferred Alternative 1B

The Preferred Alternative in Area 1 (Arlington, Long Bridge Approach) is 1B: Add Two Tracks on the West. Detailed infrastructure improvements associated with Preferred Alternative 1B are provided in Table 4.3-1, and a single-page summary schematic is shown in Figure 4.3-2. Refer to Appendix L of this Final EIS for a mapbook of the Preferred Alternative that shows additional engineering details for the 123-mile Project corridor, including permanent and temporary LOD.

Table 4.3-1: Area 1: Arlington (Long Bridge Approach) Preferred Alternative

Preferred Alternative	Proposed Infrastructure Improvements
1B: Add Two Main Tracks on the West (CFP 110.0 to CFP 109.3) The west alignment will add two additional tracks west of the existing tracks, within existing right-of-way and, in some curves, realign and improve existing tracks to increase speed. The maximum authorized speed for this area is ≤ 50 mph based on curve and track geometry; actual operating speeds will be refined during the next phases of design and future modeling of train operations.	**Track** ▪ Add two tracks to the west side of the existing tracks south of George Washington Memorial Parkway[1] (CFP 110.05) for approximately 1,650 and 3,000 feet. ▪ Add one new track beside the existing tracks to the: – West and south of the two new tracks noted above for approximately 2,900 feet. – East between the improved existing tracks and the end of Area 1/beginning of Area 2 (CFP 109.3). ▪ Improve existing tracks to increase speeds through the curve at CFP 109.7 to 109.3. ▪ Construct crossovers south of George Washington Memorial Parkway. ▪ Extend existing culverts to accommodate the new third track. ▪ Install additional 36- to 48-inch culverts, as required for drainage, under the rail line along the alignment. ▪ Install stormwater management facilities. ▪ Install signal and communication facilities. ▪ Relocate (or protect in place) utilities and/or fiber optics lines as required. **Stations** ▪ No stations in this area. **Structures** ▪ No structure modifications.

Notes: 1. No encroachment onto the existing railroad bridge over the George Washington Memorial Parkway is proposed by the addition of the two tracks from the DC2RVA Project.

Figure 4.3-2: Preferred Alternative 1B: Add Two Main Tracks on the West

4.3.1.2 Basis for Selecting 1B

In the Draft EIS, DRPT identified the approximately one-mile Alternative Area 1, located immediately south of the Long Bridge, to evaluate potential connections between the DC2RVA corridor and a future recommendation from the separate Long Bridge project (see Section 1.4.2 for summary). DRPT assumed that an additional two tracks would be added across the Potomac River as part of the Long Bridge project, and identified three DC2RVA Project Build Alternatives in Area 1 to add two tracks to the existing two tracks within existing CSXT right-of-way to connect to potential future Long Bridge recommendation options:

- 1A: Add two tracks on the east
- 1B: Add two tracks on the west
- 1C: Add one track on the west and one track on the east

Since each of these Area 1 Build Alternatives equally fulfilled the DC2RVA Project's Purpose and Need, DRPT determined in the Draft EIS that selection of the Preferred Alternative in Area 1 should be based on compatibility with the future decision on how capacity will be added at Long Bridge and deferred a recommendation until that time.

Subsequent to the Draft EIS, on June 19, 2018, DDOT released the Alternatives Development Report for the Long Bridge project[4] that established two action alternatives to be evaluated in their project Draft EIS (which is separate from this DC2RVA EIS process):

- **Long Bridge Action Alternative A.** A new two-track bridge would be constructed upstream (west) of the existing Long Bridge, and the existing two-track Long Bridge would be retained, creating a four-track crossing.
- **Long Bridge Action Alternative B.** A new two-track bridge would be constructed upstream (west) of the existing bridge, and the existing bridge would be replaced with a new two-track bridge, creating a four-track crossing.

While the Long Bridge project has two alternatives that are advancing, both Long Bridge alternatives align with DC2RVA Alternative 1B (i.e., adding two tracks upstream (west) of existing), and do not align with DC2RVA Alternatives 1A or 1C. Therefore, Alternative 1B is the Preferred Alternative for the DC2RVA Project.

4.3.1.3 Changes to 1B Subsequent to the Draft EIS

Since the publication of the Draft EIS, the alternatives development process for the Long Bridge project moved forward to allow for selection of an alignment for the DC2RVA Preferred Alternative, as described above. Additionally, comments from the public and review agencies (such as from Arlington County regarding the Long Bridge Park project[5]), combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alternative 1B.

---

[4] The Long Bridge project Alternatives Development Report is available on their project website: http://longbridgeproject.com/study-documents/

[5] Details available at the Long Bridge Park website: https://projects.arlingtonva.us/plans-studies/parks-open-space/long-bridge-park/

These conceptual engineering modifications in Area 1 originated from:

- Addressing Draft EIS comments to minimize impacts by adding or extending retaining walls
- Addressing specific comments about:
  - Adjustments to track curves for train operations or impact mitigations
  - Track improvements, such as crossovers, proposed between the existing tracks or between the existing and proposed track(s) for train operations

4.3.2 Area 2: Northern Virginia

4.3.2.1 Description of the Preferred Alternative 2A

The Preferred Alternative in Area 2 (Northern Virginia) is 2A: Add a Third or Fourth Main Track. Detailed infrastructure improvements associated with Preferred Alternative 2A are provided in Table 4.3-2, and a single-page summary schematic is shown in Figure 4.3-3. Refer to Appendix L of this Final EIS for a mapbook of the Preferred Alternative that shows additional engineering details for the 123-mile Project corridor, including permanent and temporary LOD.

Station improvements at Alexandria and Woodbridge stations are shown in Figure 4.3-4 and 4.3-5, respectively. The station at Quantico is undergoing improvements as part of a separate project being led by VRE.

4.3.2.2 Basis for Selecting 2A

Alternative Area 2 is the most congested area in the DC2RVA corridor, with intercity passenger trains, VRE commuter trains, and CSXT freight trains utilizing capacity on the existing tracks. This 47.3-mile area of the corridor, from Crystal City in Arlington to Fredericksburg, also passes through developed urban areas and crosses several major rivers, including at the Occoquan River, Neabsco Creek, Powells Creek, and Aquia Creek.

In the Draft EIS, in order to reduce impacts to property, wetlands, and existing infrastructure, DRPT considered and dismissed the alternative alignments that would increase speed and/or capacity but required construction outside the CSXT right-of-way in Area 2. By adding a fourth track to the existing triple-track section from Crystal City to Alexandria and adding a third track in locations that currently only have two tracks from Alexandria to Fredericksburg, where required, Preferred Alternative 2A will support expanded intercity passenger service, VRE commuter service, and CSXT freight service and improve reliability. Preferred Alternative 2A will also increase speed and/or capacity while remaining primarily within the existing CSXT right-of-way. Locations of river crossings were carefully selected to reduce impacts.

The Preferred Alternative will increase passenger train speeds where practicable, with increased speeds of 80 to 90 mph achievable in some sections based on curve and track geometry; actual operating speeds will be refined during the next phases of design and future modeling of train operations.

Table 4.3-2: Area 2: Northern Virginia Preferred Alternative

Preferred Alternative	Proposed Infrastructure Improvements
2A: Add a Third or Fourth Main Track (CFP 109.3 to CFP 62) 2A will add one additional main line track and, in some curves, realign and improve existing tracks to improve speed. The additional track will result in a fourth track from Crystal City to Alexandria, and a third track from Alexandria to Dahlgren Junction. The additional track will be located on either the east or west side of the existing tracks, based on rail operation considerations, site constraints, and potential impacts. Rail improvements are generally within existing right-of-way. The track maximum authorized speed in this area is variable by segment, with increased speeds of 80 to 90 mph in some sections where practicable, based on curve and track geometry; actual operating speeds will be refined during future phases of design and future modeling of train operations. Several sections within this area do not require the addition of a main track as part of the Project because either the required capacity has been added or an additional main track is under construction through an independent action: ▪ Alexandria to Franconia currently has three tracks from the AF interlocking at CFP 104.5 south to CFP 98 just north of the Franconia-Springfield VRE station. ▪ Franconia to Occoquan is currently two tracks but is being designed for three tracks as part of a separate project (project limits CFP 99 to CFP 90). ▪ A third track between Powells Creek and Arkendale (CFP 83 to CFP 72) has been approved under a separate project, and the portion of it from North Possum Point to Arkendale (CFP 79 to CFP 72) is currently under construction to add a third track (construction of the remainder is postponed until additional construction funding is available). This separate project includes improvements to Quantico Amtrak/VRE Station.	**Track** ▪ Add one new track beside the existing tracks to the: – East between the end of Area 1/beginning of Area 2 (CFP 109.3) and Norfolk Southern rail yard (CFP 103.9). – East between north of Furnace Road (CFP 90.0) and south of Rippon VRE Station (CFP 85.3). – West between south of Rippon VRE Station (CFP 85.3) and south of Powells Creek (CFP 83.7). – East between north of Brent Point Road (CFP 72.3) and north of Courthouse Road (CFP 69.1). – West between north of Courthouse Road (CFP 69.1) and north of Andrew Chapel Road (CFP 68.0). – East between north of Andrew Chapel Road (CFP 68.0) and north of Mt. Hope Church Road (CFP 67.6). – West between north of Mt. Hope Church Road (CFP 67.6) and north of Potomac Creek (CFP 65.7). – East between north of Potomac Creek (CFP 65.7) and north of Leeland Road VRE Station (CFP 64.6). – West between north of Leeland Road VRE Station (CFP 64.6) and north of Claiborne Run (CFP 62.6). – East between north of Claiborne Run (CFP 62.6) and the end of Area 2/beginning of Area 3 (CFP 62). ▪ Improve existing tracks to increase speeds from: – CFP 109.3 to 109.2 – CFP 109.2 to 109.1 – CFP 109.0 to 108.6 – CFP 108.6 to 108.2 – CFP 108.1 to 107.9 – CFP 107.8 to 107.4 – CFP 107.4 to 107.2 – CFP 106.9 to 106.5 – CFP 105.8 to 105.3 – CFP 105.2 to 104.8 – CFP 103.7 to 103.4 – CFP 102.6 to 101.8 – CFP 100.5 to 99.7 – CFP 89.5 to 88.9 – CFP 88.9 to 88.0 – CFP 86.6 to 86.3 – CFP 85.7 to 85.4 – CFP 84.5 to 83.9 – CFP 83.6 to 83.4 – CFP 72.1 to 71.7 – CFP 70.6 to 70.0 – CFP 69.7 to 69.4 – CFP 68.5 to 68.0 – CFP 67.9 to 67.4 – CFP 67.1 to 66.7 – CFP 66.4 to 65.7 – CFP 65.0 to 64.4 – CFP 63.3 to 62.4 ▪ Construct crossovers at: – Slater's Lane (CFP 106.3) – AF (CFP 104.3) – Featherstone (CFP 87.0) – Arkendale (CFP 72.1) – Ross (CFP 66.2) ▪ Improve at-grade crossing and crossing protection at: – Featherstone Road (CFP 86.9) (to be replaced in-kind) – Brent Point Road (CFP 72.3) ▪ Extend existing culverts to accommodate the new third track. ▪ Install 36- to 48-inch culverts, as required for drainage, under the rail line. ▪ Install stormwater management facilities. ▪ Install signal and communication facilities. ▪ Relocate (or protect in place) utilities and/or fiber optics lines as required.

▶ *Continued – see end of table for notes.*

Table 4.3-2: Area 2: Northern Virginia Preferred Alternative

Preferred Alternative	Proposed Infrastructure Improvements
	Stations ▪ Crystal City VRE Station (CFP 108.6) – Align tracks to accommodate VRE platform updates. ▪ Alexandria Amtrak/VRE Station (CFP 105.3) – Improve existing City-owned surface parking to accommodate ~150 parking spaces adjacent to the existing station building.[1] ▪ Woodbridge Amtrak/VRE Station (CFP 89.1) – Lengthen and widen east platform to become the center island platform, align track to accommodate VRE platform updates on the west side, and improve the pedestrian bridge. ▪ Rippon VRE Station (CFP 85.3) – Align track to accommodate VRE platform updates. ▪ Brooke VRE Station (CFP 67.9) – Align track to accommodate VRE platform updates. ▪ Leeland Road VRE Station (CFP 63.5) – Align track to accommodate VRE platform updates. **Structures** ▪ Add one track to the existing railroad bridges on the: – East side over Four Mile Run Creek (CFP 107.9) – East side over Braddock Street (CFP 105.9) – East side over Commonwealth Avenue (CFP 105.4) – East side over King Street (CFP 105.3). ▪ Construct a new single-track rail bridge adjacent to existing structure on the: – East side over Furnace Road (CFP 90.0) – East side over Farm Creek (CFP 86.6) – East side over Unnamed Creek (CFP 86.1) – East side over Andrew Chapel Road (CFP 68.0) – East side over Claiborne Run (CFP 62.5) ▪ Construct substructure/foundation for a new two-track rail bridge (DC2RVA Project includes construction of a single-track bridge with space to add a second track, if required for future capacity[2]) adjacent to the existing structure on the: – East side over the Occoquan River (CFP 89.7) – West side over Neabsco Creek (CFP 84.8) – West side over Powells Creek (CFP 83.7) – East side over Aquia Creek (CFP 70.9) – East side over Potomac Creek (CFP 65.3) ▪ Replace road overpasses to provide sufficient vertical and horizontal clearance for the new track at: – Dawson Beach Road (CFP 88.8) – Eskimo Hill Road (CFP 66.8) – Leeland Road (CFP 63.5) – Primmer House Road (CFP 63.0) ▪ Add crash wall to the pedestrian bridge at Veterans Memorial Park (CFP 87.8). ▪ Close Mt. Hope Church Road (CFP 67.6) and construct an alternative route prior to closure.

Notes: 1. Project improvements and impact limits of disturbance at the Alexandria Station, including improvements to the City-owned parking lot, are provided for station planning by the City and do not indicate property acquisition for new parking facilities.

2. Provision of alignment for future installation of a second track (fourth track) at this location does not preclude the requirement for future environmental analysis to construct the fourth track through this section of the corridor.

4.3.2.3 Changes to 2A Subsequent to the Draft EIS

Comments from the public and review agencies, combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering to Alternative 2A. These conceptual engineering modifications originated from:

- Coordinating with adjacent active projects:
  - Atlantic Gateway
  - Powells Creek to Arkendale Third Track project, including:
    - Adding design for temporary end of project at North Possum Point.
    - Adding design for completion of project from North Possum Point to Powells Creek.
    - Removing improvements proposed by DC2RVA that were added to conceptual design based on DC2RVA design criteria, e.g. shifting track to improve curve speeds and crossing protection
  - VRE Station Expansions. While the stations would be improved by others (i.e., VRE), DRPT has included the following improvements as part of the DC2RVA Project where needed to accommodate the construction of the third track:
    - Crystal City VRE Station (CFP 108.6) – Align tracks to accommodate VRE platform updates
    - Alexandria Amtrak/VRE Station (CFP 105.3) – Align tracks to accommodate VRE platform updates
    - Woodbridge Amtrak/VRE Station (CFP 89.1) – Align track to accommodate VRE platform updates on the west side, improve the pedestrian bridge, and provide for an intertrack fence
    - Rippon VRE Station (CFP 85.3) – Align track to accommodate VRE platform updates
- Addressing access impacts to driveways and properties along the corridor
- Incorporating crossing improvements, i.e., additional paving widths for crossing and pedestrian safety, and potential locations of gates and equipment sheds
- Addressing specific comments about:
  - Access at Railroad Avenue in Woodbridge
  - Adjustments to track curves for train operations or impact mitigations
  - Crash walls to protect highway bridge piers

Rail Bridge over Neabsco Creek in Area 2 (Northern Virginia)

4.3.3 Area 3: Fredericksburg

4.3.3.1 Description of the Preferred Alternative 3B

The Preferred Alternative in Area 3 (Fredericksburg) is 3B: Add Third Main Track Through City. Detailed infrastructure improvements associated with Preferred Alternative 3B are provided in Table 4.3-3, and a single-page summary schematic is shown in Figure 4.3-6. Refer to Appendix L of this Final EIS for a mapbook of the Preferred Alternative that shows additional engineering details for the 123-mile Project corridor, including permanent and temporary LOD. Station improvements at Fredericksburg Station are shown in Figure 4.3-7.

Table 4.3-3: Area 3: Fredericksburg Preferred Alternative

Preferred Alternative	Infrastructure Improvements
3B: Add Third Main Track Through the City, Add a Third Main Track North and South of the City (CFP 62 to CFP 48) 3B will add one additional main line track in areas with only two existing tracks and, in some curves, realign and improve existing tracks to improve speed. Through the city, the additional track will be constructed east of the existing two tracks. Improvements between the Amtrak/VRE station in Fredericksburg and VRE's Spotsylvania Station will be limited to re-aligning existing tracks through curves to improve speed as a third track already exists. Rail improvements are generally within existing right-of-way. The track maximum authorized speed is variable by segment , with increased speeds of 80 to 90 mph in some sections where practicable, based on curve and track geometry; actual operating speeds will be refined during future phases of design and future modeling of train operations Two areas do not require an additional main line track because the segments already have three main line tracks: ▪ Fredericksburg to Hamilton currently has three main line tracks from CFP 58.9 to CFP 55.7. ▪ Hamilton to Crossroads currently has three main line tracks from CFP 55.7 to CFP 53.2, along with the new VRE Spotsylvania Station (CFP 53.3).	**Track** ▪ Add one new track beside the existing tracks, generally to the: – East between the end of Area 2/beginning of Area 3 (CFP 62) and north of Blue & Gray Parkway (CFP 58.7) – West between CFP 57.6 and CFP 54.5 – East between south of Spotsylvania VRE Station (CFP 53.3) and south of VRE Crossroads Layover Yard (CFP 52.6) – West between south of VRE Crossroads Layover Yard (CFP 52.6) and the end of Area 3/beginning of Area 4 (CFP 48) ▪ Improve existing tracks to increase speeds from: – CFP 62.3 to 61.7 – CFP 61.6 to 61.2 – CFP 60.4 to 59.6 – CFP 59.3 to 58.5 – CFP 57.9 to 57.6 – CFP 56.8 to 56.5 – CFP 56.1 to 55.8 – CFP 55.6 to 54.8 – CFP 54.7 to 54.4 – CFP 54.1 to 53.5 – CFP 52.6 to 51.6[1] – CFP 51.5 to 51.0[1] – CFP 50.9 to 48.4[1] ▪ Construct crossovers at: – Dahlgren Junction (CFP 61.1) – Hamilton (CFP 55.7) – Crossroads (CFP 53.2) – Claiborne Crossing (CFP 48.2) ▪ Improve at-grade crossing and crossing protection at: – Mine Road (CFP 54.77) – Summit Crossing Road (Route 668) (CFP 51.41) – Claiborne Crossing Road (Route 660) (CFP 48.63) ▪ Extend existing culverts to accommodate the new third track. ▪ Install 36- to 48-inch culverts, as required for drainage, under the rail line along the alignment. ▪ Install stormwater management facilities. ▪ Install signal and communication facilities. ▪ Relocate (or protect in place) utilities and/or fiber optics lines, as required.

▶ *Continued – see end of table for notes.*

Table 4.3-3: Area 3: Fredericksburg Preferred Alternative

Preferred Alternative	Infrastructure Improvements
	Stations ▪ Fredericksburg Amtrak/VRE Station (CFP 59.4): – Lengthen and widen east platform to become a center island platform with a length of 850 feet – Length and widen the west platform to a length of 950 feet. All platforms to be 8 inches above top of rail – Construct new station building (approximately 6,800 square feet) west of the existing tracks at the intersection of Caroline Street and Lafayette Boulevard – Construct a new vertical access between the station building, platforms, and parking structure – Relocate existing elevator on east platform to accommodate the new third track – Construct a multi-level parking garage for approximately 225 parking spaces and modify the existing surface parking to accommodate approximately 20 parking spaces. The new parking garage and surface parking will be located east of the tracks opposite the new station where a current surface parking lot is located. Approximately nine ADA parking spaces will be installed adjacent to the new station building.[2] **Structures** ▪ Construct a new single-track rail bridge adjacent to the existing structure on the: – East side over Harrell Road (CFP 61.8) – East side over Claiborne Run (CFP 60.6) – East side of the platform at Fredericksburg Station (CFP 59.4) – East side over Sophia Street (CFP 59.4) – East side over Caroline Street (CFP 59.4) – East side over Princess Anne Street (CFP 59.4) – East side over Charles Street (CFP 59.3) ▪ Construct substructure/foundation for a new two-track rail bridge (DC2RVA Project includes construction of a single-track bridge with space to add a second track, if required for future capacity[3]) on the east side of the existing structure over the Rappahannock River (CFP 59.45). ▪ Construct new road overpass providing sufficient vertical and horizontal clearances for new track at Lansdowne Road (Route 638) (CFP 57.57). ▪ Replace road overpass to provide sufficient vertical and horizontal clearance for the new track at Kings Highway (CFP 60.0). ▪ Add crash wall to the existing piers at Butler/White Oak Road (CFP 60.8).

Notes: 1. These curve improvements require track constructions on a new alignment within the existing CSXT right-of-way.

2. Project improvements and impact limits of disturbance at the Fredericksburg Station, including improvements to the existing surface parking areas, are provided for station planning by the City but do not indicate property acquisition for new parking facilities.

3. Provision of alignment for future installation of a second track (fourth track) at this location does not preclude the requirement for future environmental analysis to construct the fourth track through this section of the corridor.

Figure 4.3-7: Fredericksburg Station Improvements for Preferred Alternative 3B

4.3.3.2 Basis for Selecting 3B

In the Draft EIS, DRPT screened multiple alignments and evaluated three Build Alternatives in detail:

- 3A: Maintain Two Tracks Through City
- 3B: Add One Track Through City East of Existing Tracks
- 3C: Add a Two-Track Bypass East of City

Maintaining two tracks through the City of Fredericksburg (i.e., Build Alternative 3A as evaluated in the Draft EIS) does not provide sufficient capacity to support increased intercity passenger service, support VRE commuter service, or accommodate CSXT freight service through the City, and therefore does not meet the Purpose and Need of the Project. Adding a two-track bypass to the east of the City (i.e., Build Alternative 3C as evaluated in the Draft EIS) provides sufficient capacity, but would incur substantial impacts to wetlands, historic and cultural resources, property, and infrastructure. In addition, there was strong local opposition to a new greenfield bypass. Therefore, Alternative 3B, which adds a third main track to link existing sections of three or more tracks and provides a continuous three track corridor through the City, was selected as the Preferred Alternative.

Alternative 3B provides the capacity to support intercity passenger service, VRE commuter service, and CSXT freight service, and will have fewer impacts to property, wetlands, and infrastructure than a bypass, and occurs largely within the existing CSXT-owned right-of-way. Alternative 3B supports past and ongoing investments by the Commonwealth and VRE and has local government support.

It is important to note that while the Commonwealth considered a two-track option through Fredericksburg (Build Alternative 3A), similar to the Preferred Alternative in Area 5 through Ashland (Alternative 5A, see Section 4.3.5), the two-track option through Fredericksburg did not provide sufficient capacity at the mid-point location along the Project corridor. The rail corridor through Fredericksburg hosts more train traffic than Ashland, particularly due to the presence of VRE commuter service north of Spotsylvania, and a two-track railroad with only two platform edges in Fredericksburg will not support reliable service for intercity passenger, VRE commuter, or CSXT freight trains. Therefore, FRA and DRPT determined that while two tracks will be sufficient for the Project in Ashland, additional capacity was necessary in Fredericksburg.

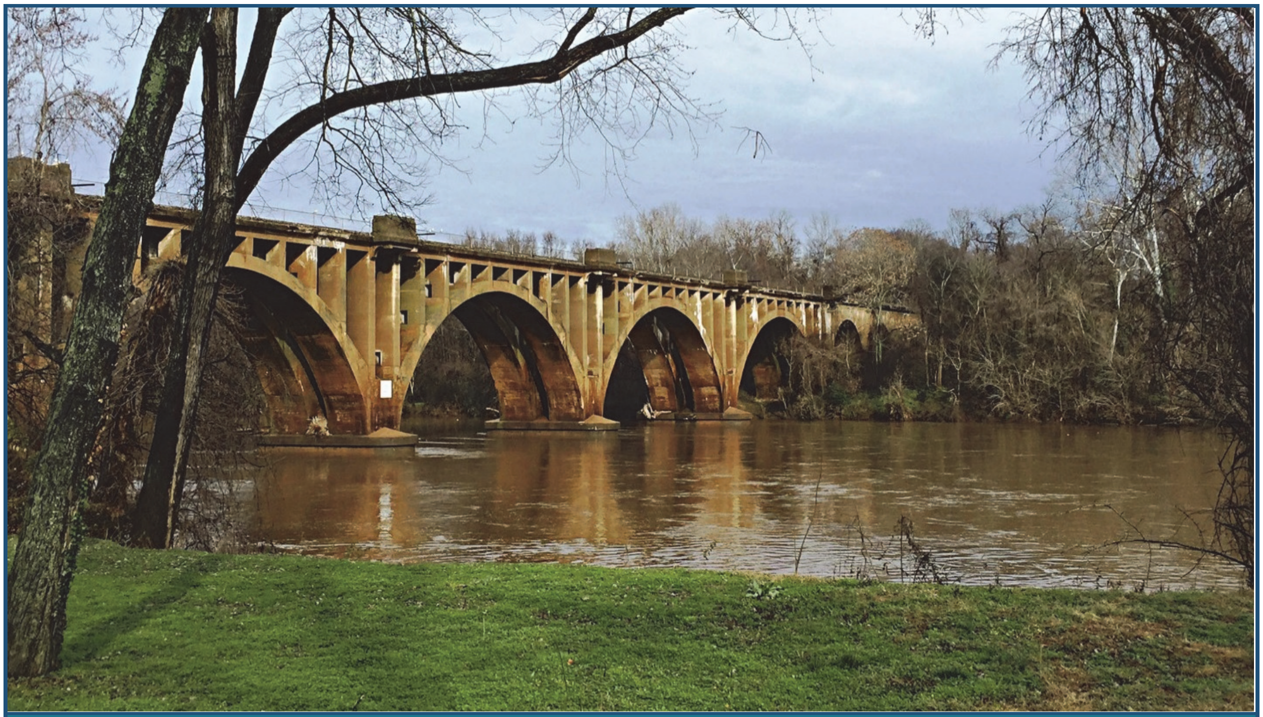
FRA and DRPT also considered extending the east and west platforms up to 1,200 feet in length to better accommodate long distance trains and crew access; however, the tracks curve south of the station on limited width right-of-way which constrains platform expansion to the south. North of the station, extended platforms of 1,200 feet would need to be built on new structures extending over the Rappahannock River, with additional impacts to property, historic and cultural resources, visual quality, natural resources, and waters of the U.S. Therefore, FRA and DRPT determined that the west side platform would be extended to 950 feet, and the east side platform would be 850 feet in length in order to improve passenger and crew access to trains while reducing impacts.

4.3.3.3 Changes to 3B Subsequent to the Draft EIS

Comments from the public and review agencies, combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alterative 3B. These conceptual engineering modifications originated from:

- Addressing train operations improvements within the existing/proposed track limits

- Addressing local planning comments to:
  - Eliminate a highway bridge replacement at White Oak Road
  - Plan for a pedestrian culvert at Naomi Road
- Addressing access impacts to driveways and properties along the corridor
- Incorporating crossing improvements, i.e., additional paving widths for crossing and pedestrian safety, and potential locations of gates and equipment sheds
- Adding a fourth track/siding to allow trains to pass a stopped or slow-moving train south of Fredericksburg
- Extending the west side platform at the Fredericksburg station to the maximum allowable by site constraints while avoiding/minimizing impacts



Rail Bridge over the Rappahannock River in Area 3 (Fredericksburg)

4.3.4 Area 4: Central Virginia

4.3.4.1 Description of the Preferred Alternative 4A

The Preferred Alternative in Area 4 (Central Virginia) is 4A: Add a Third Main Track. Detailed infrastructure improvements associated with Preferred Alternative 4A are provided in Table 4.3-4, and a single-page summary schematic is shown in Figure 4.3-8. Refer to Appendix L of this Final EIS for a mapbook of the Preferred Alternative that shows additional engineering details for the 123-mile Project corridor, including permanent and temporary LOD. There are no intercity passenger rail stations located within Area 4.

Table 4.3-4: Area 4: Central Virginia Preferred Alternative

Preferred Alternative	Proposed Infrastructure Improvements
4A: Add a Third Main Track (CFP 48 to CFP 19) 4A will add one additional main line track and, in some curves, realign and improve existing tracks to improve speed. The additional track will be located on either the east or west side of the existing tracks based on rail operation considerations, site constraints, and potential impacts. The track maximum authorized speed is variable by segment, with increased speeds of 80 to 90 mph in some sections where practicable, based on curve and track geometry; actual operating speeds will be refined during future phases of design and future modeling of train operations.	**Track** ▪ Add one new track beside the existing tracks to the: – West between the end of Area 3/beginning of Area 4 and south of the North Anna River (CFP 23.8) – East between south of the North Anna River (CFP 23.8) and north of Kings Dominion Boulevard (CFP 20.8) – West between north of Kings Dominion Boulevard (CFP 20.8) and the end of Area 4/beginning of Area 5 (CFP 19) ▪ Improve existing tracks to increase speeds from: – CFP 45.7 to 45.4 – CFP 41.9 to 41.5 – CFP 40.9 to 40.6 – CFP 40.3 to 40.0 – CFP 39.1 to 38.8 – CFP 36.4 to 36.0 – CFP 35.0 to 34.8 – CFP 31.7 to 31.1 – CFP 30.6 to 30.2 – CFP 30.0 to 29.5 – CFP 29.4 to 28.2 – CFP 27.7 to 27.1 – CFP 26.9 to 26.6 – CFP 26.4 to 25.5 – CFP 23.5 to 23.2 – CFP 20.5 to 19.9 ▪ Construct crossovers at: – Milford (CFP 37.6) – Colemans Mill (CFP 29.6) – North Doswell (CFP 23.1) ▪ Improve at-grade crossing and crossing protection at: – Stonewall Jackson Road (Route 606) (CFP 47.2) – Woodford Road (CFP 44.5) – Woodslane Road (CFP 43.5) – Paige Road (CFP 40.4) – Penola Road (CFP 33.0) – Doswell Road (CFP 21.9) – Multiple private road crossings ▪ Improve existing tracks at Rogers Clark Boulevard (CFP 38.5) to provide adequate horizontal clearance. ▪ Close existing at-grade crossing at Colemans Mill Road (CFP 29.7). ▪ Extend existing culverts to accommodate the new third track. ▪ Install 36- to 48-inch culverts, as required for drainage, under the rail line along the alignment. ▪ Install stormwater management facilities. ▪ Install signal and communication facilities. ▪ Relocate (or protect in place) utilities and/or fiber optics lines, as required. **Stations** ▪ No stations within this area. **Structures** ▪ Construct a new single-track rail bridge adjacent to the existing structure on the: – West side over Mattaponi River (CFP 34.8) – West side over North Anna River (CFP 23.9) – West side over Polecat Creek (CFP 32.1) – West side over Taylorsville Road (Route 689) (CFP 19.6) – West side over Little River (CFP 19.5) ▪ Add crash wall to the existing piers at: – Rogers Clark Boulevard (CFP 38.5) – Dry Bridge Road (CFP 28.4) – Ruther Glen Road (CFP 27.0) – I-95 (CFP 26.5)

Alternative Area Limits

Figure 4.3-8: Preferred Alternative 4A: Add a Third Main Track

4.3.4.2 Basis for Selecting 4A

In the Draft EIS, DRPT screened multiple alignments to improve capacity and reach the 90 mph speed, while minimizing impacts to wetlands, waterways, and other resources, and carried one alternative forward for further evaluation in the Draft EIS—Alternative 4A, which adds a third main track to the west of the existing two tracks through most of Area 4. Alternative 4A was selected as the Preferred Alternative as it increases passenger train speed and will add Project improvements largely within the existing CSXT-owned right-of-way. It will support expanded intercity passenger service and CSXT freight service, while minimizing impacts to wetlands and property.

4.3.4.3 Changes to 4A Subsequent to the Draft EIS

Comments from the public and review agencies, combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alternative 4A. These conceptual engineering modifications originated from:

- Addressing train operations improvements, including crossovers, within the existing or proposed track limits
- Addressing access impacts to driveways and properties along the corridor
- Incorporating crossing improvements, i.e., additional paving widths for crossing and pedestrian safety, and potential locations of gates and equipment sheds

DOSWELL

Buckingham Branch Railroad Crossing at Doswell in Area 4 (Central Virginia)

4.3.5 Area 5: Ashland

4.3.5.1 Description of the Preferred Alternative 5A

The Preferred Alternative in Area 5 (Ashland) is 5A: Maintain Two Tracks Through Town (No Station Improvements). Alternative 5A includes the construction of a third track for 3.1 miles north and 4.7 miles south of Ashland while retaining the existing two-track alignment for approximately 2.2 miles through the Town of Ashland, without improvements to the existing Ashland Station. Detailed infrastructure improvements associated with Preferred Alternative 5A are provided in Table 4.3-5, and a single-page summary schematic is shown in Figure 4.3-9. Refer to Appendix L of this Final EIS for a mapbook of the Preferred Alternative that shows additional engineering details for the 123-mile Project corridor, including permanent and temporary LOD.

Table 4.3-5: Area 5: Ashland Preferred Alternative

Preferred Alternative	Proposed Infrastructure Improvements
5A: Maintain Two Tracks Through Town (No Station Improvements) Add a Third Main Track North and South of Town (CFP 19 to CFP 9) 5A will maintain the existing two tracks (i.e., no construction of new track) through Ashland, which will be used by freight and passenger trains similar to current conditions. No station improvements are part of the Project. One new track will be constructed north and south of town, and there are some shifts of existing tracks to improve speed throughout the area. Rail improvements are generally within existing right-of-way. The track maximum authorized speed in this area is variable by segment, with increased speeds of 80 to 90 mph in some sections where practicable, and with an existing 35 mph municipal slow order within the Town of Ashland. Maximum authorized speeds are based on curve and track geometry; actual operating speeds will be refined during future phases of design and future modeling of train operations. Ashland station improvements, including new low-level side platforms, are part of a separate plan for ADA improvements by Amtrak, as discussed in Section 7.7.1. The CTB included several Ashland-specific directives as part of their resolution for this Project (Appendix H of this Final EIS), which are summarized in Section 3.4 of this Final EIS. Accordingly, at-grade road and pedestrian crossing improvements in Ashland are part of a plan separate from this Project.	**Track** ▪ Add one new track beside the existing tracks to the: – West between the end of Area 4/beginning of Area 5 (CFP 19) and north of Vaughan Road (CFP 15.6) – East between Ashcake Road (CFP 13.9) and south of Gwathmey Church Road (CFP 13.0) – West between south of Gwathmey Church Road (CFP 13.0) and the end of Area 5/beginning of Area 6 (CFP 9). ▪ Construct crossovers at: – Vaughan (CFP 15.8) – Ashcake (CFP 13.6) – Elmont (CFP 11.4) ▪ Improve at-grade crossing and crossing protection at: – Gwathmey Church Road (CFP 13.0) – Elmont Road (CFP 11.6) – Cedar Lane (CFP 11.2) – Mill Road (CFP 9.7) ▪ Extend existing culverts to accommodate the new third track. ▪ Install 36- to 48-inch culverts, as required for drainage, under the rail line along the alignment. ▪ Install stormwater management facilities. ▪ Install signal and communication facilities. ▪ Relocate (or protect in place) utilities and/or fiber optics lines as required. **Stations** ▪ Ashland Station (CFP 14.70): No improvements under the DC2RVA Project. **Structures** ▪ Construct a new single-track rail bridge adjacent to the existing structure on the west side over Elletts Crossing Road (Route 641) (CFP 17.7). ▪ Construct substructure/foundation for a new two-track rail bridge (DC2RVA Project includes construction of a single-track bridge with space to add a second track, if required for future capacity[1]) adjacent to the existing structure on the: – West side over the South Anna River (CFP 18.7) – West side over the Chickahominy River (CFP 10.6) ▪ Construct new road overpass providing sufficient vertical and horizontal clearances for new track at: – Vaughan Road (CFP 15.6) – Ashcake Road (CFP 13.9) with new connector road from Ashcake Road to Center Street ▪ Replace road overpass to provide sufficient vertical and horizontal clearance for the new track at Washington Highway (CFP 17.2). ▪ Add crash wall to the existing piers at: – Old Ridge Road (CFP 19.0) – Greenwood Road (CFP 9.9)

Notes: 1. Provision of alignment for future installation of a second track (fourth track) at this location does not preclude the requirement for future environmental analysis to construct the fourth track through this section of the corridor.

Figure 4.3-9: Preferred Alternative 5A: Maintain Two Tracks Through Town

4.3.5.2 Basis for Selecting 5A

During development of the Draft EIS, DRPT screened numerous at-grade, above-ground, below-ground, and bypass alignments, including use of the existing Buckingham Branch Railroad east of I-95. In the Draft EIS, DRPT evaluated seven alternatives in detail:

- 5A: Maintain Two Tracks Through Town (3-2-3 Option)
- 5A–Ashcake: Maintain Two Tracks Through Town (Relocate Station to Ashcake)
- 5B: Add One Track Through Town East of Existing Tracks
- 5B–Ashcake: Add One Track Through Town East of Existing Tracks (Relocate Station to Ashcake)
- 5C: Add Two-Track Western Bypass
- 5C–Ashcake: Add Two-Track Western Bypass (Relocate Station to Ashcake)
- 5D-Ashcake: Three Tracks Centered Through Town (Add One Track), Relocate Station to Ashcake

During preparation of the DC2RVA Draft EIS, DRPT recognized that many of the alternatives for greater rail capacity in the Town of Ashland and Hanover County area generated community concerns. FRA and DRPT deferred the recommendation of a preferred alternative for Area 5 to the Final EIS, and DRPT established the Ashland/Hanover Area Community Advisory Committee (CAC) to advise and inform DRPT on DC2RVA alternatives and issues in the Ashland/Hanover County area. The CAC was tasked with reassessing all previous options considered for greater rail capacity in the Ashland/Hanover County area and identifying potential options that could meet the Purpose and Need of the DC2RVA Project, while also minimizing or avoiding potential impacts to the community. The CAC process was initiated to run in parallel to the Draft EIS; in this Final EIS, refer to Section 2.1.4.3 for summary of the CAC and to Appendix G for a summary report of all CAC activities.

After careful and deliberate consideration of over 30 options for greater rail capacity in the Ashland/Hanover area, the CAC identified the following least objectionable alternatives, which were previously described in detail in Section 3.3:

- **Modified Alternative 5A.** The “3-2-3” option (i.e., maintaining two tracks through Town without station or at-grade crossing improvements) was determined by the CAC to be the least objectionable option for adding rail capacity through the Town of Ashland at-grade.
- **Three-Track Trench.** A three-track trench through the Town of Ashland was determined by the CAC to be the least objectionable option for adding capacity below-grade.
- **Modified Alternative 5C and 5C-Ashcake.** The western bypass closest to the Town of Ashland was determined by the CAC to be the least objectionable option for adding rail capacity outside the Town of Ashland—with the provision that the alignment would be adjusted to avoid directly impacting a children’s daycare facility on State Route 54, and to minimize impacts to residential properties.

Based on the information and analyses of the seven Build Alternatives presented for Area 5 in the Draft EIS, public comments on the Draft EIS, information and comments developed through the CAC process, and subsequent refined rail operations analyses, Alternative 5A was selected by FRA and DRPT as the Preferred Alternative for Area 5. Alternative 5A provides sufficient capacity to support intercity passenger rail service and CSXT freight service while keeping improvements largely within existing CSXT-owned right-of-way. Alternative 5A has the least impact on property, wetlands and other natural resources, historic and cultural resources, and the built environment compared to other Project alternatives that meet the Purpose and Need. Alternative 5A also best addresses the larger Ashland/Hanover community's concerns, including strong opposition to a bypass from Hanover County residents, and strong opposition to adding a track through Ashland from Town residents and Randolph-Macon College. Further, Preferred Alternative 5A as presented in this Final EIS further minimizes potential impacts within the downtown Ashland area with several design changes, as detailed in Section 4.3.5.3. Additionally, the CTB included a number of Ashland-specific directives as part of their resolution, which are summarized in Section 3.4 of this Final EIS.

4.3.5.3 Changes to 5A Subsequent to the Draft EIS

Comments from the public and review agencies, combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alternative 5A. Conceptual engineering modifications originated from:

- Addressing agency comments and the CTB resolution to reduce impacts to the Town of Ashland between Vaughan Road/Archie Cannon Drive and Ashcake Road that include:
    - Eliminating Project-related station improvements[6]
    - Reducing/minimizing Project footprint outside of existing CSXT right-of-way
    - Reassigning crossing safety improvements in the Town of Ashland to a future study by the town and DRPT (separate from this DC2RVA Project)
- Addressing access impacts to driveways and properties along the corridor
- Addressing train operations improvements, including crossovers, within the existing or proposed track limits
- Addressing effects of additional information at Washington Highway (Route 1), requiring replacement of the existing overpass due to insufficient horizontal clearance for an additional track and crash wall

4.3.6 Area 6: Richmond

4.3.6.1 Description of the Preferred Alternative 6F

The Preferred Alternative in Area 6 (Richmond) is 6F: Staples Mill Road and Main Street Stations Full Service with S-Line Improvements. Detailed infrastructure improvements associated with Preferred Alternative 6F are provided in Table 4.3-6, and a single-page summary schematic is shown in Figure 4.3-10. Refer to Appendix L of this Final EIS for a mapbook of the Preferred Alternative that shows additional engineering details for the 123-mile Project corridor, including permanent and temporary LOD.

Station improvements at Staples Mill Road and Main Street stations are shown in Figure 4.3-11 and Figure 4.3-12, respectively. It is important to note that the Project aligns with the recent accessibility and multimodal improvements that were completed by Amtrak at Staples Mill Road Station in June 2018 under a separate project.

---

[6] While there are no station improvements in Ashland as part of this Project, it is part of a separate plan for ADA improvements by Amtrak, as discussed in Section 7.7.1 of this Final EIS.

Table 4.3-6: Area 6: Richmond Preferred Alternative

Preferred Alternative	Proposed Infrastructure Improvements
6F: Staples Mill Road and Main Street Stations Full Service with S-Line Improvements (CFP 9 to A 11) 6F includes railroad network and station infrastructure improvements required to provide improved service through Richmond at Staples Mill Road Station and Main Street Station (Full Service), where both stations will remain operational. One main track will be added along portions of existing RF&P (north of Richmond) and S-Line (through Richmond), and, in some curves, realign and improve existing tracks to improve speed. Moving all passenger train service (except Auto Train, which does not stop in Richmond) to the S-Line, separate from CSXT's principal freight corridor through Richmond (i.e., the A-Line), will reduce rail congestion/delay. The track maximum authorized speed through this area is variable by segment, with increased speeds of 80 to 90 mph in some sections where practicable, and with top speeds of 40 mph through the Acca Yard area. Maximum authorized speeds are based on track and curve geometry; actual operating speeds will be refined during the next phases of design and future modeling of train operations. A portion within this area is part of ongoing work: the Mainline Relocation Project is under construction at Acca Yard and involves crossovers and new mainline track on west side of the yard. Passenger Service: All passenger trains that stop in Richmond will serve both stations, as described further below. Interstate Corridor (SEHSR and Carolinian) to North Carolina, Northeast Regional (SEHSR and Virginia) to Norfolk, and Long Distance (Amtrak) passenger trains moving north-south through Richmond will be routed through Staples Mill Road Station and then to the west side of Main Street Station and beyond to Centralia and points south using the S-Line. One Northeast Regional (SEHSR)	**Track** ▪ Add two new tracks beside the existing tracks to the: – East between south of Parham Rd (CFP 5.9), through Staples Mill Road Station (CFP 4.6), and north Acca Yard (CFP 3.4) – East between north Acca Yard (CFP 3.4), through Acca Yard, and south of Westwood Avenue (CFP 1.7) ▪ Add one new track beside the existing tracks to the: – West between the end of Area 5/beginning of Area 6 (CFP 9) and south of Hermitage Road (CFP 5.4) – East between south of Acca Yard (CFP 1.7) and AM Junction (CA 85.5) – West between south of Falling Creek (S 7.2) and north of Kingsland Road (S 9.2) – East between south of Jefferson Davis Highway (S 8.8) and Centralia (S 10.9). ▪ Add one new track at the following locations: – Staples Mill Road Station (CFP 4.6), east of the proposed tracks and provide two new station tracks east of the new track – Between SAY (CFP 1.3) and south of Hermitage Road (SRN 3.5) to provide a new connecting track – On the existing elevated rail structure on both the east and west side of Main Street Station (SRN 0.0): the east track is between AM Junction (CA 85.5) and Rivanna Junction (CA 84.5), and the west track is between AM Junction (CA 85.5), through the Triple Rail Crossing, and the James River – In the center of the existing tracks between the James River bridge (S 0.6) and south of the South Yard (S 2.5) – West of the existing tracks between south of the South Yard (S 1.7) and south of Ruffin Rd (S 4.0) to provide a 12,000-foot staging track ▪ Reconstruct NS track at new diamond crossing south of the James River. ▪ Close CSXT TransFlo facility and CSXT yard office on the east side of Acca Yard for CSXT to relocate to a new site to be determined by CSXT. ▪ Add a new three-track passenger layover/servicing facility inside the Bellwood Wye (S 8.9). ▪ Improve existing tracks to increase speeds from: – CFP 6.9 to 6.3 – SRN 3.0 to 2.6 – SRN 1.4 to 1.2 – S 0.6 to 0.9 – S 2.4 to 2.8 – S 8.4 to 8.6 – S 10.0 to 10.8 ▪ Construct crossovers at: – Parham (CFP 6.0) – Dumbarton (CFP 3.7) – SAY (CFP 1.3) – Hermitage (SRN 3.5) – Hospital (SRN 1.2) – Bone Dry (SRN 0.4) – Rivanna (CA 84.5) – Williams (S 1.2) – Federal (S 2.4) – Marlboro (S 4.0) – Falling Creek (S 7.2) – Bellwood (S 8.9) – Centralia (S 10.9) ▪ Improve at-grade crossing and crossing protection at: – Mountain Road (CFP 8.1) – Hermitage Road (SRN 3.37) – Brook Road (SRN 2.3) – Maury Street (S 0.8) – Goodes Street (S 1.7) – Ruffin Road (S 4.0) – Bells Road (S 4.4) – Kingsland Road (S 9.2) – Multiple private roads

▶ *Continued.*

Table 4.3-6: Area 6: Richmond Preferred Alternative

Preferred Alternative	Proposed Infrastructure Improvements
round-trip train to Richmond will serve Staples Mill Road Station and then terminate at Main Street Station. Northeast Regional (SEHSR and Virginia) passenger trains to Newport News will be routed through Staples Mill Road Station and then to the east side of Main Street Station using the Bellwood Subdivision, then continue on to Newport News using the Peninsula Subdivision.	▪ Close existing at-grade crossings at: – St. James Street (SRN 1.7) – Valley Road (SRN 1.6) – Dale Avenue / Trenton Avenue (S 4.98) – Brinkley Road (S 9.8) – Old Lane (A 10.7) ▪ Extend existing culverts to accommodate the new third track. ▪ Install 36- to 48-inch culverts, as required, under the rail line. ▪ Install stormwater management facilities. ▪ Install signal and communication facilities. ▪ Relocate (or protect in place) utilities and/or fiber optics lines, as required. **Stations** ▪ Staples Mill Road Station (CFP 4.6) – Construct two level-boarding island platforms (top elevation 48" above top of rail) 1,200 feet in length on east side of the main tracks. – Construct a pedestrian overpass or underpass with an elevator and stairs to access the platforms from the existing station. – Replace the existing station building with an approximately 10,400 square foot two-story building. ▪ Main Street Station (SRN 0.0) – Construct two low-level platforms on each side of the station (a total of four platforms). – Platforms on the east side of the station will be 850 feet long by 15 feet wide. – Platforms on the west side of the station will be 950 feet long by 15 feet wide. – The east and west-side platforms adjacent to the station (the "inside" platforms) will incorporate the platforms built into the renovated train shed and extend them north on new structures parallel to the existing track viaduct. – These platforms will be accessible from the train shed. The "outside" east and west-side platforms will be built on new structures adjacent to the existing east and west viaducts. – Elevators and staircases will provide access to the outside platforms. – Construct a crew walkway attached to both sides of the western track viaduct, extending approximately 50 feet north and 100 feet south from the new platform ends. – Construct station facilities within the approximately 6,800 square foot existing station building, and renovated train shed. **Structures** ▪ Construct substructure/foundation for a new two-track rail bridge (DC2RVA Project includes construction of a single track bridge with space to add a second track, if required for future capacity) on the S-Line across the James River. ▪ Construct new road overpasses providing sufficient vertical and horizontal clearances for new track at: – Hungary Road (CFP 6.60) – Hermitage Road (Henrico County, CFP 5.45) – St James Street Pedestrian Bridge (SRN 1.69) closing existing at-grade crossing – Hospital Street (SRN 1.23) – Commerce Road (S 3.07) on new alignment closing existing at-grade crossing ▪ Replace road overpasses to provide sufficient vertical and horizontal clearance for the new track at: – Dumbarton Road (CFP 3.71) – Elliham Avenue (S 7.83) ▪ Modify floodwall gates at the north and south floodwall penetrations for the new track across the James River bridge.

Figure 4.3-12: Main Street Station Improvements for Preferred Alternative 6F

4.3.6.2 Basis for Selecting 6F

In the Richmond area, DRPT identified alternatives by station location and service combinations along the two main north-south rail routes through the City: the CSXT A-Line to the west and the CSXT S-Line running through the city center. DRPT evaluated eight Build Alternatives for Area 6 in the Draft EIS—five are single station alternatives and three are two-station alternatives:

- 6A: Staples Mill Road Station Only (A-Line)
- 6B–A-Line: Boulevard Station Only (A-Line)
- 6B–S-Line: Boulevard Station Only (S-Line)
- 6C: Broad Street Station Only (A-Line)
- 6D: Main Street Station Only (S-Line)
- 6E: Split Service, Staples Mill Road/Main Street Stations (A-Line)
- 6F: Full Service, Staples Mill Road/Main Street Stations (S-Line)
- 6G: Shared Service, Staples Mill Road/Main Street Stations (A-Line and S-Line)

Richmond area alternatives that would rely on the A-Line to carry additional passenger service (Alternatives 6A, 6B–A-Line, 6C, 6E, and 6G) were eliminated from further consideration in the Draft EIS as being unable to meet the Project's Purpose and Need. Rail operations analyses show that passenger and freight rail performance goals cannot be met using the A-Line without additional track capacity; however, the existing A-Line through Richmond runs in a trench down the middle of I-195, which itself is within a trench, so options to expand rail capacity are limited or cost-prohibitive. These alternatives would also require a new third track on the A-Line on a bridge across the James River. An additional track cannot be added to the A-Line without expanding both the rail trench and the I-195 trench, creating extensive infrastructure and property impacts.

The three Richmond area alternatives that rely on the S-Line (Alternatives 6B–S-Line, 6D, and 6F) were retained primarily because they would consolidate passenger service on the S-Line through downtown Richmond, leaving the A-Line primarily for CSXT freight operations. The potential for conflicts between passenger and freight trains in the Richmond terminal area will be reduced, since most north-south freight traffic through Richmond will continue to use the A-Line, while passenger trains will use the S-Line. Although the S-Line route from Centralia to Staples Mill Road is one mile longer than the A-Line and passes through the urbanized core of Richmond, there is more opportunity to construct necessary capacity improvements on the S-Line than on the A-Line. Additionally, the S-Line alternatives 6D and 6F allow for the expansion of intercity passenger rail service to Richmond Main Street Station, which is nearer to the City's Central Business District. Alternative 6B–S-Line: Boulevard Station Only (S-Line) is feasible and could meet the DC2RVA passenger and freight service performance goals. However, the Boulevard Station would not be consistent with prior FRA and Commonwealth decisions regarding high speed rail and does not meet FRA and Amtrak guidance for intercity passenger trains to serve the city center. Furthermore, the Boulevard Station option would require the closure of the nearby Staples Mill Road and Main Street Stations and was not endorsed by leadership from the City of Richmond or Henrico County.

Alternative 6D: Main Street Station Only (S-Line) would not meet the Project's Purpose and Need due to insufficient track and platform capacity at Main Street Station. Spatial constraints posed by support structures for I-95 and the Triple Crossing (an iconic piece of rail infrastructure in Shockoe Valley where three rail lines cross each other at different elevations in a highly-constrained environment) limit Main Street Station to two tracks and two platform edges on the west side served by the S-Line. For the Main Street Station Only alternative, a third track and three platform edges are required on the west side to support the increased passenger service, including all necessary passenger train crew changes, and to meet passenger and freight performance goals.

DC2RVA's Basis of Design, following Amtrak's Station Program and Planning Guidelines (2013), calls for 1,200-foot long platforms for stations servicing Amtrak's Long Distance passenger trains and 850-foot long platforms for stations serving only Regional passenger trains. The Basis of Design matches the length of the platforms to the length of the train consists, with the goal of allowing direct access from the entire train to the platform with a single stop. Matching the platform length to the train consist optimizes passenger access and allows crew members to exit the train safely at the station if needed. DRPT considered adding two 1,200-foot long platforms on the west side of Main Street Station that could accommodate the full length of Long Distance trains. However, DRPT determined that two 1,200-foot platforms were not practical on the west side due to physical site constraints and potential impacts to cultural resources. Site constraints that precluded extending the platforms to 1,200 feet include:

- The viaduct on the west side of the station threads between two piers (located at the southwest corner of the station building adjacent to East Main Street) supporting I-95 elevated above the viaduct. These piers physically prevent the west side platforms from extending south.
- Approximately 500 feet north of the renovated train shed, the viaducts pass over E. Broad Street. The vertical clearance for Broad Street beneath the rail viaducts is 13 feet-8 inches, which is less than the VDOT standard of 16 feet-6 inches. Broad Street also slopes upward west of the rail viaducts to climb over I-95. Adding a platform across Broad Street on the west would further reduce the roadway clearance limitations in order to maintain access to an extended platform.
- The existing rail trestle bridge over Broad Street is an approximately 75-foot thru-truss girder span that prevents access to the tracks from a platform over Broad Street—thus any platform extending north from the station across Broad Street would have an approximately 75-foot gap with no access to the train.

Alternative 6F: Full Service, Staples Mill Road/Main Street Stations (S-Line) is feasible and supports passenger service and freight service to meet the Purpose and Need. This alternative has been modified by FRA and DRPT in response to comments from the City of Richmond and others, including extending the two low-level platforms on the west side of Main Street Station to 950 feet in length, with crew walkways added to the viaduct, and eliminating a proposed parking deck on the east side of the station. Alternative 6F is consistent with prior FRA and Commonwealth decisions regarding the SEHSR program and Main Street Station as Richmond's downtown intercity passenger station, including decisions documented in the 2002 Tier I ROD, Richmond to Hampton Roads Tier I ROD (2012), and Richmond to Raleigh Tier II ROD (2017). The alternative is also consistent with FRA and Amtrak guidance on providing intercity passenger service to the central business district and the use of a suburban station. Plus, there is strong local support for this alternative, including from the City of Richmond and Henrico County, and the alternative is consistent with their respective comprehensive plans.

Alternative 6F will add a second track on each side of Main Street Station using the existing elevated rail trestles/viaducts, which currently have one operating track on each side where two tracks previously existed. The two tracks on both east and west sides of the station will be used by both freight and passenger trains. The Project will also add two low-level platforms on each side of the station (a total of four platforms). Platforms on the east side of the station will be 850 feet long by 15 feet wide. Platforms on the west side of the station will be 950 feet long by 15 feet wide. The east and west-side platforms adjacent to the station (the “inside” platforms) will incorporate the platforms built into the renovated train shed and extend them north on new structures parallel to the existing track viaduct. These platforms will be accessible from the train shed. The “outside” east and west-side platforms will be built on new structures adjacent to the existing east and west viaducts. Elevators and staircases will provide access to the outside platforms from ground level. The Project will also add a walkway attached to both sides of the western viaduct, extending approximately 50 feet north and 100 feet south from the new platform ends. The walkways will provide crew the ability to safely enter/exit or inspect locomotives or rail cars that extend beyond the platforms when a passenger train longer than 950 feet is stopped at the station.

Main Street Station is owned by the City of Richmond, with intercity passenger services provided by Amtrak. In the Draft EIS, Alternative 6F included a parking deck on the east side of Main Street Station to illustrate how projected future passenger parking needs at Main Street Station could be met by the City of Richmond. Comments from the City of Richmond and others indicated that this parking deck was not necessary, and created impacts to private property and cultural resources. DRPT has eliminated the parking deck from Alternative 6F as part of the Preferred Alternative, and instead proposed that future parking needs for the intercity passenger service will be met through development of a Main Street Station parking plan to be developed by the City of Richmond in coordination with DRPT, which will take into account City plans for future use of the City-owned property around Main Street Station and other development in Shockoe Valley. DRPT considered and dismissed adding a third track on the west side of the station due to site constraints and potential impacts to cultural resources in the area. DRPT also considered and dismissed making the west side platforms 1,200 feet long in keeping with the Project’s Basis of Design to fully accommodate long-distance trains, opting instead for a reduced platform length of 950 feet plus an extended walkway, owing to site constraints and to minimize potential impacts to cultural resources. While Main Street Station site constraints and concerns over potential impacts to cultural resources limit the number of tracks and length of platforms proposed for the station, future passenger service amenities to be provided at the station, such as checked baggage service, are not precluded. Specific amenities to be provided at each station for a particular passenger service will be determined by DRPT when service is initiated, in coordination with Amtrak, the City of Richmond, and other station stakeholders. DRPT has assumed that Amtrak’s scheduled crew changes in the Richmond area, which currently occur at Staples Mill Road Station, will continue to occur at Staples Mill Road Station under this alternative.

Based on the above past study conclusions, FRA guidance, operational considerations, infrastructure modifications to avoid sensitive resources, and DRPT’s commitment to minimize the Project footprint to reduce potential impacts to sensitive cultural and archeological resources around Main Street Station, Alternative 6F was selected as the Preferred Alternative in the Richmond area.

The Project's preliminary conceptual design efforts took into consideration cultural and archeological resources in Shockoe Valley. Map overlays were created using historic maps and previously identified historic sites to assure that known sites and buildings were included in the analysis. In addition, Project boundaries were compared to the conceptual outlines of the Shockoe Bottom Memorial Park, a proposed memorial to the Richmond slave trade and slave jail, which operated on land in the vicinity of Main Street Station. Additional trains planned in the DC2RVA Project will follow the current track alignment and remain within the existing CSXT right-of-way in this area, and proposed new tracks will be located on the existing viaducts where tracks existed previously; therefore, the only ground disturbance as part of the Project will be from support piers for passenger platforms on the east and west side of Main Street Station. Cultural resources work has been ongoing since the publication of the Draft EIS; refer to Section 3.1 of this Final EIS and Appendix D of this Final EIS for details.

4.3.6.3 Changes to 6F Subsequent to the Draft EIS

At the inception of the DC2RVA Project, there was an overlap between the DC2RVA corridor and the R2R corridor in the Richmond area, extending from Main Street Station south to Centralia. Both projects proposed improvements in this segment of the corridor; DC2RVA's proposed improvements incorporated some of the R2R improvements, but also proposed slightly different improvements in accordance with the DC2RVA Basis of Design and Purpose and Need. For example, as part of the R2R project, all roadway crossings of the rail line were proposed to be grade separated, whereas the only new grade separation proposed in the segment as part of the DC2RVA Preferred Alternative is Commerce Road, south of downtown (all other existing at-grade crossings in this area will remain at-grade under the DC2RVA Project). FRA and DRPT have decided that when future stages of the DC2RVA Project are funded, improvements would advance under the DC2RVA Project design in the area between Main Street Station and Centralia where DC2RVA and R2R overlap.

In addition, comments from the public and review agencies, combined with new data either provided or discovered during the Draft EIS review period, resulted in modifications to the conceptual engineering for Alternative 6F. Other conceptual engineering modifications originated from:

- Addressing comments to minimize right-of-way impacts by adding or extending retaining walls
- Addressing access impacts to driveways and properties along the corridor
- Incorporating crossing improvements, i.e., additional paving widths for crossing and pedestrian safety, and potential locations of gates and equipment sheds
- Addressing train operations improvements within the track limits, including extending the west platforms at Main Street Station and adding crew walkways at both ends of these platforms to reduce the footprint of these improvements
- Addressing effects of extending the tracks across Hermitage Road (RF&P Line) in Henrico County, which requires the replacement of the at-grade crossing with a proposed overpass to avoid blockage of the crossing during train operations at Acca Yard
- Addressing the expansion of the existing parking lot at Staples Mill Road Station by DRPT, Amtrak, and VDOT in June 2018. The completed project more than doubles the amount of available parking from 288 to 600 parking spaces. The entire existing lot was

repaved, with improved taxi and ride share parking, pedestrian access, and bus loading. Along with these improvements, a second entrance off of Bremner Boulevard was added to improve parking lot access. This expanded parking lot meets the projected parking demand for DC2RVA, and no further parking improvements are recommended.

- Limiting impacts in Richmond's Shockoe Valley in response to public and agency comments, specifically:
  - Relocating the proposed turning wye and service yard to Bellwood, which reduces the Project footprint at Brown's Yard and reduces private property impacts
  - Removing the proposed parking deck on the east side of Main Street Station, thereby reducing adverse effects on cultural resources and private property; DRPT will coordinate with the City as they develop a parking plan for Main Street Station when service is instituted

Richmond Area Turning Wye and Service Yard Alternatives. The recommended preferred alternative as evaluated in the Draft EIS for the Richmond Area, Build Alternative 6F: Full Service, Staples Mill Road/Main Street Stations, included a new turning wye track at Hospital Street connecting the CSXT S-Line with the Buckingham Branch Railroad, and the addition of three siding tracks at the former CSXT Brown Street Yard for overnight storage and servicing of a passenger train. A turning wye and overnight storage/servicing yard are necessary to support a new passenger train roundtrip with an early morning departure from Richmond to Washington D.C. and Amtrak's NEC. In response to comments and to reduce the impacts associated with the new turning wye track at Hospital Street and passenger train storage and servicing facility at Brown Street Yard, DRPT has relocated the Richmond area turning wye and passenger train service yard to CSXT's existing Bellwood Wye and Yard, south of the James River. Relocating the proposed facility from Hospital Street/Brown Street Yard to Bellwood Yard will improve the efficiency of train operations, reduce property impacts outside of CSXT's right-of-way, and reduce the rail footprint within the culturally sensitive area of Richmond's Shockoe Valley. Refer to Appendix J of this Final EIS for full details on the background and decision process for the Richmond Area turning wye and service yard alternatives.

James River Bridge in Richmond, VA

4.4 ALTERNATIVES EVALUATED IN THE DRAFT EIS, BUT NOT SELECTED AS THE PREFERRED ALTERNATIVE

4.4.1 Summary of Build Alternatives Evaluated in the Draft EIS

From the wide range of alternatives and options that were considered during the alternatives development process, 23 Build Alternatives were carried forward for evaluation in the Draft EIS. The number of alternatives varied within the six alternative areas in the Project corridor. Each Build Alternative included an alignment, track configuration, and specific improvements to features such as stations and at-grade roadway crossings.

Table 4.4-1 presents the 23 Build Alternatives and indicates which were selected by FRA and the CTB as the Preferred Alternative; for those that were not selected, a short description of the alternative is provided.

Refer to Draft EIS Section 2.5.2 for detailed descriptions of each Build Alternative, including physical infrastructure improvements along the rail alignment and proposed train operations at stations.

Refer to Section 4.2 of this Final EIS for description of the proposed DC2RVA service plan for the Preferred Alternative described in Table 4.4-1.

4.4.2 No Build Alternative

The No Build Alternative defines the future infrastructure and service levels that would result from planned investments in the Washington, D.C. to Richmond rail corridor that would occur independent of any DC2RVA Project improvements—it essentially outlines a future existing condition.

While the No Build Alternative was evaluated and dismissed by the FRA and FHWA for not meeting the Purpose and Need for the overall SEHSR corridor in the 2002 Tier I EIS, it was considered as part of the Tier II Draft EIS for the DC2RVA Project as required by NEPA. The No Build Alternative provided a basis for comparing the potential effects of different DC2RVA Build Alternatives. If a planned rail or transit improvement in the Project corridor was under construction, fully funded, or was the focus of advanced collaborative planning, DRPT assumed it would be complete by 2025 for the purposes of the Draft EIS evaluation.

Refer to Section 2.5.1 of the Draft EIS for a detailed list of rail and transit infrastructure improvements that were assumed to be included in the DC2RVA No Build Alternative. Note that certain elements of these No Build projects continue to undergo design refinements and/or revised construction schedules, including the VRE yard and platform expansion programs, as the DC2RVA Project progresses. However, these minor changes are not anticipated to have an effect on the DC2RVA No Build assumptions. Refer to Section 7.7 of this Final EIS for details of coordination of this Project with other studies and projects.

In the Tier II Draft EIS for the DC2RVA Project, DRPT and FRA confirmed the findings of the 2002 Tier I EIS that the No Build Alternative does not meet the Project Purpose and Need.

Table 4.4-1: Summary of Build Alternatives Evaluated in Draft EIS

Draft EIS Alternative		Description
Area 1: Arlington: *Three Build Alternatives were evaluated in Area 1, the major difference being which side of the existing track the new track would be added (as indicated in the Build Alternative names). There are no intercity passenger rail stations in this area.*		
1A	Add Two Tracks on the East	Within the Arlington Bridge approach, two tracks would be added to the east side of the existing tracks.
1B	Add Two Tracks on the West	**Selected as the Preferred Alternative.** Aligns with both alternatives identified in the Alternatives Development Report for the separate Long Bridge Study; refer to Section 4.3.1 above for detailed description.
1C	Add One Track East and One Track West	Within the Arlington Bridge approach, one track would be added to the east side of the existing tracks and one track would be added to the west side of the existing tracks.
Area 2: Northern Virginia: *The sole Build Alternative evaluated in Area 2 adds one main track within the existing railroad right-of-way. There are three intercity passenger rail stations in the area: Alexandria, Woodbridge, and Quantico.*		
2A	Add One Track / Improve Existing Track	**Selected as the Preferred Alternative.** Refer to Section 4.3.2 above for detailed description.
Area 3: Fredericksburg: *Three Build Alternatives were evaluated in Area 3, including both two- and three-track options on the existing alignment through the city and a two-track bypass alignment around the city. The Fredericksburg Station is within this area.*		
3A	Maintain Two Tracks Through City	Within Fredericksburg, there would be no construction of new track / no additional rail capacity, and train operations would continue through the city similar to existing conditions, with station improvements. North and south of the city, there would be construction of one additional track within the existing railroad right-of-way.
3B	Add One Track Through City East of Existing	**Selected as the Preferred Alternative.** Refer to Section 4.3.3 above for detailed description.
3C	Add Two-Track Bypass East of City	A new two-track bypass east of Fredericksburg would be constructed to serve freight and passenger trains that do not stop in the city, which would require additional right-of-way. The existing rail corridor would be maintained in the city and the station would be improved. North and south of the city, there would be construction of one additional track within the existing railroad right-of-way.
Area 4: Central Virginia: *The sole Build Alternative evaluated in Area 4 adds one main track within existing railroad right-of-way. There are no intercity passenger rail stations in this area.*		
4A	Add One Track/Improve Existing Track	**Selected as the Preferred Alternative.** Refer to Section 4.3.4 above for detailed description.
Area 5: Ashland: *Seven Build Alternatives were evaluated in Area 5, varying from track alignment options through town to a new bypass. The alternatives include two different location options for the Ashland Station: a Downtown Station (which would maintain the existing station location with improvements) and an Ashcake Station location (which would close the existing station location and relocate service to a new station south of Ashcake Road). North and south of the town, all Build Alternatives would include construction of one additional track within the existing railroad right-of-way.*		
5A	Maintain Two Tracks Through Town	**Selected as the Preferred Alternative.** Refer to Section 4.3.5 above for detailed description.
5A–Ashcake	Maintain Two Tracks Through Town (Relocate Station to Ashcake)	This alternative is the same as 5A (the Preferred Alternative) but would relocate the station to Ashcake Road.
5B	Add One Track Through Town East of Existing	Within town, one track would be added adjacent to the east side of the existing tracks, which would require additional right-of-way and closure of an existing at-grade crossing within town. The existing station would be improved.

▶ *Continued.*

Table 4.4-1: Summary of Build Alternatives Evaluated in Draft EIS

Draft EIS Alternative		Description
5B–Ashcake	Add One Track Through Town East of Existing (Relocate Station to Ashcake)	This alternative is the same as 5B (as summarized above) but would relocate the station to Ashcake Road.
5C	Add Two-Track Western Bypass	A new two-track bypass west of Ashland would be constructed to serve freight and passenger trains that do not stop in town, which would require additional right-of-way. The existing rail corridor would be maintained in the city and the station would be improved.
5C–Ashcake	Add Two-Track Western Bypass (Relocate Station to Ashcake)	This alternative is the same as 5C (as summarized above) but would relocate the station to Ashcake Road.
5D–Ashcake	Three Tracks Centered Through Town (Add One Track, Relocate Station to Ashcake)	Within town, one track would be added with centering of all three tracks on the existing alignment. This would require additional right-of-way and preclude use of the existing station in town. The station would be relocated to Ashcake Road.
Area 6: Richmond: *Eight Build Alternatives were evaluated in Area 6: five single-station options (which would consolidate all service to a single station location) and three two-station options (which would divide service between two stations). Use of the A-Line or S-Line varied by alternative, based primarily on the ability to serve station locations and optimize passenger and freight routes.*		
6A	Staples Mill Road Station Only	The existing Staples Mill Road Station would be improved to become the single passenger station to serve Richmond, and existing Main Street Station would be closed to service. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6B–A-Line	Boulevard Station Only, A-Line	A new Boulevard Station would be constructed to become the single passenger station to serve Richmond, and existing Staples Mill Road and Main Street Stations would be closed to service. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6B–S-Line	Boulevard Station Only, S-Line	This alternative is similar to 6B–A-Line (as summarized above) but would add one main track on the S-Line (through the city).
6C	Broad Street Station Only	A new Broad Street Station would be constructed to become the single passenger station to serve Richmond, and existing Staples Mill Road and Main Street Stations would be closed to service. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6D	Main Street Station Only	The existing Main Street Station would be improved to become the single passenger station to serve Richmond, and existing Staples Mill Road Station would be closed to service. One main track would be added along the RF&P Line (north of the city) and the S-Line (through the city).
6E	Split Service, Staples Mill Road/Main Street Stations	Both existing Staples Mill Road and Main Street Stations would be improved and remain operational, with the majority of intercity passenger trains stopping only at Staples Mill Road. One main track would be added along the RF&P Line (north of the city) and the A-Line (through the city).
6F	Full Service, Staples Mill Road/Main Street Stations	**SELECTED AS THE PREFERRED ALTERNATIVE.** Refer to Section 4.3.6 above for detailed description.
6G	Shared Service, Staples Mill Road/Main Street Stations	Both existing Staples Mill Road and Main Street Stations would be improved and remain operational, with the majority of intercity passenger trains stopping only at both stations, but some trains following the A-Line to bypass downtown Richmond and only serve Staples Mill Road Station. One main track would be added along the RF&P Line (north of the city) and the S-Line (through the city).

4.5 CAPITAL AND OPERATING COSTS

4.5.1 Capital Infrastructure Costs

Table 4.5-1 shows the capital infrastructure cost estimate for the Preferred Alternative. Capital infrastructure costs represent the total cost associated with the design, management, land acquisition, and construction of the infrastructure improvements, including communications and signaling systems associated with track and crossing improvements, of the DC2RVA Project. These costs include a 30% contingency for unknown conditions or unidentified infrastructure. Estimated costs are based on a conceptual (10 percent) level of design for the proposed improvements, as described at the beginning of this chapter, and are based on projected unit costs for the year 2025 (i.e., the year that FRA and DRPT have assumed that the Preferred Alternative would be in place for the purposes of the NEPA). The capital infrastructure costs do not include costs for additional rolling stock that may be necessary to implement the new service as proposed by the Project; see Section 4.5.3 for details.

Table 4.5-1: Capital Infrastructure Costs for the Preferred Alternative

Alternative Area	Preferred Alternative	Capital Cost (2025 $ millions)
Area 1: Arlington (Long Bridge Approach)	1B: Add Two Main Tracks on the West	$42.4
Area 2: Northern Virginia (Long Bridge to Dahlgren Spur)	2A: Add Third or Fourth Main Track	$1,778.9
Area 3: Fredericksburg (Dahlgren Spur to Crossroads)	3B: Add a Third Main Track Through the City	$559.4
Area 4: Central Virginia (Crossroads to Doswell)	4A: Add a Third Main Track	$1,143.7
Area 5: Ashland (Doswell to I-295)	5A: Maintain Two Tracks Through Town (No Station Improvements)	$431.8
Area 6: Richmond (I-295 to Centralia)	6F: Staples Mill Road/Main Street Stations Full Service with S-Line Improvements	$1,667.0
Total Capital Infrastructure Cost for the Preferred Alternative		**$5,623.2**

4.5.2 Operations and Maintenance Costs

The estimate of long-term operations and maintenance (O&M) costs include both train operations and infrastructure maintenance. Operations consists of labor costs, fuel and other supplies, and other factors required to keep the DC2RVA Project in service, whereas maintenance includes routine servicing of vehicles, maintenance of the tracks, signals, communications, and other systems needed to keep the system safe and reliable. Table 4.5-2 presents a summary of the estimated annual cost to operate and maintain the DC2RVA passenger rail service associated with the Preferred Alternative. These costs are calculated based on the passenger rail service for the full DC2RVA corridor and are presented for the Preferred Alternative.

Table 4.5-2: Annual Estimated O&M Costs for Preferred Alternative (Year 2045)

Year	Preferred Alternative	Total O&M Cost (2015 $ millions)
2045	Alternative 1B, 2A, 3B, 4A, 5A, and 6F	$100.3

Note: Although the O&M cost varies among the alternatives, the standard deviation among all 2045 Richmond Build Alternatives was approximately 1%, which is within the margin of error for the analysis performed.

Note that the O&M costs presented in Table 4.5-2 above represent gross expenditures and do not include potential revenue generated from the operation of the passenger service, which would provide a source of income to compensate for the O&M costs.

The 2045 Preferred Alternative conditions represent approximately a doubling of intercity passenger service and ridership. Accordingly, the O&M costs for the Preferred Alternative are also approximately double the costs of today's service (2015), recognizing that frequency and level of service are the key drivers of operating and maintenance costs.

4.5.3 Cost of Rolling Stock

Rolling stock consists of the locomotives, passenger cars, and baggage cars that may be necessary to implement the new service as proposed by the Project.

The DC2RVA Project proposes to add 9 new daily intercity passenger round trips (18 total trains per day) through the corridor (refer to Section 4.2 above for details). Of the 9 new daily intercity passenger round trips (19 total trains per day) proposed by the Project:

- Four new daily round trips will be Interstate Corridor trains originating in, and supported by, North Carolina. While these trains pass through and provide service within the DC2RVA corridor, they will be part of the Richmond to Raleigh (R2R) project and are excluded from the cost estimate of rolling stock.
- Five new daily round trips will be Northeast Regional trains supported by the Commonwealth. Of these five Commonwealth-supported round trips:
  - Four will pass through and provide service within the DC2RVA corridor as part of the Richmond to Hampton Roads (R2HR) project and are excluded from the cost estimate of rolling stock.
  - One Northeast Regional new daily roundtrip train will originate in the DC2RVA corridor (at Main Street Station); costs for rolling stock to support this train are included in the cost estimate shown below.

DRPT anticipates the cost for rolling stock to support this additional service would be shared by Amtrak and those states that share in the cost of service; the cost would be apportioned through negotiated agreements at the time of service implementation and is not available at this time. The rolling stock cost estimate shown in Table 4.5-3 is an example, although how the costs will be apportioned are not known. The train originating at Main Street Station will be two locomotives and ten single-level passenger railcars, which in the early morning will run north from Main Street Station to Washington, D.C. and then onto the NEC to Boston, MA, and in the late afternoon/evening, return south. Rolling stock needed to operate this train service will include two locomotives for the round trip between Richmond and Washington, D.C. and 20 single-level passenger railcars for the round trip between Richmond and Boston. Applying a factor of 20 percent for spare vehicles, rolling stock procurement is projected to include three locomotives and 24 single level passenger railcars.

Table 4.5-3: Potential Cost of Rolling Stock

Standard Cost Category		2017 Cost ($ millions)	2025 Cost ($ millions)
70	Rolling Stock	$ 111.8	$ 144.5

APPENDIX A

ERRATA TABLE FOR THE DRAFT EIS

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

Appendix A

ERRATA TABLE FOR THE DRAFT EIS

Pursuant to Section 1304 of the FAST Act "Efficient Environmental Reviews for Project Decision Making" and Section 1319 of MAP-21 "Accelerated Decision-making in Environmental Reviews," this appendix provides an errata table for the Draft EIS in lieu of rewriting the Draft EIS documentation in its entirety.

As explained in Section 1.1, the Final EIS is presented in a condensed document format to allow the reader to readily focus on the reasons for selecting the Preferred Alternative and its potential environmental impacts and avoidance/mitigation measures. To avoid duplication with the Draft Environmental Impact Statement (EIS), the Final EIS does not re-inventory all data and analyses at the same level of detail as the Draft EIS and its technical appendices, such as re-documentation of all 23 Build Alternatives that were evaluated in the Draft EIS. Accordingly, the purpose of this errata table is to document factual corrections and/or minor clarifications to the portions of the September 2017 Draft EIS that were not fully re-issued as part of the Final EIS, including:

- Draft EIS Executive Summary
- Draft EIS Chapter 1 – Purpose and Need
- Draft EIS Chapter 2 – Alternatives
- Draft EIS Chapter 3 – Affected Environment
- Draft EIS Chapter 4 – Environmental Consequences
- Draft EIS Chapter 6 – Public Involvement and Agency Coordination
- Draft EIS Chapter 7 – DRPT Recommended Preferred Alternative
- Draft EIS Chapter 8 – Distribution of Draft EIS
- Draft EIS Chapter 12 – References

The corrections and clarifications in the errata do not affect the selection of the Preferred Alternative. The factual corrections, minor clarifications, and/or updates that are itemized within this errata table were identified from agency and public comments as well as ongoing coordination and documentation that has occurred since the publication of the Draft EIS.

Detailed responses to agency and public comments are provided in Appendices B and C, respectively, and any modifications as a result of substantive comments are incorporated into the appropriate chapters of the Final EIS, and are not part of this errata table. The errata table does not include the Draft EIS technical appendices.

The following pages present the errata table by chapter of the Draft EIS, as listed on the previous page. Each errata entry includes reference to relevant page, table, and/or figure numbers from the Draft EIS[1], included herein by reference, and presents the original text followed by the revised or replacement text, which is underlined for quick identification. Figures and/or tables that are republished due to changes in data (as referenced in the table) are presented after the table at the end of this appendix.

---

[1] The Draft EIS is available on the Project website: http://dc2rvarail.com/draft/

DEIS Page #	Section/Table/ Figure	Original Text	Revised Text (Note: New and/or revised text is underlined in this column)
Draft EIS Executive Summary			
3	1. Project Overview	Last paragraph. "Because the DC2RVA Project corridor is shared corridor…"	Replace with: "Because the DC2RVA Project corridor is a shared corridor…"
64	Area 6: Preferred Alternative	First paragraph. "Interstate Corridor (SEHSR) and Northeast Regional (SEHSR and Virginia) to Norfolk passenger trains moving north-south through Richmond would be routed from Staples Mill Road Station to the west side of Main Street Station and then to Centralia using the S-Line. Interstate Corridor (Carolinian) and Long Distance passenger trains would be routed through Staples Mill Road Station to Centralia using the A-Line, bypassing Main Street Station. One Northeast Regional (SEHSR) round trip would terminate at Main Street Station."	Replace with: "All Long-Distance, Interstate Corridor, and Northeast Regional passenger trains moving north-south through Richmond would be routed through Staples Mill Road Station to the west side of Main Street Station and then to Centralia using the S-Line. The Northeast Regional service to Newport News would continue to use the east side of Main Street Station on the Peninsula Subdivision line."
Draft EIS Chapter 1 – Purpose and Need			
1-25	Section 1.5.2.7	End of first paragraph. "The cities of Alexandria, Fairfax, Falls Church, Manassas and Manassas Park, and the counties of Arlington, Fairfax, Loudoun, and Prince William are currently nonattainment areas for the 2008 8-hour ozone standard."	Replace with: "The cities of Alexandria, Fairfax, Falls Church, Manassas and Manassas Park, and the counties of Arlington, Fairfax, Loudoun, and Prince William are currently part of the Washington, DC-MD-VA marginal nonattainment areas for the 2008 8-hour ozone standard based on the EPA's Green Book."
Draft EIS Chapter 2 – Alternatives			
2-20	Table 2.3-3	First bullet. "Avoid, reduce, or mitigate impacts to sensitive human, natural and physical environmental resources."	Replace with: "Avoid, reduce, or mitigate impacts to sensitive human, cultural, natural, and physical environmental resources."
2-23	Section 2.3.3.1	Top of page. "DRPT recognizes there is a trade-off between meeting the Project's Purpose and Need and impacts to human and natural resources."	Replace with: " DRPT recognizes there is a trade-off between the Project's benefits and the Project's impacts to human, cultural, natural, and physical environmental resources."
2-34	Table 2.4-3	Row 1, column 2. "Caroline County/Area 4: Central Virginia"	Replace with: "Town of Ashland/Area 5: Ashland"
2-44	Table 2.5-1	[End of "Rail" section of table, below VRE Potomac Shores Station]	Add new rows for: "VRE Crystal City Station improvements" and "VRE L'Enfant Station improvements"
2-47	Section 2.5.1.1	Third bullet. "VRE will also improve the tunnel connecting the island platform to the main station for ADA accessibility."	Replace with: "VRE proposes to also build a new ADA-compliant tunnel connecting the station to the island platform, with a potential extension of the tunnel to connect to the King Street Metro station."
2-55	Section 2.5.2.2	First line. "…extends from the Crystal City station in Arlington County…"	Replace with: "…extends from the VRE Crystal City station in Arlington County…"
2-121	Table 2.6-2	Row 11 (6F): "*No Service* | *No Service* | 2:29 | 2:25 | *No Service* | *No Service*" Row 13 (6G): "2:15 | 2:13 | 2:21 | 2:18 | *No Service* | *No Service*"	The data in Row 11 and 13 were switched in the Draft EIS. Replace with: Row 11 (6F): "2:15 | 2:13 | 2:21 | 2:18 | *No Service* | *No Service*" Row 13 (6G): "No Service | No Service | 2:29 | 2:25 | *No Service* | *No Service*"
2-125	Figure 2.8-1	[Figure included a remnant watermark indicating "DRAFT"]	*Remove "DRAFT" watermark. [Note that this figure is not re-issued in this errata table, as the figure content remains unchanged.]*
2-125	Section 2.8	Two paragraphs under Rail Construction. "The proposed track structure is ballasted track to be constructed on a prepared track bed. As the earthwork is completed, a sub-ballast layer would be constructed with aggregates hauled from the local quarries and from contractor's stockpiles. The sub-ballast would be graded, rolled, and compacted to establish a solid base. Following placement of the sub-ballast, an 8-inch layer of ballast would be placed as the final layer. This new surface is called a track bed. Once the track bed is in place, railroad ties (wood or concrete) would be placed and the continuous welded rail (CWR) fastened and anchored in place. As placement of the ties and CWR can disturb the ballast, tamping and lining track would be done to finish the installation. In addition to new main track construction, construction would also involve shifting the existing track alignment. The track shifts would utilize existing rail and track bed if possible. In areas where existing rail and track bed are not feasible to use, additional grading and installation of new track bed would occur, followed by tamping and lining the track to finish."	Replace with: "The proposed track structure is ballasted track to be constructed on a prepared track bed. As the earthwork is completed, a sub-ballast layer will be constructed with aggregates hauled from local quarries and/or from contractor's stockpiles of CSX approved aggregates. The sub-ballast will be graded, rolled, and compacted to establish a solid base (track bed). Following placement, testing and approval of the sub-ballast, railroad ties (wood or concrete) would be placed and the continuous welded rail (CWR) fastened and anchored to the ties. Once the track is in place, a 12-inch layer of ballast would be placed in "lifts" until there is 12 inches of ballast between the tie and the sub ballast. Tamping the ballast around and beneath the ties, and lining and surfacing the track, would finish the installation. In addition to new main track construction, construction would also involve shifting the existing track alignment. The track shifts would use the existing rail and track bed where possible. In areas where existing rail and track bed are not feasible to use, additional grading and installation of new track bed would occur followed by installation of the new track and ballast including tamping, lining and surfacing to complete the installation."

▶ Continued.

DEIS Page #	Section/Table/Figure	Original Text	Revised Text (Note: New and/or revised text is *underlined in this column*)
Draft EIS Chapter 3 – Affected Environment			
3-23	Section 3.1.7	Sixth paragraph. "The Project falls within SDWA Zone 1 (5-mile radius) for three public surface water supply intakes - Fairfax County Water Authority, Hanover Suburban Water System, and City of Richmond. Fairfax County Water Authority and City of Richmond water supplies are located upstream of the existing rail corridor."	Replace with: "The project falls within SDWA Zone 1 (5-mile radius) of seven public surface water supply intakes - Fairfax County Water Authority, Quantico Marine Base Mainside, Stafford County Utilities, Spotsylvania County Utilities (2 intakes), Hanover Suburban Water System, and City of Richmond. With the exception of the Hanover County Water System, the surface water supply intakes are located upstream of the existing rail corridor."
3-38	Section 3.6	End of first paragraph.	Add text to end of paragraph: "These pollutants are summarized below along with air quality trends as monitored by the EPA (EPA, 2018)."
3-38	Section 3.6	Second paragraph. "From 1980 to 2013, there was a 33 percent decrease…"	Replace with: "From 1980 to 2016, there was a 31 percent decrease…"
3-38	Section 3.6	Third paragraph. "From 1980 to 2013, was a 58 percent decrease…"	Replace with: "From 1980 to 2016, there was a 62 percent decrease…"
3-38	Section 3.6	Fourth paragraph. "From 1990 to 2013, there was a 34 percent decrease… From 2000 to 2013, there was a 34 percent decrease…"	Replace with: "From 1990 to 2016, there was a 39 percent decrease… From 2000 to 2016, there was a 44 percent decrease…"
3-38	Section 3.6	Fifth paragraph. "From 1980 to 2013, there was an 84 percent decrease…"	Replace with: "From 1980 to 2016, there was an 85 percent decrease…"
3-40	Section 3.6.2	Second bullet. "*The regulations for Determining Conformity of General Federal Actions of State or Federal Implementation Plans* were published in the Federal Register on November 30, 1993. (…) On March 24, 2010, EPA revised the general conformity regulations to improve the process federal entities use to demonstrate that their actions will not contribute to a violation of an NAAQS. In Virginia, general conformity criteria and procedures are set forth in 9 *Virginia Administrative Code* (VAC) 5-10-20. In the District of Columbia, these criteria and procedures are set forth in 57 DCR 527."	Replace with: "The regulations for *Determining Conformity of General Federal Actions of State or Federal Implementation Plans* were published in the Federal Register on November 30, 1993 (58 FR 63214). (…) On March 24, 2010 (75 FR 14260), EPA revised the general conformity regulations to improve the process federal entities use to demonstrate that their actions will not contribute to a violation of a NAAQS. In Virginia, general conformity criteria and procedures are set forth in 9 Virginia Administrative Code (VAC) 5-10-20 and 9VAC5-160. In the District of Columbia, these criteria and procedures are set forth in 20-15 DCMR (January 8, 2010, 57 DCR 527)."
3-40	Section 3.6.3	First line. "In June 2004, as part of the Clean Air Nonroad Diesel Rule…"	Replace with: "On June 29, 2004 (69 FR 38958), as part of the Clean Air Nonroad Diesel Rule…"
3-41	Section 3.6.4	First paragraph. "Effective 27, 2007, EPA adopted controls on mobile source air toxics (MSATS)….In June 2008, EPA published the final rule…"	Replace with: "Effective April 27, 2007, EPA adopted controls on mobile source air toxics (MSATs) (February 26, 2007, 72 FR 8428). …On June 30, 2008 (73 FR 37096), EPA published the final rule…"
3-41	Section 3.6.4	Second paragraph. "Locomotives and marine diesel engines…"	Replace with: "According to EPA's June 30, 2008 final rule, locomotives and marine diesel engines…"
3-41	Section 3.6.4	Third paragraph. "On a nationwide annual basis…"	Replace with: "Based on EPA's final rule, on a nationwide annual basis…"
3-41	Section 3.6.5.1	End of first paragraph.	Add to end of first paragraph: "The EPA Green Book provides detailed information about area NAAQS designations, classifications, and nonattainment status."
3-42	Table 3.6-2	Footnote.	Add to footnote: "Note: Arlington County, Alexandria, Fairfax County, and Prince William County are part of the Washington DC-MD-VA marginal nonattainment area based on the EPA's Green Book."
3-55	Section 3.9.2	Sensitive Resources.	Add: "Potomac Heritage National Scenic Trail" and "The Captain John Smith Chesapeake National Historic Trail"
3-57	Section 3.9.2.1	Area 1: Arlington – VAU 1-1: "Sensitive Resources 1. George Washington Memorial Parkway 2. Roaches Run Wildlife Sanctuary 3. Long Bridge Park"	Replace with: "Sensitive Resources (Owner) 1. George Washington Memorial Parkway (NPS)/Potomac Heritage National Scenic Trail (NPS) 2. Roaches Run Wildlife Sanctuary (NPS) 3. Long Bridge Park (Arlington County)"

Falling Creek Park (Chesterfield County)"
3-72	Section 3.9.2.6	Area 6: Richmond – VAU 6-6 "Sensitive Resources 1. James River 2. Great Shiplock Park 3. Libby Hill Park"	Replace with: "Sensitive Resources (Owner) 1. James River (n/a) 2. Great Shiplock Park (City of Richmond) 3. Libby Hill Park (City of Richmond)"
3-75	Section 3.10.1.1	Second line. "…which are managed by the USFWS for the protection and conservation…"	Replace with: "…which are managed by the USFWS and NPS for the protection and conservation…"
3-75	Section 3.10.1.1	End of first sentence in Roaches Run Waterfowl Sanctuary. "…is part of the George Washington Memorial Parkway."	Replace with: "…is part of the George Washington Memorial Parkway and is an administrative unit of the NPS."
3-90	Section 3.10.5	First sentence of last paragraph. "Seven federally listed threatened or endangered species are reported to occur or potentially occur within…"	Replace with: "Eight federally listed threatened or endangered species and one proposed federally listed threatened species are reported to occur or potentially occur within…"
3-91	Table 3.10-8	*[Table in its entirety is republished at end of this appendix.]*	See end of this appendix for updated Table 3.10-8 (Updated to show two undocumented species, Rusty Patch Bumble Bee and Yellow Lance, and their locations; updated to show the correct locations of all species in each Alternative area).
3-100	Section 3.11.3.2	Prince William County, third paragraph. "The concept for the Government Center is to concentrate a town center, with more dense commerce and employment opportunities south of Prince William Parkway, west of I-95 (several miles west of the Project corridor) and north of Dale City, and a County Center north of Prince William Parkway, and to include access to mass transit options. The Parkway Employment Center is north of Potomac Mills Mall and west of I-95 and is currently wooded, but it is intended to provide a transition between the intensely developed Potomac Mill area and residential areas to the north and west, while providing significant employment opportunities in the area. The Potomac Communities surround the Project corridor, and the sector plan is a refocusing on the comprehensive planning surrounding U.S. 1 and its relationship to the surrounding communities. The sector plan discusses the existing VRE stations: Quantico (also an Amtrak station), Rippon, and Woodbridge (also an Amtrak station). The Potomac Shores Station is under construction in Cherry Hill, with a planned opening in 2017. The sector plan has several action strategies that encourage "expanding existing mass transit services in Potomac Communities" (Prince William County, 2012)."	Replace with: "North Woodbridge is a Metropolitan Washington Council of Governments (MWCOG) Regional Activity Center, a Study Area in the Potomac Communities Revitalization Plan and a Center of Commerce in Prince William County. It is designated for Urban Mixed-Use development. Projects include the Route 123 and Route 1 interchange, the Potomac Heritage National Scenic Trail, and the Occoquan Riverfront Park. Large-scale redevelopment at the highest density permitted at the northern gateway to Prince William County is possible. Potomac Shores is a Metropolitan Washington Council of Governments Regional Activity Center and is mostly designated as a Regional Employment Center - an urban high-density, mixed-use designation. It is zoned for a dense, mixed-use development including a town center, a proposed VRE station, parks and trails, which include the Potomac Heritage National Scenic Trail."
3-103	Section 3.11.3.2	Town of Ashland, first paragraph, last sentence. "The plan specifically states that the Town "supports the Southeast High Speed Rail Corridor initiatives" and "shall work with federal, state, and regional partners to ensure the success and development of this initiative" (Town of Ashland, 2011)."	Replace with: "The plan specifically states that the Town "opposes options such as the addition of a third rail through downtown" (Town of Ashland, 2016)."
3-107	Table 3.11-5	Hanover County row, Community Center/Museum column. "0"	Replace with: "1" (Ashland/Hanover Visitor's Center/Train Station)
3-133	Table 3.13-4	Row 3, column 3. "Alexandria Depot" Row 5, column 3. "Parker-Gray Historic District/Uptown"	Replace with: "Alexandria Union Station" Replace with: "Uptown/Parker-Gray Historic District"
3-157	Table 3.14-1	Row 2, column 5.	Add one bullet to end of existing list: "• Includes portion of Potomac Heritage National Scenic Trail "
3-157	Table 3.14-1	[End of existing table, below "George Washington Memorial Parkway" row]	Add new row: "Daingerfield Island Park | Northern Virginia | 162 | NPS | • Located adjacent to the George Washington Memorial Parkway • Sailing and fishing are available at the park • Popular destination for fireworks viewing on the 4th of July"
3-158	Figure 3.14-1	*[The edited sheet of this figure is republished at end of this appendix.]*	See end of this appendix for updated Sheet 1 of Figure 3.14-1 (updated to show the undocumented public/private with public access parks; updated to show the correct location / boundaries of Braddock Park/Lenny Harris Memorial Field at Braddock Park).
3-173	Table 3.14-2	Rows 2 and 3 (Leesylvania State Park and Widewater State Park), column 5.	Add two bullets to existing list: "• Site on the Chesapeake NHT • Includes portion of proposed Potomac Heritage National Scenic Trail"

3-180	Table 3.14-4	Row 3, column 5, bulleted list.	Add one bullet to end of existing list: "• Includes portion of proposed Potomac Heritage National Scenic Trail"
3-181	Section 3.14.5	First paragraph. "…which they are located.. fOwnership of trails…"	Replace with: "…which they are located. Ownership of trails…"
3-181	Table 3.14-5	Row for Mount Vernon Trail, column 5, bulleted list.	Add one bullet to end of existing list: "• Includes portion of proposed Potomac Heritage National Scenic Trail"
3-182	Table 3.14-5	Row 5, column 1. "Potomac Heritage Trail"	Replace with: "Potomac Heritage National Scenic Trail corridor"
3-183	Table 3.14-5	Row 4, column 1. "Captain John Smith Historic Trail" Row 4, column 2. "Richmond" Row 4, column 5. "• Water trail on the James River throughout the study area "	Replace with: "Captain John Smith Chesapeake National Historic Trail" Replace with: "Arlington, Fredericksburg, and Richmond" Replace with the following bullets: "• Water trail extending throughout the Chesapeake Bay and its major tributaries • First water trail designated under the National Trails System Act • Commemorates the exploratory voyages of Captain John Smith on the Chesapeake Bay and its tributaries • Water trail on the Potomac, Rappahannock and James rivers and other tributaries, rivers, and streams throughout the study area"
3-184	Table 3.14-6	Title row, first column. "City/County"	Replace with: "Location (City/County)"
3-184	Table 3.14-6	[Middle of existing table, below row with George Washington Memorial Parkway]	Add two rows: "City of Alexandria | Northern Virginia | Eugene Simpson Stadium Park City of Alexandria | Northern Virginia | Joseph Hensley Park"
3-185	Table 3.14-7	*[Table in its entirety is republished at end of this appendix.]*	See end of this appendix for updated Table 3.14-7. (Updated with new rows for the following parks in the City of Alexandria: Potomac Yard Landbay N, Potomac Yard Park, Swan Finger Park, Rail Park, Custis Linear / Finger Park, and Howell Linear; updated to remove the following parks: Traffic Circle Park (City of Alexandria) and North Ashland Park (Hanover County)).
Draft EIS Chapter 4 – Environmental Consequences			
4-5	Section 4.1.1.1	First paragraph. "…would cross five to seven of the Coast Guard regulated…"	Replace with: "…would cross five to eight of the Coast Guard regulated…"
4-5	Section 4.1.1.1	Navigable Waters bulleted list.	Add one bullet to end of existing list: "• Four Mile Run"
4-13	Table 4.1-3	Third column, "Public Surface Water Zone 1 (acres)". In the table, Permanent and Temporary impacts are presented in separate columns for "Fairfax County", "Hanover County", and "City of Richmond" for each Build Alternative.	Remove the column for "Fairfax County". There are no (zero) Permanent or Temporary impacts to the Fairfax County water authority. Remove the column for "City of Richmond". There are no (zero) Permanent or Temporary impacts to the City of Richmond water authority/system. Within the "Hanover County" column (the Hanover Suburban water system): – For Build Alternative 4A, replace "P: 42.48" with "P: 25.52". – For Build Alternative 4A, replace "T: 23.36" with "T: 12.47". – Remove Permanent and Temporary impacts for all Build Alternatives within Area 5 (there are no (zero) impacts for 5A, 5A-Ashcake, 5B, 5B-Ashcake, 5C, 5C-Ashcake, and 5D-Ashcake).

► *Continued.*

DEIS Page #	Section/Table/ Figure	Original Text	Revised Text *(Note: New and/or revised text is underlined in this column)*
4-71	Section 4.10.1.1	Third subheading, County Wildlife Lands. “DRPT anticipates that Build Alternative 2A would result in approximately 0.55 acre of temporary impacts to Pohick Seeps Conservation Area. The site is located on parcels owned by Fairfax County that have a Permanent Wildlife Conservation Easement. Depending on the type of impacts proposed, temporary impacts could potentially be considered permanent for the rare habitat located there. Proposed work in this area will require coordination with Fairfax County.”	Replace text with: “DRPT anticipates that Build Alternative 2A will not result in any permanent or temporary impacts to Pohick Seeps Conservation Area. The site is located on parcels owned by Fairfax County that have a Permanent Wildlife Conservation Easement.” There is no impact to Pohick Seeps Conservation Area as part of the DC2RVA Project; Franconia to Occoquan (CFP 99 to 90) is currently two tracks but is being designed for three tracks as part of a separate project that is assumed to be complete as part of the DC2RVA Project, as detailed in Chapter 4 of the Final EIS.
4-72	Table 4.10-2	5th column; 3rd row. Area 2, County Wildlife Lands, “T: 0.55”.	Replace with: “T: 0.00” (see above row for details on this removal of temporary impact).
4-80 to 4-81	Table 4.10-4	*[Table in its entirety is republished at end of this appendix.]*	See end of this appendix for updated Table 4.10-4. (The Draft EIS table originally reported anticipated impacts in Linear Feet and has been updated to reflect anticipated impacts in Acreage to better account for both physical impediments as well as shadowing effects which could potentially interrupt anadromous/migratory movements.)
4-96	Table 4.11-1	*[Table in its entirety is republished at end of this appendix.]*	See end of this appendix for updated Table 4.11-1. (Updated row for Alternative 3B to show 1 relocation in Stafford County, Other, and Alternative 3C to show 1 relocation in Stafford County, General Commercial).
4-104	Table 4.11-2	*[Table in its entirety is republished at end of this appendix.]*	See end of this appendix for updated Table 4.11-2. (Updated row for Alternative 3C to show 1 relocation in Stafford County).
4-108	Section 4.11.5.3	Second paragraph. "…(Fairfax County, Stafford County, the City of Fredericksburg, Caroline County, the Town of Ashland, the City of Richmond, and Chesterfield County)"	Replace with: “… (Fairfax County, Prince William County, Stafford County, the City of Fredericksburg, Caroline County, the Town of Ashland, the City of Richmond, and Chesterfield County)”
4-129	Section 4.13	Second paragraph (below bullets). “See the *Cultural Resources Reports* (Appendix R) for technical reports and mapping related to cultural resource studies and historic properties.”	Add the following sentence at the end of the original text: “Note that the locations of archaeological sites are restricted by legislation established in the Archaeological Resources Protection Act of 1979 (ARPA). Per ARPA stipulations, to see this data, an individual must meet the Secretary of the Interior's Standards as a qualified archaeologist. The goal of this stipulation is to protect sites from unauthorized or improper excavation to avoid site destruction. Given this, the exact locations of archaeological sites are removed from public documents throughout the United States, including in Appendix R.”
4-136	Table 4.13-4	Row 4, column 2. "Parker-Gray Historic District/Uptown" Row 6, column 2. "Alexandria Depot"	Replace with: "Uptown/Parker-Gray Historic District" Replace with: "Alexandria Union Station"
4-170	Section 4.15.1.3	First bullet. “For each Build Alternative…”	Replace with: “For each Richmond Station Alternative…”
4-174	Section 4.15.1.4	End of last sentence in the section.	Add new text: “Additionally, at Woodbridge Station, free parking is provided through a combination of surface parking and a parking deck, with a combined capacity of 730 spaces shared by Amtrak and VRE. The parking lot is at approximately 65% capacity per day, with ample capacity to absorb the DC2RVA daily parking space demand as projected above. Accordingly, DRPT is not recommending additional parking infrastructure improvements as part of the Project.”
4-180	Section 4.15.2.1	Second bullet. "DRPRT"	Replace with: "DRPT"
4-194	Section 4.15.2.1	End of second bullet. "…as part of all Build Alternatives."	Replace with: "…as part of all Build Alternatives that add a third track to the A-Line."
4-228	Section 4.20.2.3	Bulleted list, “The following rail and transit projects have been identified within the indirect and cumulative effects study area.”	Add new bullet to existing list: “"• Potomac Yard Metrorail Station Project, Alexandria"
Draft EIS Chapter 6 – Public Involvement and Agency Coordination			
6-6	Section 6.1.4	Third paragraph on page. “DRPT received 1,625 scoping comments. The formal comment period lasted 30 days, from October 27, 2014 to December 5, 2014. All comments received were fully considered. DRPT reviewed each comment, categorized them by topic and appropriately grouped them for response, and prepared summary responses that were published in the Scoping Summary Report (Appendix V). Public comments ranged from general support or opposition to very specific remarks on particular locations and resources. They also included several logistical comments and questions related to the scoping meetings and comment process, such as requests for meeting accommodations for sign language, comments on website function, and information requests.”	Replace with: “DRPT received 1,625 scoping comments – 1,614 public comments and 11 agency comments. The formal comment period lasted 30 days, from October 27, 2014 to December 5, 2014. All comments received were fully considered. Of the 1,614 public comments received, 1,220 of them were two separate form letters, one from Virginians for High Speed Rail (428 copies received), and another from the East Coast Greenway Alliance (792 copies received). These two form letters were printed in full in Section 4.2.1 of the Scoping Summary Report (Appendix V), along with DRPT’s response to each. The remaining 394 public comments were unique letters, emails, comment forms, or telephone comments, though many of them touched on similar themes. DRPT reviewed each comment, categorized them by topic and appropriately grouped them for response, and prepared summary responses that were published in Section 4.2.2 of the Scoping Summary Report. Public comments ranged from general support or opposition to very specific remarks on particular locations and resources. They also included several logistical comments and questions related to the scoping meetings and comment process, such as requests for meeting accommodations for sign language, comments on website function, and information requests.”

Park Resources

Table 3.14-3: County/City and Other Local Parklands

Resource Name	Alternative Area	Size (acres)	Ownership	Features
Arlington County				
Long Bridge Park	Arlington	29	Arlington County	▪ Multi-sport, lighted, athletic fields, ▪ Walkways ▪ Greenspace ▪ Playgrounds
Crystal Park North	Northern Virginia	2	Private ownership – open to the public, no fee for access	▪ Small urban park ▪ Part of Crystal City development
Crystal City Water Park	Northern Virginia	2.5	Private ownership – open to the public, no fee for access	▪ Urban park ▪ Landscaped gardens ▪ Large water fountains ▪ Seating areas ▪ Part of Crystal City development
Crystal City Courtyard Green	Northern Virginia	4.3	Private ownership – open to the public, no fee for access	▪ Urban greenspace ▪ Flower gardens ▪ Trails and park benches ▪ Part of Crystal City development
Crystal City Children's Park	Northern Virginia	4.4	Private ownership – no fee for access during non-business hours	▪ Facility was built primarily for use by the resident day-care facility, but it is open to use by area families during non-business hours ▪ Playgrounds ▪ Part of Crystal City development
City of Alexandria				
Potomac Yard Landbay N	Northern Virginia	5.21	City Alexandria	▪ Open Space
Potomac Greens Park	Northern Virginia	18	City of Alexandria	▪ Playgrounds ▪ Seating areas ▪ Wooded trails
Potomac Yard Park	Northern Virginia	21.6	City of Alexandria	▪ Playground equipment ▪ Interactive fountain for water play ▪ Walking/biking trails ▪ Tennis and Basketball courts
Swann Finger Park	Northern Virginia	0.48	City of Alexandria	▪ Open Space
Rose Square	Northern Virginia	0.26	Private ownership – open to the public, no fee for access	▪ Open Space
Rail Park	Northern Virginia	4.17	City of Alexandria	▪ Open Space
Neighborhood Park	Northern Virginia	0.65	Private ownership – open to the public, no fee for access	▪ Open Space ▪ Walking Areas and Benches
Custis Linear/Finger Park	Northern Virginia	0.52	City of Alexandria	▪ Open Space

Table 3.14-3: County/City and Other Local Parklands

Resource Name	Alternative Area	Size (acres)	Ownership	Features
Howell Linear	Northern Virginia	0.82	City of Alexandria	▪ Open Space
PY Plaza West	Northern Virginia	0.56	Private ownership – open to the public, no fee for access	▪ Open Space ▪ Landscaped Areas
Portner Park	Northern Virginia	0.04	Private ownership, under construction	▪ Pocket Park
Old Town Greens Recreational Area	Northern Virginia	1.7	Private ownership – for Old Town Greens residents use only	▪ Tennis courts ▪ Greenspace
Eugene Simpson Stadium Park	Northern Virginia	9.94	City of Alexandria	▪ Includes Eugene Simpson Stadium ▪ Soccer fields
Braddock Park	Northern Virginia	7.1	City of Alexandria	▪ Baseball/softball fields ▪ Football fields
Metro Linear Park	Northern Virginia	3.8	City of Alexandria	▪ Linear pathway that connects the Buchanan Street neighborhood with the metro stations at Braddock Road and King Street
King Street Gardens	Northern Virginia	0.4	City of Alexandria	▪ Consists primarily of public art and gardens for the public's enjoyment ▪ Public art
Hooff's Run Park and Greenway	Northern Virginia	4.5	City of Alexandria	▪ Portion of the park closest to the railroad consists of only walking trails
Buchanan Park	Northern Virginia	2.8	City of Alexandria	▪ Adjacent to Jefferson Houston Elementary School ▪ Includes the Olde Town Pool ▪ Playground facilities
Sunset Mini Park	Northern Virginia	1.4	City of Alexandria	▪ Playground
Dog Run Park at Carlyle	Northern Virginia	3.0	City of Alexandria	▪ Fenced dog exercise area ▪ Tennis courts
Witter Fields	Northern Virginia	13	City of Alexandria	▪ Obtained by the City as a result of the Woodrow Wilson Bridge Settlement Agreement Record of Decision between the City of Alexandria and the Federal Highway Administration (FHWA) ▪ Includes lighted diamond field, two lighted synthetic turf rectangular fields, restrooms, park pavilions, and pedestrian trail
Clermont Natural Area	Northern Virginia	6.0	City of Alexandria	▪ Consists solely of a wooded area

Table 3.14-3: County/City and Other Local Parklands

Resource Name	Alternative Area	Size (acres)	Ownership	Features
Joseph Hensley Park	Northern Virginia	22	City of Alexandria	▪ Soccer and softball fields ▪ Picnic shelters
Fairfax County				
Backlick Stream Valley Park	Northern Virginia	75	Fairfax County Park Authority (FCPA)	▪ Passive recreation such as hiking
Franconia Forest	Northern Virginia	6.7	FCPA	▪ Hiking/biking trails
Loisdale Park	Northern Virginia	8.6	FCPA	▪ Playgrounds ▪ Tennis courts ▪ Multi-use courts ▪ Soccer fields
Accotink Stream Valley Park	Northern Virginia	475	FCPA	▪ Passive recreation such as hiking
Pohick Stream Valley Park	Northern Virginia	323	FCPA	▪ Passive recreation such as hiking
Mason Neck West	Northern Virginia	76	FCPA	▪ In development ▪ 44 acres are planned for sporting facilities ▪ 32 acres have been acquired but future use remains unplanned, currently unimproved
Old Colchester Preserve and Park	Northern Virginia	141	FCPA	▪ Natural preserve with rare communities and animal species ▪ Includes a variety of archaeological resources ▪ Includes portion of proposed Potomac Heritage National Scenic Trail
Prince William County				
Jefferson Park Site	Northern Virginia	6.9	Prince William County	▪ Identified as a future neighborhood park ▪ Currently open space
Veterans Memorial Park	Northern Virginia	110	Prince William County	▪ Outdoor athletic fields ▪ Walking trails and picnic pavilions ▪ Skate park ▪ Includes portion of proposed Potomac Heritage National Scenic Trail
Marumsco Acre Lake Park	Northern Virginia	20	Prince William County	▪ Basketball court ▪ Picnic pavilion ▪ Playground area
Cockpit Point	Northern Virginia	96	Prince William County	▪ In development ▪ Not open yet; will be open to visitors on a limited basis at first

Table 3.14-3: County/City and Other Local Parklands

Resource Name	Alternative Area	Size (acres)	Ownership	Features
				▪ Part of a rezoning agreement with the Potomac Shores community ▪ Includes portion of proposed Potomac Heritage National Scenic Trail
Stafford County				
Embry Farm	Fredericksburg	11	Private ownership by the George Washington Foundation - not open to the public	▪ Historic preservation ▪ Not open to the public
George Washington's Ferry Farm	Fredericksburg	75	Private ownership by the George Washington Foundation - open to the public for a fee	▪ George Washington's boyhood home
City of Fredericksburg				
Cobblestone Park	Fredericksburg	10	City of Fredericksburg	▪ Wooded area with pedestrian trails ▪ Adjacent to Hazel Run Creek
Pierson/Slaughter Pen Farm	Fredericksburg	200	Private ownership by the Civil War Preservation Trust – open to the public without a fee	▪ Acquired in 2006 ▪ Key historic part of the nearby Fredericksburg Battlefield
Spotsylvania and Caroline Counties				
Mary Lee Carter Park	Fredericksburg	4.5	Spotsylvania County	▪ Multi-use athletic fields ▪ Walking trails ▪ Playground ▪ Picnic areas
Alexander Berger Memorial Sanctuary	Fredericksburg	865	Private ownership by the Nature Conservancy – open to the public without a fee	▪ Includes recreational trails near the Rappahannock River ▪ Includes remnants of a Civil War encampment
Hanover County				
North Ashland Park	Ashland	n/a	Town of Ashland	▪ Conceptual Plan only
Railside Park	Ashland	1.0	Town of Ashland	▪ Connects to Vaughan Road by a 1/3-mile-long path along the rail tracks ▪ Remains largely open space ▪ Picnic table and park benches for viewing passing trains
Blincoe Field	Ashland	116	Private ownership by Randolph Macon College – not regularly open to the public	▪ Athletic stadium at Randolph Macon College ▪ Open to the public for a fee during special events

Table 3.14-3: County/City and Other Local Parklands

Resource Name	Alternative Area	Size (acres)	Ownership	Features
				▪ Primarily for use by faculty and students
Carter Park	Ashland	13.5	Town of Ashland	▪ Junior Olympic-size swimming pool ▪ One-half basketball court ▪ Picnic shelter ▪ Playground ▪ Gravel walking trails through the wooded areas
Ashland Trolley Line	Ashland	6.7	Hanover County and Town of Ashland	▪ 0.5 miles in length ▪ Walkway and park ▪ Part of the historic Ashland-Richmond Trolley Line ▪ Northern portion includes Walder Lane
Henrico County				
Hunton Community Center	Ashland	4.9	Henrico County	▪ Playground ▪ Ball fields ▪ Pavilion
RF&P Park	Richmond	60	Henrico County	▪ Includes four restored RF&P train cars ▪ Picnic shelters ▪ Athletic fields including The Glen Allen Stadium at RF&P Park
Laurel Recreation Area	Richmond	10	Henrico County	▪ Skate park ▪ Athletic fields ▪ Picnic shelter
City of Richmond				
Joseph Bryan Park	Richmond	250	City of Richmond	▪ Extensive open space ▪ Walking trails ▪ Disc golf course ▪ Home to many festivals and events
Maggie Walker Governor's School Athletic Fields	Richmond	4.9	Maggie L Walker Governor's School Regional School Board	▪ Outdoor athletic fields
Calhoun Community Center	Richmond	6.6	Richmond Redevelopment and Housing Authority (RRHA)	▪ Basketball courts ▪ Football field ▪ Baseball field ▪ Playground
Canal Walk Plaza and Entrance	Richmond	3.8	City of Richmond	▪ Recreational trails and walking areas near the James River ▪ Site on the Chesapeake NHT
Walker's Creek Retention Basin Park	Richmond	6.4	City of Richmond, Public Works	▪ Provides access to the walk along the floodwall south of the James River

Table 3.14-3: County/City and Other Local Parklands

Resource Name	Alternative Area	Size (acres)	Ownership	Features
Monument Avenue Linear Park	Richmond	13	City of Richmond	▪ In the median along Monument Avenue ▪ Well-known Richmond landmark punctuated by statues memorializing Virginian Confederate generals and the Richmond native and tennis star Arthur Ashe
Albert Hill Athletic Facility	Richmond	3.2	City of Richmond	▪ Includes some outdoor recreational areas and a community garden
Humphrey Calder Community Center and Garden	Richmond	5.4	City of Richmond	▪ Richmond's largest park ▪ System of parks along both sides of the James River as it passes through the city
James River Park	Richmond	550	City of Richmond	▪ Adjacent to the Humphrey Calder Community Center and Garden ▪ Includes athletic fields ▪ Site on the Chesapeake NHT
Covington Road Properties	Richmond	6.6	City of Richmond	▪ Currently consists of undeveloped land with a mix of open space and trees ▪ No recreational facilities are provided at this location
Hickory Hill Community Center and Elementary School	Richmond	7,2	City of Richmond	▪ Basketball court ▪ Playground ▪ Ball field ▪ Walking trail
Libby Hill Park	Richmond	11	City of Richmond	▪ One of the three original parks in Richmond's park system ▪ Includes an ornamental fountain and small park house ▪ Includes a monument erected in 1894 for Confederate soldiers and sailors
Cannonball Triangle Park	Richmond	0.2	City of Richmond	▪ Central element of the park is a stone monument to the Confederate Naval Yard in the James River just to the south of the monument
Great Shiplock Park	Richmond	18	City of Richmond	▪ Located along the northern bank of the James River ▪ Includes the lowest of the historic Kanawha Canal locks as well as an interpretive display

Table 3.14-3: County/City and Other Local Parklands

Resource Name	Alternative Area	Size (acres)	Ownership	Features
Chesterfield County				
Falling Creek Linear Park	Richmond	93	Chesterfield County	▪ In development ▪ Ironworks are open for free tours by reservation only ▪ Remainder of the park is adjacent to Falling Creek and is primarily wooded
Bensley Elementary School	Richmond	3.8	Chesterfield County	▪ Athletic fields ▪ Playgrounds ▪ Separated from railroad by sliver of land belonging to Bellwood Supply Depot, which is part of an active military installation ▪ School playground is fenced with no access to Bellwood Supply Depot land or the railroad tracks
Gates Mill Park	Richmond	11	Chesterfield County	▪ Hiking trails

APPENDIX B

DETAILED RESPONSES TO AGENCY AND ORGANIZATION COMMENTS

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

Appendix B

DETAILED RESPONSES TO AGENCY AND ORGANIZATION COMMENTS

HOW TO USE THIS APPENDIX

Following this introduction, detailed responses to agency and organization comments are presented in the following order:

- **B1. Detailed Responses to Federal Agency Comments**
- **B2. Detailed Responses to State Agency Comments**
- **B3. Detailed Responses to Local Agency Comments**
- **B4. Detailed Responses to Consulting Party Comments**
- **B5. Detailed Responses to Operator Comments**
- **B6. Detailed Responses to Other Organization and Group Comments**

Responses to agency and organization comments are provided in a side-by-side format with each agency and organization letter. The left side of the page is a full reproduction of each letter, with individual comments noted and numbered on each page of the letters (indicated by vertical black, numbered bars). The right side of the page contains detailed responses to each comment that correspond to the black-bar numbering on each letter.

AGENCY AND ORGANIZATION COMMENT RESPONSE PROCESS

As described in Chapter 2 of this Final EIS, thirty-four (34) agencies and organizations submitted comments regarding the Project during the formal comment period and public hearing process that followed publication of the Draft EIS. The Virginia Department of Rail and Public Transportation (DRPT) carefully reviewed each comment, concern, and request, and provided detailed responses to substantive comments, which are provided in this appendix; these detailed responses include reference to information provided in both the Draft EIS and this Final EIS, and are the outcome of ongoing agency coordination and additional analyses that have occurred since the publication of the Draft EIS. Additionally, responses to substantive comments are incorporated by way of minor corrections, clarifying explanations, or supplemental documentation, as needed, into the content of the appropriate sections of this Final EIS. In general, substantive comments are those that question, with reasonable basis, the accuracy of information and methodology in the Draft EIS or present new information not considered in the Draft EIS, and cause changes or revisions in one or more alternative or environmental resource.

Many agency and organization comments included the following topics, which did not warrant changes to the methodologies or information provided in the Draft EIS. Notwithstanding, the Federal Railroad Administration (FRA) and DRPT provided responses to these topics within the detailed responses provided in this appendix.

- Overall position/opinion for or against the Project.
- Preference for and/or opposition to a specific alignment or Build Alternative that was evaluated in the Draft EIS.
- Suggestion of additional alternatives to consider, most of which were considered but dismissed during the 2002 Tier I EIS for the Southeast High Speed Rail (SEHSR) corridor between Washington, D.C. and Charlotte, NC, or do not align with the implementing actions that were the outcome of the 2002 Tier I EIS and Record of Decision (ROD).
- Requests for detailed information or data that is beyond the scope of an environmental document and would be developed during the final design and permitting process.
  - Environmental documentation for the Project is based on conceptual engineering, which is approximately a 10% design level.
  - Chapter 5 of this Final EIS clarifies the use of temporary and permanent impacts to environmental resources. Temporary impacts at the conceptual design level are a fixed offset from the permanent impact limits; this is an allowance for possible construction means and methods that may exceed the permanent impact limits.
  - Final design will clarify the potential construction means and methods that might be used to eliminate or mitigate temporary impacts. Final design will occur in the future after Project funding becomes available and incremental improvements are scheduled.
  - Chapter 7 of this Final EIS has been included to add descriptions of future steps for the Project.
- Requests for ongoing coordination beyond the National Environmental Policy Act (NEPA) phase of the Project; refer to Section 7.8 of the Final EIS for details of Project regulatory actions, approvals, and commitments.

APPENDIX B1

RESPONSES TO FEDERAL AGENCY COMMENTS

D.C. TO RICHMOND SOUTHEAST HIGH SPEED RAIL

Appendix B1

RESPONSES TO FEDERAL AGENCY COMMENTS

This Appendix Section B1 provides detailed responses to Federal agency letters, presented in the below order:

- US Environmental Protection Agency (EPA), Region III B-4
- US Army Corps of Engineers (USACE) B-19
- Department of the Interior (DOI) B-30
- Federal Aviation Administration (FAA) B-59

Re: Washington, D.C. to Richmond High Speed Rail Project Tier II Draft Environmental Impact Statement, September 2017 CEQ # 20170172

Dear Ms. Osterhues:

In accordance with the National Environmental Policy Act (NEPA), Section 309 of the Clean Air Act and the Council on Environmental Quality regulations implementing NEPA (40 CFR 1500-1508), the United States Environmental Protection Agency (EPA) has reviewed the Washington, D.C. to Richmond High Speed Rail Project (DC2RVA) Tier II Draft Environmental Impact Statement (DEIS). The purpose of the proposed action is to increase railroad capacity between Washington, DC and Richmond to deliver higher speed passenger rail, expand commuter rail, and accommodate growth of freight rail service in an efficient and reliable multimodal rail corridor.

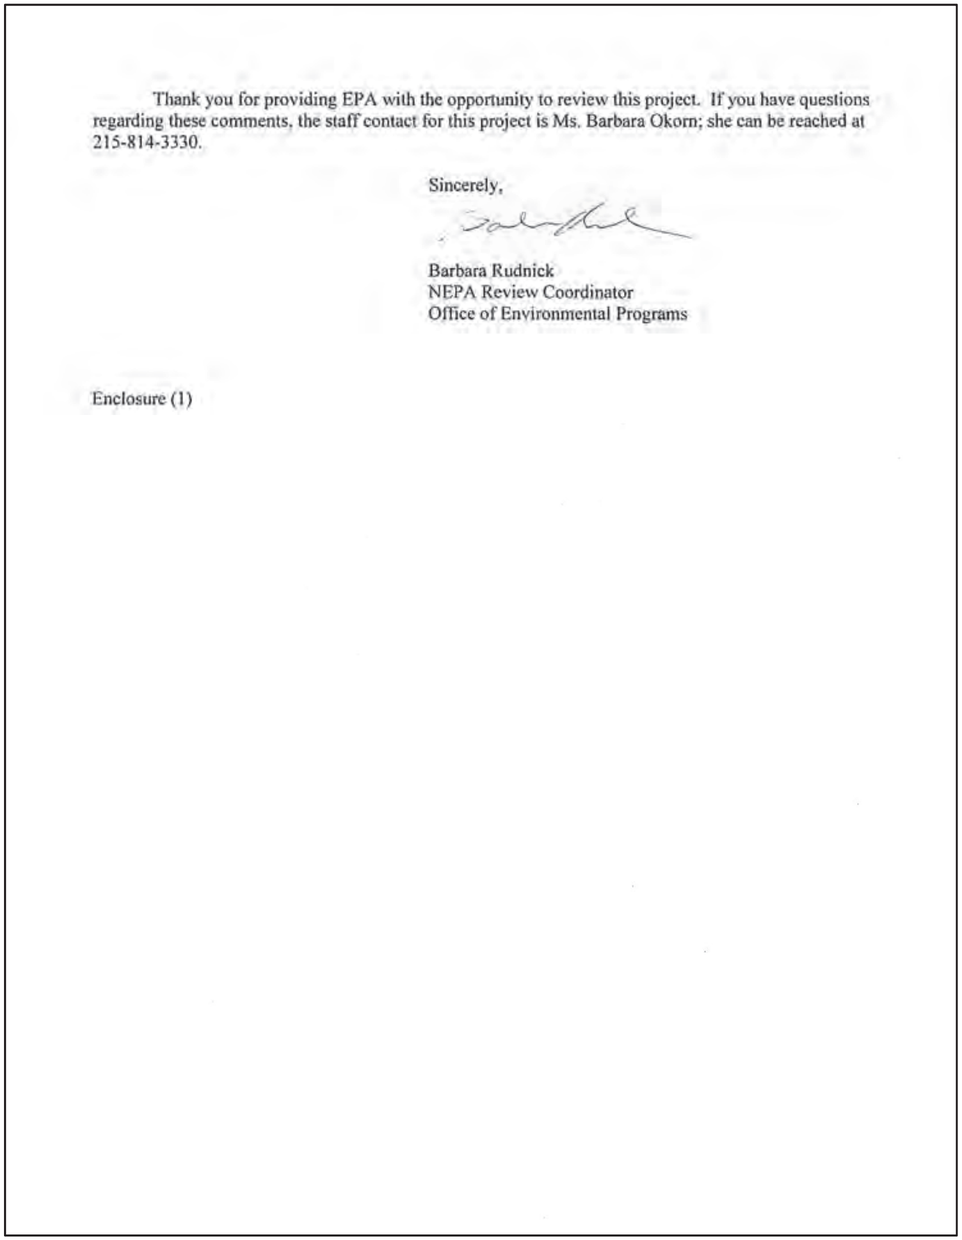
The DEIS divides the 123-mile corridor into six sections with multiple alternatives within the sections. The project's Preferred Alternative is 2A, 3B, 4A, and 6F. The alternative decision on Segment 1 (Arlington) is deferred until after completion of the Long Bridge Study and the decision on Section 5 (Ashland) is deferred until the Final EIS. We understand that the project team will be working with the Community Advisory Committee (CAC) to look at alternatives in the DEIS as well as potential new alternatives for the Ashland segment. We suggest that the project team also work with EPA, the U.S. Army Corps of Engineers and other federal and state agencies as the process moves forward. It should be noted that additional NEPA analysis may be needed if new alternatives are developed. 1

2 Based on our review, EPA has rated the Preferred Alternative (and Section 5) as Environmental Concerns - Insufficient Information (EC-2) and the Arlington section as Lack of Objections (LO). A description of our rating system can be found at https://www.epa.gov/nepa/environmental-impact-statement-rating-system-criteria. The basis for our ratings and general comments for your consideration is provided in the enclosed Technical Comments.

Please continue to work with EPA and other stakeholders as the Final EIS, Record of Decision and additional NEPA analysis for the various components of this plan move forward. We suggest efforts to avoid and minimize impacts to the community and natural environment and close coordination with the public continue as the project moves forward.

US EPA REGION III

1. The Department of Rail and Public Transportation (DRPT) has continued to coordinate with federal and state agencies, affected locali6ties, the general public, and other stakeholders during the preparation of this Final Environmental Impact Statement (EIS) and its associated Record of Decision (ROD), and will continue coordination efforts during final design and permitting (after funding becomes available and incremental improvements are scheduled) in accordance with all applicable federal and state laws and regulations. Neither the Federal Railroad Administration (FRA) nor DRPT anticipates that any new alternatives would be developed as part of this Project; however, if any new alternatives are developed, DRPT and FRA would determine whether supplemental National Environmental Policy Act (NEPA) documentation is warranted in accordance with Council on Environmental Quality regulations (40 CFR 1502.9), at that time.
2. The ratings of the Preferred Alternative (and Section 5) and the Arlington section that were provided by the Environmental Protection Agency (EPA) are noted, and all comments were considered as part of the recommendation process for the Preferred Alternative upon which the Final EIS is based. DRPT has endeavored to address EPA's concerns by providing information in response to each of EPA's Technical Comments; refer to DRPT numbered statements #3 through #32 of this response



Thank you for providing EPA with the opportunity to review this project. If you have questions regarding these comments, the staff contact for this project is Ms. Barbara Okorn; she can be reached at 215-814-3330.

Sincerely,

Barbara Rudnick
NEPA Review Coordinator
Office of Environmental Programs

Washington, D.C. to Richmond High Speed Rail Project
Tier II Draft Environmental Impact Statement
Technical Comments

Purpose and Need and Alternatives

- We suggest clarification be provided related to the Southeast High Speed Rail (SEHSR) Program and the DC2RVA project needs. Accommodating freight rail movement through the corridor, including to and from Virginia ports, is listed as a project purpose and need for the DC2RVA but it is not specifically mentioned as need for the SEHSR project. Please discuss any changes occurring between studies. 3
- We suggest additional information be provided related to freight transport which may help inform alternatives. For example, are hazardous materials transported currently or will they be in the future? Are there certain design criteria or safety requirements that should be factored in to the design? We recommend an explanation of any impacts that might be associated with hazardous release response or risk minimization (eg access roads, runoff controls/cleanouts, reduced infiltration in ROW) be discussed and analyzed in the NEPA study. 4
- We suggest coordinating with local governments and emergency services to address response and potential issues with release of hazardous substances in the event of accidents. Special consideration should be given to close proximity to reservoirs and other areas at risk areas. 5
- While the DEIS states that some avoidance and minimization of impacts has been considered, we suggest that efforts to avoid and minimize impacts to community and environmental resources continue. 6
- It is unclear if impacts associated with construction and operation are considered in the limits of disturbance (i.e. access roads, noise walls, station locations etc.) EPA recommends that the final EIS clarify any associated temporary or permanent impacts. 7

Aquatic Resources

- It is unclear what methodologies were used to assess aquatic impacts. We suggest the project team closely coordinate with U.S. Army Corps of Engineers, EPA and other agencies as the project moves forward. Page 3-4 states that field surveys were conducted to verify the existence of potential ephemeral, intermittent and perennial streams and wetlands within 100 feet of the existing rail on the side of the track where improvements are proposed. We recommend the study document the methods used to identify and classify these resources. Please state if potential impacts beyond 100 feet from the existing rail were considered at this time (i.e. changes in hydrology, etc.) 8
- Page 4-11 of appendix M describes Long-Term Temporary impacts which seem to be permanent (i.e. introduction of invasive species, decreased groundwater recharge due to increased impervious surfaces, increased potential for toxic compounds entering the wetland system from construction, equipment, increased train traffic, application of snow and ice removal chemicals, and application of herbicides to keep tracks clear of vegetation, altered hydrologic patterns). We suggest the study clarify the definition of Long-Term Temporary, and possibly re-consider if above-mentioned impacts can be considered temporary. 9

  Specific details are provided related to the Section 404 permit process. While these may be true in a general sense, it is premature to assume the details of what may be required at that time of the permit process and without consideration of specific project impacts and lost functions 10
- The DEIS presents general classifications of aquatic resources. Effort should be made to 11

US EPA REGION III (continued)

3. Clarifying language on the Project Need, including the unique needs of the DC2RVA corridor as well as developments since the 2002 Tier I EIS, can be found in Final EIS Section 1.3, which has been added since the Draft EIS.

4. The DC2RVA Project's stated Purpose is to increase railroad capacity between Washington, D.C. and Richmond, VA to deliver higher speed passenger rail service, while also supporting the planned expansion of VRE commuter rail service and accommodating the forecasted growth of freight rail service by developing an efficient and reliable multimodal rail corridor. As stated in Section 1.3.1 of the Final EIS, while the corridor where the Project is located is owned and operated by freight railroad CSXT, the infrastructure and service proposed for the Project are not expected to create increased freight volumes because freight transport responds to economic demands created by commercial activities and independent market forces, separate from this Project. As Project alternatives were developed and compared, DRPT did consider the volume of total freight traffic by identifying the volume of total freight traffic by the general number, schedule, and type of freight train. Neither FRA nor DRPT anticipate that the additional 9 new daily intercity passenger round-trip trains (18 total trains per day) proposed by the Project would result in any change in either the types or quantities of freight shipped on the corridor, including hazardous materials.

   Please see response to DRPT-numbered statement #5 below for more specific information about discussion of hazardous materials in the Draft EIS.

US EPA REGION III (continued)

5. As summarized in Chapter 2 of the Final EIS, coordination with local governments occurred during Project scoping and continued throughout the development of the Draft EIS, which was then distributed to local governments for review and comment. Draft EIS Section 4.5 addresses hazardous materials in the corridor, with a focus on known existing sites containing hazardous materials, and Final EIS Section 5.5 presents this information for the Preferred Alternative. As indicated in these sections, hazardous materials within sites impacted by construction, including any additional hazardous materials discovered during construction or demolition of existing structures, will be removed and disposed of in compliance with all applicable federal, state, and local regulations. All necessary remediation will be conducted in compliance with applicable federal, state, and local environmental laws and will be coordinated with EPA, the Virginia Department of Environmental Quality (VDEQ), and other federal, state, or local agencies as necessary. Final EIS Section 5.1.4 provides detail on public surface waters, including additional information since the Draft EIS. Final EIS Section 5.18 addresses public health and safety associated with hazardous materials transport on the rail line, with clarifications provided since the Draft EIS, including regulation of transport of hazardous materials on railroads.

6. DRPT will continue efforts to avoid and minimize impacts to community and environmental resources throughout final design and permitting, after funding becomes available and incremental improvements are scheduled.

US EPA REGION III (continued)

7. In response to EPA's recommendation that the Final EIS clarify impacts in relation to the Limits of Disturbance (LOD), the opening section of Chapter 5 of the Final EIS provides additional definitions of permanent and temporary LOD. Appendix L of the Final EIS provides a detailed mapbook of the Preferred Alternative, including identification of both temporary and permanent limits of disturbance. As described in Final EIS Chapter 5, temporary LOD represent areas encompassed by short-term construction easements, affected by short-term impacts from construction activity, or other non-permanent Project-related land disturbance, and permanent LOD represent the final long-term boundaries of the Project where the land would be disturbed. For potential effects caused by the operation of the proposed additional intercity passenger rail services, such as noise and effects to water quality or air quality, DRPT used analysis thresholds which extend beyond the physical LOD. Both temporary and permanent limits of disturbance are discussed as appropriate for each environmental attribute evaluated in the Final EIS; in addition, Section 5.19 Construction Impacts, summarizes the short-term or temporary impacts from construction activities for the Preferred Alternative.

- The DEIS presents general classifications of aquatic resources. Effort should be made to 11

US EPA REGION III (continued)

8. As indicated on page 3-5 of the Draft EIS, the delineation of wetlands along the corridor followed methods contained in the Eastern Mountains and Piedmont – Version 2.0 or the Atlantic and Gulf Coastal Plain Region – Version 2.0 regional supplements of the United States Army Corps of Engineers (USACE) delineation manual, as applicable to each given location. Potentially impacted stream channels were assessed using the Unified Stream Methodology form. Field reviews by USACE and the Virginia Department of Environmental Quality (VDEQ) were conducted at several intervals during the field surveys to ensure that surveys were conducted according to agency expectations. As indicated in Draft EIS Section 3.1.4, wetlands were classified using an abbreviated version of the Cowardin System (Cowardin, et al., 1979). The majority of the Preferred Alternative involves the construction of one additional new track approximately 15 feet from the existing tracks, and the permanent Limits of Disturbance (LOD) are generally within 40 feet of the existing CSXT right-of-way (see the beginning of Chapter 5 of the Final EIS for full LOD descriptions, and Appendix L of the Final EIS for mapbooks of the Preferred Alternative). Therefore, 100-foot delineation for wetland identification provides adequate buffer to encompass areas that would be impacted by the Project. Possible impacts to aquatic resources beyond 100 feet are addressed in the analysis of indirect effects in Draft EIS Section 4.10.1.6. DRPT has coordinated with the USACE on wetland and related assessments since Project inception, including several joint field visits to ensure that survey and assessment methods were consistent with agency expectations. The USACE also commented on the Draft EIS (refer to their letter and responses) and as indicated therein, DRPT will use the methodology in use by USACE at the time of application for determining compensation requirements.

9. DRPT quantified potential impacts to natural resources based on limits of disturbance identified as permanent (i.e., areas where Project infrastructure would physically replace existing conditions) and temporary (i.e., areas required for construction that would be regraded and reseeded). Please see response to DRPT-numbered statement #7: these definitions have been clarified in Final EIS Chapter 5.

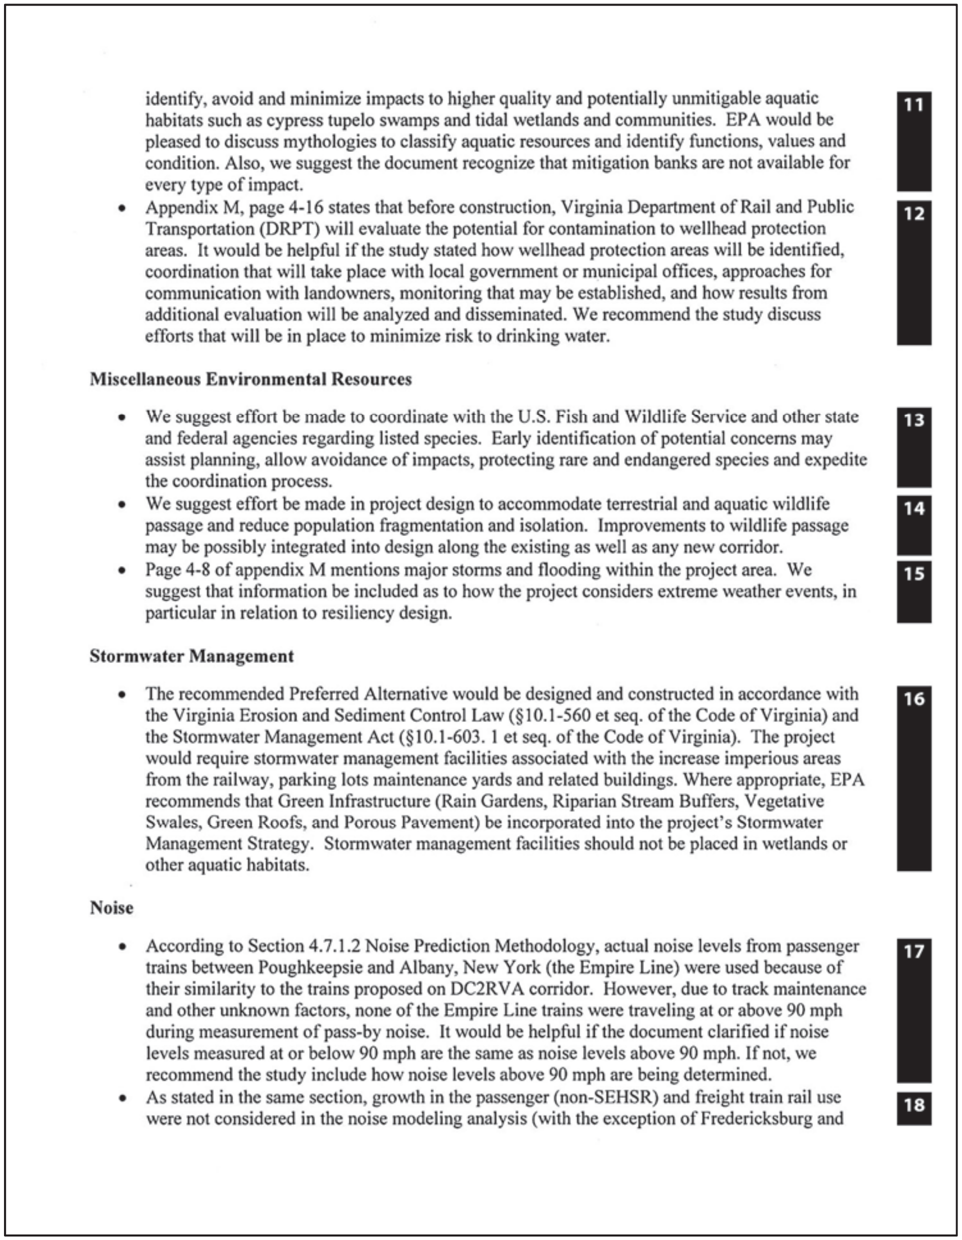
US EPA REGION III (continued)

10. Comment noted. DRPT will determine specific requirements at the time of permitting in coordination with the permitting agencies during final design, after funding becomes available and incremental improvements are scheduled. Final EIS Chapter 7 provides an overview of future steps of the Project, including final design and permitting and other regulatory actions, approvals, and permits that would be required.

11. The abbreviated Cowardin classifications (as provided in Table 4.1-2 of the Draft EIS and Table 5.1-2 of the Final EIS) include cypress-tupelo swamps and tidal wetlands and communities. However, there are no cypress-tupelo swamps present within the Project area (i.e., the 100-foot delineation). The presence of tidally-influenced wetlands is identified in Draft EIS Section 4.1.2, and updated in Final EIS Section 5.1.2 (0.85 acres of permanent impact in Preferred Alternative 2A and 4A, and 0.50 acres of temporary impact in Preferred Alternative 1B, 2A, and 4A). As indicated in Final EIS Section 5.1.6.1, efforts to avoid and minimize impacts to wetlands will continue into final design, after funding becomes available and incremental improvements are scheduled. At that time, the functions, values and condition of wetlands and the availability of mitigation sites will be evaluated.



identify, avoid and minimize impacts to higher quality and potentially unmitigable aquatic habitats such as cypress tupelo swamps and tidal wetlands and communities. EPA would be pleased to discuss mythologies to classify aquatic resources and identify functions, values and condition. Also, we suggest the document recognize that mitigation banks are not available for every type of impact. 11

- Appendix M, page 4-16 states that before construction, Virginia Department of Rail and Public Transportation (DRPT) will evaluate the potential for contamination to wellhead protection areas. It would be helpful if the study stated how wellhead protection areas will be identified, coordination that will take place with local government or municipal offices, approaches for communication with landowners, monitoring that may be established, and how results from additional evaluation will be analyzed and disseminated. We recommend the study discuss efforts that will be in place to minimize risk to drinking water. 12

Miscellaneous Environmental Resources

- We suggest effort be made to coordinate with the U.S. Fish and Wildlife Service and other state and federal agencies regarding listed species. Early identification of potential concerns may assist planning, allow avoidance of impacts, protecting rare and endangered species and expedite the coordination process. 13
- We suggest effort be made in project design to accommodate terrestrial and aquatic wildlife passage and reduce population fragmentation and isolation. Improvements to wildlife passage may be possibly integrated into design along the existing as well as any new corridor. 14
- Page 4-8 of appendix M mentions major storms and flooding within the project area. We suggest that information be included as to how the project considers extreme weather events, in particular in relation to resiliency design. 15

Stormwater Management

- The recommended Preferred Alternative would be designed and constructed in accordance with the Virginia Erosion and Sediment Control Law (§10.1-560 et seq. of the Code of Virginia) and the Stormwater Management Act (§10.1-603. 1 et seq. of the Code of Virginia). The project would require stormwater management facilities associated with the increase imperious areas from the railway, parking lots maintenance yards and related buildings. Where appropriate, EPA recommends that Green Infrastructure (Rain Gardens, Riparian Stream Buffers, Vegetative Swales, Green Roofs, and Porous Pavement) be incorporated into the project's Stormwater Management Strategy. Stormwater management facilities should not be placed in wetlands or other aquatic habitats. 16

Noise

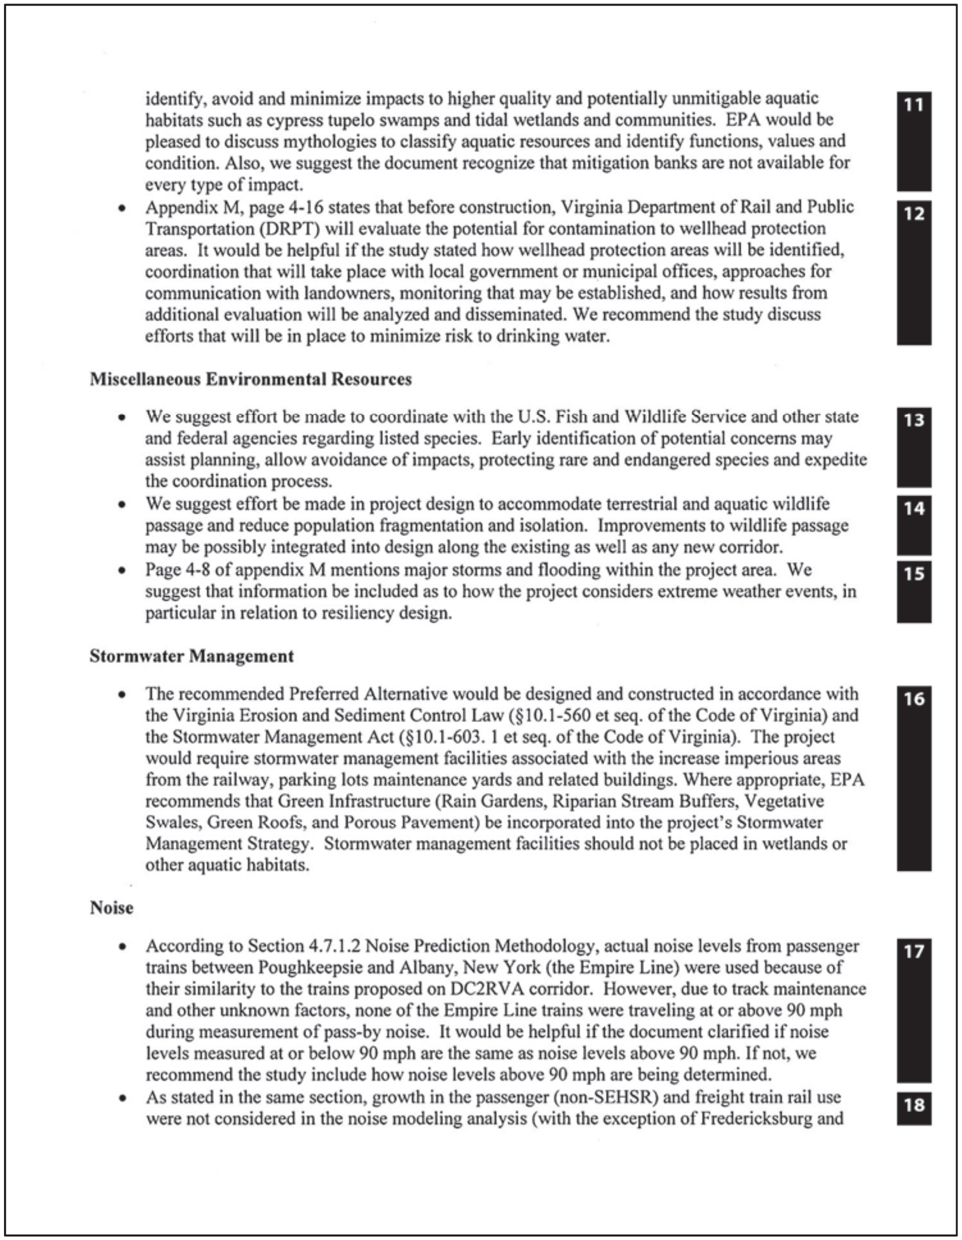
- According to Section 4.7.1.2 Noise Prediction Methodology, actual noise levels from passenger trains between Poughkeepsie and Albany, New York (the Empire Line) were used because of their similarity to the trains proposed on DC2RVA corridor. However, due to track maintenance and other unknown factors, none of the Empire Line trains were traveling at or above 90 mph during measurement of pass-by noise. It would be helpful if the document clarified if noise levels measured at or below 90 mph are the same as noise levels above 90 mph. If not, we recommend the study include how noise levels above 90 mph are being determined. 17
- As stated in the same section, growth in the passenger (non-SEHSR) and freight train rail use were not considered in the noise modeling analysis (with the exception of Fredericksburg and 18

US EPA REGION III (continued)

(Response to comment 11 on previous page)

12. Locations of public groundwater sources and private wells within the Project corridor were mapped according to datasets maintained by the Virginia Department of Health (VDH), Virginia Department of Mines, Minerals & Energy (DMME), and Virginia Department of Transportation (VDOT). Wellhead protection areas were identified based on designations by the Virginia Department of Environmental Quality (VDEQ) in its Wellhead Protection Plan (2005), which was approved by the US Environmental Protection Agency (EPA). There are no Project-specific regulatory requirements relative to wellhead protection areas. Rather, localities are encouraged, through state and federal technical assistance and grants, to develop strategies to protect community water system sources at the local level, largely through land use management authorities (e.g., zoning and comprehensive planning). Notwithstanding, as indicated in Section 5.1.6.4 of the Final EIS, efforts to minimize impacts to drinking water could involve modifications, such as further alignment shifts to avoid or minimize impacts; the use of best management practices (BMPs); the use of retaining walls; and temporary and permanent stormwater management measures to reduce transportation of chemicals by stormwater, and they should include limited use or avoidance of snow removal and vegetation maintenance chemicals near source protection areas and well locations. Measures that would be implemented to comply with surface water pollution protection under Virginia's erosion and sediment control regulations, stormwater management program, and stormwater pollution prevention plan requirements also would protect against groundwater contamination. These measures, as well as hazardous materials spill response measures (see response to DRPT-numbered statement #5 above) would minimize risks to drinking water. Coordination with local government or municipal offices and the public during final design, as well as the findings of any additional evaluations that may be conducted, will occur in a manner similar to the coordination during the EIS development. Monitoring is not anticipated at this time but could be implemented if determined necessary as a condition of state or federal water quality permits that would need to be acquired for the Project.

(Responses are continued on next page)



identify, avoid and minimize impacts to higher quality and potentially unmitigable aquatic habitats such as cypress tupelo swamps and tidal wetlands and communities. EPA would be pleased to discuss mythologies to classify aquatic resources and identify functions, values and condition. Also, we suggest the document recognize that mitigation banks are not available for every type of impact. **11**

- Appendix M, page 4-16 states that before construction, Virginia Department of Rail and Public Transportation (DRPT) will evaluate the potential for contamination to wellhead protection areas. It would be helpful if the study stated how wellhead protection areas will be identified, coordination that will take place with local government or municipal offices, approaches for communication with landowners, monitoring that may be established, and how results from additional evaluation will be analyzed and disseminated. We recommend the study discuss efforts that will be in place to minimize risk to drinking water. **12**

Miscellaneous Environmental Resources

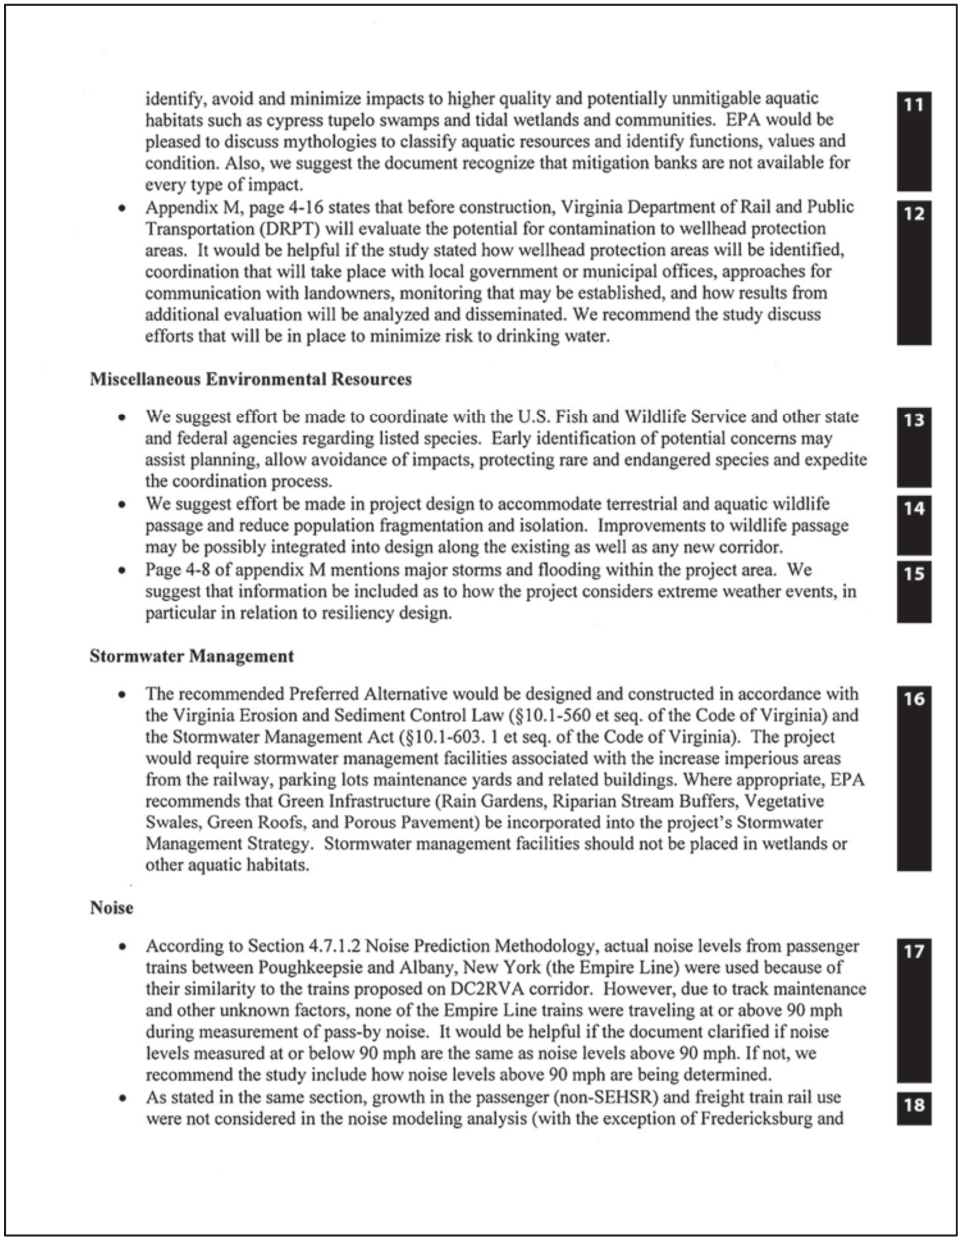
It would be helpful if the document clarified if noise levels measured at or below 90 mph are the same as noise levels above 90 mph. If not, we recommend the study include how noise levels above 90 mph are being determined. **17**
- As stated in the same section, growth in the passenger (non-SEHSR) and freight train rail use were not considered in the noise modeling analysis (with the exception of Fredericksburg and **18**

US EPA REGION III (continued)

13. DRPT solicited agency concerns about listed species through the scoping process, participating agency meetings, and ongoing consultation with regulatory agencies, including the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), Virginia Department of Game and Inland Fisheries (VDGIF), Virginia Department of Conservation and Recreation (VDCR), and Virginia Marine Resources Commission (VMRC). In addition, information regarding federally listed threatened and endangered species that may be impacted by the Project was obtained from USFWS via the Information, Planning, and Conservation (IPaC) system, and included in Draft EIS Section 4.10.3; updated IPaC information was obtained in February 2018 and is presented in Final EIS Section 5.10.3 for the Preferred Alternative. As indicated in Final EIS Section 5.10.3.2, DRPT will continue to coordinate with USFWS, EPA, VDCR, VDGIF, and other regulatory agencies regarding habitat and wildlife, including any future updates to listed species, to ensure impacts are avoided to the extent practicable throughout final design (after funding becomes available and incremental improvements are scheduled) and that appropriate mitigation is developed where impacts are unavoidable.

14. Subsequent to submitting these written comments on the Draft EIS, the EPA and DRPT discussed the Project's potential impact to wildlife crossing in a call on June 6, 2018. At that time, the EPA suggested inclusion of natural bottom culverts as an example to improve wildlife passage, and it was agreed that those types of accommodations would be determined during final design (refer to Section 5.10.1.1 of the Final EIS for further details). Accordingly, DRPT will continue to consider special design features to improve wildlife corridors during final design.

(Responses are continued on next page)



11 identify, avoid and minimize impacts to higher quality and potentially unmitigable aquatic habitats such as cypress tupelo swamps and tidal wetlands and communities. EPA would be pleased to discuss mythologies to classify aquatic resources and identify functions, values and condition. Also, we suggest the document recognize that mitigation banks are not available for every type of impact.

- 12 Appendix M, page 4-16 states that before construction, Virginia Department of Rail and Public Transportation (DRPT) will evaluate the potential for contamination to wellhead protection areas. It would be helpful if the study stated how wellhead protection areas will be identified, coordination that will take place with local government or municipal offices, approaches for communication with landowners, monitoring that may be established, and how results from additional evaluation will be analyzed and disseminated. We recommend the study discuss efforts that will be in place to minimize risk to drinking water.

Miscellaneous Environmental Resources

- 13 We suggest effort be made to coordinate with the U.S. Fish and Wildlife Service and other state and federal agencies regarding listed species. Early identification of potential concerns may assist planning, allow avoidance of impacts, protecting rare and endangered species and expedite the coordination process.
- 14 We suggest effort be made in project design to accommodate terrestrial and aquatic wildlife passage and reduce population fragmentation and isolation. Improvements to wildlife passage may be possibly integrated into design along the existing as well as any new corridor.
- 15 Page 4-8 of appendix M mentions major storms and flooding within the project area. We suggest that information be included as to how the project considers extreme weather events, in particular in relation to resiliency design.

Stormwater Management

- 16 The recommended Preferred Alternative would be designed and constructed in accordance with the Virginia Erosion and Sediment Control Law (§10.1-560 et seq. of the Code of Virginia) and the Stormwater Management Act (§10.1-603. 1 et seq. of the Code of Virginia). The project would require stormwater management facilities associated with the increase imperious areas from the railway, parking lots maintenance yards and related buildings. Where appropriate, EPA recommends that Green Infrastructure (Rain Gardens, Riparian Stream Buffers, Vegetative Swales, Green Roofs, and Porous Pavement) be incorporated into the project's Stormwater Management Strategy. Stormwater management facilities should not be placed in wetlands or other aquatic habitats.

Noise

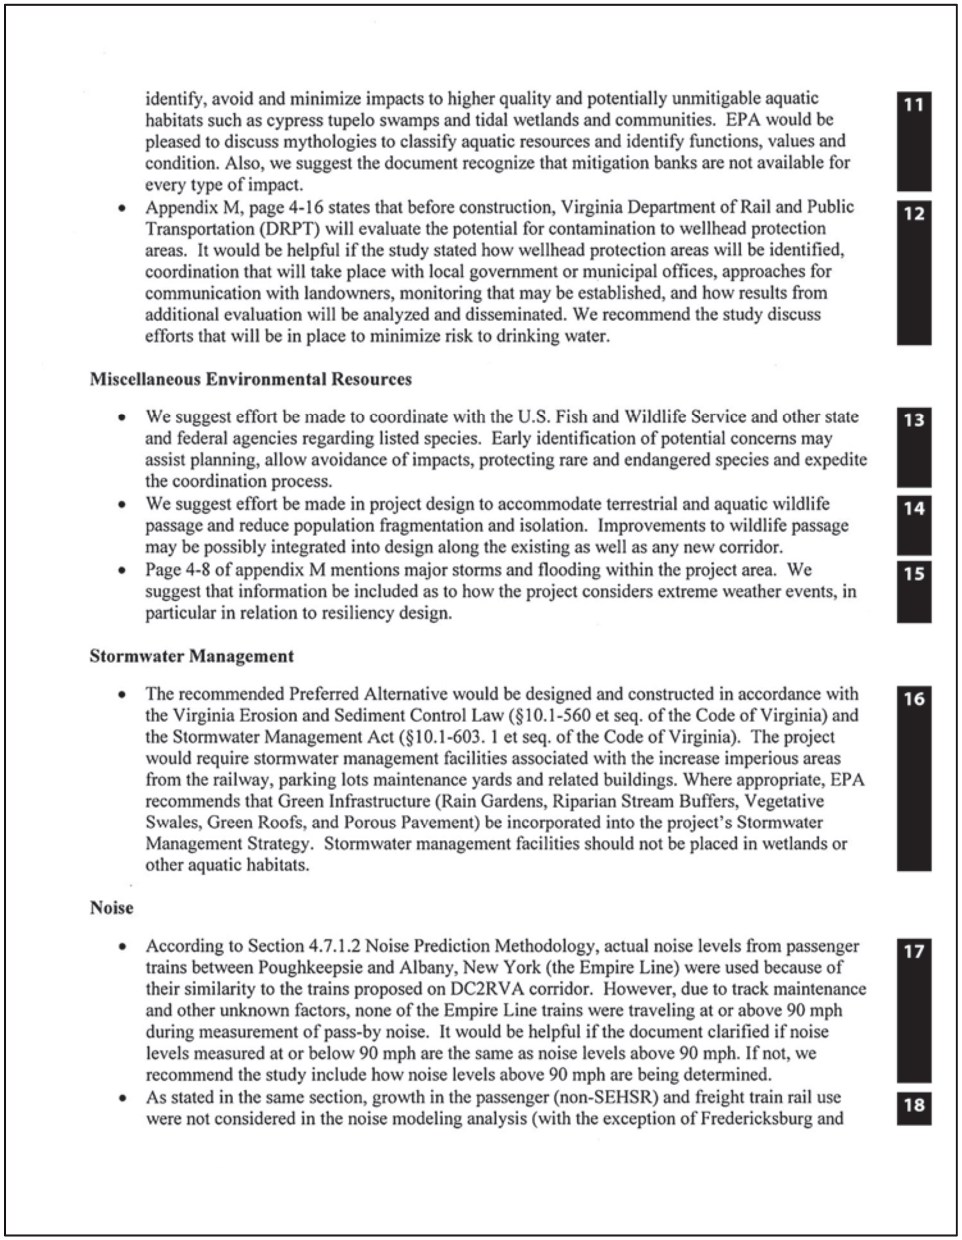
- 17 According to Section 4.7.1.2 Noise Prediction Methodology, actual noise levels from passenger trains between Poughkeepsie and Albany, New York (the Empire Line) were used because of their similarity to the trains proposed on DC2RVA corridor. However, due to track maintenance and other unknown factors, none of the Empire Line trains were traveling at or above 90 mph during measurement of pass-by noise. It would be helpful if the document clarified if noise levels measured at or below 90 mph are the same as noise levels above 90 mph. If not, we recommend the study include how noise levels above 90 mph are being determined.
- 18 As stated in the same section, growth in the passenger (non-SEHSR) and freight train rail use were not considered in the noise modeling analysis (with the exception of Fredericksburg and

US EPA REGION III (continued)

15. As presented in Section 5.1.6.2 of the Final EIS, the Project will be designed in accordance with Executive Order 11988-Floodplain Management and 23 CFR 650 Subpart A – Location and Hydraulic Design of Encroachments on Flood Plains. Accordingly, the Project is not expected to increase flood height elevations, the probability of flooding, or the potential for property loss and hazard to life. A detailed hydraulic survey and study will be conducted during final design (after funding becomes available and incremental improvements are scheduled) to ensure that no substantial increases to flooding would occur as a result of the Project. Examples of extreme weather events, which could include unusual heat or cold, prolonged or intense rainfall, and flooding, and resiliency to such events, would be addressed during the final design of the Project, after funding is secured and incremental improvements are scheduled. Potential for expansion and contraction of rails in response to extreme heat and cold also would be considered in the design and specifications for the rails at that time. Additional design, operational, and maintenance elements would also be considered, as appropriate, during further Project development as federal and state guidance with regard to resiliency design continues to evolve.

16. While much of the rail bed is permeable to rainfall (i.e., ballast and side slopes), measures to avoid or minimize impacts to water quality and adjacent habitat could include use of vegetative buffers and swales (see Final EIS Section 5.1.6.3) and minimizing clearing and grubbing in riparian areas (see Final EIS Section 4.10.1.4). Placement of stormwater management facilities will avoid wetlands and other aquatic habitats, to the extent feasible, to be determined during final design after funding becomes available and incremental improvements are scheduled. DRPT will consider opportunities to incorporate additional green infrastructure or low impact design, where appropriate, during final design (after funding becomes available and incremental improvements are scheduled).

(Responses are continued on next page)



11 identify, avoid and minimize impacts to higher quality and potentially unmitigable aquatic habitats such as cypress tupelo swamps and tidal wetlands and communities. EPA would be pleased to discuss mythologies to classify aquatic resources and identify functions, values and condition. Also, we suggest the document recognize that mitigation banks are not available for every type of impact.

- 12 Appendix M, page 4-16 states that before construction, Virginia Department of Rail and Public Transportation (DRPT) will evaluate the potential for contamination to wellhead protection areas. It would be helpful if the study stated how wellhead protection areas will be identified, coordination that will take place with local government or municipal offices, approaches for communication with landowners, monitoring that may be established, and how results from additional evaluation will be analyzed and disseminated. We recommend the study discuss efforts that will be in place to minimize risk to drinking water.

Miscellaneous Environmental Resources

- 13 We suggest effort be made to coordinate with the U.S. Fish and Wildlife Service and other state and federal agencies regarding listed species. Early identification of potential concerns may assist planning, allow avoidance of impacts, protecting rare and endangered species and expedite the coordination process.
- 14 We suggest effort be made in project design to accommodate terrestrial and aquatic wildlife passage and reduce population fragmentation and isolation. Improvements to wildlife passage may be possibly integrated into design along the existing as well as any new corridor.
- 15 Page 4-8 of appendix M mentions major storms and flooding within the project area. We suggest that information be included as to how the project considers extreme weather events, in particular in relation to resiliency design.

Stormwater Management

- 16 The recommended Preferred Alternative would be designed and constructed in accordance with the Virginia Erosion and Sediment Control Law (§10.1-560 et seq. of the Code of Virginia) and the Stormwater Management Act (§10.1-603. 1 et seq. of the Code of Virginia). The project would require stormwater management facilities associated with the increase imperious areas from the railway, parking lots maintenance yards and related buildings. Where appropriate, EPA recommends that Green Infrastructure (Rain Gardens, Riparian Stream Buffers, Vegetative Swales, Green Roofs, and Porous Pavement) be incorporated into the project's Stormwater Management Strategy. Stormwater management facilities should not be placed in wetlands or other aquatic habitats.

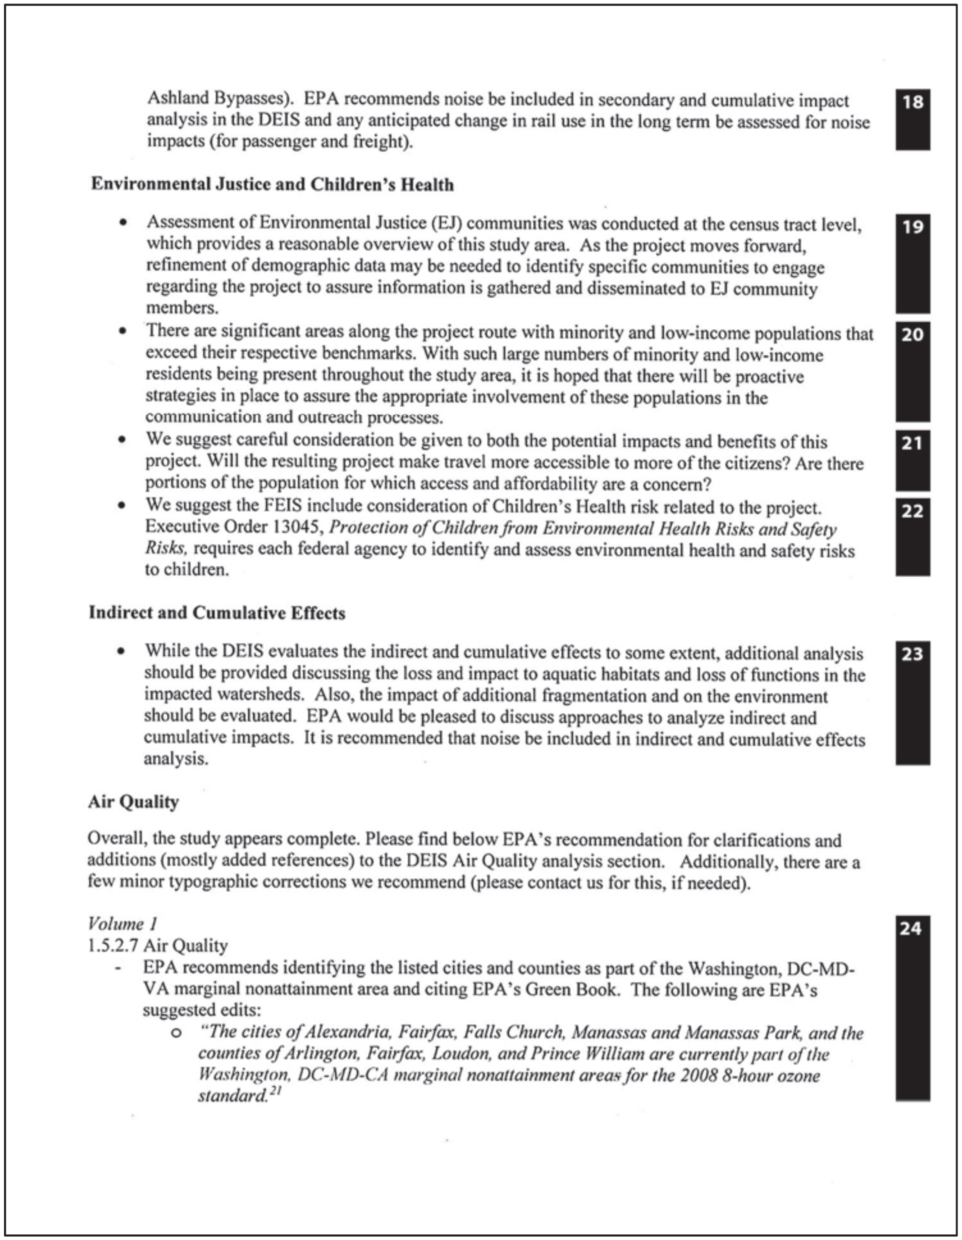
Noise

- 17 According to Section 4.7.1.2 Noise Prediction Methodology, actual noise levels from passenger trains between Poughkeepsie and Albany, New York (the Empire Line) were used because of their similarity to the trains proposed on DC2RVA corridor. However, due to track maintenance and other unknown factors, none of the Empire Line trains were traveling at or above 90 mph during measurement of pass-by noise. It would be helpful if the document clarified if noise levels measured at or below 90 mph are the same as noise levels above 90 mph. If not, we recommend the study include how noise levels above 90 mph are being determined.
- 18 As stated in the same section, growth in the passenger (non-SEHSR) and freight train rail use were not considered in the noise modeling analysis (with the exception of Fredericksburg and

US EPA REGION III (continued)

17. EPA is correct that the Empire Line in New York did not reach speeds above 90 mph. As described in Draft EIS Section 4.7.1.2, the sound exposure levels measured along the Empire Line were used to calculate noise for passenger trains traveling below 90 mph, and the sound exposure levels for proposed intercity passenger trains traveling at 90 mph were obtained from FRA's "High Speed Ground Transportation Noise and Vibration Impact Assessment" (September 2012) guidance document, which includes procedures to adjust train noise levels to the actual speeds being modeled. Note that the maximum authorized speed for passenger trains would vary in the 123-mile Project corridor from 90 miles per hour (which would be achieved in different segments of the corridor that, combined, total approximately 41 miles) to 35 miles per hour (approximately 2 miles of the corridor).

18. In response to EPA's recommendation that noise be included as a secondary and cumulative impact, refer to Section 5.20 of the Final EIS for qualitative discussion of growth in freight volumes as a cumulative effect, which has been added since the Draft EIS. Noise measurements taken as the baseline for the noise analysis (see Draft EIS Section 4.7 for methodology details) reflect the cumulative impacts of past and present projects within the area of potential noise effects of the Project. Noise impacts associated with future development are anticipated to occur mostly within existing urban and suburban environments consistent with local community comprehensive plans. The noise analysis completed for the DC2RVA Project measured existing noise from trains currently using the corridor, which also accounts for all other background noise sources near each measurement location. The noise analysis then calculated noise levels associated with the proposed 9 new daily intercity passenger round-trip trains (18 total trains per day) along the corridor. There were also some instances where the DC2RVA Project proposes to realign tracks on which freight trains may operate, and these were included in the noise analysis performed for the Project. It is important to note that all existing or planned increases in other trains using that corridor would occur irrespective of and independent from the DC2RVA Project. Section 5.7 of the Final EIS presents the noise analysis associated with the Preferred Alternative, and includes additional clarification since the Draft EIS.



Ashland Bypasses). EPA recommends noise be included in secondary and cumulative impact analysis in the DEIS and any anticipated change in rail use in the long term be assessed for noise impacts (for passenger and freight). 18

Environmental Justice and Children's Health

- Assessment of Environmental Justice (EJ) communities was conducted at the census tract level, which provides a reasonable overview of this study area. As the project moves forward, refinement of demographic data may be needed to identify specific communities to engage regarding the project to assure information is gathered and disseminated to EJ community members. 19
- There are significant areas along the project route with minority and low-income populations that exceed their respective benchmarks. With such large numbers of minority and low-income residents being present throughout the study area, it is hoped that there will be proactive strategies in place to assure the appropriate involvement of these populations in the communication and outreach processes. 20
- We suggest careful consideration be given to both the potential impacts and benefits of this project. Will the resulting project make travel more accessible to more of the citizens? Are there portions of the population for which access and affordability are a concern? 21
- We suggest the FEIS include consideration of Children's Health risk related to the project. Executive Order 13045, *Protection of Children from Environmental Health Risks and Safety Risks,* requires each federal agency to identify and assess environmental health and safety risks to children. 22

Indirect and Cumulative Effects

- While the DEIS evaluates the indirect and cumulative effects to some extent, additional analysis should be provided discussing the loss and impact to aquatic habitats and loss of functions in the impacted watersheds. Also, the impact of additional fragmentation and on the environment should be evaluated. EPA would be pleased to discuss approaches to analyze indirect and cumulative impacts. It is recommended that noise be included in indirect and cumulative effects analysis. 23

Air Quality

Overall, the study appears complete. Please find below EPA's recommendation for clarifications and additions (mostly added references) to the DEIS Air Quality analysis section. Additionally, there are a few minor typographic corrections we recommend (please contact us for this, if needed).

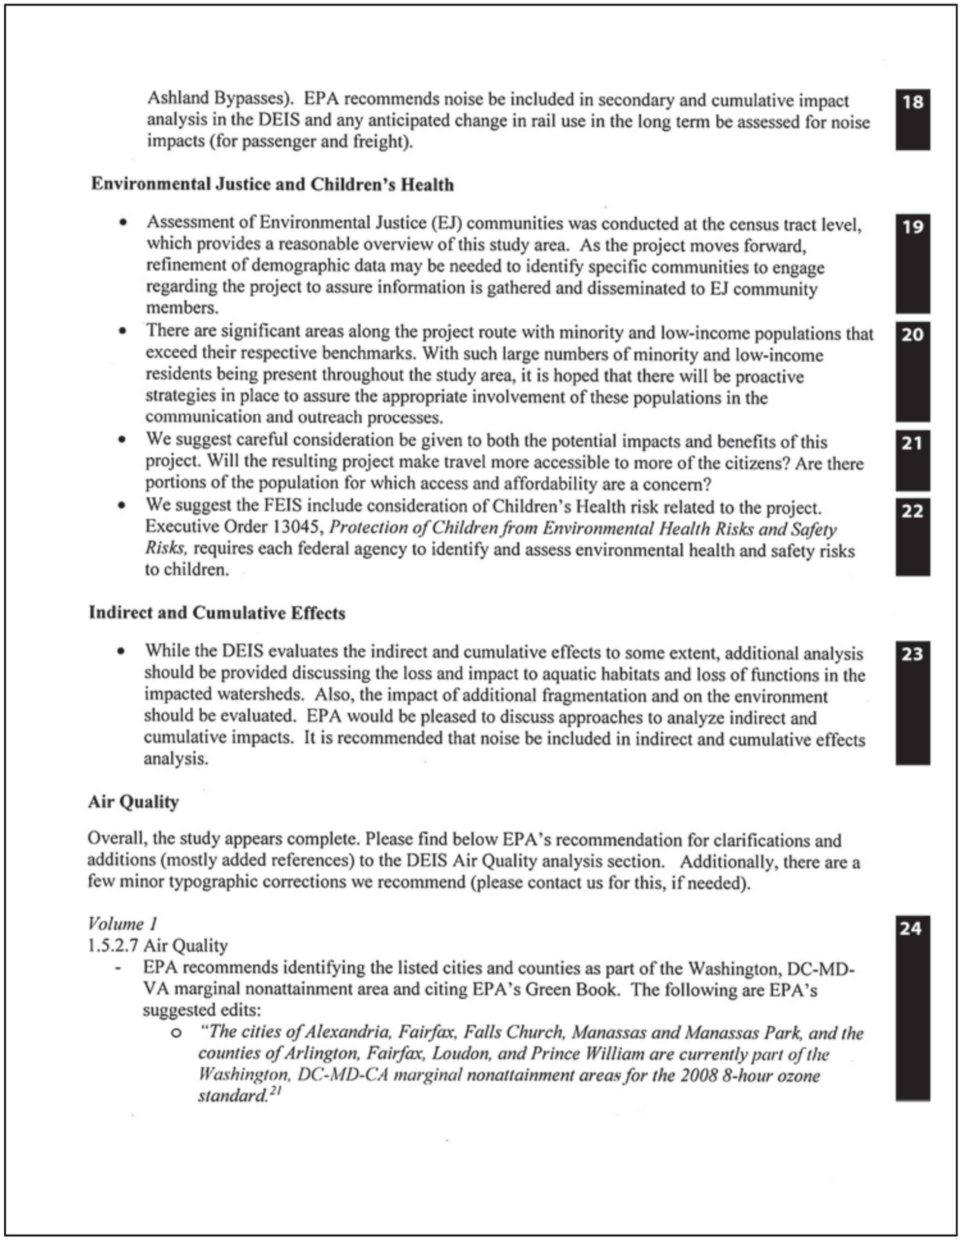
Volume 1 24
1.5.2.7 Air Quality
- EPA recommends identifying the listed cities and counties as part of the Washington, DC-MD-VA marginal nonattainment area and citing EPA's Green Book. The following are EPA's suggested edits:
    - *"The cities of Alexandria, Fairfax, Falls Church, Manassas and Manassas Park, and the counties of Arlington, Fairfax, Loudon, and Prince William are currently part of the Washington, DC-MD-CA marginal nonattainment areas for the 2008 8-hour ozone standard.*[21]

US EPA REGION III (continued)

(Response to comment 18 on previous page)

19. Comment noted. The Project has followed an extensive community outreach and participation process, and details regarding Environmental Justice (EJ) / Title VI outreach were provided in Chapter 6 Public Involvement and Agency Coordination of the Draft EIS. DRPT agrees that refinement of demographic data that was appropriate for EIS analyses may be required during future design phases of the Project, to be determined at that time.
20. Title VI, EJ, and Limited English-Proficiency populations and communities were identified early in the Project and were targeted with public outreach materials at a variety of locations within their communities, as detailed in Section 6 of the Draft EIS. Census data were updated to confirm existing locations of Title VI, EJ, or LEP populations and communities twice during the Project, and any field-identified communities were also included in the public outreach process.
21. Comment noted. The potential direct and indirect impacts of the Preferred Alternative are evaluated in Chapter 5 of the Final EIS, and have been updated since the Draft EIS. The potential benefits of the Project were considered during the development of the Purpose and Need of the Project, and are further quantitively evaluated as part of the Corridor Service Development Plan (which is being developed as part of this Project, refer to Section 7.3 of the Final EIS for further details) as part of a public benefits analysis, per US Department of Transportation guidance. The greater frequency of intercity passenger service, the extension of service within Richmond to Main Street Station, and the allowance of new intercity passenger trains from Norfolk and into North Carolina, all of which would be provided by the Project, makes travel more accessible within and beyond the DC2RVA corridor. DRPT anticipates that the 9 new daily intercity passenger round-trip trains (18 total trains per day) to be added by the Project would be operated by Amtrak, like other intercity passenger trains in the corridor. The fares for passenger service on these new trains would be set by Amtrak in coordination with DRPT and other stakeholders at the time the trains are brought into service.

(Responses are continued on next page)



Ashland Bypasses). EPA recommends noise be included in secondary and cumulative impact analysis in the DEIS and any anticipated change in rail use in the long term be assessed for noise impacts (for passenger and freight). 18

Environmental Justice and Children's Health

- Assessment of Environmental Justice (EJ) communities was conducted at the census tract level, which provides a reasonable overview of this study area. As the project moves forward, refinement of demographic data may be needed to identify specific communities to engage regarding the project to assure information is gathered and disseminated to EJ community members. 19
- There are significant areas along the project route with minority and low-income populations that exceed their respective benchmarks. With such large numbers of minority and low-income residents being present throughout the study area, it is hoped that there will be proactive strategies in place to assure the appropriate involvement of these populations in the communication and outreach processes. 20
- We suggest careful consideration be given to both the potential impacts and benefits of this project. Will the resulting project make travel more accessible to more of the citizens? Are there portions of the population for which access and affordability are a concern? 21
- We suggest the FEIS include consideration of Children's Health risk related to the project. Executive Order 13045, *Protection of Children from Environmental Health Risks and Safety Risks,* requires each federal agency to identify and assess environmental health and safety risks to children. 22

Indirect and Cumulative Effects

- While the DEIS evaluates the indirect and cumulative effects to some extent, additional analysis should be provided discussing the loss and impact to aquatic habitats and loss of functions in the impacted watersheds. Also, the impact of additional fragmentation and on the environment should be evaluated. EPA would be pleased to discuss approaches to analyze indirect and cumulative impacts. It is recommended that noise be included in indirect and cumulative effects analysis. 23

Air Quality

Overall, the study appears complete. Please find below EPA's recommendation for clarifications and additions (mostly added references) to the DEIS Air Quality analysis section. Additionally, there are a few minor typographic corrections we recommend (please contact us for this, if needed).

Volume 1 24

1.5.2.7 Air Quality

- EPA recommends identifying the listed cities and counties as part of the Washington, DC-MD-VA marginal nonattainment area and citing EPA's Green Book. The following are EPA's suggested edits:
    - *"The cities of Alexandria, Fairfax, Falls Church, Manassas and Manassas Park, and the counties of Arlington, Fairfax, Loudon, and Prince William are currently part of the Washington, DC-MD-CA marginal nonattainment areas for the 2008 8-hour ozone standard.*[21]

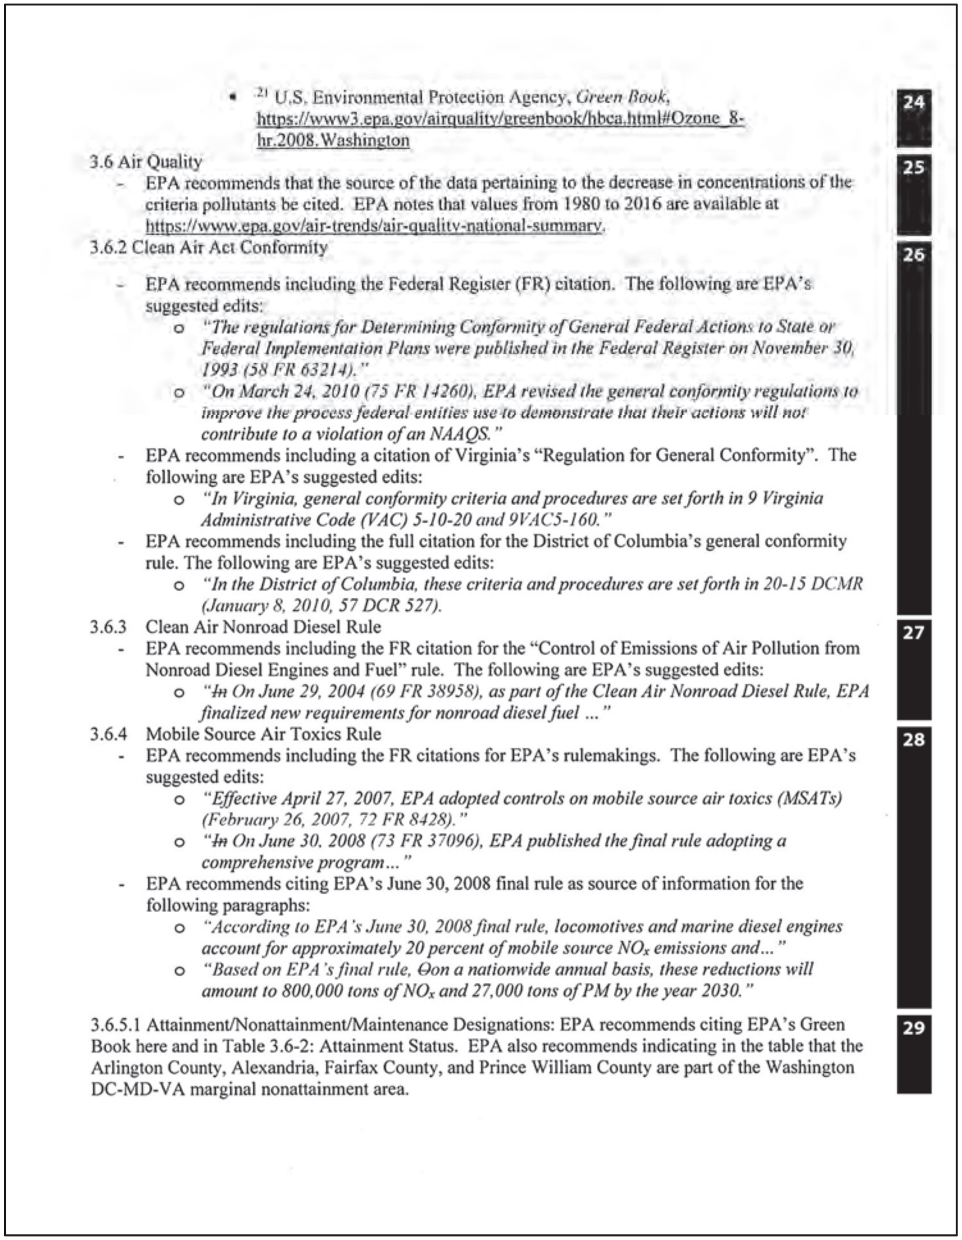
US EPA REGION III (continued)

22. As requested by EPA, Executive Order 13045 is addressed in Section 5.18 of the Final EIS, which has been added since the Draft EIS.

23. The analysis of indirect effects followed a detailed seven-step process based on National Cooperative Highway Research Program Report 466, Desk Reference for Estimating the Indirect Effects of Proposed Transportation Projects. The cumulative effects analysis in the Draft EIS used a five-part evaluation process based on FHWA guidance. Subsequent to submitting these written comments on the Draft EIS, the EPA and DRPT discussed the Project's indirect and cumulative effects in a call on June 6, 2018. EPA and DRPT discussed analysis methodology, specifically in regard to past / present / future actions for all resources, including water quality, aquatic systems, habitat fragmentation, noise, induced development, and the Shockoe Bottom area near Main Street Station. DRPT updated the discussion of indirect and cumulative effects (Section 5.20 in the Final EIS) as agreed to with FRA during this call, as summarized below.

    In the context of impact-causing activities related to construction and operation of the rail facilities, DRPT assessed two kinds of indirect impacts, those associated with potential induced development and those associated with proximity or downstream (in time and place) impacts. With respect to EPA's comments regarding watershed/water quality impacts, DRPT employed a qualitative assessment; as suggested during the teleconference, DRPT added more discussion on the impacts of other past and present actions in the Final EIS. With respect to noise, based on scoping and the nature of the corridor and the expected impacts, DRPT did not conclude that indirect noise impacts were likely to represent a potentially significant issue, and therefore excluded it from detailed quantitative analysis in the indirect effects evaluation; however, as discussed on the teleconference, a high-level qualitative discussion was added to the Final EIS. The cultural resources discussion in the Richmond Main Street Station area is more thoroughly discussed throughout the Final EIS (refer to Section 3.1 of the Final EIS for additional historical context).

(Response to comment 24 on next page)



- [21] U.S. Environmental Protection Agency, *Green Book*, https://www3.epa.gov/airquality/greenbook/hbca.html#Ozone_8-hr.2008.Washington 24

3.6 Air Quality

- EPA recommends that the source of the data pertaining to the decrease in concentrations of the criteria pollutants be cited. EPA notes that values from 1980 to 2016 are available at https://www.epa.gov/air-trends/air-quality-national-summary. 25

3.6.2 Clean Air Act Conformity

- EPA recommends including the Federal Register (FR) citation. The following are EPA's suggested edits: 26
  - *"The regulations for Determining Conformity of General Federal Actions to State or Federal Implementation Plans were published in the Federal Register on November 30, 1993 (58 FR 63214)."*
  - *"On March 24, 2010 (75 FR 14260), EPA revised the general conformity regulations to improve the process federal entities use to demonstrate that their actions will not contribute to a violation of an NAAQS."*
- EPA recommends including a citation of Virginia's "Regulation for General Conformity". The following are EPA's suggested edits:
  - *"In Virginia, general conformity criteria and procedures are set forth in 9 Virginia Administrative Code (VAC) 5-10-20 and 9VAC5-160."*
- EPA recommends including the full citation for the District of Columbia's general conformity rule. The following are EPA's suggested edits:
  - *"In the District of Columbia, these criteria and procedures are set forth in 20-15 DCMR (January 8, 2010, 57 DCR 527).*

3.6.3 Clean Air Nonroad Diesel Rule 27

- EPA recommends including the FR citation for the "Control of Emissions of Air Pollution from Nonroad Diesel Engines and Fuel" rule. The following are EPA's suggested edits:
  - *"~~In~~ On June 29, 2004 (69 FR 38958), as part of the Clean Air Nonroad Diesel Rule, EPA finalized new requirements for nonroad diesel fuel ..."*

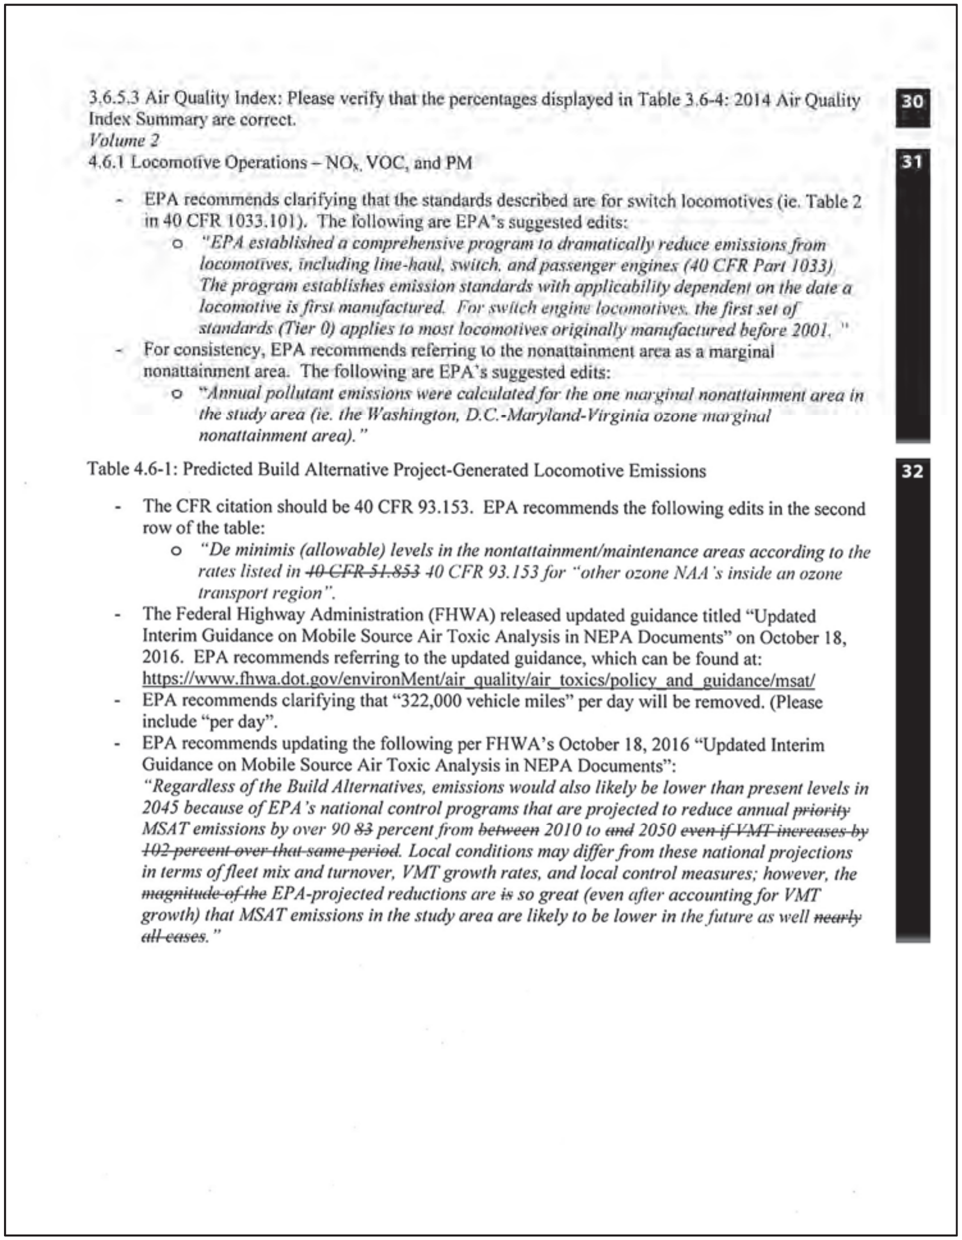
3.6.4 Mobile Source Air Toxics Rule 28

- EPA recommends including the FR citations for EPA's rulemakings. The following are EPA's suggested edits:
  - *"Effective April 27, 2007, EPA adopted controls on mobile source air toxics (MSATs) (February 26, 2007, 72 FR 8428)."*
  - *"~~In~~ On June 30, 2008 (73 FR 37096), EPA published the final rule adopting a comprehensive program..."*
- EPA recommends citing EPA's June 30, 2008 final rule as source of information for the following paragraphs:
  - *"According to EPA's June 30, 2008 final rule, locomotives and marine diesel engines account for approximately 20 percent of mobile source NO_x emissions and..."*
  - *"Based on EPA's final rule, ~~O~~on a nationwide annual basis, these reductions will amount to 800,000 tons of NO_x and 27,000 tons of PM by the year 2030."*

3.6.5.1 Attainment/Nonattainment/Maintenance Designations: EPA recommends citing EPA's Green Book here and in Table 3.6-2: Attainment Status. EPA also recommends indicating in the table that the Arlington County, Alexandria, Fairfax County, and Prince William County are part of the Washington DC-MD-VA marginal nonattainment area. 29

US EPA REGION III (continued)

24. through 29. The requested text / source / data / citation clarifications are included in the errata table for the Draft EIS, which is Appendix A of the Final EIS.



30 3.6.5.3 Air Quality Index: Please verify that the percentages displayed in Table 3.6-4: 2014 Air Quality Index Summary are correct.

Volume 2

31 4.6.1 Locomotive Operations – NO_x, VOC, and PM

- EPA recommends clarifying that the standards described are for switch locomotives (ie. Table 2 in 40 CFR 1033.101). The following are EPA's suggested edits:
  - *"EPA established a comprehensive program to dramatically reduce emissions from locomotives, including line-haul, switch, and passenger engines (40 CFR Part 1033). The program establishes emission standards with applicability dependent on the date a locomotive is first manufactured. For switch engine locomotives, the first set of standards (Tier 0) applies to most locomotives originally manufactured before 2001."*
- For consistency, EPA recommends referring to the nonattainment area as a marginal nonattainment area. The following are EPA's suggested edits:
  - *"Annual pollutant emissions were calculated for the one marginal nonattainment area in the study area (ie. the Washington, D.C.-Maryland-Virginia ozone marginal nonattainment area)."*

32 Table 4.6-1: Predicted Build Alternative Project-Generated Locomotive Emissions

- The CFR citation should be 40 CFR 93.153. EPA recommends the following edits in the second row of the table:
  - *"De minimis (allowable) levels in the nontattainment/maintenance areas according to the rates listed in ~~40 CFR 51.853~~ 40 CFR 93.153 for "other ozone NAA's inside an ozone transport region".*
- The Federal Highway Administration (FHWA) released updated guidance titled "Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents" on October 18, 2016. EPA recommends referring to the updated guidance, which can be found at: https://www.fhwa.dot.gov/environMent/air_quality/air_toxics/policy_and_guidance/msat/
- EPA recommends clarifying that "322,000 vehicle miles" per day will be removed. (Please include "per day".
- EPA recommends updating the following per FHWA's October 18, 2016 "Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents":
  "Regardless of the Build Alternatives, emissions would also likely be lower than present levels in 2045 because of EPA's national control programs that are projected to reduce annual ~~priority~~ MSAT emissions by over 90 ~~83~~ percent from ~~between~~ 2010 to ~~and~~ 2050 ~~even if VMT increases by 102 percent over that same period~~. Local conditions may differ from these national projections in terms of fleet mix and turnover, VMT growth rates, and local control measures; however, the ~~magnitude of the~~ EPA-projected reductions are ~~is~~ so great (even after accounting for VMT growth) that MSAT emissions in the study area are likely to be lower in the future as well ~~nearly all cases~~."

US EPA REGION III (continued)

30. The 2014 air quality index data presented in Table 3.6-4 of the Draft EIS reflects the most recent data that was available from the USEPA website at the time of preparation of the Draft EIS. While the 2014 data has since been updated, the changes are relatively minor and would not affect any of the conclusions drawn in the Draft EIS.

31. The requested text clarifications have been addressed in Section 5.6.1 of the Final EIS.

32. The requested text clarifications have been addressed in Section 5.6.1 of the Final EIS.

Virginia Department of Rail and
Public Transportation
ATTN: Ms. Emily Stock
600 East Main Street, Suite 2102
Richmond, VA 23219

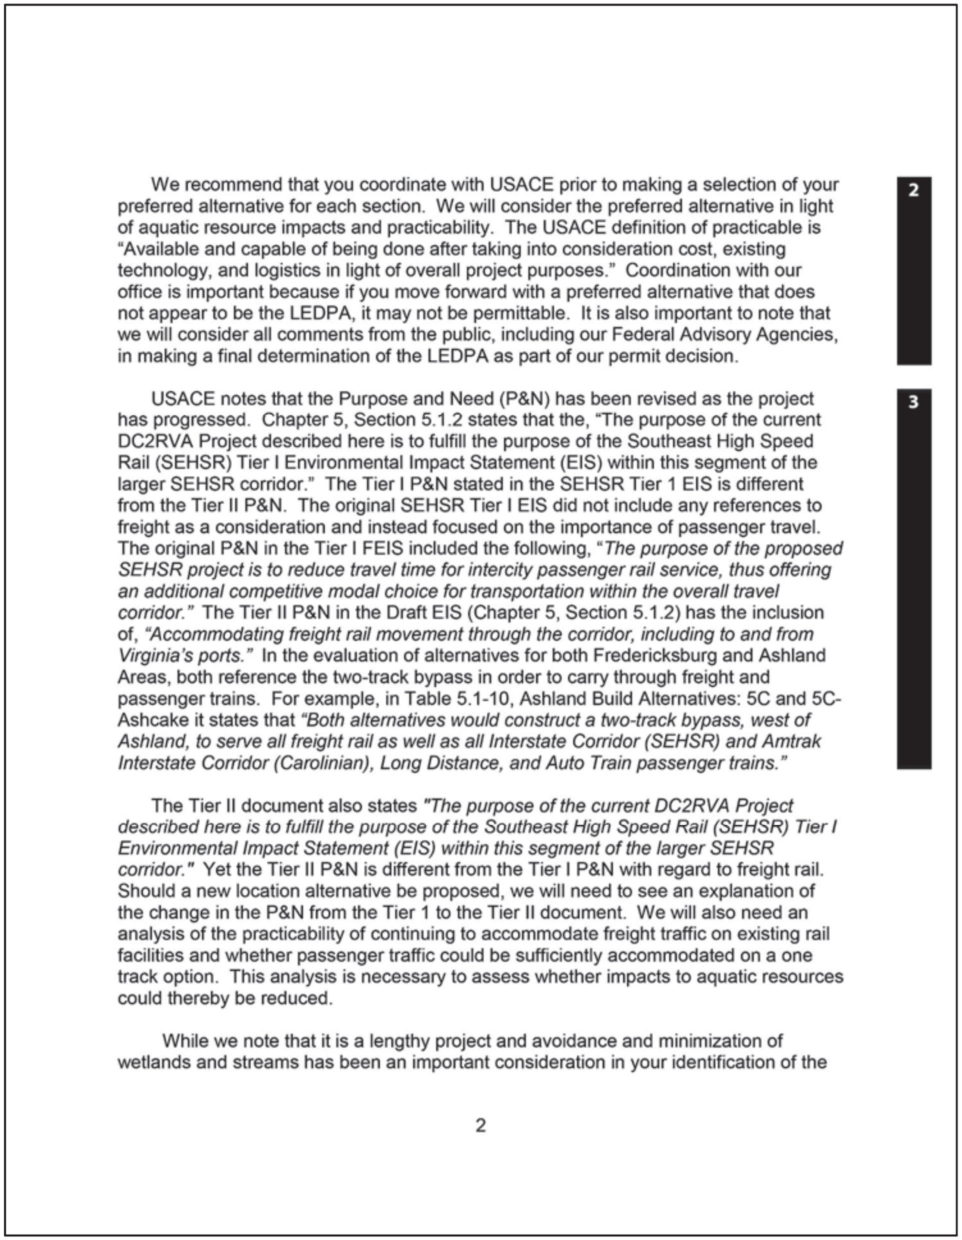
Dear Mr. Winkle and Ms. Stock:

This letter provides comments on the Tier II Draft Environmental Impact Statement (DEIS) prepared for the Washington, D.C. to Richmond High Speed Rail Project (DC2RVA) Tier II from Washington, D.C. to Richmond, VA. The DEIS was prepared by the U. S. Department of Transportation Federal Rail Administration (FRA) and the Virginia Department of Rail and Public Transportation. Based on the information in the document, the project will involve a discharge of fill into waters of the United States and will require authorization from the Corps of Engineers (USACE). If an application is submitted for any part of the DC2RVA, USACE will make a permit decision after conducting a full public interest review, including review of any responses to our public notice of receipt of a complete application. 1

As confirmed in a letter dated March 9, 2015, USACE is a cooperating agency in accordance with the National Environmental Policy Act (NEPA; 40 CFR 1501.6) for the development of the EIS. We have reviewed the DEIS. As noted in our earlier comments, in accordance with the 404(b)(1) Guidelines, the Corps can authorize only the least environmentally damaging practicable alternative (LEDPA). In addition to wetland and waters impacts, we must consider factors such as economics (including displacements of homes and businesses), floodplain hazards and values, water supply and conservation, water quality, safety, cost, economics, threatened and endangered species, historic and cultural resources, and environmental justice. As part of our public interest review, we will consider operability and constructability, cost, and impacts to the social/economic factors as well as the natural environment in our identification of the LEDPA further in our review process.

US ARMY CORPS OF ENGINEERS

1. The Department of Rail and Public Transportation (DRPT) anticipates submitting a Joint Permit Application (JPA) for review by the United States Army Corps of Engineers (USACE), Virginia Department of Environmental Quality (VDEQ), and Virginia Marine Resources Commission (VMRC) during final design, after funding becomes available and incremental improvements are scheduled. USACE's public interest review process is noted.



2 We recommend that you coordinate with USACE prior to making a selection of your preferred alternative for each section. We will consider the preferred alternative in light of aquatic resource impacts and practicability. The USACE definition of practicable is "Available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes." Coordination with our office is important because if you move forward with a preferred alternative that does not appear to be the LEDPA, it may not be permittable. It is also important to note that we will consider all comments from the public, including our Federal Advisory Agencies, in making a final determination of the LEDPA as part of our permit decision.

3 USACE notes that the Purpose and Need (P&N) has been revised as the project has progressed. Chapter 5, Section 5.1.2 states that the, "The purpose of the current DC2RVA Project described here is to fulfill the purpose of the Southeast High Speed Rail (SEHSR) Tier I Environmental Impact Statement (EIS) within this segment of the larger SEHSR corridor." The Tier I P&N stated in the SEHSR Tier 1 EIS is different from the Tier II P&N. The original SEHSR Tier I EIS did not include any references to freight as a consideration and instead focused on the importance of passenger travel. The original P&N in the Tier I FEIS included the following, "*The purpose of the proposed SEHSR project is to reduce travel time for intercity passenger rail service, thus offering an additional competitive modal choice for transportation within the overall travel corridor.*" The Tier II P&N in the Draft EIS (Chapter 5, Section 5.1.2) has the inclusion of, *"Accommodating freight rail movement through the corridor, including to and from Virginia's ports."* In the evaluation of alternatives for both Fredericksburg and Ashland Areas, both reference the two-track bypass in order to carry through freight and passenger trains. For example, in Table 5.1-10, Ashland Build Alternatives: 5C and 5C-Ashcake it states that *"Both alternatives would construct a two-track bypass, west of Ashland, to serve all freight rail as well as all Interstate Corridor (SEHSR) and Amtrak Interstate Corridor (Carolinian), Long Distance, and Auto Train passenger trains."*

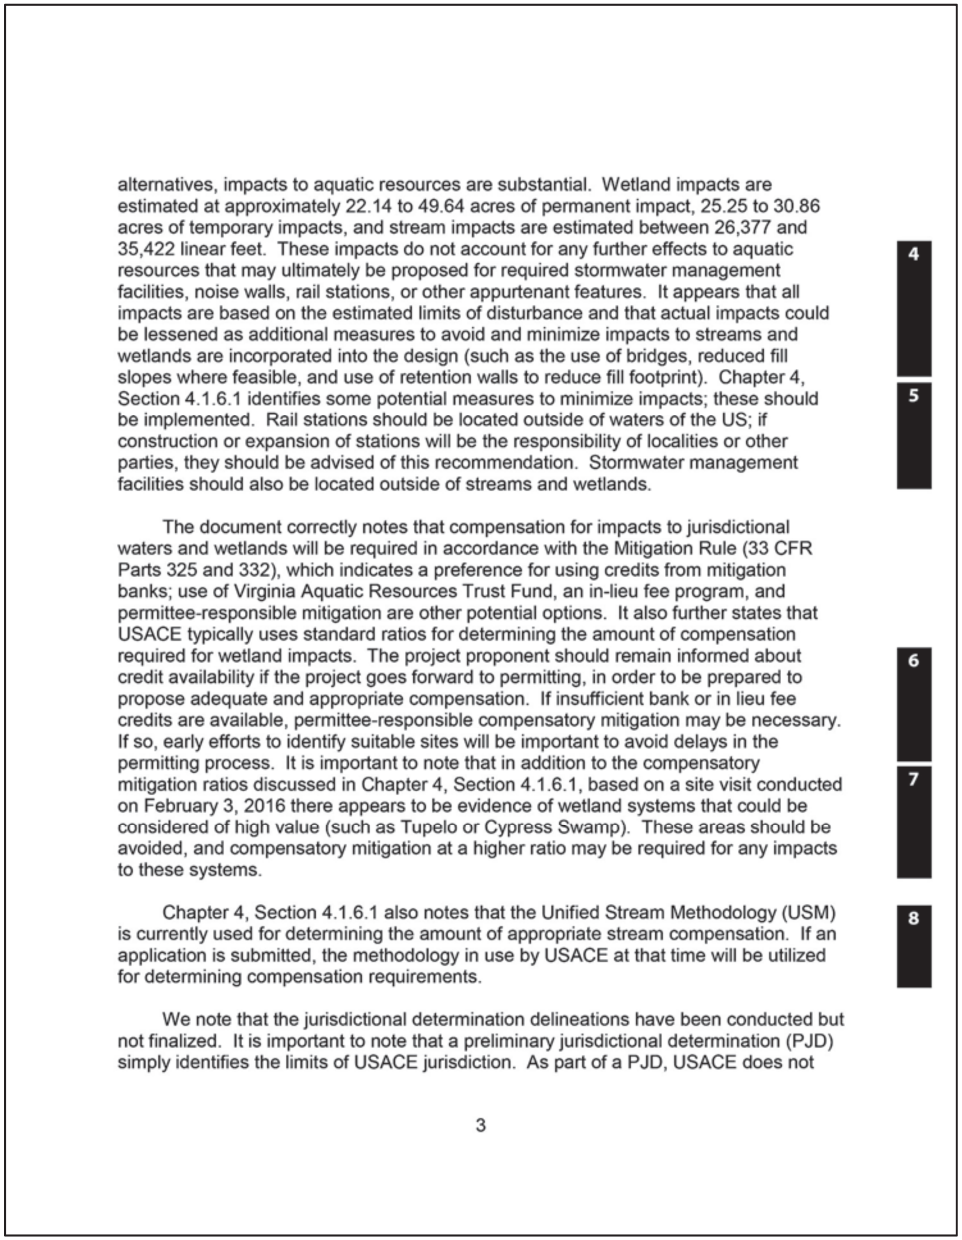
The Tier II document also states *"The purpose of the current DC2RVA Project described here is to fulfill the purpose of the Southeast High Speed Rail (SEHSR) Tier I Environmental Impact Statement (EIS) within this segment of the larger SEHSR corridor."* Yet the Tier II P&N is different from the Tier I P&N with regard to freight rail. Should a new location alternative be proposed, we will need to see an explanation of the change in the P&N from the Tier 1 to the Tier II document. We will also need an analysis of the practicability of continuing to accommodate freight traffic on existing rail facilities and whether passenger traffic could be sufficiently accommodated on a one track option. This analysis is necessary to assess whether impacts to aquatic resources could thereby be reduced.

While we note that it is a lengthy project and avoidance and minimization of wetlands and streams has been an important consideration in your identification of the

US ARMY CORPS OF ENGINEERS (continued)

2. DRPT will apply for and obtain any required USACE permit(s) once funding becomes available and incremental improvements are scheduled. DRPT recognizes that in order to be permitted by the USACE, the Project must comply with the Section 404(b)(1) Guidelines [40CFR 230.10(a)] and USACE must determine that the alternative is the Least Environmentally Damaging Practicable Alternative (LEDPA). DRPT appreciates the cooperation and guidance provided by USACE during the development of the EIS and is confident that the Preferred Alternative identified in the Final EIS will meet USACE's requirement as the LEDPA.

3. Clarifying language on the Project Need, including the unique needs of the DC2RVA corridor as well as developments since the 2002 Tier I EIS, can be found in Final EIS Section 1.3, which has been added since the Draft EIS.



alternatives, impacts to aquatic resources are substantial. Wetland impacts are
estimated at approximately 22.14 to 49.64 acres of permanent impact, 25.25 to 30.86
acres of temporary impacts, and stream impacts are estimated between 26,377 and
35,422 linear feet. These impacts do not account for any further effects to aquatic 4
resources that may ultimately be proposed for required stormwater management
facilities, noise walls, rail stations, or other appurtenant features. It appears that all
impacts are based on the estimated limits of disturbance and that actual impacts could
be lessened as additional measures to avoid and minimize impacts to streams and
wetlands are incorporated into the design (such as the use of bridges, reduced fill
slopes where feasible, and use of retention walls to reduce fill footprint). Chapter 4,
Section 4.1.6.1 identifies some potential measures to minimize impacts; these should 5
be implemented. Rail stations should be located outside of waters of the US; if
construction or expansion of stations will be the responsibility of localities or other
parties, they should be advised of this recommendation. Stormwater management
facilities should also be located outside of streams and wetlands.

The document correctly notes that compensation for impacts to jurisdictional
waters and wetlands will be required in accordance with the Mitigation Rule (33 CFR
Parts 325 and 332), which indicates a preference for using credits from mitigation
banks; use of Virginia Aquatic Resources Trust Fund, an in-lieu fee program, and
permittee-responsible mitigation are other potential options. It also further states that
USACE typically uses standard ratios for determining the amount of compensation
required for wetland impacts. The project proponent should remain informed about 6
credit availability if the project goes forward to permitting, in order to be prepared to
propose adequate and appropriate compensation. If insufficient bank or in lieu fee
credits are available, permittee-responsible compensatory mitigation may be necessary.
If so, early efforts to identify suitable sites will be important to avoid delays in the
permitting process. It is important to note that in addition to the compensatory
mitigation ratios discussed in Chapter 4, Section 4.1.6.1, based on a site visit conducted 7
on February 3, 2016 there appears to be evidence of wetland systems that could be
considered of high value (such as Tupelo or Cypress Swamp). These areas should be
avoided, and compensatory mitigation at a higher ratio may be required for any impacts
to these systems.

Chapter 4, Section 4.1.6.1 also notes that the Unified Stream Methodology (USM) 8
is currently used for determining the amount of appropriate stream compensation. If an
application is submitted, the methodology in use by USACE at that time will be utilized
for determining compensation requirements.

We note that the jurisdictional determination delineations have been conducted but
not finalized. It is important to note that a preliminary jurisdictional determination (PJD)
simply identifies the limits of USACE jurisdiction. As part of a PJD, USACE does not

US ARMY CORPS OF ENGINEERS (continued)

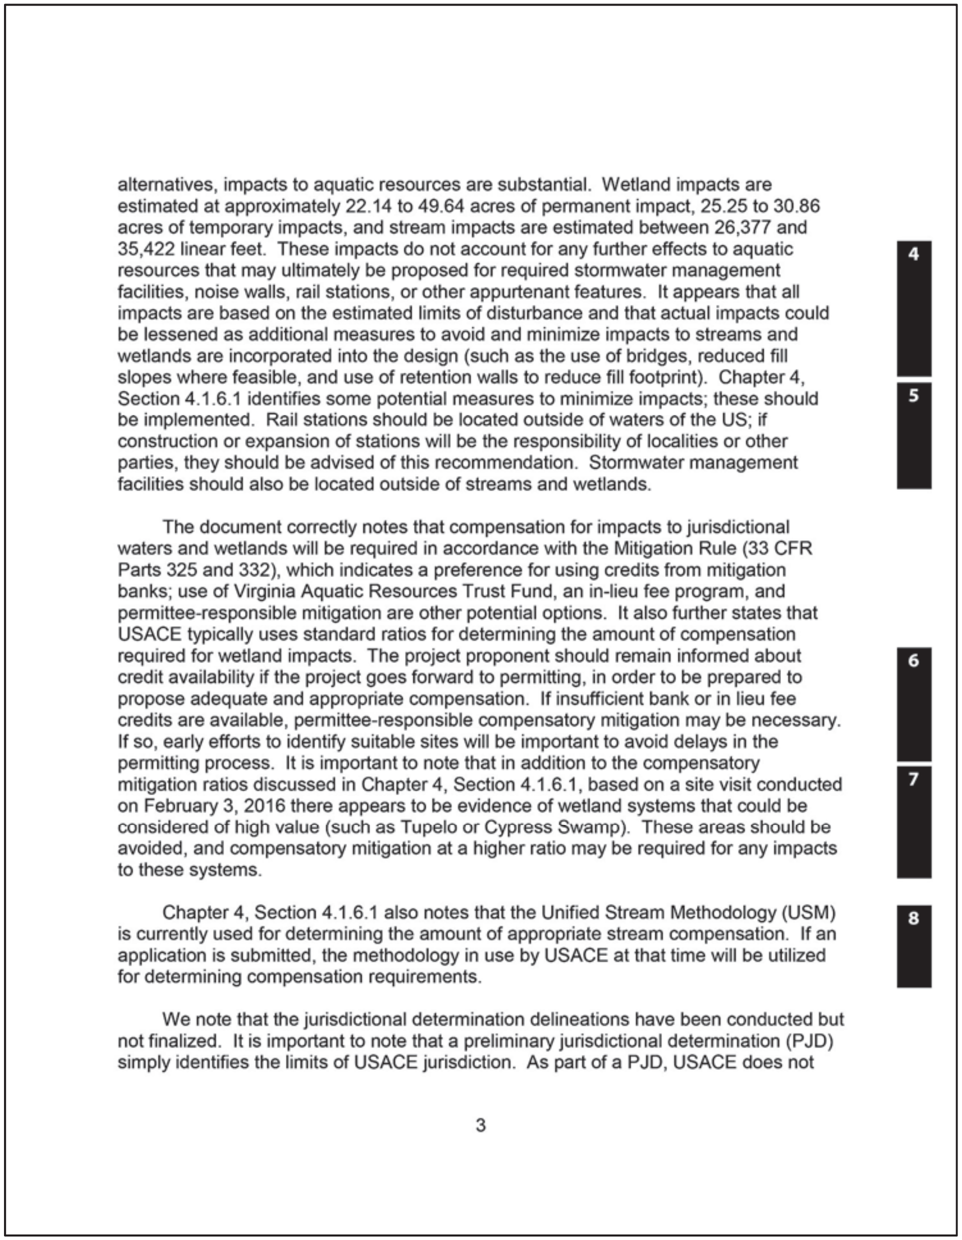
4. The estimated Limits of Disturbance (LOD) for each Build Alternative evaluated in the Draft EIS and Preferred Alternative evaluated in the Final EIS includes proposed station locations and appurtenant features. While additional stream and wetland impacts may be identified for Project facilities to be designed during future phases (e.g., stormwater management facilities and noise mitigation), impacts could also be lessened through continued efforts to further avoid and minimize impacts (see Final EIS Section 5.1.6.1) as part of final design, after funding becomes available and incremental improvements are scheduled.

5. Minimization measures listed in Final EIS Section 5.1.6.1 have been incorporated into the conceptual design for the Preferred Alternative. As noted, DRPT will continue efforts to further avoid and minimize impacts as part of final design, after funding becomes available and incremental improvements are scheduled. Stations and stormwater management facilities would be located outside of streams and wetlands to the extent practicable.

6. DRPT will consult the Regulatory In-Lieu Fee and Bank Information Tracking System (RIBITS) to investigate the availability of mitigation bank credits during final design, after funding becomes available and incremental improvements are scheduled. If there are insufficient bank or in-lieu fee credits, DRPT is prepared to develop a permittee-responsible mitigation proposal in coordination with USACE early in the permitting process. Proposed compensatory mitigation will be developed in coordination with the USACE during preparation of the JPA.

7. DRPT has confirmed that there are no cypress-tupelo swamps within the LOD for the Preferred Alternative (refer to the wetland determination data forms for the Project, which are included as Attachment G to Appendix M of the Draft EIS). DRPT will continue to strive to avoid impacts to any wetland systems through final design (after funding becomes available and incremental improvements are scheduled). If avoidance of such wetlands is not feasible, DRPT will compensate for impacts at ratios identified in coordination with USACE.

(Responses are continued on next page)



alternatives, impacts to aquatic resources are substantial. Wetland impacts are
estimated at approximately 22.14 to 49.64 acres of permanent impact, 25.25 to 30.86
acres of temporary impacts, and stream impacts are estimated between 26,377 and
35,422 linear feet. These impacts do not account for any further effects to aquatic 4
resources that may ultimately be proposed for required stormwater management
facilities, noise walls, rail stations, or other appurtenant features. It appears that all
impacts are based on the estimated limits of disturbance and that actual impacts could
be lessened as additional measures to avoid and minimize impacts to streams and
wetlands are incorporated into the design (such as the use of bridges, reduced fill
slopes where feasible, and use of retention walls to reduce fill footprint). Chapter 4,
Section 4.1.6.1 identifies some potential measures to minimize impacts; these should 5
be implemented. Rail stations should be located outside of waters of the US; if
construction or expansion of stations will be the responsibility of localities or other
parties, they should be advised of this recommendation. Stormwater management
facilities should also be located outside of streams and wetlands.

The document correctly notes that compensation for impacts to jurisdictional
waters and wetlands will be required in accordance with the Mitigation Rule (33 CFR
Parts 325 and 332), which indicates a preference for using credits from mitigation
banks; use of Virginia Aquatic Resources Trust Fund, an in-lieu fee program, and
permittee-responsible mitigation are other potential options. It also further states that
USACE typically uses standard ratios for determining the amount of compensation
required for wetland impacts. The project proponent should remain informed about 6
credit availability if the project goes forward to permitting, in order to be prepared to
propose adequate and appropriate compensation. If insufficient bank or in lieu fee
credits are available, permittee-responsible compensatory mitigation may be necessary.
If so, early efforts to identify suitable sites will be important to avoid delays in the
permitting process. It is important to note that in addition to the compensatory
mitigation ratios discussed in Chapter 4, Section 4.1.6.1, based on a site visit conducted 7
on February 3, 2016 there appears to be evidence of wetland systems that could be
considered of high value (such as Tupelo or Cypress Swamp). These areas should be
avoided, and compensatory mitigation at a higher ratio may be required for any impacts
to these systems.

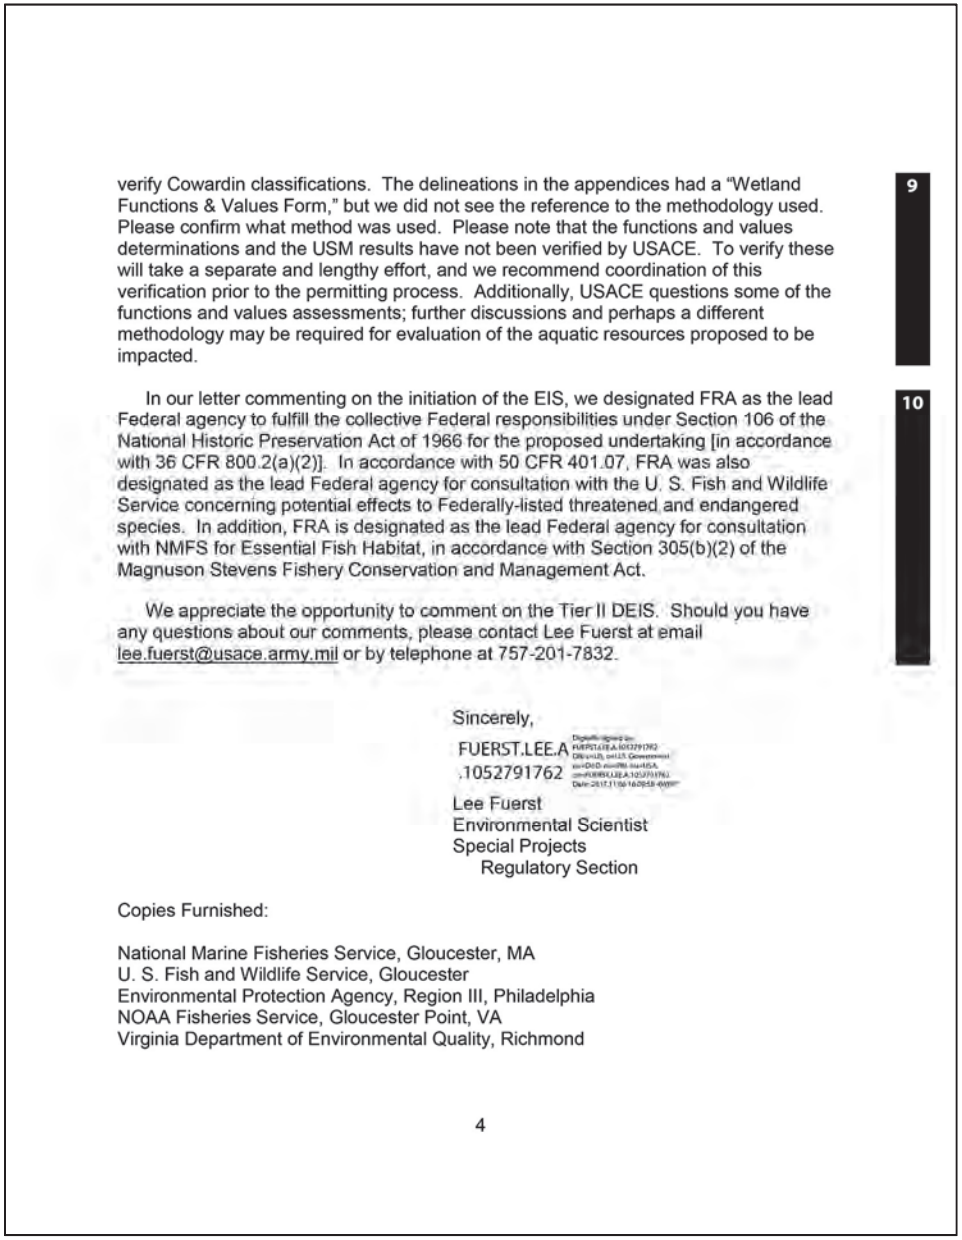
Chapter 4, Section 4.1.6.1 also notes that the Unified Stream Methodology (USM) 8
is currently used for determining the amount of appropriate stream compensation. If an
application is submitted, the methodology in use by USACE at that time will be utilized
for determining compensation requirements.

We note that the jurisdictional determination delineations have been conducted but
not finalized. It is important to note that a preliminary jurisdictional determination (PJD)
simply identifies the limits of USACE jurisdiction. As part of a PJD, USACE does not

3

US ARMY CORPS OF ENGINEERS (continued)

8. Comment noted. While the Unified Stream Methodology (USM) is the current approved methodology in Virginia for assessing existing stream conditions, and DRPT met with USACE prior to conducting the fieldwork to ensure that survey and assessment methods were consistent with agency expectations, DRPT will use the methodology in use by USACE at the time of permit application for determining compensation requirements.



verify Cowardin classifications. The delineations in the appendices had a "Wetland Functions & Values Form," but we did not see the reference to the methodology used. Please confirm what method was used. Please note that the functions and values determinations and the USM results have not been verified by USACE. To verify these will take a separate and lengthy effort, and we recommend coordination of this verification prior to the permitting process. Additionally, USACE questions some of the functions and values assessments; further discussions and perhaps a different methodology may be required for evaluation of the aquatic resources proposed to be impacted. 9

In our letter commenting on the initiation of the EIS, we designated FRA as the lead Federal agency to fulfill the collective Federal responsibilities under Section 106 of the National Historic Preservation Act of 1966 for the proposed undertaking [in accordance with 36 CFR 800.2(a)(2)]. In accordance with 50 CFR 401.07, FRA was also designated as the lead Federal agency for consultation with the U. S. Fish and Wildlife Service concerning potential effects to Federally-listed threatened and endangered species. In addition, FRA is designated as the lead Federal agency for consultation with NMFS for Essential Fish Habitat, in accordance with Section 305(b)(2) of the Magnuson Stevens Fishery Conservation and Management Act. 10

We appreciate the opportunity to comment on the Tier II DEIS. Should you have any questions about our comments, please contact Lee Fuerst at email lee.fuerst@usace.army.mil or by telephone at 757-201-7832.

Sincerely,

FUERST.LEE.A

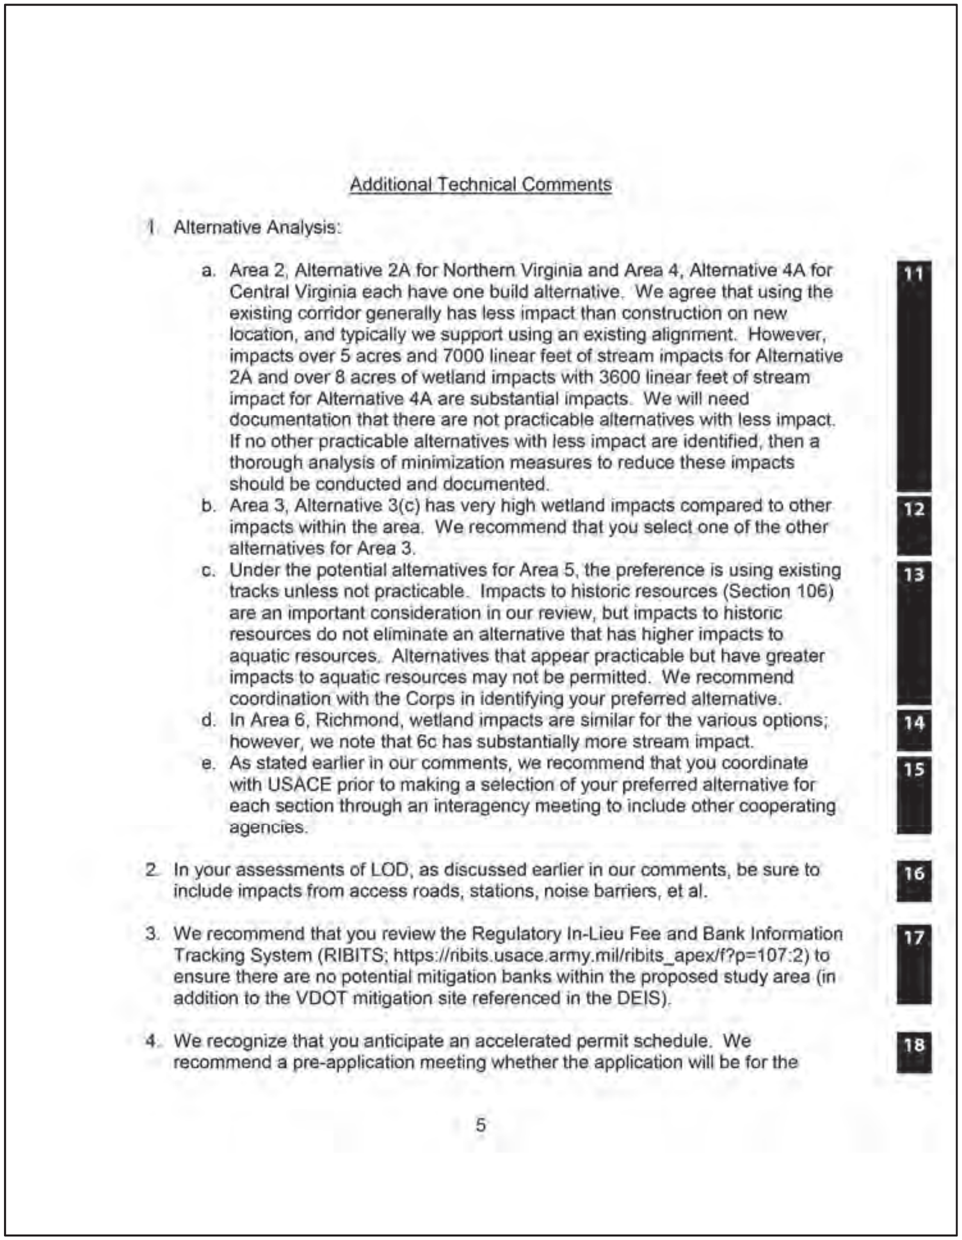
4

US ARMY CORPS OF ENGINEERS (continued)

9. The wetland functions and values assessment conducted as part of the DC2RVA Project was a qualitative field-level check of functions and values of each wetland based on the professional judgment of the wetland scientists conducting the surveys; this assessment approach provides consistent scoring amongst the 335 wetlands identified in the 123-mile Project corridor. DRPT recognizes that the functions and values determinations and the USM results have yet to be verified by USACE, and DRPT will coordinate with USACE regarding the functions and values assessments prior to the permitting process.
10. Comment noted. DRPT concurs that the Federal Railroad Administration (FRA) is the lead federal agency to fulfill the collective federal responsibilities under Section 106 of the National Historic Preservation Act of 1966, for Section 7 consultation with USFWS, and consultation with National Marine Fisheries Service (NMFS) for essential fish habitat in accordance with Section 305(b)(2) of the Magnuson Stevens Fishery Conservation and Management Act.



Additional Technical Comments

1. Alternative Analysis:

   a. Area 2, Alternative 2A for Northern Virginia and Area 4, Alternative 4A for Central Virginia each have one build alternative. We agree that using the existing corridor generally has less impact than construction on new location, and typically we support using an existing alignment. However, impacts over 5 acres and 7000 linear feet of stream impacts for Alternative 2A and over 8 acres of wetland impacts with 3600 linear feet of stream impact for Alternative 4A are substantial impacts. We will need documentation that there are not practicable alternatives with less impact. If no other practicable alternatives with less impact are identified, then a thorough analysis of minimization measures to reduce these impacts should be conducted and documented. 11
   b. Area 3, Alternative 3(c) has very high wetland impacts compared to other impacts within the area. We recommend that you select one of the other alternatives for Area 3. 12
   c. Under the potential alternatives for Area 5, the preference is using existing tracks unless not practicable. Impacts to historic resources (Section 106) are an important consideration in our review, but impacts to historic resources do not eliminate an alternative that has higher impacts to aquatic resources. Alternatives that appear practicable but have greater impacts to aquatic resources may not be permitted. We recommend coordination with the Corps in identifying your preferred alternative. 13
   d. In Area 6, Richmond, wetland impacts are similar for the various options; however, we note that 6c has substantially more stream impact. 14
   e. As stated earlier in our comments, we recommend that you coordinate with USACE prior to making a selection of your preferred alternative for each section through an interagency meeting to include other cooperating agencies. 15

2. In your assessments of LOD, as discussed earlier in our comments, be sure to include impacts from access roads, stations, noise barriers, et al. 16

3. We recommend that you review the Regulatory In-Lieu Fee and Bank Information Tracking System (RIBITS; https://ribits.usace.army.mil/ribits_apex/f?p=107:2) to ensure there are no potential mitigation banks within the proposed study area (in addition to the VDOT mitigation site referenced in the DEIS). 17

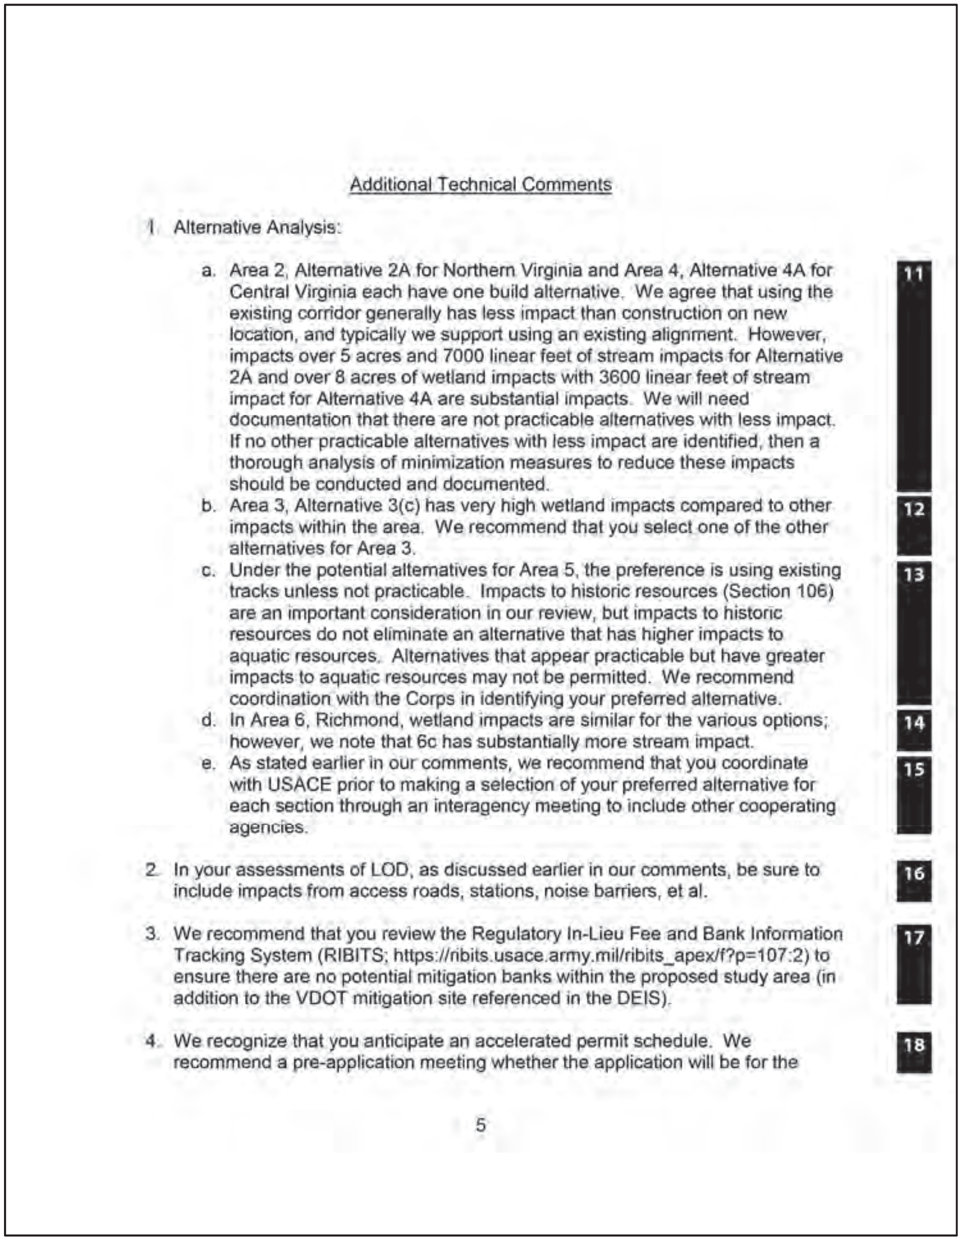
4. We recognize that you anticipate an accelerated permit schedule. We recommend a pre-application meeting whether the application will be for the 18

5

US ARMY CORPS OF ENGINEERS (continued)

11. Where feasible, FRA and DRPT recommended the Preferred Alternative that is located within the existing CSXT right-of-way and utilized existing bridges or recommended new parallel structures, thereby minimizing potential impacts of the Project. Additionally, prior to conducting the detailed evaluation of Project alternatives shown in the Draft EIS, FRA and DRPT conducted a thorough evaluation of multiple alignments and optional alternatives along the DC2RVA corridor, including Alternative Areas 2 and 4, as documented in Appendix A Alternatives Technical Report of the Draft EIS. Chapter 5 of Appendix A documents the alternatives development and screening process for the Project, and Chapter 6 of Appendix A presents the results of the screening process. Potential impacts to wetlands was an important criterion in the screening process. The process establishes a range of alternatives for consideration and then systematically evaluates and screens the range of alternatives down to only the more reasonable alternatives for detailed analysis in the Draft EIS. Reasonable alternatives are those that meet the Project's Purpose and Need, are buildable and cost-effective compared to other similar alternatives, and are anticipated to have acceptable levels of impact to the human and natural environments. DRPT believes that the set of "practicable" alternatives as defined by USACE's permitting regulations would be either the same or a subset of the "reasonable" alternatives identified in the Draft EIS. As described in Appendix A of the Draft EIS, DRPT identified approximately seven optional rail alignments for each rail section. During the screening process documented in Chapters 5 and 6 of Appendix A of the Draft EIS, DRPT evaluated each alignment option for its potential impacts on wetlands. Section alignments with greater wetland impacts were eliminated from further consideration. The remaining section alignments were combined to form the area alternatives carried forward for further evaluation in the Draft EIS.

(Responses are continued on next page)



Additional Technical Comments

1. Alternative Analysis:

   a. Area 2, Alternative 2A for Northern Virginia and Area 4, Alternative 4A for Central Virginia each have one build alternative. We agree that using the existing corridor generally has less impact than construction on new location, and typically we support using an existing alignment. However, impacts over 5 acres and 7000 linear feet of stream impacts for Alternative 2A and over 8 acres of wetland impacts with 3600 linear feet of stream impact for Alternative 4A are substantial impacts. We will need documentation that there are not practicable alternatives with less impact. 4. We recognize that you anticipate an accelerated permit schedule. We recommend a pre-application meeting whether the application will be for the 18

5

US ARMY CORPS OF ENGINEERS (continued)

12. Consistent with the Commonwealth Transportation Board (CTB) resolution from December 6, 2017, Alternative 3B: Add One Track East of Existing was selected as the Preferred Alternative, and is consistent with the USACE's recommendation. Other Area 3 Build Alternatives that were evaluated in the Draft EIS are not recommended in the Final EIS.

13. Refer to DRPT-numbered statement #2 for response. Alternative 5A was selected as the Preferred Alternative through this area, which maintains two tracks through the Town of Ashland, and is consistent with the USACE's stated preference.

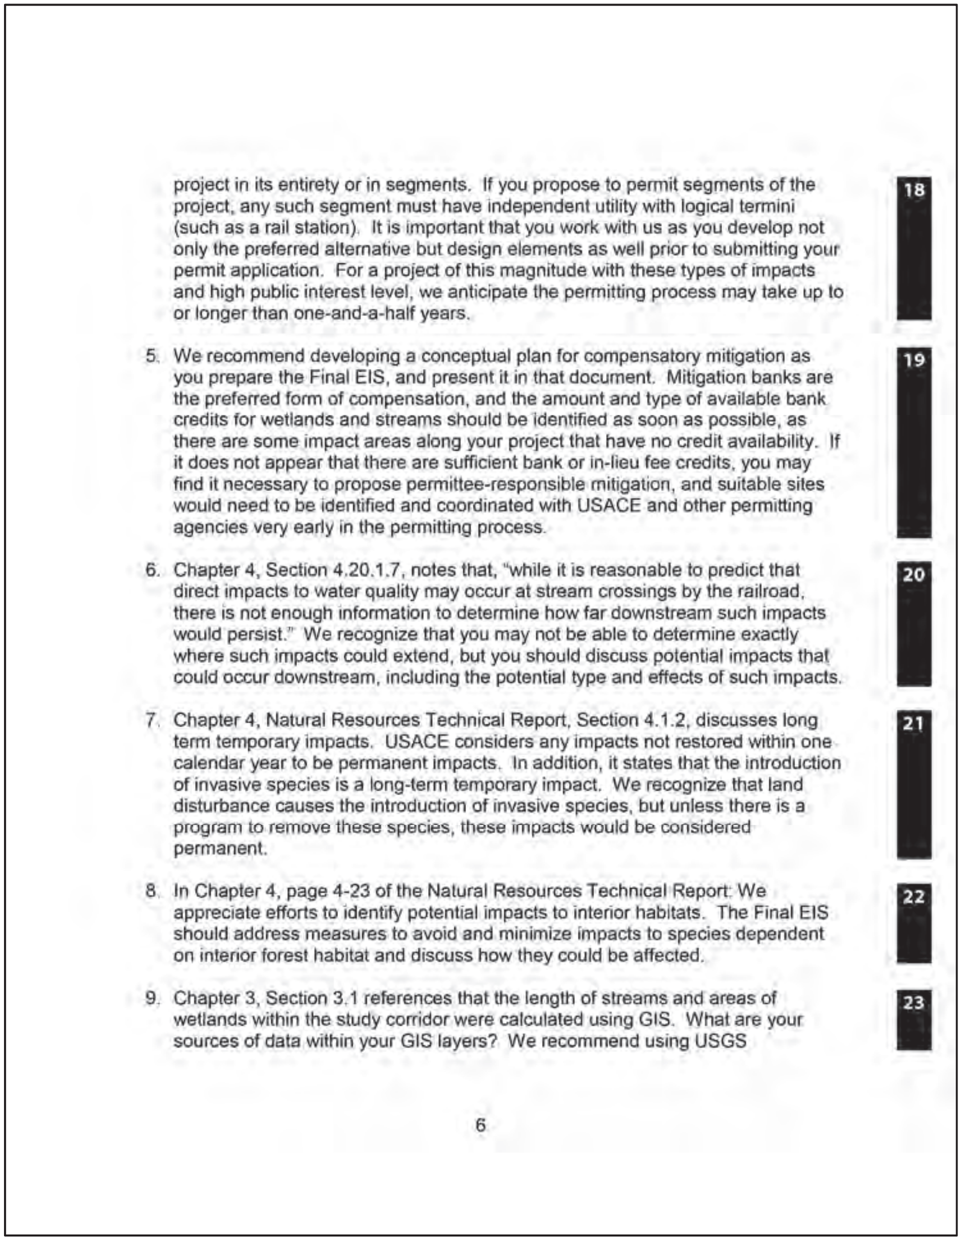
14. Consistent with the CTB resolution from December 6, 2017, Alternative 6F: Full Service (Staples Mill Road Station and Main Street Station) was selected as the Preferred Alternative. Other Area 6 Build Alternatives that were evaluated in the Draft EIS are not recommended in the Final EIS.

15. Refer to DRPT-numbered statement #2 for response.

16. Please refer to the opening section of Chapter 5 of the Final EIS, which provides additional definitions of permanent and temporary Limits of Disturbance (LOD) since the Draft EIS. The LOD for each Build Alternative evaluated in the Draft EIS and for the Preferred Alternative evaluated in the Final EIS includes proposed station locations and appurtenant features, as well as access roads. The estimated temporary LOD include areas of anticipated construction access. As discussed in Final EIS Section 5.7.1.3, noise barriers are not commonly used on rail projects because it is not cost effective to treat multiple individual locations across large areas. If noise barriers are included in the final design, the construction footprint of such barriers would be included in the refined LOD at that time.

17. See response to DRPT-numbered statement #6.

18. Comment noted. DRPT will continue to coordinate with USACE throughout future final design and permitting.



project in its entirety or in segments. If you propose to permit segments of the project, any such segment must have independent utility with logical termini (such as a rail station). It is important that you work with us as you develop not only the preferred alternative but design elements as well prior to submitting your permit application. For a project of this magnitude with these types of impacts and high public interest level, we anticipate the permitting process may take up to or longer than one-and-a-half years. **18**

5. We recommend developing a conceptual plan for compensatory mitigation as you prepare the Final EIS, and present it in that document. Mitigation banks are the preferred form of compensation, and the amount and type of available bank credits for wetlands and streams should be identified as soon as possible, as there are some impact areas along your project that have no credit availability. If it does not appear that there are sufficient bank or in-lieu fee credits, you may find it necessary to propose permittee-responsible mitigation, and suitable sites would need to be identified and coordinated with USACE and other permitting agencies very early in the permitting process. **19**

6. Chapter 4, Section 4.20.1.7, notes that, "while it is reasonable to predict that direct impacts to water quality may occur at stream crossings by the railroad, there is not enough information to determine how far downstream such impacts would persist." We recognize that you may not be able to determine exactly where such impacts could extend, but you should discuss potential impacts that could occur downstream, including the potential type and effects of such impacts. **20**

7. Chapter 4, Natural Resources Technical Report, Section 4.1.2, discusses long term temporary impacts. USACE considers any impacts not restored within one calendar year to be permanent impacts. In addition, it states that the introduction of invasive species is a long-term temporary impact. We recognize that land disturbance causes the introduction of invasive species, but unless there is a program to remove these species, these impacts would be considered permanent. **21**

8. In Chapter 4, page 4-23 of the Natural Resources Technical Report: We appreciate efforts to identify potential impacts to interior habitats. The Final EIS should address measures to avoid and minimize impacts to species dependent on interior forest habitat and discuss how they could be affected. **22**

9. Chapter 3, Section 3.1 references that the length of streams and areas of wetlands within the study corridor were calculated using GIS. What are your sources of data within your GIS layers? We recommend using USGS **23**

6

US ARMY CORPS OF ENGINEERS (continued)

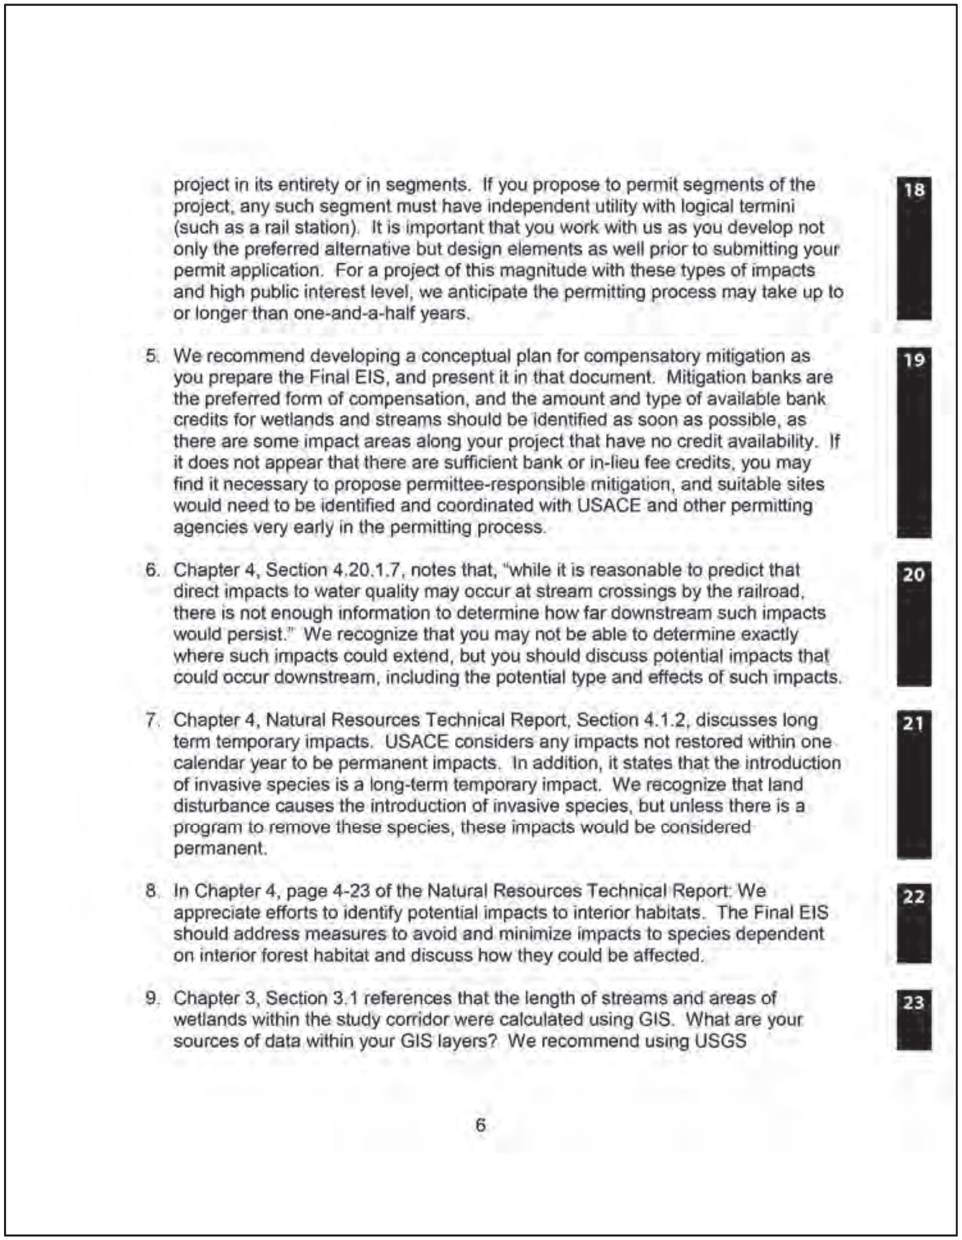
(Response to comment 18 on previous page)

19. Draft EIS Section 4.1.6.1 provides a conceptual level mitigation strategy based on *USACE's and EPA's Compensatory Mitigation for Losses of Aquatic Resources*, Final Rule (June 2008); the corresponding section of the Final EIS (Section 5.1.6.1) contains an expanded discussion of conceptual compensatory mitigation. DRPT recognizes the importance of early identification of the amount and type of available bank credits for wetlands and streams. DRPT will conduct a more detailed investigation of the availability of mitigation bank credits and prepare a more detailed compensatory mitigation plan during final design. If there are insufficient bank or in-lieu fee credits, DRPT is prepared to develop a permittee-responsible mitigation proposal in coordination with the USACE early in the permitting process.

20. The referenced statement in Draft EIS Section 4.20.1.7 regarding the indirect downstream effects was intended as a lead-in to the discussion in the bullet points which describes DRPT's rational for concluding that the potential impacts are expected to be limited. The indirect and cumulative effects discussion has been updated in Section 5.20 of the Final EIS.

21. Estimates of construction timeframes would be developed as part of final design, after funding becomes available and incremental improvements are scheduled. DRPT quantified potential impacts to natural resources based on limits of disturbance identified as permanent (i.e., areas where Project infrastructure would physically replace existing conditions) and temporary (i.e., areas required for construction that would be regraded and reseeded); these definitions have been clarified in the opening paragraph of Final EIS Chapter 5. As clarified in Final EIS Section 5.10.1.2, there is potential for the Preferred Alternative to inadvertently introduce additional invasive species into the corridor during construction; however, with implementation of the measures identified in Final EIS Section 5.10.1.4, including prompt seeding of disturbed areas with seeds that are tested in accordance with the Virginia Seed Law and implementation of Best Management Practices (BMPs), DRPT does not anticipate temporary and/or permanent invasive species impacts.

(Responses are continued on next page)



project in its entirety or in segments. If you propose to permit segments of the project, any such segment must have independent utility with logical termini (such as a rail station). It is important that you work with us as you develop not only the preferred alternative but design elements as well prior to submitting your permit application. For a project of this magnitude with these types of impacts and high public interest level, we anticipate the permitting process may take up to or longer than one-and-a-half years. 18

5. We recommend developing a conceptual plan for compensatory mitigation as you prepare the Final EIS, and present it in that document. Mitigation banks are the preferred form of compensation, and the amount and type of available bank credits for wetlands and streams should be identified as soon as possible, as there are some impact areas along your project that have no credit availability. If it does not appear that there are sufficient bank or in-lieu fee credits, you may find it necessary to propose permittee-responsible mitigation, and suitable sites would need to be identified and coordinated with USACE and other permitting agencies very early in the permitting process. 19

6. Chapter 4, Section 4.20.1.7, notes that, "while it is reasonable to predict that direct impacts to water quality may occur at stream crossings by the railroad, there is not enough information to determine how far downstream such impacts would persist." We recognize that you may not be able to determine exactly where such impacts could extend, but you should discuss potential impacts that could occur downstream, including the potential type and effects of such impacts. 20

7. Chapter 4, Natural Resources Technical Report, Section 4.1.2, discusses long term temporary impacts. USACE considers any impacts not restored within one calendar year to be permanent impacts. In addition, it states that the introduction of invasive species is a long-term temporary impact. We recognize that land disturbance causes the introduction of invasive species, but unless there is a program to remove these species, these impacts would be considered permanent. 21

8. In Chapter 4, page 4-23 of the Natural Resources Technical Report: We appreciate efforts to identify potential impacts to interior habitats. The Final EIS should address measures to avoid and minimize impacts to species dependent on interior forest habitat and discuss how they could be affected. 22

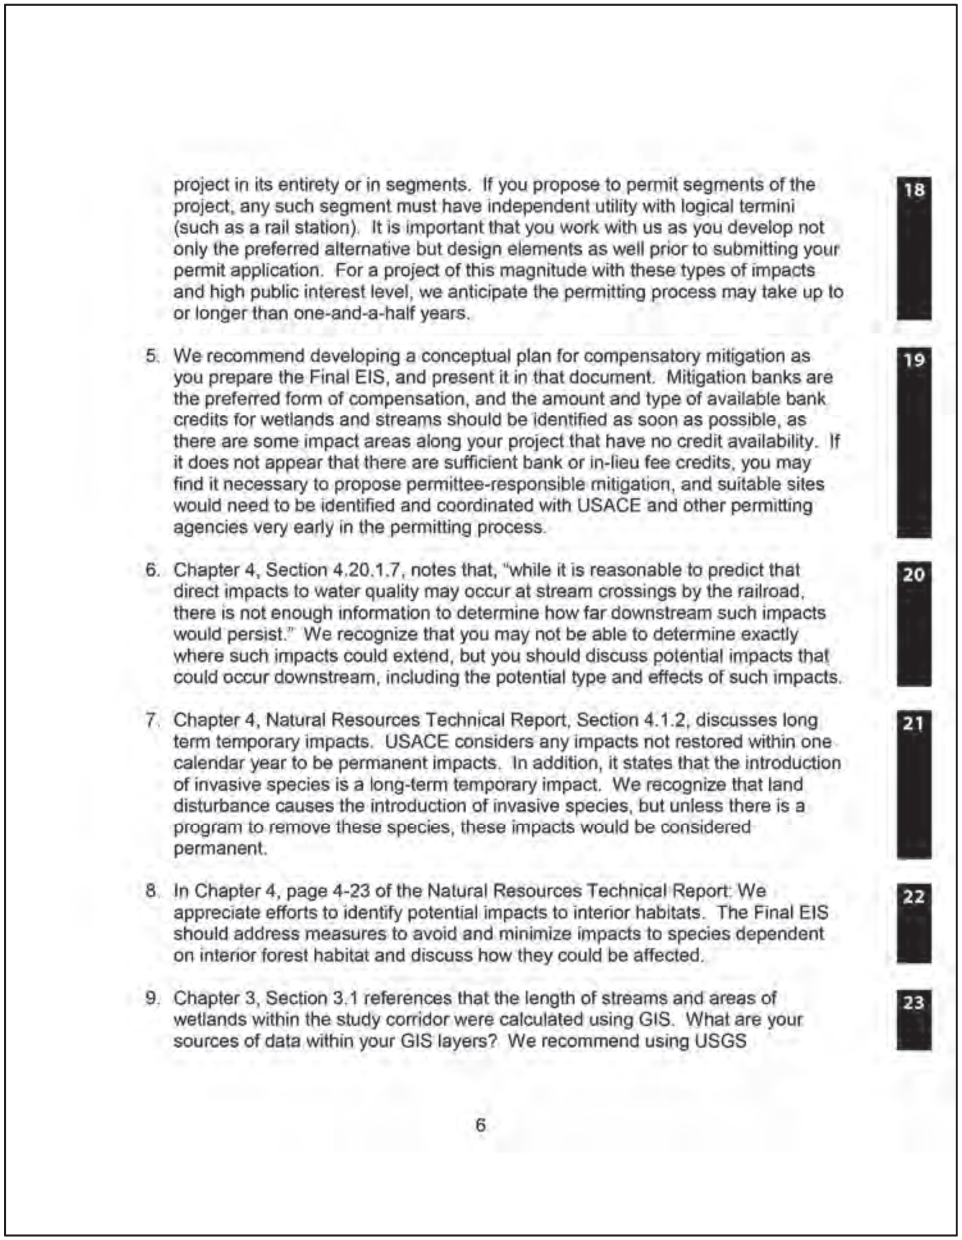
9. Chapter 3, Section 3.1 references that the length of streams and areas of wetlands within the study corridor were calculated using GIS. What are your sources of data within your GIS layers? We recommend using USGS 23

6

US ARMY CORPS OF ENGINEERS (continued)

22. The effects of fragmentation of interior forest habitat are addressed in Draft EIS Section 4.10.1 Habitat and Natural Communities and Draft EIS Section 4.10.2.2 Migratory Birds. The importance of interior forest habitat to forest interior dwelling species (FIDS) is introduced in Draft EIS Section 4.10.1. As noted there, fragmentation of interior forest habitat is of particular concern for neotropical migratory birds; therefore, further discussion of the effects of fragmentation of interior forest habitat, including predation, displacement, and competition, is provided within the discussion of migratory birds in Draft EIS Section 4.10.2.2. Avoidance and minimization measures provided in Draft EIS Section 4.10.1.4 and Draft EIS Section 4.10.2.4, including minor alignment shifts, minimizing clearing and grubbing, tree replacement, native revegetation, and wildlife crossings, would reduce impacts of fragmentation of interior forest habitats. Final EIS Sections 5.10.2.3 (avoidance, minimization, and mitigation evaluation for wildlife) and 5.20 (indirect and cumulative effects) have been updated since the Draft EIS and include further clarifications on this topic.

(Responses are continued on next page)



project in its entirety or in segments. If you propose to permit segments of the project, any such segment must have independent utility with logical termini (such as a rail station). It is important that you work with us as you develop not only the preferred alternative but design elements as well prior to submitting your permit application. For a project of this magnitude with these types of impacts and high public interest level, we anticipate the permitting process may take up to or longer than one-and-a-half years. 18

5. We recommend developing a conceptual plan for compensatory mitigation as you prepare the Final EIS, and present it in that document. Mitigation banks are the preferred form of compensation, and the amount and type of available bank credits for wetlands and streams should be identified as soon as possible, as there are some impact areas along your project that have no credit availability. If it does not appear that there are sufficient bank or in-lieu fee credits, you may find it necessary to propose permittee-responsible mitigation, and suitable sites would need to be identified and coordinated with USACE and other permitting agencies very early in the permitting process. 19

6. Chapter 4, Section 4.20.1.7, notes that, "while it is reasonable to predict that direct impacts to water quality may occur at stream crossings by the railroad, there is not enough information to determine how far downstream such impacts would persist." We recognize that you may not be able to determine exactly where such impacts could extend, but you should discuss potential impacts that could occur downstream, including the potential type and effects of such impacts. 20

7. Chapter 4, Natural Resources Technical Report, Section 4.1.2, discusses long term temporary impacts. USACE considers any impacts not restored within one calendar year to be permanent impacts. In addition, it states that the introduction of invasive species is a long-term temporary impact. We recognize that land disturbance causes the introduction of invasive species, but unless there is a program to remove these species, these impacts would be considered permanent. 21

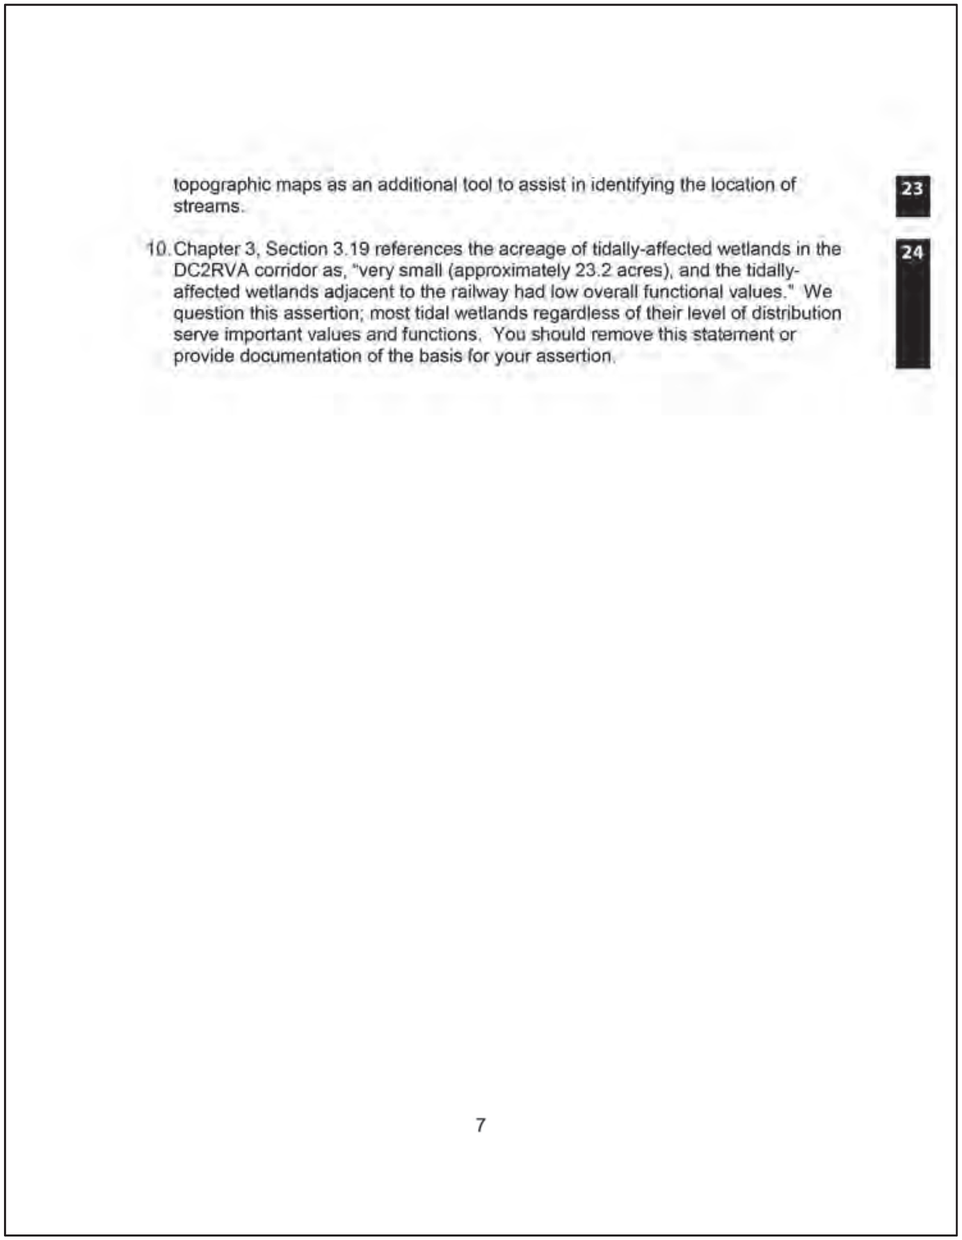
8. In Chapter 4, page 4-23 of the Natural Resources Technical Report: We appreciate efforts to identify potential impacts to interior habitats. The Final EIS should address measures to avoid and minimize impacts to species dependent on interior forest habitat and discuss how they could be affected. 22

9. Chapter 3, Section 3.1 references that the length of streams and areas of wetlands within the study corridor were calculated using GIS. What are your sources of data within your GIS layers? We recommend using USGS 23

US ARMY CORPS OF ENGINEERS (continued)

23. Data sources vary by resource. Streams, wetlands, and floodplains within a 500-foot-wide study area centered on the DC2RVA corridor were initially identified by reviewing aerial photographs and topographic maps, Virginia Wetlands Catalog maps from the Virginia Department of Conservation and Recreation (VDCR) Division of Natural Heritage, wetlands digitized by the City of Richmond, National Hydrography Dataset (NHD) maps from the United States Geological Survey (USGS), National Wetlands Inventory (NWI) maps from the United States Fish and Wildlife Service (USFWS), Virginia Department of Transportation's (VDOT) "Comprehensive Environmental Data and Reporting System" (CEDAR) Geographic Information System (GIS) data, VDOT mitigation sites, and Flood Insurance Rate Maps (FIRM) from the Federal Emergency Management Agency (FEMA). DRPT conducted field surveys in September 2015 through September 2016 to verify the existence of potential ephemeral, intermittent, and perennial streams and wetlands within 100 feet of the existing rail on the side of the track where improvements are proposed. The field survey findings augmented and updated the NHD and NWI mapping.

In the Draft EIS, a full detailed listing of the GIS source data is included in the Alternatives Technical Report (which is Appendix A of the Draft EIS); see its Appendix B: Data Received for Washington, D.C. to Richmond Southeast High Speed Rail Project.



topographic maps as an additional tool to assist in identifying the location of streams. 23

10. Chapter 3, Section 3.19 references the acreage of tidally-affected wetlands in the DC2RVA corridor as, "very small (approximately 23.2 acres), and the tidally-affected wetlands adjacent to the railway had low overall functional values." We question this assertion; most tidal wetlands regardless of their level of distribution serve important values and functions. You should remove this statement or provide documentation of the basis for your assertion. 24

US ARMY CORPS OF ENGINEERS (continued)

(Response to comment 23 on previous page)

24. The referenced text appears on Page 3-19 of Appendix M of the Draft EIS, which is the Natural Resources Technical Memorandum; DRPT concurs, by way of this comment, that the referenced sentence regarding low overall functional values of tidally-affected wetlands should be removed. Section 5.1.2 of the Final EIS documents the impact of the Preferred Alternative on wetlands and does not include any reference to low overall functional values of any wetlands that are adjacent to the railway.

Subject: **Tier II Draft Environmental Impact Statement and Section (4)f Evaluation—DC to Richmond Southeast High Speed Rail**

Dear Mr. Winkle:

The Department of the Interior (Department) has reviewed the Draft Environmental Impact Statement (DEIS) and Section 4(f) Evaluation for the proposed improvements to rail lines between Washington D.C. and Richmond, Virginia to allow for high speed rail service. The purpose of this project is to deliver higher speed passenger rail service, increase passenger and freight rail capacity, and improve passenger rail service frequency and reliability in a corridor shared by growing volumes of passenger, commuter, and freight rail traffic, thereby providing a competitive option for travelers going between Washington, D.C. and Richmond and those traveling to and from adjacent connecting corridors. We offer the following comments on this project for your consideration.

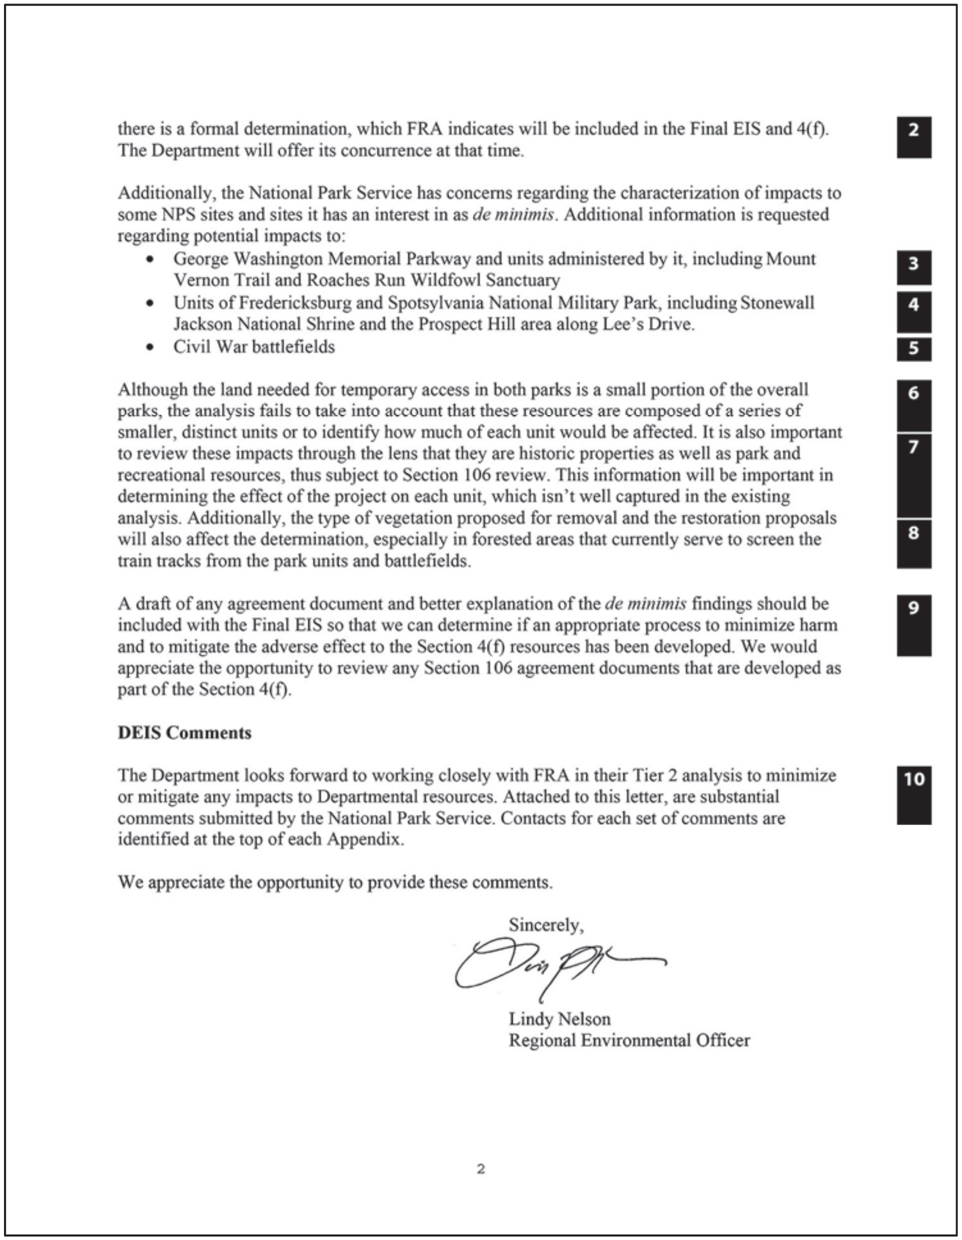
Section 4(f) Evaluation Comments

The Department appreciates your efforts to coordinate with various agencies regarding this project and the development of the Section 4(f) Evaluation. We encourage continued coordination with these agencies and tribes throughout the life of this project. DOI comments on the DEIS indicate that additional consulting parties may still need to be contacted, including the superintendents of George Washington Memorial Parkway and the Potomac Heritage National Scenic Trail. These parties and any others identified during the review of the DEIS should be asked to work with you on the development of an agreement document to determine the effect of the project on NPS units and other Section 4(f) properties, and resolve or minimize adverse effects that may be identified through the review of the DEIS and additional consultation. 1

Although the Section 4(f) Evaluation identifies numerous Section 4(f) resources that have the potential for 4(f) use, the Department of the Interior is unable to provide concurrence that there is no feasible and prudent alternative and that all measures have been taken to minimize harm until 2

DEPARTMENT OF THE INTERIOR

1. Chapter 6 of the Final EIS includes a discussion of the coordination on Section 4(f) uses that has taken place since the publication of the Draft EIS. As noted in that chapter, eight offices of the National Park Service (NPS) are consulting parties under Section 106 of the National Historic Preservation Acton for this undertaking (including both agencies that the Department referenced in the comment): American Battlefield Protection Program, Captain John Smith Chesapeake National Heritage Trail (NHT), Potomac Heritage National Scenic Trail, Washington-Rochambeau National Historic Trail, George Washington Memorial Parkway (GWMP), Fredericksburg & Spotsylvania National Military Park (FRSP), Richmond National Battlefield Park, and the National Capital Regional Office. FRA and DRPT will continue to coordinate with these agencies, and others as needed, to resolve or minimize potential use of Section 4(f) properties and on NPS units, and regarding the content of an agreement to mitigate any adverse effects/impacts, through final design, which would occur after funding becomes available.
2. Comment noted; FRA and DRPT appreciate the Department's continued cooperation on this Project.



there is a formal determination, which FRA indicates will be included in the Final EIS and 4(f). The Department will offer its concurrence at that time. 2

Additionally, the National Park Service has concerns regarding the characterization of impacts to some NPS sites and sites it has an interest in as *de minimis*. Additional information is requested regarding potential impacts to:

- George Washington Memorial Parkway and units administered by it, including Mount Vernon Trail and Roaches Run Wildfowl Sanctuary 3
- Units of Fredericksburg and Spotsylvania National Military Park, including Stonewall Jackson National Shrine and the Prospect Hill area along Lee's Drive. 4
- Civil War battlefields 5

Although the land needed for temporary access in both parks is a small portion of the overall parks, the analysis fails to take into account that these resources are composed of a series of smaller, distinct units or to identify how much of each unit would be affected. 6 It is also important to review these impacts through the lens that they are historic properties as well as park and recreational resources, thus subject to Section 106 review. This information will be important in determining the effect of the project on each unit, which isn't well captured in the existing analysis. 7 Additionally, the type of vegetation proposed for removal and the restoration proposals will also affect the determination, especially in forested areas that currently serve to screen the train tracks from the park units and battlefields. 8

A draft of any agreement document and better explanation of the *de minimis* findings should be included with the Final EIS so that we can determine if an appropriate process to minimize harm and to mitigate the adverse effect to the Section 4(f) resources has been developed. We would appreciate the opportunity to review any Section 106 agreement documents that are developed as part of the Section 4(f). 9

DEIS Comments

The Department looks forward to working closely with FRA in their Tier 2 analysis to minimize or mitigate any impacts to Departmental resources. Attached to this letter, are substantial comments submitted by the National Park Service. Contacts for each set of comments are identified at the top of each Appendix. 10

We appreciate the opportunity to provide these comments.

Sincerely,

Lindy Nelson
Regional Environmental Officer

DEPARTMENT OF THE INTERIOR (continued)

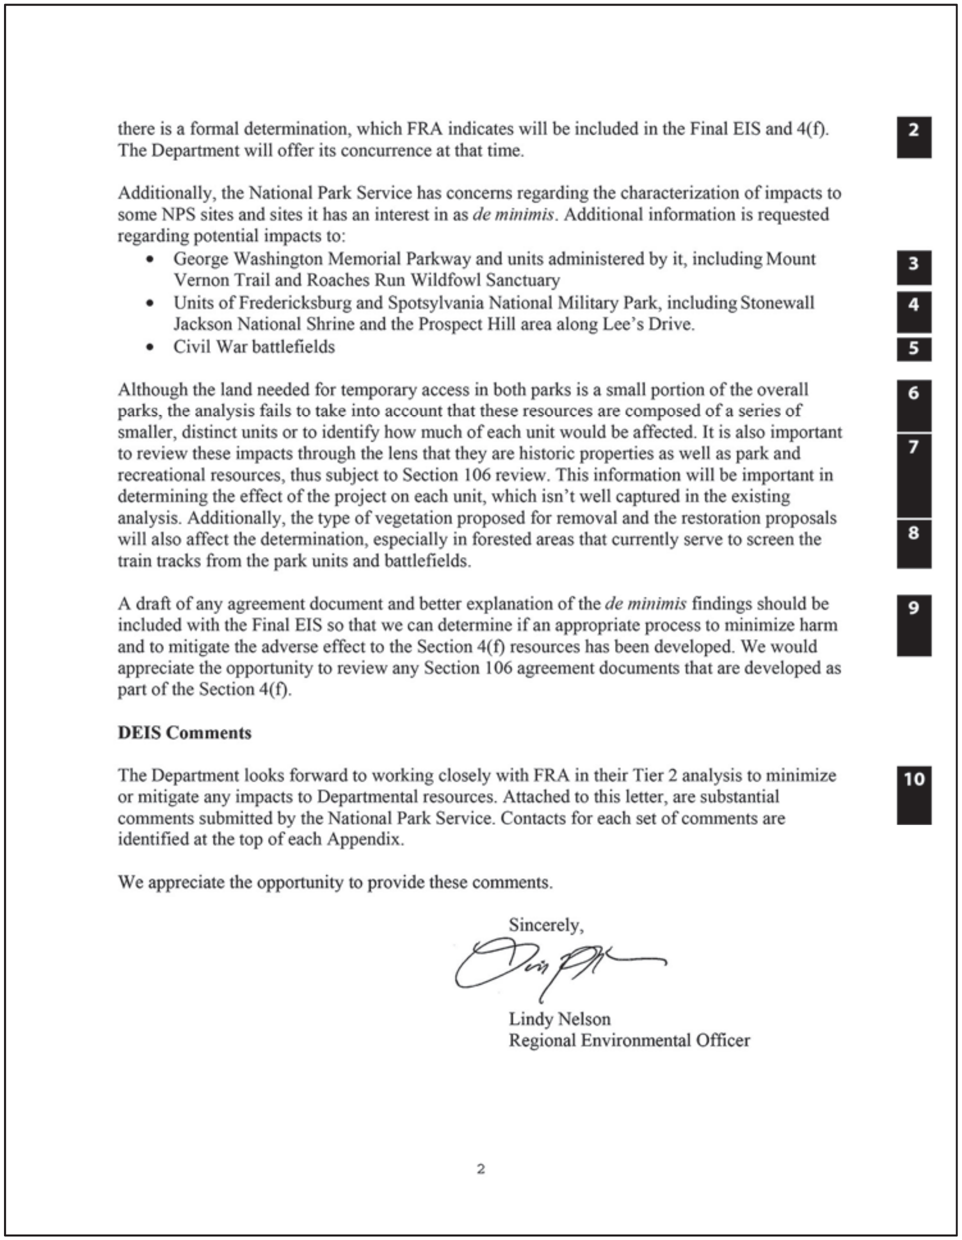
(Response to comment 2 on previous page)

3. Alternative 1B: Add Two Tracks on the West was selected as the Preferred Alternative (refer to Final EIS Section 4.3.1 for details). Park impacts from the Preferred Alternative are presented in Section 5.14 of the Final EIS, and are based on the Limits of Disturbance that have been revised since the publication of the Draft EIS. No permanent right-of-way will need to be acquired from the GWMP or the Mount Vernon Trail; there will only be temporary easements needed along these facilities. No permanent or temporary right-of-way will need to be acquired from the Roaches Run Waterfowl Sanctuary. The land adjacent to the railroad to the east in this area is owned by Arlington County.

   The Final Section 4(f) Evaluation is Chapter 6 of the Final EIS. FRA and DRPT will continue to coordinate with the NPS regarding the temporary occupancy of these Section 4(f) resources during final design, after funding becomes available and incremental improvements are scheduled. Note that temporary occupancies are excepted from the requirement for Section 4(f) approvals if they meet the conditions listed in 23 CFR 774.13(d) and would not be considered a de minimis use. It important to note that the Section 4(f) Evaluation for this Project follows FHWA and FTA procedures; while FRA is not directly subject to these rules, FRA has determined that these procedures are appropriate for use on this Project.

4. As presented in Section 5.14 of the Final EIS, no permanent right-of-way will need to be acquired from the Fredericksburg and Spotsylvania National Military Park (both the Prospect Hill area and the Stonewall Jackson National Shrine). Additionally, the Final Section 4(f) Evaluation is Chapter 6 of the Final EIS. FRA and DRPT will continue to coordinate with the NPS regarding the temporary occupancy of these Section 4(f) resources during final design, after funding becomes available and incremental improvements are scheduled. Note that temporary occupancies are excepted from the requirement for Section 4(f) approvals if they meet the conditions listed in 23 CFR 774.13(d) and would not be considered a de minimis use.

(Responses are continued on next page)



there is a formal determination, which FRA indicates will be included in the Final EIS and 4(f). The Department will offer its concurrence at that time. 2

Additionally, the National Park Service has concerns regarding the characterization of impacts to some NPS sites and sites it has an interest in as *de minimis*. Additional information is requested regarding potential impacts to:

- George Washington Memorial Parkway and units administered by it, including Mount Vernon Trail and Roaches Run Wildfowl Sanctuary 3
- Units of Fredericksburg and Spotsylvania National Military Park, including Stonewall Jackson National Shrine and the Prospect Hill area along Lee's Drive. 4
- Civil War battlefields 5

Although the land needed for temporary access in both parks is a small portion of the overall parks, the analysis fails to take into account that these resources are composed of a series of smaller, distinct units or to identify how much of each unit would be affected. 6 It is also important to review these impacts through the lens that they are historic properties as well as park and recreational resources, thus subject to Section 106 review. This information will be important in determining the effect of the project on each unit, which isn't well captured in the existing analysis. 7 Additionally, the type of vegetation proposed for removal and the restoration proposals will also affect the determination, especially in forested areas that currently serve to screen the train tracks from the park units and battlefields. 8

A draft of any agreement document and better explanation of the *de minimis* findings should be included with the Final EIS so that we can determine if an appropriate process to minimize harm and to mitigate the adverse effect to the Section 4(f) resources has been developed. We would appreciate the opportunity to review any Section 106 agreement documents that are developed as part of the Section 4(f). 9

DEIS Comments

The Department looks forward to working closely with FRA in their Tier 2 analysis to minimize or mitigate any impacts to Departmental resources. Attached to this letter, are substantial comments submitted by the National Park Service. Contacts for each set of comments are identified at the top of each Appendix. 10

We appreciate the opportunity to provide these comments.

Sincerely,

Lindy Nelson
Regional Environmental Officer

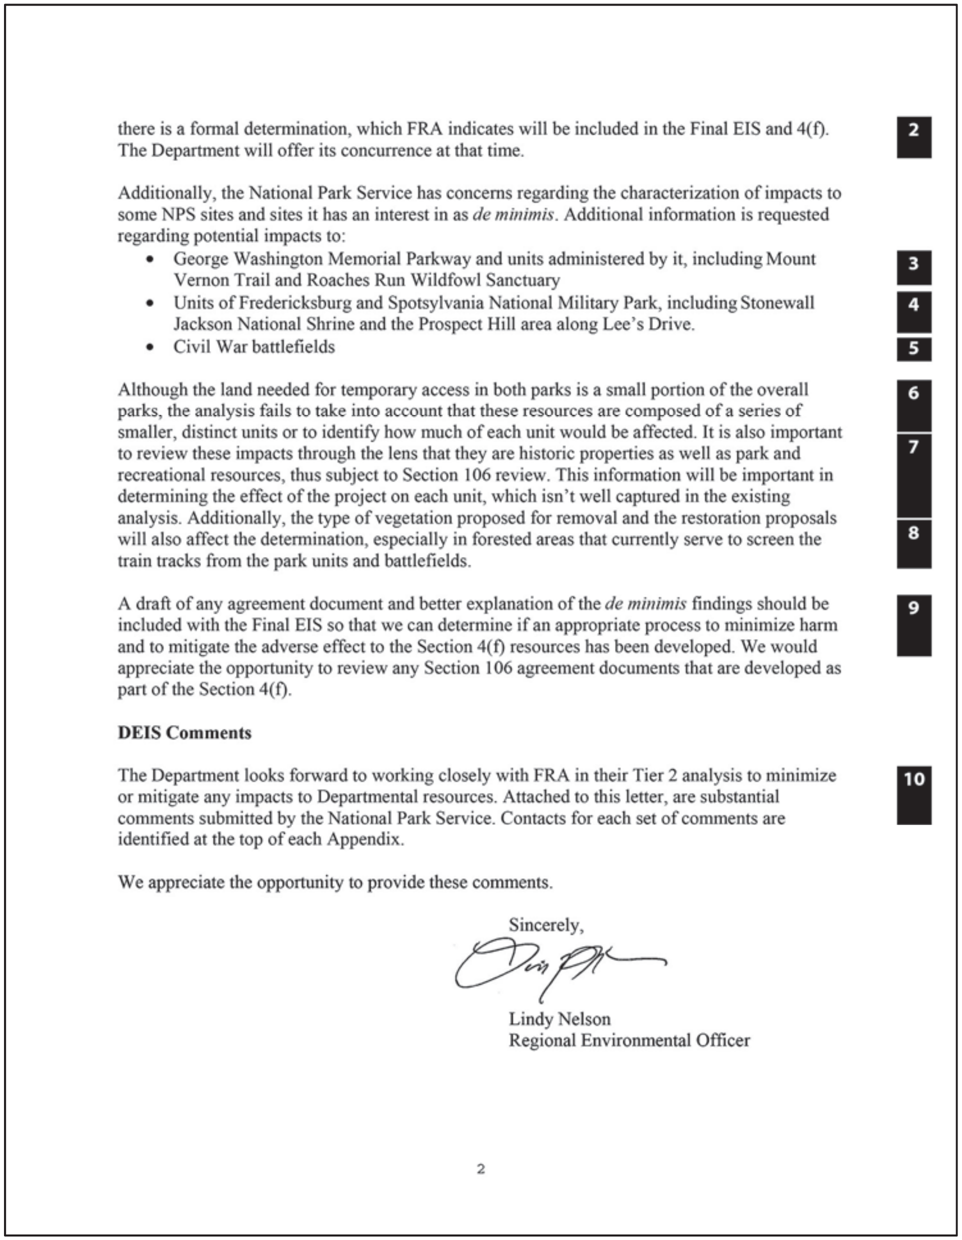
DEPARTMENT OF THE INTERIOR (continued)

5. Of the eight offices of the NPS that are consulting parties on this undertaking, three are stewards of Civil War-related resources: American Battlefield Protection Program, FRSP, and Richmond National Battlefield Park. FRA and DRPT commenced coordination with these groups in February 2015 and have continued communicating through letters, emails, telephone calls, and in-person meetings. In addition, DRPT has undertaken extensive coordination with Virginia Department of Historic Resources (DHR) since November 2014, including acquiring data on previously recorded resources (including battlefields) and conducting identification- and evaluation-level studies as needed to meet Section 106 of the National Historic Preservation Act. DRPT viewed mapping data of all historic properties, including war-related resources, and sought to avoid these properties. If avoidance was not possible, DRPT worked closely with the agencies to minimize the Project's footprint and reduce any potential impacts. This data was shared with all NPS branches and consulting parties, including dialogues with the DHR on Project effects. FRA and DRPT have been and will continue to consult with the NPS in production of the Section 106 Memorandum of Agreement (MOA) to outline stipulations to mitigate any adverse effects caused by the undertaking (the Section 106 Draft MOA is Appendix K of the Final EIS).

6. Chapter 6 of the Final EIS includes clarification to address the impacts relative to the smaller park units as well as the overall park for the referenced parks. Specifically, the two units of Fredericksburg and Spotsylvania National Military Park (Stonewall Jackson Shrine and the area near Prospect Hill; the Draft EIS already addressed Mount Vernon Trail and GWMP separately. There are no impacts to Roaches Run from the Project. Additional information on Civil War battlefields is provided in Section 5.13.3 of the Final EIS.

7. The Project is complying with Section 106 of the National Historic Preservation Act of 1966 to determine the effect of the Project on each unit; refer to Section 5.13 of the Final EIS.

(Responses are continued on next page)



there is a formal determination, which FRA indicates will be included in the Final EIS and 4(f). The Department will offer its concurrence at that time. 2

Additionally, the National Park Service has concerns regarding the characterization of impacts to some NPS sites and sites it has an interest in as *de minimis*. Additional information is requested regarding potential impacts to:

- George Washington Memorial Parkway and units administered by it, including Mount Vernon Trail and Roaches Run Wildfowl Sanctuary 3
- Units of Fredericksburg and Spotsylvania National Military Park, including Stonewall Jackson National Shrine and the Prospect Hill area along Lee's Drive. 4
- Civil War battlefields 5

Although the land needed for temporary access in both parks is a small portion of the overall parks, the analysis fails to take into account that these resources are composed of a series of smaller, distinct units or to identify how much of each unit would be affected. 6 It is also important to review these impacts through the lens that they are historic properties as well as park and recreational resources, thus subject to Section 106 review. This information will be important in determining the effect of the project on each unit, which isn't well captured in the existing analysis. 7 Additionally, the type of vegetation proposed for removal and the restoration proposals will also affect the determination, especially in forested areas that currently serve to screen the train tracks from the park units and battlefields. 8

A draft of any agreement document and better explanation of the *de minimis* findings should be included with the Final EIS so that we can determine if an appropriate process to minimize harm and to mitigate the adverse effect to the Section 4(f) resources has been developed. We would appreciate the opportunity to review any Section 106 agreement documents that are developed as part of the Section 4(f). 9

DEPARTMENT OF THE INTERIOR (continued)

8. DRPT will continue to coordinate with the Department of the Interior regarding temporary impacts during final design, after funding becomes available and incremental improvements are scheduled. At that time, types of vegetation impacted will be determined and DRPT will work with the Department to develop mutually agreeable restoration plans.

9. The Final Section 4(f) Evaluation is Chapter 6 of the Final EIS, and Appendix E presents the Section 106 and Section 4(f) coordination efforts since the beginning of the Project. FRA and DRPT have described the coordination and information in support of FRA's Section 4(f) determinations. In addition, as a Section 106 consulting party, all steps in the cultural resource compliance process are shared with the NPS, which includes determining eligibility, evaluating effect, examining ways to avoid and/or minimize impacts, and forming Section 106 Memorandum of Agreement stipulations set forth to mitigate any adverse effects/impacts on NPS-related properties (the Section 106 Draft MOA is Appendix K of the Final EIS).

10. DRPT has responded to DOI's detailed comments below.

NO.	Page/line number	NPS COMMENT	
1		General: The document seems silent on actions that would be required by NPS in order for this to move forward. For example, should this project require access permits, special use permits, land exchange from NPS, NPS would be required to make a federal decision. It is our hope that we would be able to adopt this NEPA document to make carry forward with our federal action (i.e., issuing a permit). Acknowledging those NPS decision points would help facilitate that process. Also, in general, those areas where NPS would be directly impacted needs to be called out. Lastly, the document needs to do a better job at identifying NPS administrative units as being administered by the NPS.	**A1**
2	Exec Summary	A NPS permit will also be needed for any access, staging, temporary, or permanent impacts from the project.	**A2**
3	Page 2-20	add cultural to first bullet- avoid, reduce or mitigate impacts to…	**A3**
4	Page 2-23, 2nd line (GLOBAL)	Should include impacts to "human, **cultural,** and natural resources."	**A4**
5	02-26	Purpose and Need- The "Purpose and Need" should recognize the inter-connected and multi-modal character of transportation in the 21st century and, in the Tier II DEIS, recognize ways in which rail stations associated with a potential high speed rail line would serve as trailheads for domestic and international travelers and as gateways to outdoor recreational experiences, including local and long-distance bicycling, hiking and paddling. While recognizing some impacts to parks and trails, the document fails to describe adequately mitigation opportunities, including a continuous, associated non-motorized trail network between, at minimum, Leesylvania State Park and Falmouth and the need for crossings that meet ADA guidelines.	**A5**
6	2.53	1A,1B, 1C How can you add two tracks either southwest, or east of the GWMP, when the current alignment and drawings show the tracks intersecting the GWMP at a perpendicular angle? Confusing. Is there any encroachment onto the parkway? This needs to be made clear. Should NPS need to adopt this document in order to either provide easements or special use permits, information like this needs to be made clear.	**A6**
7	Page 2-54, Figure	The figure doesn't accurately show National Park Service property around Roaches Run. In addition, all three figures appear to show adding one new track to the east at the southern end of Roaches Run, but it is unclear how far that extends. This would all be adjacent to the NPS-George Washington Memorial Parkway, a National Register listed property. Please clarify the graphics.	**A7**
8	Page 2-55, Table 2.56	States in Table 2.56 it will "generally" exist within the ROW….where does it not? It is not clear if the Arlington to Alexandria segment will all be within the ROW as described in Table 2.57 (page 2-56) .	**A8**

DEPARTMENT OF THE INTERIOR (continued)

Appendix A to DOI Letter – Comments from National Park Service:

A1. Section 3.14 of the Draft EIS identifies lands owned and administered by NPS that are within the Build Alternative limits of disturbance, including the GWMP, the Roaches Run Waterfowl Sanctuary (which is part of the GWMP property), Mount Vernon Trail, and Fredericksburg and Spotsylvania National Military Park. As noted in Final EIS Section 5.14.1, only temporary impacts during construction are expected for the GWMP, Mount Vernon Trail, and the Fredericksburg and Spotsylvania National Military Park. As noted in Chapter 6 of the Final EIS, the Preferred Alternative would have no permanent or temporary impacts to Roaches Run Waterfowl Sanctuary.

DRPT will continue to coordinate with the NPS during the final design and construction phases of the Project to further avoid and minimize the temporary impacts to NPS lands. Should temporary impacts be unavoidable, DRPT will apply to NPS for temporary construction access permits and/or special use permits.

These actions have been addressed in a manner consistent with NPS's Director's Order 12 - Conservation Planning, Environmental Impact Analysis, and Decision-Making and should allow NPS to adopt this NEPA document to carry forward with the agency's federal action (i.e., issuing a permit).

A2. As noted above, FRA and DRPT do not anticipate any permanent impacts to NPS lands. DRPT will continue to coordinate with the NPS during final design and construction to avoid the indicated temporary impacts. Should such temporary impacts be unavoidable, DRPT will ask NPS for temporary construction access permits, as required, at that time.

TO DEPARTMENT OF THE INTERIOR (continued)

DRPT will continue to coordinate with NPS during final design (after funding becomes available and incremental improvements are scheduled) to provide the information needed to apply for permits from NPS for temporary construction impacts to GWMP and Fredericksburg and Spotsylvania National Military Park.

A3. The requested text clarification is addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS

A4. The requested text clarifications are addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

A5. The DC2RVA Project Purpose and Need recognizes the multimodal transportation network within which intercity passenger rail operates. Intercity passenger rail carries passengers long distances between cities, towns, and other populated urban or suburban areas, with one or two stations in or near the city center, as compared to commuter rail which carries passengers shorter distances to and from city center with more frequent stops. In keeping with the history of rail development along this corridor, most of the current stations providing intercity passenger rail service are located in or near their respective downtowns, or in nearby suburban locations. Business and leisure travelers using the stations rely on local transportation options, including light rail, bus, car, bicycle, or foot, to move between the station and their respective origin/destination points, including outdoor recreation venues. While these factors played a key role in the recommendation for a downtown Richmond station location, the physical improvements recommended by the Project are limited to rail access and rail service frequency to stations, and do not extend to improvements to other modes of transportation. Refer to Chapter 7 of the Final EIS for details about the Corridor Service Development Plan, which is being developed as part of this Project and includes a station analysis that assesses each intercity passenger rail station's capacity (i.e., parking, roadway, intermodal connection, and ADA accessibility) to meet the needs of the intercity passenger rail service.

DEPARTMENT OF THE INTERIOR (continued)

If a Preferred Alternative alignment impacts (i.e., crosses) an existing pedestrian and/or bicycle crossing, that crossing will be designed to current safety standards and in compliance with Americans with Disabilities Act (ADA) as part of this Project. FRA considered the addition of a greenway, but determined such a bicycle/walking path was not part of the Project's Purpose and Need as it does not support or enhance passenger rail service, nor does it provide a reasonable transportation choice for intercity corridor travel. The decision to establish a new bicycle and pedestrian greenway is a separate and distinct action from establishing high speed passenger rail service under the National Environmental Policy Act (NEPA) and is not part of the Purpose and Need of this Project. The addition of a greenway along the corridor from Leesylvania State Park to Falmouth is outside the Project Purpose and Need, and would be ineligible for FRA funding as part of the DC2RVA Project.

A6. DRPT recognizes that the DC2RVA corridor in Northern Virginia must include a smooth transition to the proposed new Long Bridge. Construction of a new railroad bridge over the GWMP is under consideration as part of the separate Long Bridge project, and any related temporary or permanent impacts would be part of that project and not part of the DC2RVA Project.

In the Draft EIS, to avoid unnecessarily constraining the possible alternatives of the separate Long Bridge project, FRA and DRPT identified and evaluated three possible configurations for the one-mile section of the DC2RVA corridor in Arlington. Subsequently, Alternative 1B: Add Two Tracks on the West was selected as the Preferred Alternative for the DC2RVA Project to align with the two alternatives that were recommended in the Long Bridge Alternatives Report (refer to Final EIS Section 4.3.1 for details). Preferred Alternative 1B will add two tracks on the west side (upstream) of the existing two tracks, beginning south of the GWMP. The proposed tracks will diverge from the existing tracks south of the existing railroad bridge over GWMP.

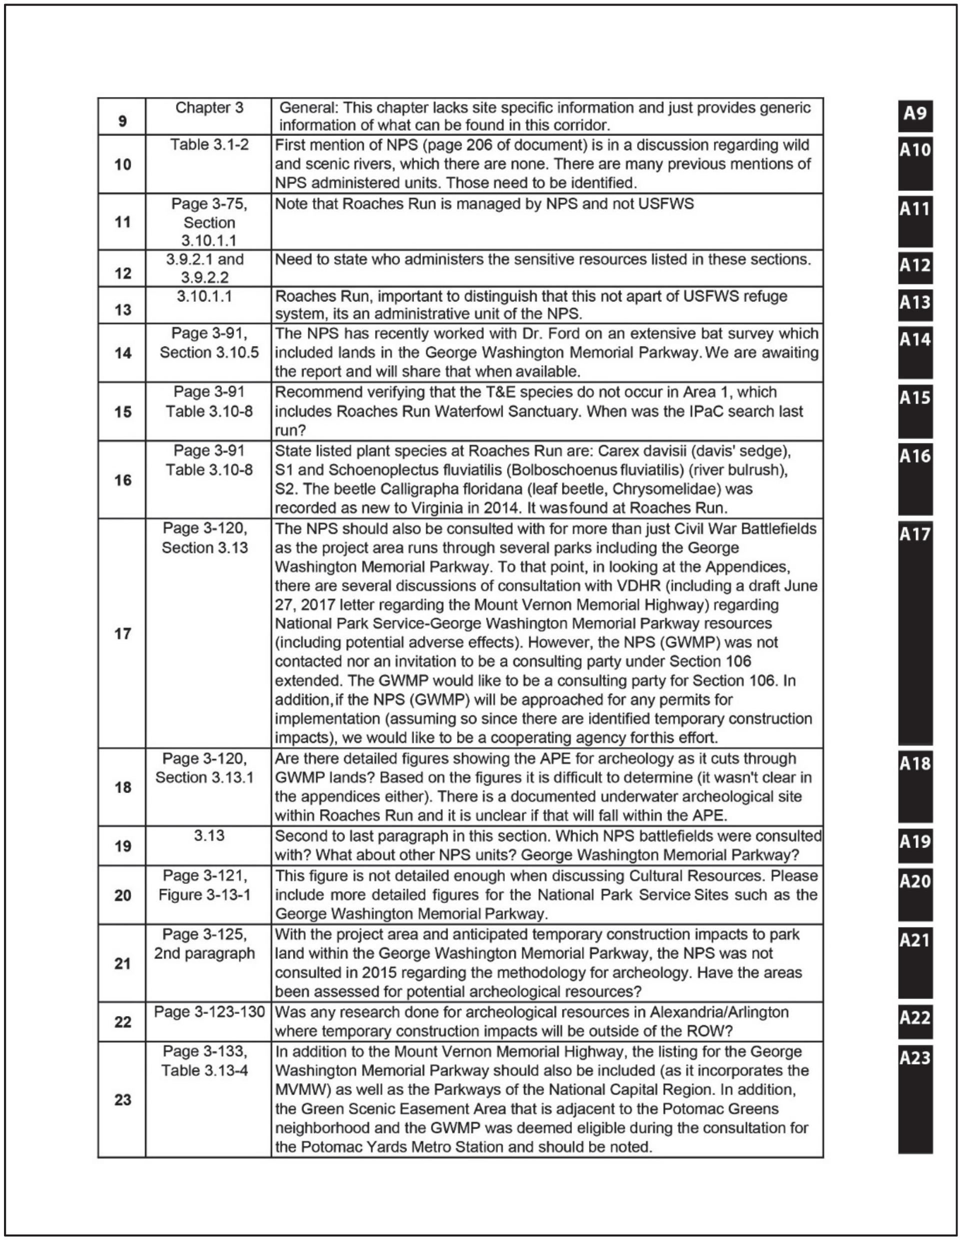
8	Page 2-55, Table 2.56	States in Table 2.56 it will "generally" exist within the ROW….where does it not? It is not clear if the Arlington to Alexandria segment will all be within the ROW as described in Table 2.57 (page 2-56) .	A8

DEPARTMENT OF THE INTERIOR (continued)

The permanent and temporary Limits of Disturbance (LOD) for the Preferred Alternative, which includes construction staging and activities along the DC2RVA corridor, do not encroach onto the railroad bridge over the GWMP. Clarifying text stating this was added in Section 4.3.1 of the Final EIS.

A7. The intent of the chapter figure schematics in the Draft EIS, including the referenced Draft EIS Figure 2.5-1, was to give a general overview of proposed improvements, with base mapping pulled from an ESRI service. Property lines are shown in the full mapbooks of the Preferred Alternative, which is Appendix L of the Final EIS. DRPT has ensured that the text in Chapter 4 of the Final EIS refers the reader to Appendix L for full details. Refer to DRPT-numbered statement #3 for response to NPS boundaries at Roaches Run and Long Bridge Park.

A8. Locations where the proposed improvements extend beyond the right-of-way are identified in the detailed mapbook graphics of the Preferred Alternative, which is Appendix L of the Final EIS. Improvements that are located outside of the existing CSXT right-of-way are identified as permanent or temporary limits of disturbance (refer to the opening paragraphs of Chapter 5 of the Final EIS for full definitions). Chapter 4 of the Final EIS provides additional detail on the limits of the Preferred Alternative, including between Arlington to Alexandria. Designs in support of the Draft and Final EIS are at the conceptual level, approximately a 10% level of design, and would be further refined during final design, after funding becomes available and incremental improvements are scheduled.



9	Chapter 3	General: This chapter lacks site specific information and just provides generic information of what can be found in this corridor.	A9
10	Table 3.1-2	First mention of NPS (page 206 of document) is in a discussion regarding wild and scenic rivers, which there are none. There are many previous mentions of NPS administered units. Those need to be identified.	A10
11	Page 3-75, Section 3.10.1.1	Note that Roaches Run is managed by NPS and not USFWS	A11
12	3.9.2.1 and 3.9.2.2	Need to state who administers the sensitive resources listed in these sections.	A12
13	3.10.1.1	Roaches Run, important to distinguish that this not apart of USFWS refuge system, its an administrative unit of the NPS.	A13
14	Page 3-91, Section 3.10.5	The NPS has recently worked with Dr. Ford on an extensive bat survey which included lands in the George Washington Memorial Parkway. We are awaiting the report and will share that when available.	A14
15	Page 3-91 Table 3.10-8	Recommend verifying that the T&E species do not occur in Area 1, which includes Roaches Run Waterfowl Sanctuary. When was the IPaC search last run?	A15
16	Page 3-91 Table 3.10-8	State listed plant species at Roaches Run are: Carex davisii (davis' sedge), S1 and Schoenoplectus fluviatilis (Bolboschoenus fluviatilis) (river bulrush), S2. The beetle Calligrapha floridana (leaf beetle, Chrysomelidae) was recorded as new to Virginia in 2014. It was found at Roaches Run.	A16
17	Page 3-120, Section 3.13	The NPS should also be consulted with for more than just Civil War Battlefields as the project area runs through several parks including the George Washington Memorial Parkway. To that point, in looking at the Appendices, there are several discussions of consultation with VDHR (including a draft June 27, 2017 letter regarding the Mount Vernon Memorial Highway) regarding National Park Service-George Washington Memorial Parkway resources (including potential adverse effects). However, the NPS (GWMP) was not contacted nor an invitation to be a consulting party under Section 106 extended. The GWMP would like to be a consulting party for Section 106. In addition, if the NPS (GWMP) will be approached for any permits for implementation (assuming so since there are identified temporary construction impacts), we would like to be a cooperating agency for this effort.	A17
18	Page 3-120, Section 3.13.1	Are there detailed figures showing the APE for archeology as it cuts through GWMP lands? Based on the figures it is difficult to determine (it wasn't clear in the appendices either). There is a documented underwater archeological site within Roaches Run and it is unclear if that will fall within the APE.	A18
19	3.13	Second to last paragraph in this section. Which NPS battlefields were consulted with? What about other NPS units? George Washington Memorial Parkway?	A19
20	Page 3-121, Figure 3-13-1	This figure is not detailed enough when discussing Cultural Resources. Please include more detailed figures for the National Park Service Sites such as the George Washington Memorial Parkway.	A20
21	Page 3-125, 2nd paragraph	With the project area and anticipated temporary construction impacts to park land within the George Washington Memorial Parkway, the NPS was not consulted in 2015 regarding the methodology for archeology. Have the areas been assessed for potential archeological resources?	A21
22	Page 3-123-130	Was any research done for archeological resources in Alexandria/Arlington where temporary construction impacts will be outside of the ROW?	A22
23	Page 3-133, Table 3.13-4	In addition to the Mount Vernon Memorial Highway, the listing for the George Washington Memorial Parkway should also be included (as it incorporates the MVMW) as well as the Parkways of the National Capital Region. In addition, the Green Scenic Easement Area that is adjacent to the Potomac Greens neighborhood and the GWMP was deemed eligible during the consultation for the Potomac Yards Metro Station and should be noted.	A23

DEPARTMENT OF THE INTERIOR (continued)

A9. Due to the length of the DC2RVA corridor (123 miles), some site-specific information was provided in the technical report appendices of the Draft EIS. This was done to enhance readability and maintain the Draft EIS chapter at a reasonable length and level of detail for decisions to be made. The Draft EIS technical reports covered natural resources (Appendix M of the Draft EIS), community resources (Appendix Q of the Draft EIS), cultural resources (Appendix R of the Draft EIS), transportation (Appendix S of the Draft EIS), and noise and vibration (Appendix P of the Draft EIS). The Draft EIS environmental resource mapping has been updated, as needed, for the Final EIS; refer to Appendix M.

A10. The requested text clarifications are addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

A11. The requested text clarification is addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

A12. The requested text clarification is addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

A13. The requested text clarification is addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

A14. Comment noted.

A15. Information regarding federally listed threatened and endangered species that may be impacted by the Project was obtained from USFWS via the Information, Planning, and Conservation (IPaC) system, and included in Draft EIS Section 4.10.3; updated IPAC information was obtained in February 2018 for the Preferred Alternative and is presented in Section 5.10.3 of the Final EIS. The IPaC query will also be rerun prior to construction, and coordination with USFWS and NMFS pursuant to Section 7 of the Endangered Species Act for potential impacts to federally listed species will be conducted, where required.

(Responses are continued on next page)

In addition, the Green Scenic Easement Area that is adjacent to the Potomac Greens neighborhood and the GWMP was deemed eligible during the consultation for the Potomac Yards Metro Station and should be noted.	A23

DEPARTMENT OF THE INTERIOR (continued)

A16. The species listed in the comment are considered "sensitive" by the state, but are not legally designated as "threatened" or "endangered". Notwithstanding, DRPT will coordinate with resource agencies to avoid or minimize impacts to all species, including sensitive species, during final design and permitting (after funding becomes available and incremental improvements are scheduled).

A17. Both the GWMP and NCRO are consulting parties under Section 106 of the National Historic Preservation Acton for this undertaking and as such, have been included in ongoing dialogues regarding historic properties and Project effects, including attendance at meetings and telephone and email dialogues regarding technical studies, resource eligibility, Project effect, and providing feedback on mitigation to adverse effects. Refer to Appendix E of the Final EIS for updated Section 106 and Section 4(f) comments and coordination.

A18. Seventeen technical reports with detailed maps on the APE were submitted to the consulting parties in the summer of 2017 for review and comment. An additional five reports were submitted to consulting parties in May 2018 for review and comment; the five technical reports completed in 2018 (after the publication of the Draft EIS) can be found in Appendix D. All 22 reports are available via the Project website and upon request. DRPT has also made GIS data available to consulting parties showing the limits of the APE and boundaries of recorded resources at their request.

A19. Please refer to DRPT-numbered statement #1 in DOI's main letter, which lists eight offices of the NPS that are consulting parties on this Project (including the GWMP) and have been contacted via email, telephone, letters, and in-person meetings regarding the Project and ongoing studies.

In addition, the Green Scenic Easement Area that is adjacent to the Potomac Greens neighborhood and the GWMP was deemed eligible during the consultation for the Potomac Yards Metro Station and should be noted.	A23

DEPARTMENT OF THE INTERIOR (continued)

A20. Detailed maps showing above-ground resources are presented in the technical reports (see Appendix R of the Draft EIS for the original 17 reports submitted for NPS review in 2017 and Appendix D of the Final EIS for the follow-up five reports submitted to the NPS for review in 2018) and in separate information sent to the eight NPS consulting parties. This information was disseminated through the reports, in emails, and in-person meetings; refer to Appendix E of the Final EIS for updated Section 106 and Section 4(f) comments and coordination. Archaeological data was also given to the eight NPS consulting parties.

A21. Yes. An archaeological Phase IA reconnaissance and predictive model was sent to the consulting parties, which includes eight offices of NPS, for their review and comment [note that the GWMP was included as a consulting party in July 2017 and has since received copies of all technical studies and documentation to date]. Additional archaeological studies were performed on areas that have since been added to the limits of disturbance; these areas were the subject of study in the winter and spring of 2017 and 2018. The ensuing technical report was submitted to the eight offices of the NPS for their review in May 2018 and are included in Chapter 5 and Appendix D of the Final EIS. The archaeological methodology used in all reports was approved by the DHR and meets all state standards for archaeological survey. All reports were submitted to the DHR for review and concurrence.

A22. Yes. The archaeological APE includes both permanent and temporary limits of disturbance. Previous studies included the limits of disturbance as determined as of August 2016. More recent archaeological surveys since publication of the Draft EIS include additional areas, which have been refined since the original study; refer to Section 5.13 of the Final EIS. The methodology meets DHR standards and adheres to the Project predictive model, as reviewed and approved in 2015.

A23

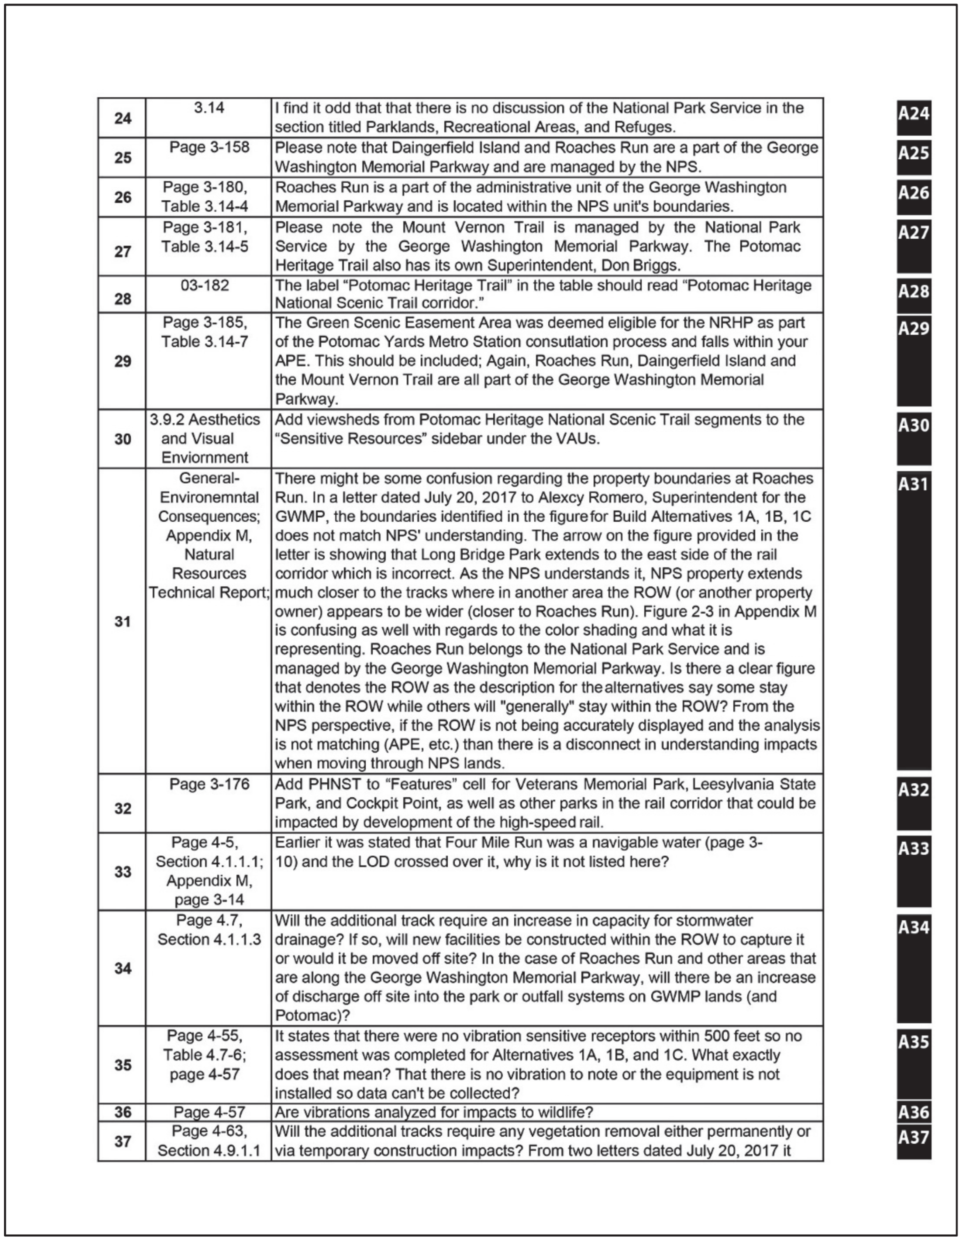
DEPARTMENT OF THE INTERIOR (continued)

A23. The limits of the GWMP as a historic property as presented in the Draft EIS and associated technical reports reflect the limits on file at the DHR at the time the documents were prepared. DRPT has confirmed the boundaries, including the aforementioned aspects, and updated boundaries, as required, are reflected in the analyses of the Preferred Alternative in Section 5.13 of the Final EIS.



24	3.14	I find it odd that that there is no discussion of the National Park Service in the section titled Parklands, Recreational Areas, and Refuges.	A24
25	Page 3-158	Please note that Daingerfield Island and Roaches Run are a part of the George Washington Memorial Parkway and are managed by the NPS.	A25
26	Page 3-180, Table 3.14-4	Roaches Run is a part of the administrative unit of the George Washington Memorial Parkway and is located within the NPS unit's boundaries.	A26
27	Page 3-181, Table 3.14-5	Please note the Mount Vernon Trail is managed by the National Park Service by the George Washington Memorial Parkway. The Potomac Heritage Trail also has its own Superintendent, Don Briggs.	A27
28	03-182	The label "Potomac Heritage Trail" in the table should read "Potomac Heritage National Scenic Trail corridor."	A28
29	Page 3-185, Table 3.14-7	The Green Scenic Easement Area was deemed eligible for the NRHP as part of the Potomac Yards Metro Station consultation process and falls within your APE. This should be included; Again, Roaches Run, Daingerfield Island and the Mount Vernon Trail are all part of the George Washington Memorial Parkway.	A29
30	3.9.2 Aesthetics and Visual Enviornment	Add viewsheds from Potomac Heritage National Scenic Trail segments to the "Sensitive Resources" sidebar under the VAUs.	A30
31	General- Environemntal Consequences; Appendix M, Natural Resources Technical Report;	There might be some confusion regarding the property boundaries at Roaches Run. In a letter dated July 20, 2017 to Alexcy Romero, Superintendent for the GWMP, the boundaries identified in the figure for Build Alternatives 1A, 1B, 1C does not match NPS' understanding. The arrow on the figure provided in the letter is showing that Long Bridge Park extends to the east side of the rail corridor which is incorrect. As the NPS understands it, NPS property extends much closer to the tracks where in another area the ROW (or another property owner) appears to be wider (closer to Roaches Run). Figure 2-3 in Appendix M is confusing as well with regards to the color shading and what it is representing. Roaches Run belongs to the National Park Service and is managed by the George Washington Memorial Parkway. Is there a clear figure that denotes the ROW as the description for the alternatives say some stay within the ROW while others will "generally" stay within the ROW? From the NPS perspective, if the ROW is not being accurately displayed and the analysis is not matching (APE, etc.) than there is a disconnect in understanding impacts when moving through NPS lands.	A31
32	Page 3-176	Add PHNST to "Features" cell for Veterans Memorial Park, Leesylvania State Park, and Cockpit Point, as well as other parks in the rail corridor that could be impacted by development of the high-speed rail.	A32
33	Page 4-5, Section 4.1.1.1; Appendix M, page 3-14	Earlier it was stated that Four Mile Run was a navigable water (page 3-10) and the LOD crossed over it, why is it not listed here?	A33
34	Page 4.7, Section 4.1.1.3	Will the additional track require an increase in capacity for stormwater drainage? If so, will new facilities be constructed within the ROW to capture it or would it be moved off site? In the case of Roaches Run and other areas that are along the George Washington Memorial Parkway, will there be an increase of discharge off site into the park or outfall systems on GWMP lands (and Potomac)?	A34
35	Page 4-55, Table 4.7-6; page 4-57	It states that there were no vibration sensitive receptors within 500 feet so no assessment was completed for Alternatives 1A, 1B, and 1C. What exactly does that mean? That there is no vibration to note or the equipment is not installed so data can't be collected?	A35
36	Page 4-57	Are vibrations analyzed for impacts to wildlife?	A36
37	Page 4-63, Section 4.9.1.1	Will the additional tracks require any vegetation removal either permanently or via temporary construction impacts? From two letters dated July 20, 2017 it	A37

DEPARTMENT OF THE INTERIOR (continued)

A24. Section 3.14 of the Draft EIS discussed the existing recreational, parkland and trail resources within the study area (500 feet to either side of the existing rail line). Specifically, Section 3.14.1 discussed the federally-owned parklands and referenced the GWMP and Fredericksburg and Spotsylvania National Military Park as owned by NPS. Section 3.14.4 discussed Wildlife Refuges and referenced Roaches Run Waterfowl Sanctuary as owned by NPS. Clarification has also been added stating that Daingerfield Island Park is owned by NPS and is included in the errata table for the Draft EIS which is Appendix A of the Final EIS.

A25. The requested text clarification is addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

A26. The requested text clarification is addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

A27. Comment noted.

A28. The requested text clarification is addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS

A29. Refer to DRPT-numbered statement #23 for response.

A30. Viewsheds from the Potomac Heritage National Scenic Trail have been clarified as sensitive visual resources, where applicable refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

(Responses are continued on next page)

Roaches Run belongs to the National Park Service and is managed by the George Washington Memorial Parkway. Is there a clear figure that denotes the ROW as the description for the alternatives say some stay within the ROW while others will "generally" stay within the ROW? From the NPS perspective, if the ROW is not being accurately displayed and the analysis is not matching (APE, etc.) than there is a disconnect in understanding impacts when moving through NPS lands.	A31
32	Page 3-176	Add PHNST to “Features” cell for Veterans Memorial Park, Leesylvania State Park, and Cockpit Point, as well as other parks in the rail corridor that could be impacted by development of the high-speed rail.	A32
33	Page 4-5, Section 4.1.1.1; Appendix M, page 3-14	Earlier it was stated that Four Mile Run was a navigable water (page 3-10) and the LOD crossed over it, why is it not listed here?	A33
34	Page 4.7, Section 4.1.1.3	Will the additional track require an increase in capacity for stormwater drainage? If so, will new facilities be constructed within the ROW to capture it or would it be moved off site? In the case of Roaches Run and other areas that are along the George Washington Memorial Parkway, will there be an increase of discharge off site into the park or outfall systems on GWMP lands (and Potomac)?	A34
35	Page 4-55, Table 4.7-6; page 4-57	It states that there were no vibration sensitive receptors within 500 feet so no assessment was completed for Alternatives 1A, 1B, and 1C. What exactly does that mean? That there is no vibration to note or the equipment is not installed so data can't be collected?	A35
36	Page 4-57	Are vibrations analyzed for impacts to wildlife?	A36
37	Page 4-63, Section 4.9.1.1	Will the additional tracks require any vegetation removal either permanently or via temporary construction impacts? From two letters dated July 20, 2017 it	A37

DEPARTMENT OF THE INTERIOR (continued)

A31. Arlington County owns a long narrow parcel of land that is located to the east of the rail corridor that, per the County’s Long Bridge Park Master Plan, is part of Long Bridge Park. The figure that is referenced in the comment includes the portion of Long Bridge Park that is located to the east of the Project, and is consistent with the information presented in the Draft and Final EIS. Alternative 1B has been selected as the Preferred Alternative (refer to Final EIS Section 4.1.3 for details). The Preferred Alternative does not have temporary or permanent right of way impacts to Roaches Run Waterfowl Sanctuary. DRPT will continue to coordinate with the NPS during final design (after funding becomes available and incremental improvements are scheduled) to ensure that boundaries and assessments of lands impacted are accurate.

A32. The requested clarifications to the features cells of the appropriate parks within the tables in Section 3.14 of the Draft EIS are addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

A33. Clarification to indicate that Four Mile Run is a navigable waterway is addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS. All references to Four Mile Run in the Final EIS indicate that it is a navigable waterway.

A34. The additional track will require only a small increase in stormwater drainage capacity as much of the rail bed is permeable to rainfall; rail ballast is considered a pervious cover since it does not significantly impede or prevent infiltration into the soil. The location of stormwater management facilities for portions of the Project within or adjacent to the GWMP will be determined during final design (after funding becomes available and incremental improvements are scheduled) in coordination with the NPS.

DEPARTMENT OF THE INTERIOR (continued)

A35. Alternative 1B has been selected as the Preferred Alternative (refer to Final EIS Section 4.1.3 for details). None of the land uses within 500 feet of Alternative 1B (or dismissed Alternatives 1A or 1C), as evaluated in the Draft and Final EIS using FRA's required methodology, are sensitive to vibration. Therefore, potential vibration associated with the proposed intercity passenger trains was not evaluated for those segments.

A36. DRPT conducted vibration analyses based on the FRA General Vibration Assessment method, which does not include an evaluation of wildlife response to vibration. Many of the Build Alternatives as evaluated in the Draft EIS follow existing rail alignments. As shown in Table 4.7-2 of the Draft EIS, the Sound Exposure Level (SEL) for passenger trains traveling at 90 mph does not meet or exceed the screening threshold of 100 SEL for effects on animal behavior within distances of 50 feet or greater from the track. The SEL for freight train railcars and for locomotive horns range from 108 to 110 SEL within 50 feet of the track. Projected noise impacts were found to be highest along the Fredericksburg and Ashland Bypass alternatives due to the addition of freight train noise in areas that do not currently have trains under existing conditions; however, FRA and DRPT are not recommending any of the bypass alternatives as part of the Preferred Alternative. Animals are expected to respond to the noise impacts by avoiding establishment of nests, dens, or territories within the areas immediately adjacent to the tracks where noise impacts occur; however, wildlife in the Project area would already be acclimated to the existing rail traffic in the vicinity of the existing rail corridor.

Potential impacts of construction noise on wildlife known to be sensitive to noise, including migratory birds and bald eagles, are discussed in Final EIS Sections 5.10.2.1 and 5.10.3.1, respectively.

DEPARTMENT OF THE INTERIOR (continued)

A37. Construction of the Project will require vegetation removal in some areas of the existing right-of-way and in temporary easements outside of the existing right-of-way. DRPT will restore vegetation removed during construction in temporary easements outside of the existing right-of-way to the extent practicable.

A sufficient forested buffer will remain such that DRPT anticipates views from the GWMP will remain relatively unchanged. The low visual ratings for VAU's 1-1 and 2-1, as documented in Section 4.9.1 of the Draft EIS and Section 5.9.1 of the Final EIS, takes into account the overall views of the tracks through these sections from the surrounding areas. Given that the area is already urbanized and a single track is being added adjacent to existing tracks, DRPT determined that the low visual impact rating is appropriate.

		appears that there would be vegetation clearing needed by Roaches Run (Alternatives 1A, 1B, and 1C) and the George Washington Memorial Parkway, as well as VAU 2-1 (Alternative 2A). Will this be needed throughout the corridor for this section? This could be more than low visual impact when moving through NPS lands especially where the rail line is very close to the parkway. Please clarify.	A37
38	Page 4-68, Section 4.10.1	This project moves through lands managed by the NPS-George Washington Memorial Parkway and from our understanding will impact vegetation. Although it is "already altered by local activities" on the current rail side, the other side is within the boundaries of a National Park. Depending on the cumulative impact of the vegetation as a result of Alternatives 1A, 1B, or 1C, and 2A, there could be more impacts than is being suggested here. For example, there are a couple of state listed plant species at Roaches Run, Davis' sedge (*Carex davisii*) *and River bulrush (* Schoenoplectus fluviatilis*)*. Will these be disturbed?	A38
39	Page 4-73, Section 4.10.1.2	Please note, removal of vegetation on NPS lands will not necessarily just require "seeding" as a restoration approach.	A39
40	Page 4-83	Please see earlier comments regarding recent study on NPS lands regarding bats.	A40
41	Page 4-130 - 4-155; Appendix	Please note earlier comments regarding cultural resources on NPS- GWMP lands. There are resources missing and it is unclear if the extent of the APE for archeology would include resources that have been identified but are not included.	A41
42	Page 4-133	seems to be missing the visual for Areas 1 & 2, Table 4.13-1 starts with Area 3	A42
43	Page 4-157, Table 4.14-1	In a July 20, 2017 letter to the Superintendent of the GWMP, several areas of temporary impacts were shown at Roaches Run under 1A. Is that accounted for here?	A43
44	Page 4-180	typo- second bullet, DRPT	A44
45	Page 4-199	Effects on Bicycle and Pedestrian Connectivity: Project development and design for the project should include facilities for bicyclists and pedestrians to travel safely between rail stations.	A45
46	Page 4-212-4-226	There is no explanation of the construction impacts associated with the removal of vegetation to the cultural landscape (and views) of the George Washington Memorial Parkway and Mount Vernon Memorial Highway. The removal of vegetation (how many trees?, etc.) is an impact. The removal of these areas of screening, how extensive will it be? Where is this information?	A46
47	Chapter 5	Chapter 5 Comments: Draft 4(f) state that the project would only have de minimis impacts on GWMP. Few things to that need to be reconsidered 1) GWMP is not listed as a historic resource, 2) The draft 4(f) needs to provide better rationale as to why clearing an acre of trees (referred to as vacant forest) would be de minimis. 4(f) states that the area would be restored afterwards; but takes 50 years to restore a 50 year old tree. Also, the draft 4(f) tries to minimize this tree impact by saying that the acre of trees accounts for just 0.1 percent of the total forested area. But the question is, what do these trees do? Are they habitat for Northern Long-Eared Bats? Do they protect the viewshed of the GWMP? 3) There seems to be confusion with regards to the ownership of Roaches Run, it is not a wildlife refuge, as it is shown in the maps. 4) Impacts to the Mount Vernon Trail are not clear (How would connectivity be maintained? What are they accessing? What's the duration?). 5) There is no 'Least Overall Harm' analysis, but does provide recommended preferred alternative for 4 sections.	A47
48	Page 5-1	The same issues commented on earlier are carried over here as it relates to Section 4 (f) and the NPS lands for the George Washington Memorial Parkway (including Roaches Run). Please address.	A48

DEPARTMENT OF THE INTERIOR (continued)

(Response to comment A37 on previous page)

A38. Davis' sedge and river bulrush are not listed as "threatened" or "endangered" and are therefore not included in the analysis of threatened and endangered species in Final EIS Section 5.10.3. There is potential for the Project to impact these plant species where wetland impacts will occur. DRPT will coordinate with resource agencies to avoid or minimize impacts to all species, including sensitive species, during final design and permitting (after funding becomes available and incremental improvements are scheduled). Avoidance, minimization, and mitigation measures identified for wetlands in Final Section 5.1.6.1 and natural communities in Section 5.10.1.4, including minor alignment shifts, minimizing clearing and grubbing, and revegetation of disturbed areas using native plants in coordination with the resource agencies, will minimize impacts on sensitive plant species.

A39. Comment noted. DRPT will develop specific mitigation measures for impacts to sensitive habitats in coordination with the resource agencies during the permitting process after construction funding has been identified.

A40. Comment noted. Refer to DRPT-numbered statement #14.

A41. Comment noted. Refer to DRPT-numbered statements #17 through #23.

A42. In the Final EIS, a note has been added to any resource table that does not include all six alternative areas, to indicate that only the areas with impacts and/or resources are included, and to specifically state which areas do not have any impacts and/or resources (and are therefore not listed in the tables). In regard to the referenced Draft EIS Table 4.13-1, there are no adverse effects in Alternative Areas 1 and 2, and a lack of adverse effects results in "0"s in the table for these areas.

(Responses are continued on next page)

		appears that there would be vegetation clearing needed by Roaches Run (Alternatives 1A, 1B, and 1C) and the George Washington Memorial Parkway, as well as VAU 2-1 (Alternative 2A). DEPARTMENT OF THE INTERIOR (continued)

A43. Alternative 1B has been selected as the Preferred Alternative (refer to Final EIS Section 4.1.3 for details). The temporary impacts on the east side of the existing tracks are within the area identified as Long Bridge Park and owned by the City of Arlington. According to parcel ownership information, which was acquired from the County on June 8, 2016 during the development of the Draft EIS and reacquired on July 31, 2017, there are no permanent or temporary impacts to Roaches Run Waterfowl Sanctuary. The impact analysis in Section 5.14 and Chapter 6 of the Final EIS reflect this determination.

A44. Comment noted.

A45. The owner of the railroad right-of-way, CSXT, does not permit private or public parallel bicycle/pedestrian paths within the railroad's right-of-way. The DC2RVA Project, however, does not preclude the development of bicycle and pedestrian facilities between rail stations using private property or public rights-of-way outside of the railroad's right-of-way, separate from this Project. Refer to DRPT-numbered statement #5 for more information about the Project Purpose and Need and multimodal connections with intercity passenger rail.

A46. See response to DRPT-numbered statement #37.

A47. Part 1) Mount Vernon Memorial Highway (portion of GWMP DHR-ID 029-0218) was addressed separately in Draft Section 6.4.3 (associated Final EIS Section 5.4.3) from GWMP as a parkland resource. No permanent right-of-way acquisition would be required from GWMP.

(Responses are continued on next page)

		appears that there would be vegetation clearing needed by Roaches Run (Alternatives 1A, 1B, and 1C) and the George Washington Memorial Parkway, as well as VAU 2-1 (Alternative 2A). DEPARTMENT OF THE INTERIOR (continued)

Part 2) The Draft EIS refers to a temporary occupancy of a Section 4(f) resource, not a de minimis impact (because de minimis only occurs when impacts are considered a 4(f) use). In accordance with Section 4(f) of the U.S. DOT Act of 1966 (49 U.S.C. 303[c]), as amended by Section 6009 of the Safe, Accountable, Flexible, Efficient, Transportation Equity Act: a Legacy for Users (SAFETEA-LU), impacts to Section 4(f) resources were determined to be either a Section 4(f) use, de minimis use, or a temporary occupancy. Temporary occupancies are exempted from the requirement for Section 4(f) approvals if they meet the conditions listed in 23 CFR 774.13(d). It important to note that the Section 4(f) Evaluation for this Project follows FHWA and FTA procedures; while FRA is not directly subject to these rules, FRA has determined that these procedures are appropriate for use in this Project.

As stated in the Final Section 4(f) Evaluation (Chapter 6 of the Final EIS), the temporary occupancy of GWMP is 1.2 acres in size and is generally a long narrow strip of approximately 10 feet in width. This area is temporarily needed during construction for access, erosion control, and material placement. Impacts to mature trees, if any, can likely be avoided during final design. DRPT will work with NPS to restore any temporary visual and habitat conditions during construction to prior conditions.

Part 3) DRPT understands that Roaches Run is a designated waterfowl sanctuary, and has updated all labeling to indicate such in the Final Section 4(f) Evaluation.

(Responses are continued on next page)

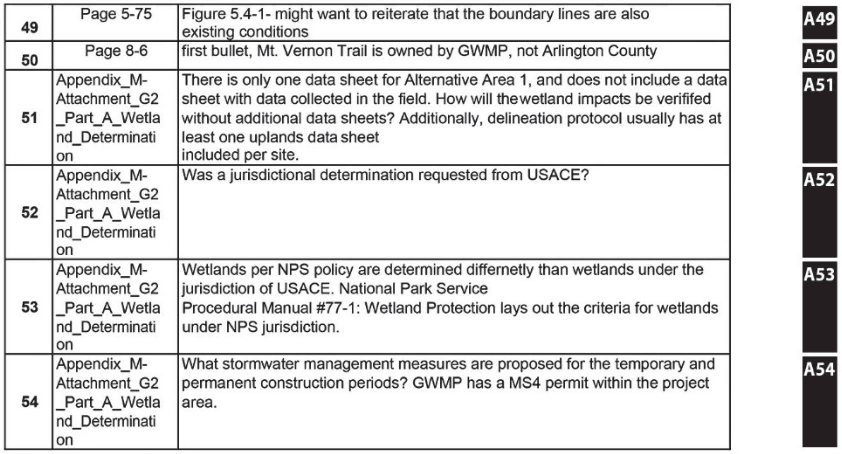
		appears that there would be vegetation clearing needed by Roaches Run (Alternatives 1A, 1B, and 1C) and the George Washington Memorial Parkway, as well as VAU 2-1 (Alternative 2A). Will this be needed throughout the corridor for this section? This could be more than low visual impact when moving through NPS lands especially where the rail line is very close to the parkway. Please clarify.	A37
38	Page 4-68, Section 4.10.1	This project moves through lands managed by the NPS-George Washington Memorial Parkway and from our understanding will impact vegetation. Although it is "already altered by local activities" on the current rail side, the other side is within the boundaries of a National Park. Depending on the cumulative impact of the vegetation as a result of Alternatives 1A, 1B, or 1C, and 2A, there could be more impacts than is being suggested here. For example, there are a couple of state listed plant species at Roaches Run, Davis' sedge (*Carex davisii*) *and River bulrush (* Schoenoplectus fluviatilis*)*. Will these be disturbed?	A38
39	Page 4-73, Section 4.10.1.2	Please note, removal of vegetation on NPS lands will not necessarily just require "seeding" as a restoration approach.	A39
40	Page 4-83	Please see earlier comments regarding recent study on NPS lands regarding bats.	A40
41	Page 4-130 - 4-155; Appendix	Please note earlier comments regarding cultural resources on NPS- GWMP lands. There are resources missing and it is unclear if the extent of the APE for archeology would include resources that have been identified but are not included.	A41
42	Page 4-133	seems to be missing the visual for Areas 1 & 2, Table 4.13-1 starts with Area 3	A42
43	Page 4-157, Table 4.14-1	In a July 20, 2017 letter to the Superintendent of the GWMP, several areas of temporary impacts were shown at Roaches Run under 1A. Is that accounted for here?	A43
44	Page 4-180	typo- second bullet, DRPT	A44
45	Page 4-199	Effects on Bicycle and Pedestrian Connectivity: Project development and design for the project should include facilities for bicyclists and pedestrians to travel safely between rail stations.	A45
46	Page 4-212-4-226	There is no explanation of the construction impacts associated with the removal of vegetation to the cultural landscape (and views) of the George Washington Memorial Parkway and Mount Vernon Memorial Highway. The removal of vegetation (how many trees?, etc.) is an impact. The removal of these areas of screening, how extensive will it be? Where is this information?	A46
47	Chapter 5	Chapter 5 Comments: Draft 4(f) state that the project would only have de minimis impacts on GWMP. Few things to that need to be reconsidered 1) GWMP is not listed as a historic resource, 2) The draft 4(f) needs to provide better rationale as to why clearing an acre of trees (referred to as vacant forest) would be de minimis. 4(f) states that the area would be restored afterwards; but takes 50 years to restore a 50 year old tree. Also, the draft 4(f) tries to minimize this tree impact by saying that the acre of trees accounts for just 0.1 percent of the total forested area. But the question is, what do these trees do? Are they habitat for Northern Long-Eared Bats? Do they protect the viewshed of the GWMP? 3) There seems to be confusion with regards to the ownership of Roaches Run, it is not a wildlife refuge, as it is shown in the maps. 4) Impacts to the Mount Vernon Trail are not clear (How would connectivity be maintained? What are they accessing? What's the duration?). 5) There is no 'Least Overall Harm' analysis, but does provide recommended preferred alternative for 4 sections.	A47
48	Page 5-1	The same issues commented on earlier are carried over here as it relates to Section 4 (f) and the NPS lands for the George Washington Memorial Parkway (including Roaches Run). Please address.	A48

DEPARTMENT OF THE INTERIOR (continued)

Part 4) As stated in the Final Section 4(f) Evaluation (Chapter 6 of the Final EIS), 20 feet of the Mount Vernon Trail would be temporarily impacted during construction. The 20 feet that would be temporarily impacted is located on the east side of the existing rail right-of-way on GWMP land opposite Crystal City Water Park and near Ronald Reagan National Airport. Construction planning and timing will be developed during final design, after funding is determined and incremental sequencing is developed. DRPT will continue to work with NPS throughout final design, and will maintain trail connectivity and functionality throughout Project construction activities that affect the Mount Vernon Trail.

Part 5) Chapter 6 of the Final EIS includes the full discussion of the Final Section 4(f) analysis, including the required least harm analysis.

A48. Comment note. Refer to DRPT-numbered statements #17 through #23.



49	Page 5-75	Figure 5.4-1- might want to reiterate that the boundary lines are also existing conditions	A49
50	Page 8-6	first bullet, Mt. Vernon Trail is owned by GWMP, not Arlington County	A50
51	Appendix_M-Attachment_G2_Part_A_Wetland_Determination	There is only one data sheet for Alternative Area 1, and does not include a data sheet with data collected in the field. How will thewetland impacts be verififed without additional data sheets? Additionally, delineation protocol usually has at least one uplands data sheet included per site.	A51
52	Appendix_M-Attachment_G2_Part_A_Wetland_Determination	Was a jurisdictional determination requested from USACE?	A52
53	Appendix_M-Attachment_G2_Part_A_Wetland_Determination	Wetlands per NPS policy are determined differnetly than wetlands under the jurisdiction of USACE. National Park Service Procedural Manual #77-1: Wetland Protection lays out the criteria for wetlands under NPS jurisdiction.	A53
54	Appendix_M-Attachment_G2_Part_A_Wetland_Determination	What stormwater management measures are proposed for the temporary and permanent construction periods? GWMP has a MS4 permit within the project area.	A54

DEPARTMENT OF THE INTERIOR (continued)

A49. Text was added before the referenced figure to clarify the existing conditions boundary lines (see Chapter 6 of the Final EIS for the Final Section 4(f) Evaluation).

A50. The referenced text was addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

A51. Only one wetland area has been identified within the limits of disturbance for Area 1 (01-WTL-01-wet). As noted in the Remarks section under Summary of Findings on the first page of the Wetland Determination Data Form, a wetland data point was not taken at this location because of access restrictions. The wetland boundaries were mapped based on best available data including aerial photographs, topographic maps, and VDCR, NHD, and NWI mapping. The location of the wetlands will be verified as needed in coordination with the resource agencies during the Joint Permit Application process during final design, after funding becomes available and incremental improvements are scheduled.

A52. As noted on page 3-5 of the Draft EIS and page 3-2 of its Appendix M, field reviews by US Army Corps of Engineers (USACE) and Virginia Department of Environmental Quality (DEQ) and spot checks with the field crews at several intervals during the field survey ensured methods were conducted according to agency expectations. A request for a formal jurisdictional determination will be submitted to the USACE during the Joint Permit Application process during final design, after funding becomes available and incremental improvements are scheduled.

A53. The USACE definition of wetlands has been used for the inventory and analysis in the Draft and Final EIS. NPS Water Resources Division will be consulted regarding wetland impacts during final design, after funding becomes available and incremental improvements are scheduled. Following completion of the final design and before construction, DRPT will complete the activities necessary to comply with NPS Procedural Manual #77-1 and will coordinate with NPS staff as needed.

(Responses are continued on next page)

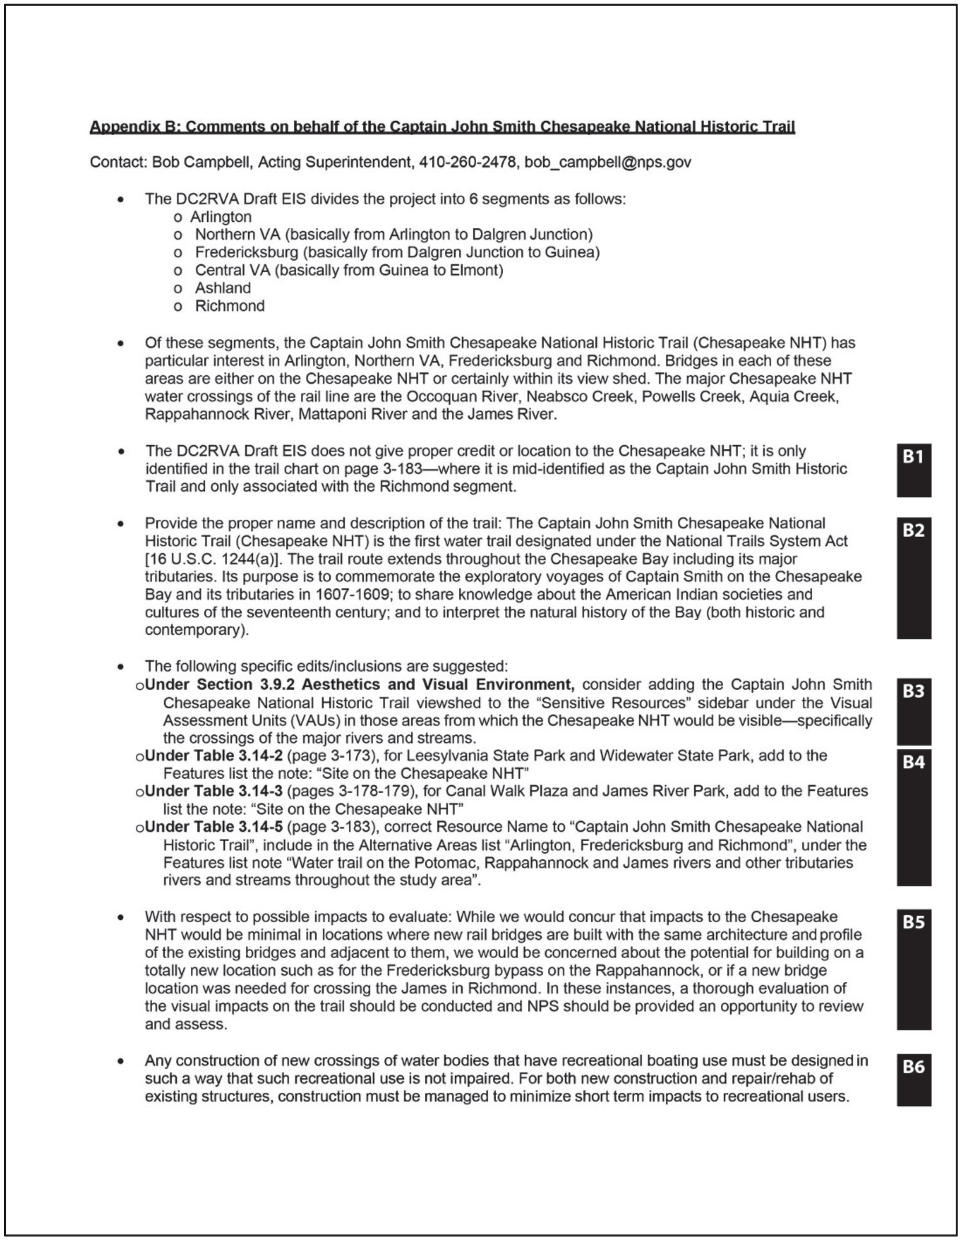
DEPARTMENT OF THE INTERIOR (continued)

A54. As noted in Section 4.1.6.2 of the Draft EIS and Section 5.1.6.2 of the Final EIS, permanent stormwater management measures may include upgrading of existing stormwater facilities and installation of new stormwater facilities, including detention basins, to capture and treat run-off. The Preferred Alternative will be designed and constructed in accordance with the Virginia Erosion and Sediment Control Law (§10.1-560 et seq. of the Code of Virginia); the Stormwater Management Act (§10.1-603. 1 et seq. of the Code of Virginia) and the terms and conditions of water quality permits required by USACE, Virginia DEQ, and VMRC. DRPT will provide detailed drainage design plans to NPS during final design, after funding becomes available and incremental improvements are scheduled.



Appendix B: Comments on behalf of the Captain John Smith Chesapeake National Historic Trail

Contact: Bob Campbell, Acting Superintendent, 410-260-2478, bob_campbell@nps.gov

- The DC2RVA Draft EIS divides the project into 6 segments as follows:
  - Arlington
  - Northern VA (basically from Arlington to Dalgren Junction)
  - Fredericksburg (basically from Dalgren Junction to Guinea)
  - Central VA (basically from Guinea to Elmont)
  - Ashland
  - Richmond
- Of these segments, the Captain John Smith Chesapeake National Historic Trail (Chesapeake NHT) has particular interest in Arlington, Northern VA, Fredericksburg and Richmond. Bridges in each of these areas are either on the Chesapeake NHT or certainly within its view shed. The major Chesapeake NHT water crossings of the rail line are the Occoquan River, Neabsco Creek, Powells Creek, Aquia Creek, Rappahannock River, Mattaponi River and the James River.
- The DC2RVA Draft EIS does not give proper credit or location to the Chesapeake NHT; it is only identified in the trail chart on page 3-183—where it is mid-identified as the Captain John Smith Historic Trail and only associated with the Richmond segment. **B1**
- Provide the proper name and description of the trail: The Captain John Smith Chesapeake National Historic Trail (Chesapeake NHT) is the first water trail designated under the National Trails System Act [16 U.S.C. 1244(a)]. The trail route extends throughout the Chesapeake Bay including its major tributaries. Its purpose is to commemorate the exploratory voyages of Captain Smith on the Chesapeake Bay and its tributaries in 1607-1609; to share knowledge about the American Indian societies and cultures of the seventeenth century; and to interpret the natural history of the Bay (both historic and contemporary). **B2**
- The following specific edits/inclusions are suggested:
  - **Under Section 3.9.2 Aesthetics and Visual Environment,** consider adding the Captain John Smith Chesapeake National Historic Trail viewshed to the "Sensitive Resources" sidebar under the Visual Assessment Units (VAUs) in those areas from which the Chesapeake NHT would be visible—specifically the crossings of the major rivers and streams. **B3**
  - **Under Table 3.14-2** (page 3-173), for Leesylvania State Park and Widewater State Park, add to the Features list the note: "Site on the Chesapeake NHT" **B4**
  - **Under Table 3.14-3** (pages 3-178-179), for Canal Walk Plaza and James River Park, add to the Features list the note: "Site on the Chesapeake NHT"
  - **Under Table 3.14-5** (page 3-183), correct Resource Name to "Captain John Smith Chesapeake National Historic Trail", include in the Alternative Areas list "Arlington, Fredericksburg and Richmond", under the Features list note "Water trail on the Potomac, Rappahannock and James rivers and other tributaries rivers and streams throughout the study area".
- With respect to possible impacts to evaluate: While we would concur that impacts to the Chesapeake NHT would be minimal in locations where new rail bridges are built with the same architecture and profile of the existing bridges and adjacent to them, we would be concerned about the potential for building on a totally new location such as for the Fredericksburg bypass on the Rappahannock, or if a new bridge location was needed for crossing the James in Richmond. In these instances, a thorough evaluation of the visual impacts on the trail should be conducted and NPS should be provided an opportunity to review and assess. **B5**
- Any construction of new crossings of water bodies that have recreational boating use must be designed in such a way that such recreational use is not impaired. For both new construction and repair/rehab of existing structures, construction must be managed to minimize short term impacts to recreational users. **B6**

DEPARTMENT OF THE INTERIOR (continued)

__Appendix B to DOI Letter – Comments from Captain John Smith Chesapeake National Historic Trail:__

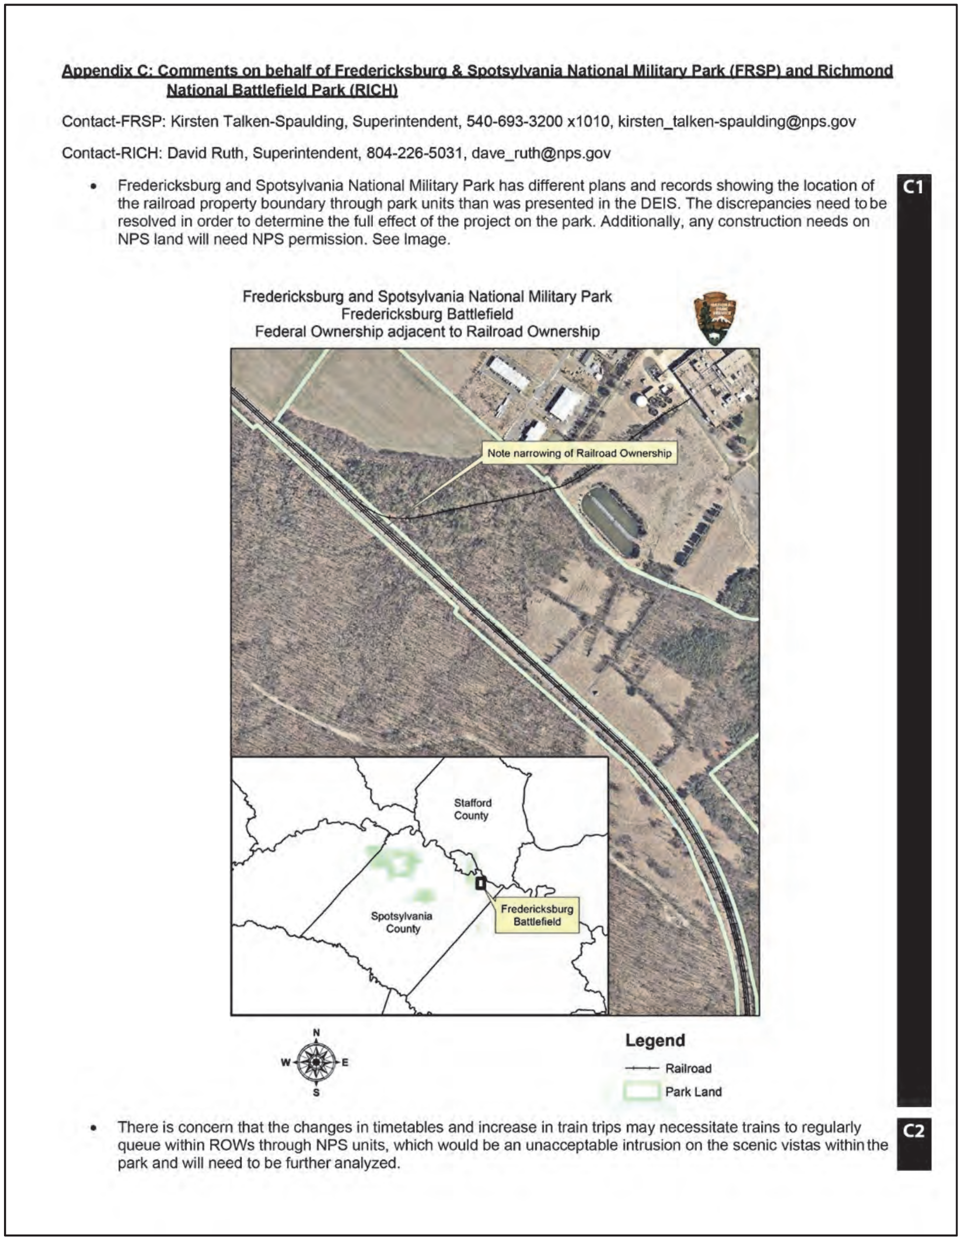
B1. and B2. The name and description of the referenced trail have been updated, as requested; refer to the errata table for the Draft EIS, which is Appendix A to the Final EIS.

B3. The referenced trail has been added as a sensitive visual resource, as requested; refer to the errata table for the Draft EIS, which is Appendix A to the Final EIS.

B4. The requested clarifications have been addressed in the errata table for the Draft EIS, which is Appendix A to the Final EIS.

B5. Build Alternative 3C, a bypass around Fredericksburg and across the Rappahannock River, is the only Build Alternative analyzed in the Draft EIS with a river bridge at a new crossing location. The visual assessment ranked it as having a high visual impact in Visual Assessment Unit 3-2. However, this alternative is not the Preferred Alternative. Alternative 3B, which includes a new track adjacent to existing track and a bridge adjacent to the existing bridge over the Rappahannock, was selected as the Preferred Alternative (refer to Final EIS Section 4.3.3 for details).

B6. All of the Preferred Alternative's crossings of water bodies are adjacent to existing crossings. After funding becomes available and incremental improvements are scheduled, the final design of the DC2RVA Project will, at a minimum, match the existing horizontal and vertical openings of the existing crossings. Construction phasing, to occur during final design after funding becomes available, will address impacts to recreational uses.



Appendix C: Comments on behalf of Fredericksburg & Spotsylvania National Military Park (FRSP) and Richmond National Battlefield Park (RICH)

Contact-FRSP: Kirsten Talken-Spaulding, Superintendent, 540-693-3200 x1010, kirsten_talken-spaulding@nps.gov

Contact-RICH: David Ruth, Superintendent, 804-226-5031, dave_ruth@nps.gov

- Fredericksburg and Spotsylvania National Military Park has different plans and records showing the location of the railroad property boundary through park units than was presented in the DEIS. The discrepancies need to be resolved in order to determine the full effect of the project on the park. Additionally, any construction needs on NPS land will need NPS permission. See Image.

- There is concern that the changes in timetables and increase in train trips may necessitate trains to regularly queue within ROWs through NPS units, which would be an unacceptable intrusion on the scenic vistas within the park and will need to be further analyzed.

C2

DEPARTMENT OF THE INTERIOR (continued)

Appendix C to DOI Letter – Comments from Fredericksburg & Spotsylvania National Military Park and Richmond National Battlefield:

C1. The parcel boundaries are based on information DRPT acquired from the County on June 8, 2016 during the development of the Draft EIS, which DRPT has confirmed are consistent with current County data (acquired July 31, 2017). DRPT has confirmed that these County parcel boundaries are consistent with those shown on the NPS website. DRPT will clarify parcel boundaries during final design, after funding becomes available and incremental improvements are scheduled. DRPT will continue to coordinate with the NPS through final design to ensure that the boundaries of the Fredericksburg & Spotsylvania National Military Park are accurate. Additionally, DRPT will coordinate for any construction needs on NPS property.

C2. As part of the DC2RVA Project, DRPT conducted computer-based railroad operations simulations to determine the Project's impacts on rail traffic in the corridor. To address the Department of Interior's comment, DRPT has reviewed the results of the operations simulations to determine the estimated changes in train delay (what the Department of Interior refers to as queuing) at locations where the DC2RVA corridor is adjacent to the FRSP. Two locations were identified for this analysis: (a) the Hamilton interlocking and proposed Fredericksburg controlled siding (milepost CFP 55.7), which is adjacent to the Fredericksburg Battlefield, and (b) the Guinea interlocking (milepost CFP 47.5), which is adjacent to the "Stonewall" Jackson Shrine. The delay analysis at these locations was conducted for the year 2045 (the 20-year horizon for measuring impacts from the DC2RVA Project) and compared the total delay (time that trains were not moving) between the No Build case (which assesses year 2045 operations at the location without the additional infrastructure or passenger train frequencies proposed by the DC2RVA Project) and the Preferred Alternative Build case (which assesses year 2045 operations at the location including the additional infrastructure and passenger train frequencies proposed by the DC2RVA Project).

DEPARTMENT OF THE INTERIOR (continued)

After conducting an evaluation of train delay at the Hamilton interlocking, DRPT determined that in the year 2045, the railroad corridor would operate more efficiently in this area with a decrease in average daily train delay resulting from train queuing by 8 minutes per day if the DC2RVA Project were to be implemented, when compared to the No Build results. The decrease in queuing would result in no visual impact to the Fredericksburg Battlefield due to train queuing. DRPT acknowledges that the computer-based railroad operations simulation provides only an estimate of the operations at a particular location along the corridor. Actual rail operations and train delays are subject to variability; however, and the potential decrease in train delays near the Hamilton interlocking demonstrate a reduction in potential impacts at this location.

After conducting an evaluation of train delay at the Guinea interlocking, DRPT determined that in the year 2045, the average daily train delay resulting from train queuing would increase by 3 minutes per day if the DC2RVA Project were to be implemented, when compared to the No Build results. This slight increase in queuing would have little overall visual impact to the "Stonewall" Jackson Shrine which is already located adjacent to the existing tracks and is currently exposed to the infrequent visual effects of train queuing. DRPT acknowledges that the computer-based railroad operations simulation provides only an estimate of the operations at a particular location along the corridor. Actual rail operations and train delays are subject to variability; however, and the potential three-minute increase in train delays near the Guinea interlocking is minimal.

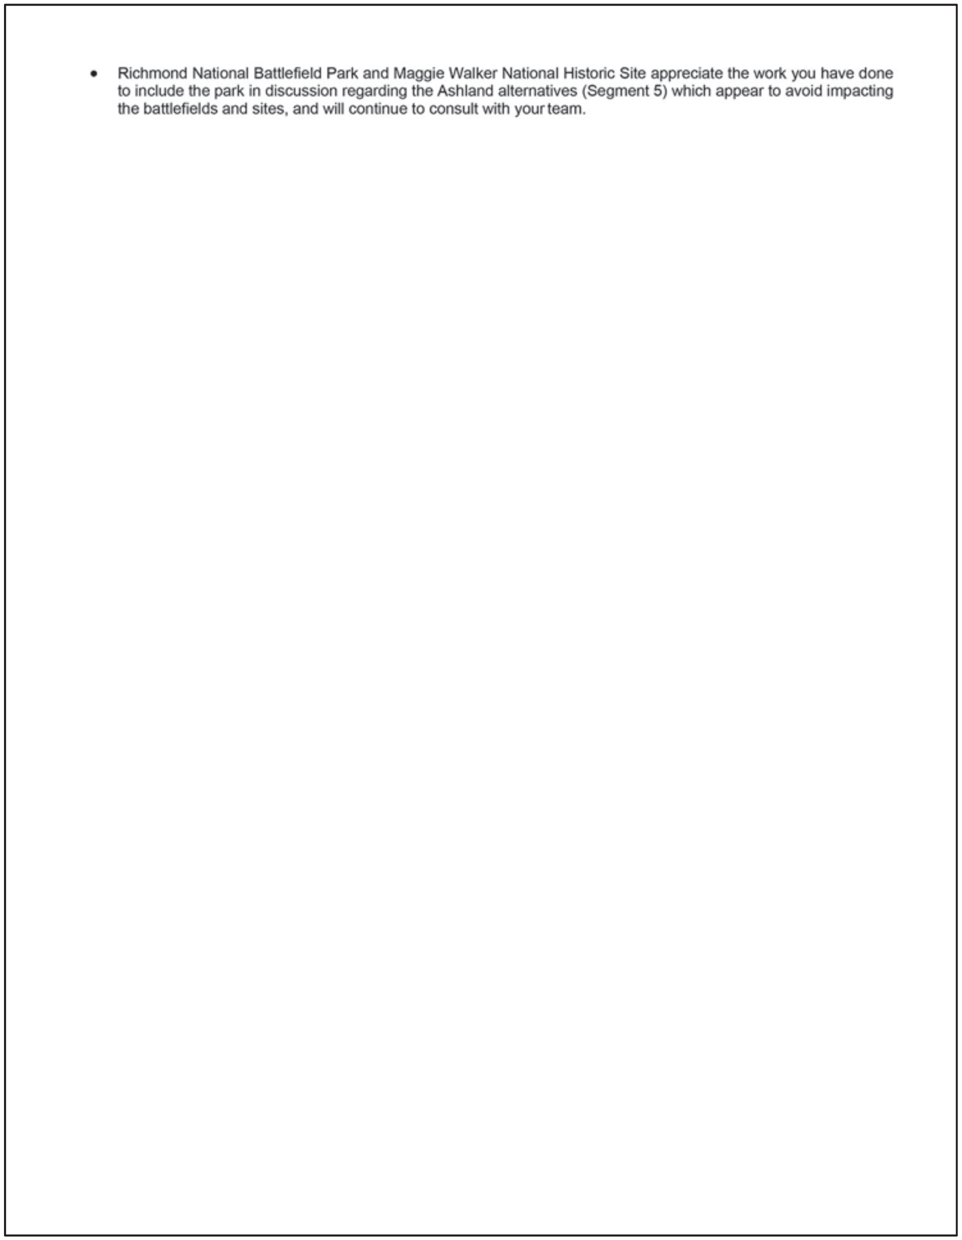
DEPARTMENT OF THE INTERIOR (continued)

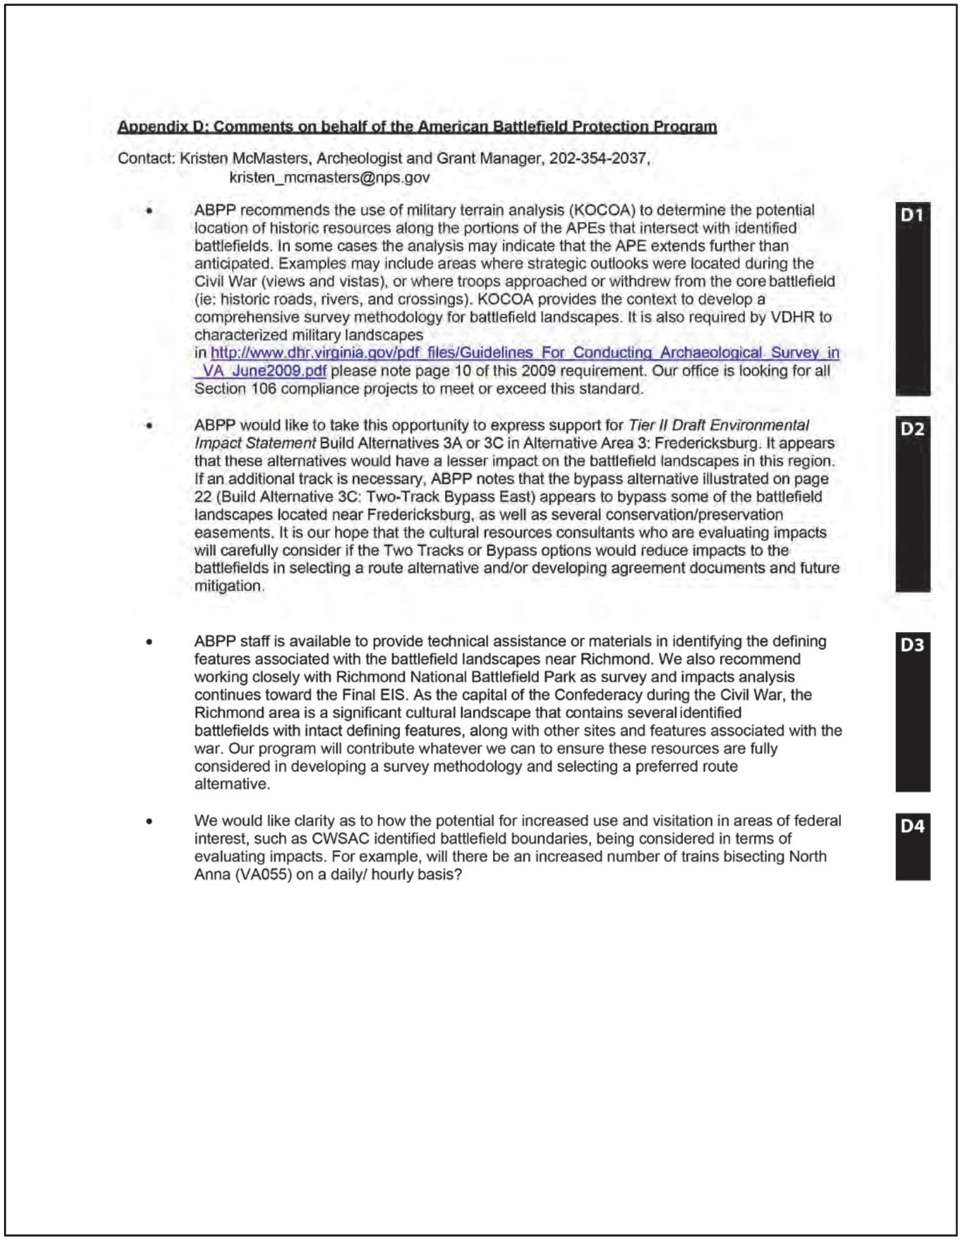
The Richmond National Battlefield Park (RICH) Civil War Visitor Center is located at 470 Tredegar Street in Richmond, Virginia, on the site of the former Tredegar Iron Works along the James River. This site is approximately 1.1 miles west of the railroad tracks that are part of the DC2RVA Project area. However, the site is adjacent to railroad tracks that connect with railroad lines in the DC2RVA corridor. Therefore, DRPT analyzed the differences in train delay (or queuing) for eastbound trains on the CSXT Rivanna Subdivision that were approaching and preparing to enter the DC2RVA corridor at Rivanna Junction in Richmond. After conducting an evaluation of train delay for eastbound trains on the Rivanna Subdivision at the Rivanna Junction interlocking, DRPT determined that in the year 2045, the average daily train delay resulting from train queuing would increase by 4.66 minutes per day if the DC2RVA Project were to be implemented, when compared to the No Build results. This slight increase in queuing would have little overall visual impact to the Richmond National Battlefield Park Civil War Visitor Center which is already located adjacent to the existing tracks and is currently exposed to the infrequent visual effects of train queuing. DRPT acknowledges that the computer-based railroad operations simulation provides only an estimate of the operations at a particular location along the corridor. Actual rail operations and train delays are subject to variability; however, the potential increase in train delays by less than five minutes near the Rivanna Junction interlocking is minimal.



- Richmond National Battlefield Park and Maggie Walker National Historic Site appreciate the work you have done to include the park in discussion regarding the Ashland alternatives (Segment 5) which appear to avoid impacting the battlefields and sites, and will continue to consult with your team.

DEPARTMENT OF THE INTERIOR (continued)

(No comments on this page)



Appendix D: Comments on behalf of the American Battlefield Protection Program

Contact: Kristen McMasters, Archeologist and Grant Manager, 202-354-2037,
kristen_mcmasters@nps.gov

- ABPP recommends the use of military terrain analysis (KOCOA) to determine the potential location of historic resources along the portions of the APEs that intersect with identified battlefields. In some cases the analysis may indicate that the APE extends further than anticipated. Examples may include areas where strategic outlooks were located during the Civil War (views and vistas), or where troops approached or withdrew from the core battlefield (ie: historic roads, rivers, and crossings). KOCOA provides the context to develop a comprehensive survey methodology for battlefield landscapes. It is also required by VDHR to characterized military landscapes in http://www.dhr.virginia.gov/pdf_files/Guidelines_For_Conducting_Archaeological_Survey_in_VA_June2009.pdf please note page 10 of this 2009 requirement. Our office is looking for all Section 106 compliance projects to meet or exceed this standard. **D1**
- ABPP would like to take this opportunity to express support for *Tier II Draft Environmental Impact Statement* Build Alternatives 3A or 3C in Alternative Area 3: Fredericksburg. It appears that these alternatives would have a lesser impact on the battlefield landscapes in this region. If an additional track is necessary, ABPP notes that the bypass alternative illustrated on page 22 (Build Alternative 3C: Two-Track Bypass East) appears to bypass some of the battlefield landscapes located near Fredericksburg, as well as several conservation/preservation easements. It is our hope that the cultural resources consultants who are evaluating impacts will carefully consider if the Two Tracks or Bypass options would reduce impacts to the battlefields in selecting a route alternative and/or developing agreement documents and future mitigation. **D2**
- ABPP staff is available to provide technical assistance or materials in identifying the defining features associated with the battlefield landscapes near Richmond. We also recommend working closely with Richmond National Battlefield Park as survey and impacts analysis continues toward the Final EIS. As the capital of the Confederacy during the Civil War, the Richmond area is a significant cultural landscape that contains several identified battlefields with intact defining features, along with other sites and features associated with the war. Our program will contribute whatever we can to ensure these resources are fully considered in developing a survey methodology and selecting a preferred route alternative. **D3**
- We would like clarity as to how the potential for increased use and visitation in areas of federal interest, such as CWSAC identified battlefield boundaries, being considered in terms of evaluating impacts. For example, will there be an increased number of trains bisecting North Anna (VA055) on a daily/ hourly basis? **D4**

DEPARTMENT OF THE INTERIOR (continued)

Appendix D to DOI Letter -- Comments from American Battlefield Protection Program:

D1. At a meeting with DRPT on February 13, 2018, the DHR determined that KOCOA analysis (as requested in this comment) is not needed to determine Project Section 106 effects. If factors change upon an analysis of the Project results and effect determinations, additional research may be completed at that time.

D2. Alternative 3B was selected as the Preferred Alternative, which adds one track to the existing two-track alignment through Fredericksburg (refer to Final EIS Section 4.3.3. for details). DRPT will continue to coordinate with the NPS as consulting parties in the cultural resource process, and has involved the NPS in the development of Section 106 MOA stipulations to mitigate any adverse effects on battle-related historic properties caused by the undertaking (the Section 106 Draft MOA is Appendix K of the Final EIS).

D3. The Richmond National Battlefield Park and the FRSP are among the eight offices of the NPS who are consulting parties on this Project.

D4. The North Anna Battlefield Park is located at 11576 Verdon Road in Doswell, Virginia, approximately 1.25 miles west of the DC2RVA corridor. The battlefield is located along the Buckingham Branch Railroad, at a location west of the DC2RVA Project corridor. The DC2RVA Project does not propose any increases to intercity passenger rail traffic or changes to current railroad operating patterns or practices on the segment of the Buckingham Branch Railroad line west of Doswell by the North Anna Battlefield Park.

Administration**

October 25, 2017

Ms. Emily Stock
Virginia Department of Rail and Public Transportation
600 East Main Street
Suite 2102
Richmond, Virginia 23219

Dear Ms. Stock:

Thank you for the opportunity to review the Washington, D.C. to Richmond High Speed Rail Project Tier II Draft Environmental Impact Statement (Draft EIS). The Federal Aviation Administration (FAA) is supportive of all modal efforts to reduce congestion and increase efficiency within the transportation systems of our capital region and along the eastern seaboard.

Our staff has reviewed the material provided by your organization from an aviation policy and environmental perspective. The scope of the proposed project does not appear to encompass direct intermodal links of high speed rail to the region's airports, therefore we do not presently assess there to be any FAA required actions or approvals related to this effort. 1

The FAA is appreciative of information contained within the Draft EIS section describing *Air Travel Congestion*, and notes that some of the descriptions are reflective of our national aviation system overall. While the successful development of high speed rail to Richmond and beyond may offer relief within our regional transportation corridor, we recommend care be exercised within this section so as not to infer this project as a singular solution to aviation congestion at the national level. 2

We are happy to provide additional information or answer questions which may further assist your efforts. Please contact Chris Brown, Assistant Administrator for Government and Industry Affairs, at (202) 267-3277.

Sincerely,

Michael P. Huerta
Administrator

cc: John Winkle, Federal Railroad Administration
Randy Brown, Federal Railroad Administration

FEDERAL AVIATION ADMINISTRATION

1. The Federal Aviation Administration (FAA) is correct: direct intermodal links to the region's airports are not part of the Project's Purpose and Need.

2. Conditions in the Project corridor currently support the 2002 Tier I EIS Purpose and Need and are the foundation for the DC2RVA Project. These conditions were detailed in Chapter 1 of the Draft EIS and include air travel congestion at regional and national airports. However, the DC2RVA Project is not intended to be the singular solution to national or regional air travel congestion. Rather, the DC2RVA Project would provide a competitive travel alternative in the Washington, D.C. to Richmond corridor by improving the frequency, reliability, and travel time of passenger rail operations in Virginia and beyond.

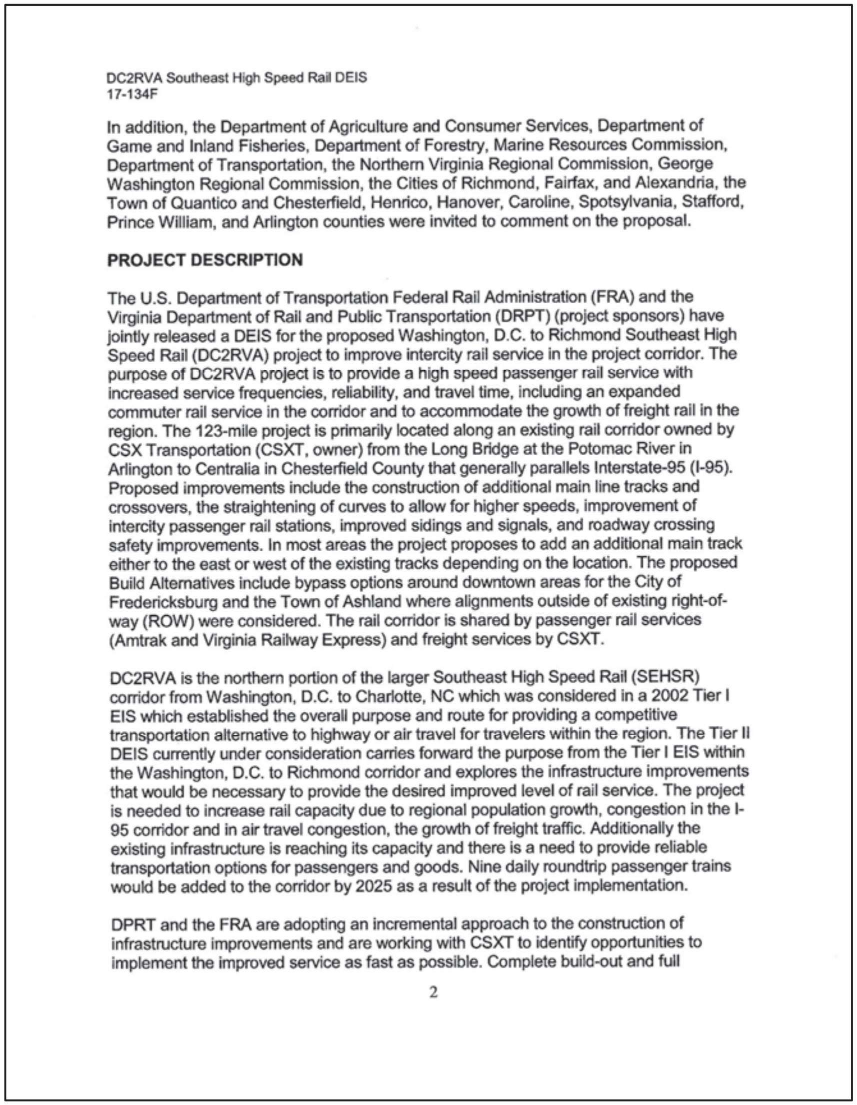
RE: Comments on the Tier II Draft Environmental Impact Statement for the Washington, D.C. to Richmond Southeast High Speed Rail Project, Federal Railway Administration and Virginia Department of Rail and Public Transportation

Dear Ms. Stock:

The Commonwealth of Virginia has completed its review of the above-referenced document. The Department of Environmental Quality (DEQ) is responsible for coordinating Virginia's review of federal environmental documents submitted under the National Environmental Policy Act (NEPA) and responding to appropriate federal officials and project contacts on behalf of the Commonwealth. This is in response to the September 2017 Draft Environmental Impact Statement (DEIS) prepared by the U.S. Department of Transportation Federal Railroad Administration and the Virginia Department of Rail and Public Transportation for the above-referenced project. The following agencies, localities and planning district commissions (PDC) participated in the review of this proposal:

Department of Environmental Quality (DEQ)
Department of Conservation and Recreation (DCR)
Department of Health (VDH)
Department of Historic Resources (DHR)
Richmond Regional PDC
Crater PDC
Virginia Outdoors Foundation
Town of Ashland
City of Fredericksburg
Fairfax County

VIRGINIA DEQ (continued)



In addition, the Department of Agriculture and Consumer Services, Department of Game and Inland Fisheries, Department of Forestry, Marine Resources Commission, Department of Transportation, the Northern Virginia Regional Commission, George Washington Regional Commission, the Cities of Richmond, Fairfax, and Alexandria, the Town of Quantico and Chesterfield, Henrico, Hanover, Caroline, Spotsylvania, Stafford, Prince William, and Arlington counties were invited to comment on the proposal.

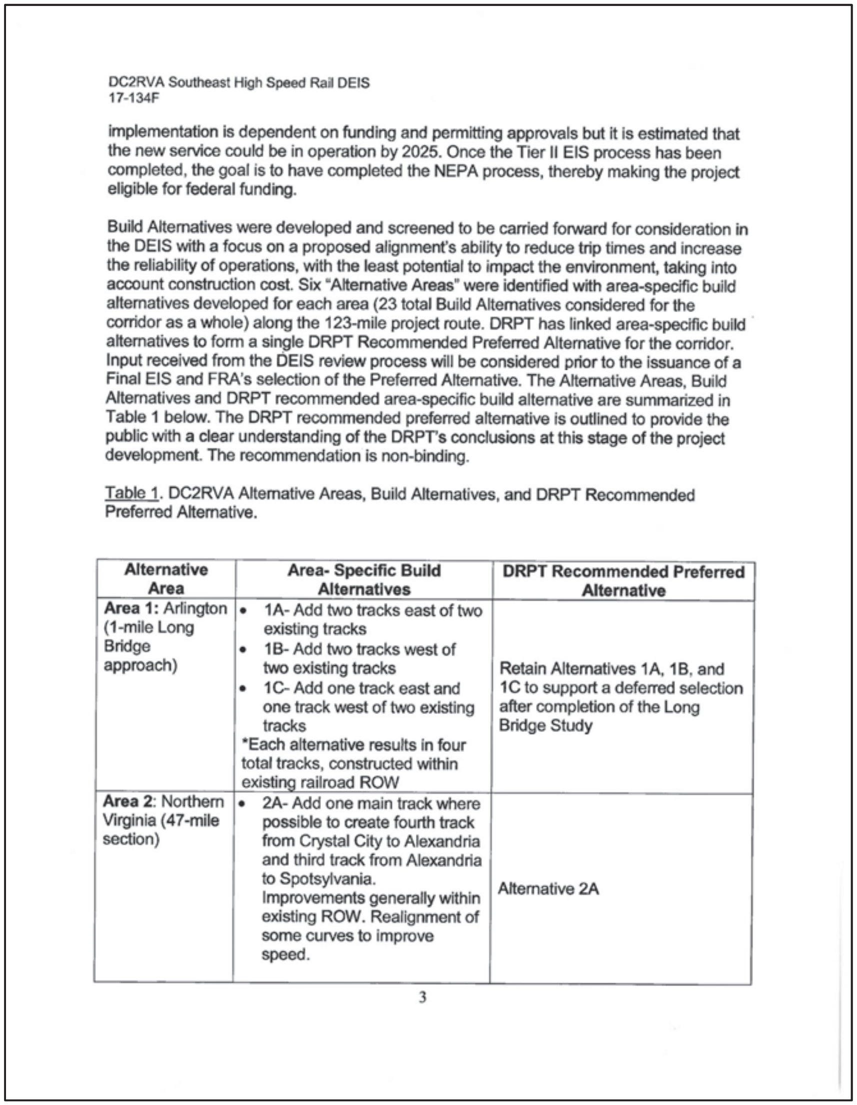
PROJECT DESCRIPTION

The U.S. Department of Transportation Federal Rail Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) (project sponsors) have jointly released a DEIS for the proposed Washington, D.C. to Richmond Southeast High Speed Rail (DC2RVA) project to improve intercity rail service in the project corridor. The purpose of DC2RVA project is to provide a high speed passenger rail service with increased service frequencies, reliability, and travel time, including an expanded commuter rail service in the corridor and to accommodate the growth of freight rail in the region. The 123-mile project is primarily located along an existing rail corridor owned by CSX Transportation (CSXT, owner) from the Long Bridge at the Potomac River in Arlington to Centralia in Chesterfield County that generally parallels Interstate-95 (I-95). Proposed improvements include the construction of additional main line tracks and crossovers, the straightening of curves to allow for higher speeds, improvement of intercity passenger rail stations, improved sidings and signals, and roadway crossing safety improvements. In most areas the project proposes to add an additional main track either to the east or west of the existing tracks depending on the location. The proposed Build Alternatives include bypass options around downtown areas for the City of Fredericksburg and the Town of Ashland where alignments outside of existing right-of-way (ROW) were considered. The rail corridor is shared by passenger rail services (Amtrak and Virginia Railway Express) and freight services by CSXT.

DC2RVA is the northern portion of the larger Southeast High Speed Rail (SEHSR) corridor from Washington, D.C. to Charlotte, NC which was considered in a 2002 Tier I EIS which established the overall purpose and route for providing a competitive transportation alternative to highway or air travel for travelers within the region. The Tier II DEIS currently under consideration carries forward the purpose from the Tier I EIS within the Washington, D.C. to Richmond corridor and explores the infrastructure improvements that would be necessary to provide the desired improved level of rail service. The project is needed to increase rail capacity due to regional population growth, congestion in the I-95 corridor and in air travel congestion, the growth of freight traffic. Additionally the existing infrastructure is reaching its capacity and there is a need to provide reliable transportation options for passengers and goods. Nine daily roundtrip passenger trains would be added to the corridor by 2025 as a result of the project implementation.

DPRT and the FRA are adopting an incremental approach to the construction of infrastructure improvements and are working with CSXT to identify opportunities to implement the improved service as fast as possible. Complete build-out and full

VIRGINIA DEQ (continued)



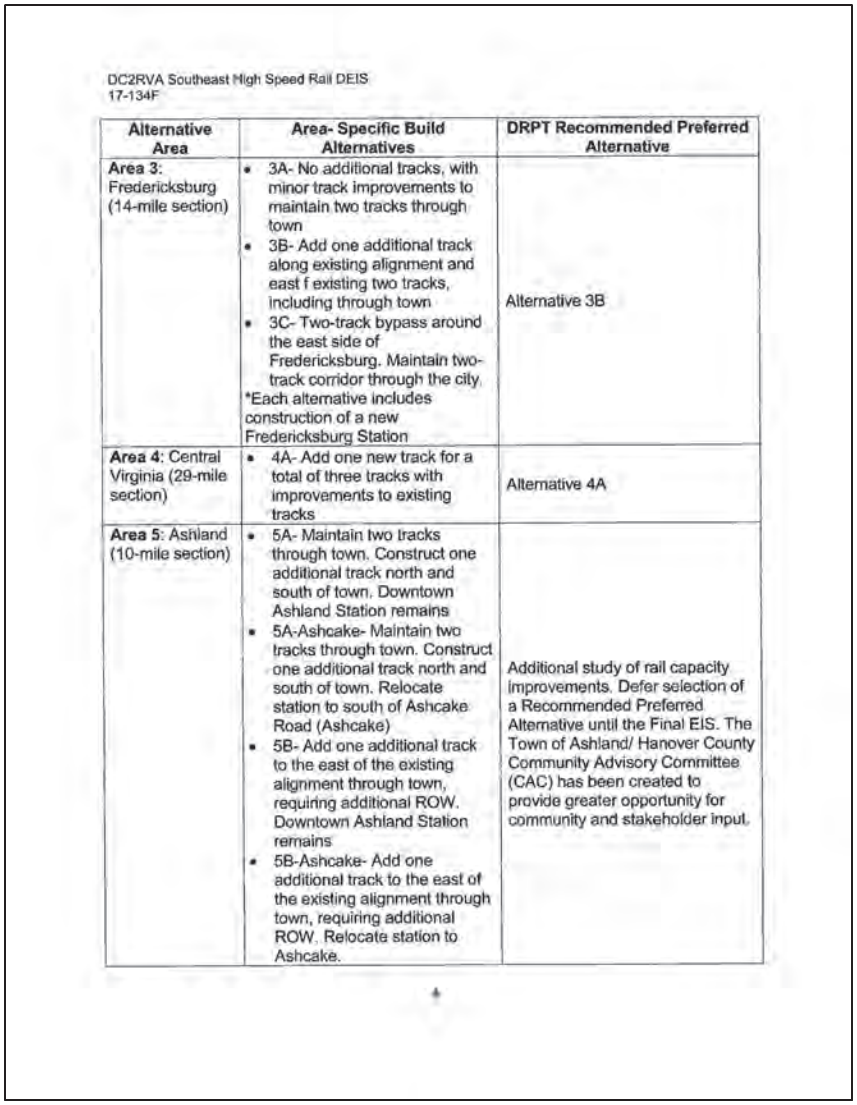
implementation is dependent on funding and permitting approvals but it is estimated that the new service could be in operation by 2025. Once the Tier II EIS process has been completed, the goal is to have completed the NEPA process, thereby making the project eligible for federal funding.

Build Alternatives were developed and screened to be carried forward for consideration in the DEIS with a focus on a proposed alignment's ability to reduce trip times and increase the reliability of operations, with the least potential to impact the environment, taking into account construction cost. Six "Alternative Areas" were identified with area-specific build alternatives developed for each area (23 total Build Alternatives considered for the corridor as a whole) along the 123-mile project route. DRPT has linked area-specific build alternatives to form a single DRPT Recommended Preferred Alternative for the corridor. Input received from the DEIS review process will be considered prior to the issuance of a Final EIS and FRA's selection of the Preferred Alternative. The Alternative Areas, Build Alternatives and DRPT recommended area-specific build alternative are summarized in Table 1 below. The DRPT recommended preferred alternative is outlined to provide the public with a clear understanding of the DRPT's conclusions at this stage of the project development. The recommendation is non-binding.

Table 1. DC2RVA Alternative Areas, Build Alternatives, and DRPT Recommended Preferred Alternative.

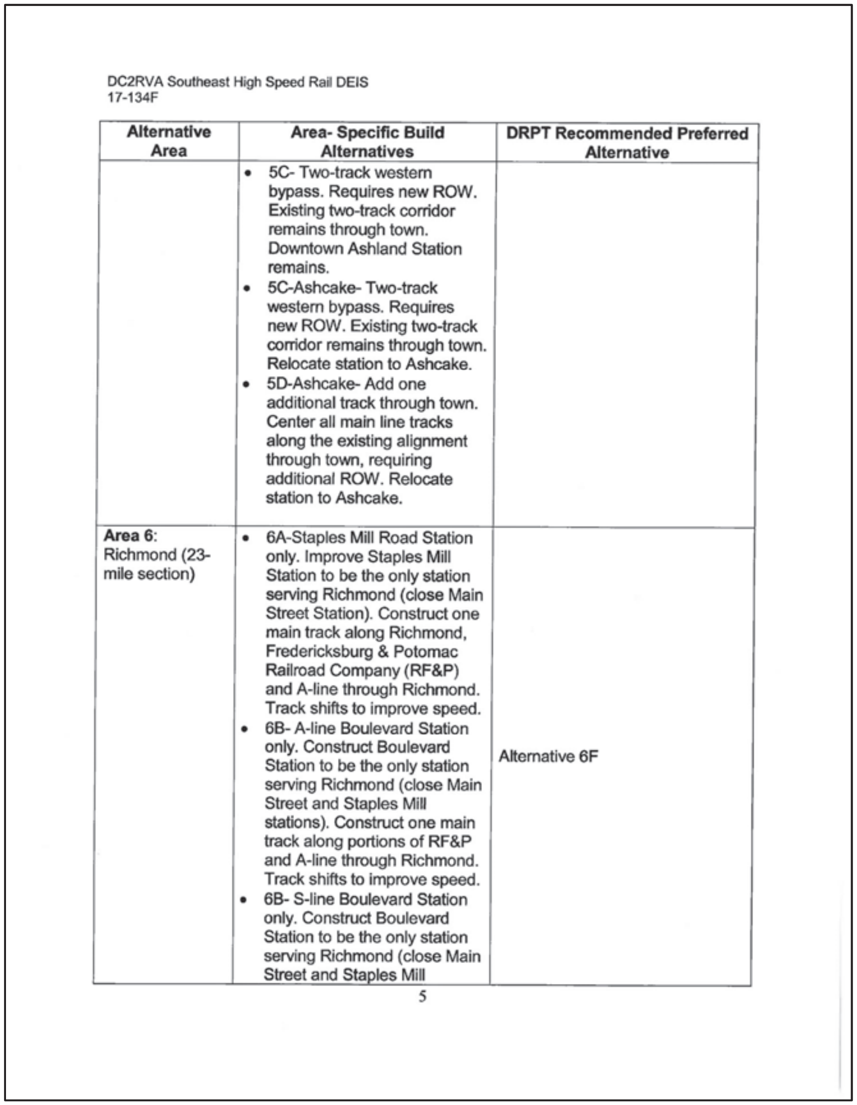
Alternative Area	Area- Specific Build Alternatives	DRPT Recommended Preferred Alternative
Area 1: Arlington (1-mile Long Bridge approach)	• 1A- Add two tracks east of two existing tracks • 1B- Add two tracks west of two existing tracks • 1C- Add one track east and one track west of two existing tracks *Each alternative results in four total tracks, constructed within existing railroad ROW	Retain Alternatives 1A, 1B, and 1C to support a deferred selection after completion of the Long Bridge Study
Area 2: Northern Virginia (47-mile section)	• 2A- Add one main track where possible to create fourth track from Crystal City to Alexandria and third track from Alexandria to Spotsylvania. Improvements generally within existing ROW. Realignment of some curves to improve speed.	Alternative 2A

VIRGINIA DEQ (continued)



Alternative Area	Area- Specific Build Alternatives	DRPT Recommended Preferred Alternative
Area 3: Fredericksburg (14-mile section)	• 3A- No additional tracks, with minor track improvements to maintain two tracks through town • 3B- Add one additional track along existing alignment and east f existing two tracks, including through town • 3C- Two-track bypass around the east side of Fredericksburg. Maintain two-track corridor through the city. *Each alternative includes construction of a new Fredericksburg Station	Alternative 3B
Area 4: Central Virginia (29-mile section)	• 4A- Add one new track for a total of three tracks with improvements to existing tracks	Alternative 4A
Area 5: Ashland (10-mile section)	• 5A- Maintain two tracks through town. Construct one additional track north and south of town. Downtown Ashland Station remains • 5A-Ashcake- Maintain two tracks through town. Construct one additional track north and south of town. Relocate station to south of Ashcake Road (Ashcake) • 5B- Add one additional track to the east of the existing alignment through town, requiring additional ROW. Downtown Ashland Station remains • 5B-Ashcake- Add one additional track to the east of the existing alignment through town, requiring additional ROW. Relocate station to Ashcake.	Additional study of rail capacity improvements. Defer selection of a Recommended Preferred Alternative until the Final EIS. The Town of Ashland/ Hanover County Community Advisory Committee (CAC) has been created to provide greater opportunity for community and stakeholder input.

VIRGINIA DEQ (continued)



DC2RVA Southeast High Speed Rail DEIS
17-134F

Alternative Area	Area- Specific Build Alternatives	DRPT Recommended Preferred Alternative
	• 5C- Two-track western bypass. Requires new ROW. Existing two-track corridor remains through town. Downtown Ashland Station remains. • 5C-Ashcake- Two-track western bypass. Requires new ROW. Existing two-track corridor remains through town. Relocate station to Ashcake. • 5D-Ashcake- Add one additional track through town. Center all main line tracks along the existing alignment through town, requiring additional ROW. Relocate station to Ashcake.	
Area 6: Richmond (23-mile section)	• 6A-Staples Mill Road Station only. Improve Staples Mill Station to be the only station serving Richmond (close Main Street Station). Construct one main track along Richmond, Fredericksburg & Potomac Railroad Company (RF&P) and A-line through Richmond. Track shifts to improve speed. • 6B- A-line Boulevard Station only. Construct Boulevard Station to be the only station serving Richmond (close Main Street and Staples Mill stations). Construct one main track along portions of RF&P and A-line through Richmond. Track shifts to improve speed. • 6B- S-line Boulevard Station only. Construct Boulevard Station to be the only station serving Richmond (close Main Street and Staples Mill	Alternative 6F

DEQ NEPA REVIEW

1

DEQ has provided recommendations for minimizing potential impacts from the proposed activity and for compliance with applicable legal requirements below. DEQ received extensive comments from some reviewing agencies and affected localities. A summary of the comments is provided below in the Environmental Impacts and Mitigation section. The summary is not meant to substitute for the totality of the comments received and DEQ recommends that the FRA consider every comment, correction, or recommendation detailed in the attached individual comments (see Attachment A: Complete Comments Submitted on DC2RVA DEIS).

ENVIRONMENTAL IMPACTS AND MITIGATION

1. Water Quality and Wetlands. According to the DEIS (page 3-4), streams, floodplains, and wetlands within a 500-foot wide study area centered on the DC2RVA corridor were identified via mapping, photographic, and database resources. Field surveys were conducted from September 2015 to September 2016 to verify the existence of potential ephemeral, intermittent, and perennial streams and wetlands within 100-feet of the existing track, along the side where construction is proposed. The study area includes over 350 rivers, streams, and surface waters and 490.2 total acres of wetlands.

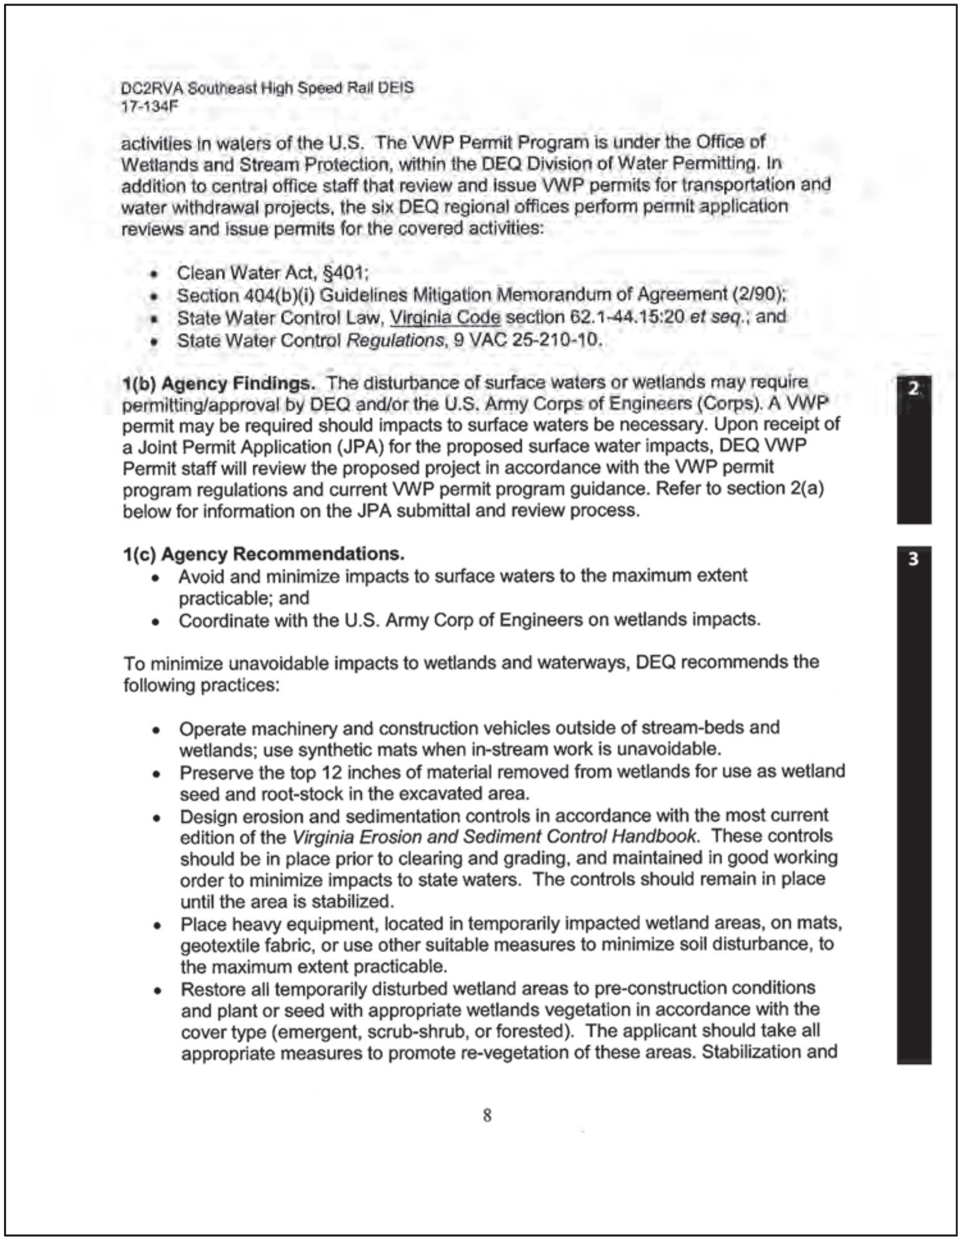
Due to the linear nature and length of this project, each alternative would include unavoidable impacts on water resources (DEIS, page 4-3). Depending on the ultimate combination of build alternative chosen, between 151 and 191 streams would be permanently impacted with linear encroachments to these stream estimated to be between 26,377 and 35,422 linear feet. Permanent impacts to wetlands are estimated to be between 22.14 and 49.64-acres (DEIS, page 4-8).

1(a) Agency Jurisdiction. The State Water Control Board promulgates Virginia's water regulations covering a variety of permits to include the Virginia Pollutant Discharge Elimination System Permit (VPDES) regulating point source discharges to surface waters, Virginia Pollution Abatement Permit regulating sewage sludge, storage and land application of biosolids, industrial wastes (sludge and wastewater), municipal wastewater, and animal wastes, the Surface and Groundwater Withdrawal Permit, and the Virginia Water Protection (VWP) Permit regulating impacts to streams, wetlands, and other surface waters. The VWP permit is a state permit which governs wetlands, surface water, and surface water withdrawals and impoundments. It also serves as §401 certification of the federal Clean Water Act §404 permits for dredge and fill

7

VIRGINIA DEQ (continued)

1. As Virginia Department of Environmental Quality (DEQ) serves as a clearinghouse for State agencies and locality comments, the FRA and DRPT have reviewed and responded to all the State agency and locality comments provided by DEQ in their Appendix A, as appropriate. In the main body of their comment letter DEQ summarized the substantive comments from the State agencies and localities. For some comments, DRPT responded to DEQ's summary of the comment. In other cases, to avoid repetition, DRPT responded to the more detailed comment and discussion contained in the agency letter attached to DEQ's comment. When practical, DRPT has responded to the comment only once and then referenced this response when the comment was repeated in the attachment to DEQ's comment.



activities in waters of the U.S. The VWP Permit Program is under the Office of Wetlands and Stream Protection, within the DEQ Division of Water Permitting. In addition to central office staff that review and issue VWP permits for transportation and water withdrawal projects, the six DEQ regional offices perform permit application reviews and issue permits for the covered activities:

- Clean Water Act, §401;
- Section 404(b)(i) Guidelines Mitigation Memorandum of Agreement (2/90);
- State Water Control Law, Virginia Code section 62.1-44.15:20 *et seq.*; and
- State Water Control *Regulations*, 9 VAC 25-210-10.

1(b) Agency Findings. The disturbance of surface waters or wetlands may require permitting/approval by DEQ and/or the U.S. Army Corps of Engineers (Corps). A VWP permit may be required should impacts to surface waters be necessary. Upon receipt of a Joint Permit Application (JPA) for the proposed surface water impacts, DEQ VWP Permit staff will review the proposed project in accordance with the VWP permit program regulations and current VWP permit program guidance. Refer to section 2(a) below for information on the JPA submittal and review process. 2

1(c) Agency Recommendations. 3

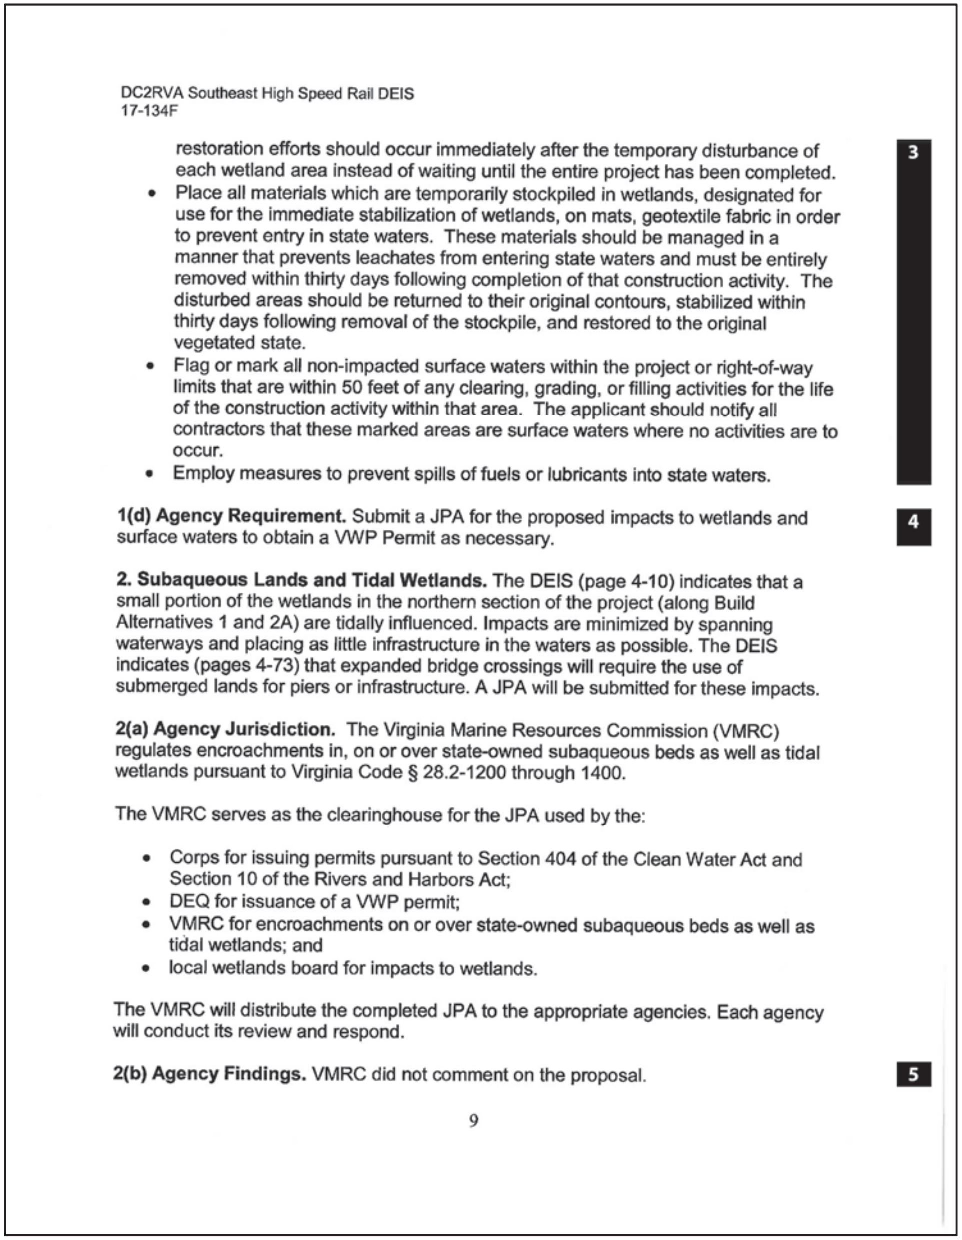
- Avoid and minimize impacts to surface waters to the maximum extent practicable; and
- Coordinate with the U.S. Army Corp of Engineers on wetlands impacts.

To minimize unavoidable impacts to wetlands and waterways, DEQ recommends the following practices:

- Operate machinery and construction vehicles outside of stream-beds and wetlands; use synthetic mats when in-stream work is unavoidable.
- Preserve the top 12 inches of material removed from wetlands for use as wetland seed and root-stock in the excavated area.
- Design erosion and sedimentation controls in accordance with the most current edition of the *Virginia Erosion and Sediment Control Handbook*. These controls should be in place prior to clearing and grading, and maintained in good working order to minimize impacts to state waters. The controls should remain in place until the area is stabilized.
- Place heavy equipment, located in temporarily impacted wetland areas, on mats, geotextile fabric, or use other suitable measures to minimize soil disturbance, to the maximum extent practicable.
- Restore all temporarily disturbed wetland areas to pre-construction conditions and plant or seed with appropriate wetlands vegetation in accordance with the cover type (emergent, scrub-shrub, or forested). The applicant should take all appropriate measures to promote re-vegetation of these areas. Stabilization and

VIRGINIA DEQ (continued)

2. through 4. The Project will have unavoidable impacts to water resources, but FRA and DRPT have minimized or avoided impacts to the extent practicable. As noted in Final EIS Section 5.1.5, DRPT anticipates submitting a Joint Permit Application (JPA) for Project impacts to surface waters and wetlands, for review by the US Army Corps of Engineers (USACE), DEQ, Virginia Marine Resource Commission (VMRC), and the Local Wetlands Boards during final design, after funding becomes available and incremental improvements are scheduled. DRPT will incorporate the recommended minimization measures provided by Virginia DEQ in section "1(c) Agency Recommendations" of their letter into the JPA, where appropriate, and in coordination with the USACE and VMRC.



restoration efforts should occur immediately after the temporary disturbance of each wetland area instead of waiting until the entire project has been completed.

- Place all materials which are temporarily stockpiled in wetlands, designated for use for the immediate stabilization of wetlands, on mats, geotextile fabric in order to prevent entry in state waters. These materials should be managed in a manner that prevents leachates from entering state waters and must be entirely removed within thirty days following completion of that construction activity. The disturbed areas should be returned to their original contours, stabilized within thirty days following removal of the stockpile, and restored to the original vegetated state.
- Flag or mark all non-impacted surface waters within the project or right-of-way limits that are within 50 feet of any clearing, grading, or filling activities for the life of the construction activity within that area. The applicant should notify all contractors that these marked areas are surface waters where no activities are to occur.
- Employ measures to prevent spills of fuels or lubricants into state waters.

3

1(d) Agency Requirement. Submit a JPA for the proposed impacts to wetlands and surface waters to obtain a VWP Permit as necessary. 4

2. Subaqueous Lands and Tidal Wetlands. The DEIS (page 4-10) indicates that a small portion of the wetlands in the northern section of the project (along Build Alternatives 1 and 2A) are tidally influenced. Impacts are minimized by spanning waterways and placing as little infrastructure in the waters as possible. The DEIS indicates (pages 4-73) that expanded bridge crossings will require the use of submerged lands for piers or infrastructure. A JPA will be submitted for these impacts.

2(a) Agency Jurisdiction. The Virginia Marine Resources Commission (VMRC) regulates encroachments in, on or over state-owned subaqueous beds as well as tidal wetlands pursuant to Virginia Code § 28.2-1200 through 1400.

The VMRC serves as the clearinghouse for the JPA used by the:

- Corps for issuing permits pursuant to Section 404 of the Clean Water Act and Section 10 of the Rivers and Harbors Act;
- DEQ for issuance of a VWP permit;
- VMRC for encroachments on or over state-owned subaqueous beds as well as tidal wetlands; and
- local wetlands board for impacts to wetlands.

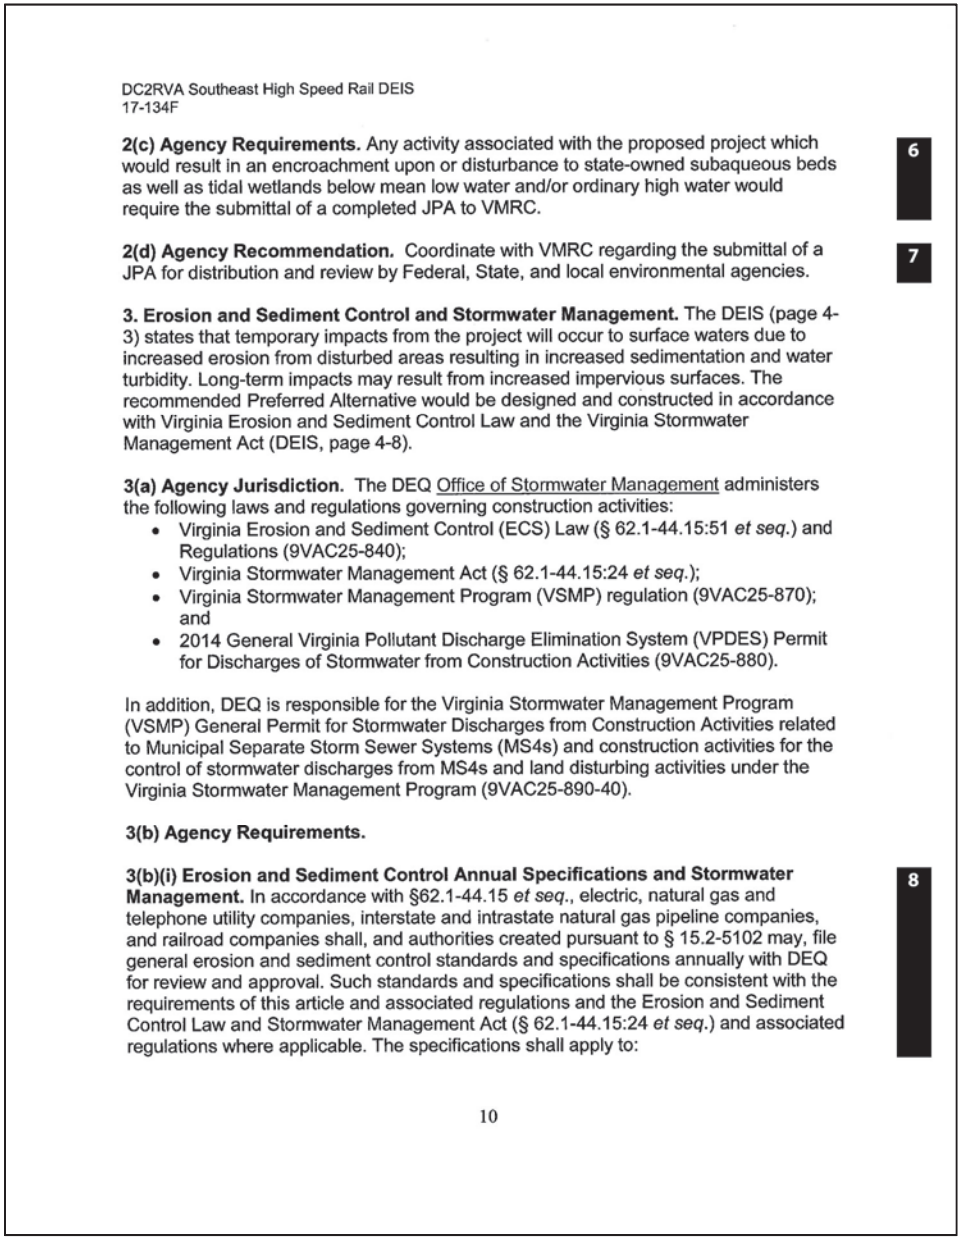
The VMRC will distribute the completed JPA to the appropriate agencies. Each agency will conduct its review and respond.

2(b) Agency Findings. VMRC did not comment on the proposal. 5

VIRGINIA DEQ (continued)

(Response to comment 4 on previous page)

5. Comment noted; DRPT did not receive comments directly from VRMC.



6 **2(c) Agency Requirements.** Any activity associated with the proposed project which would result in an encroachment upon or disturbance to state-owned subaqueous beds as well as tidal wetlands below mean low water and/or ordinary high water would require the submittal of a completed JPA to VMRC.

7 **2(d) Agency Recommendation.** Coordinate with VMRC regarding the submittal of a JPA for distribution and review by Federal, State, and local environmental agencies.

3. Erosion and Sediment Control and Stormwater Management. The DEIS (page 4-3) states that temporary impacts from the project will occur to surface waters due to increased erosion from disturbed areas resulting in increased sedimentation and water turbidity. Long-term impacts may result from increased impervious surfaces. The recommended Preferred Alternative would be designed and constructed in accordance with Virginia Erosion and Sediment Control Law and the Virginia Stormwater Management Act (DEIS, page 4-8).

3(a) Agency Jurisdiction. The DEQ Office of Stormwater Management administers the following laws and regulations governing construction activities:

- Virginia Erosion and Sediment Control (ECS) Law (§ 62.1-44.15:51 *et seq.*) and Regulations (9VAC25-840);
- Virginia Stormwater Management Act (§ 62.1-44.15:24 *et seq.*);
- Virginia Stormwater Management Program (VSMP) regulation (9VAC25-870); and
- 2014 General Virginia Pollutant Discharge Elimination System (VPDES) Permit for Discharges of Stormwater from Construction Activities (9VAC25-880).

In addition, DEQ is responsible for the Virginia Stormwater Management Program (VSMP) General Permit for Stormwater Discharges from Construction Activities related to Municipal Separate Storm Sewer Systems (MS4s) and construction activities for the control of stormwater discharges from MS4s and land disturbing activities under the Virginia Stormwater Management Program (9VAC25-890-40).

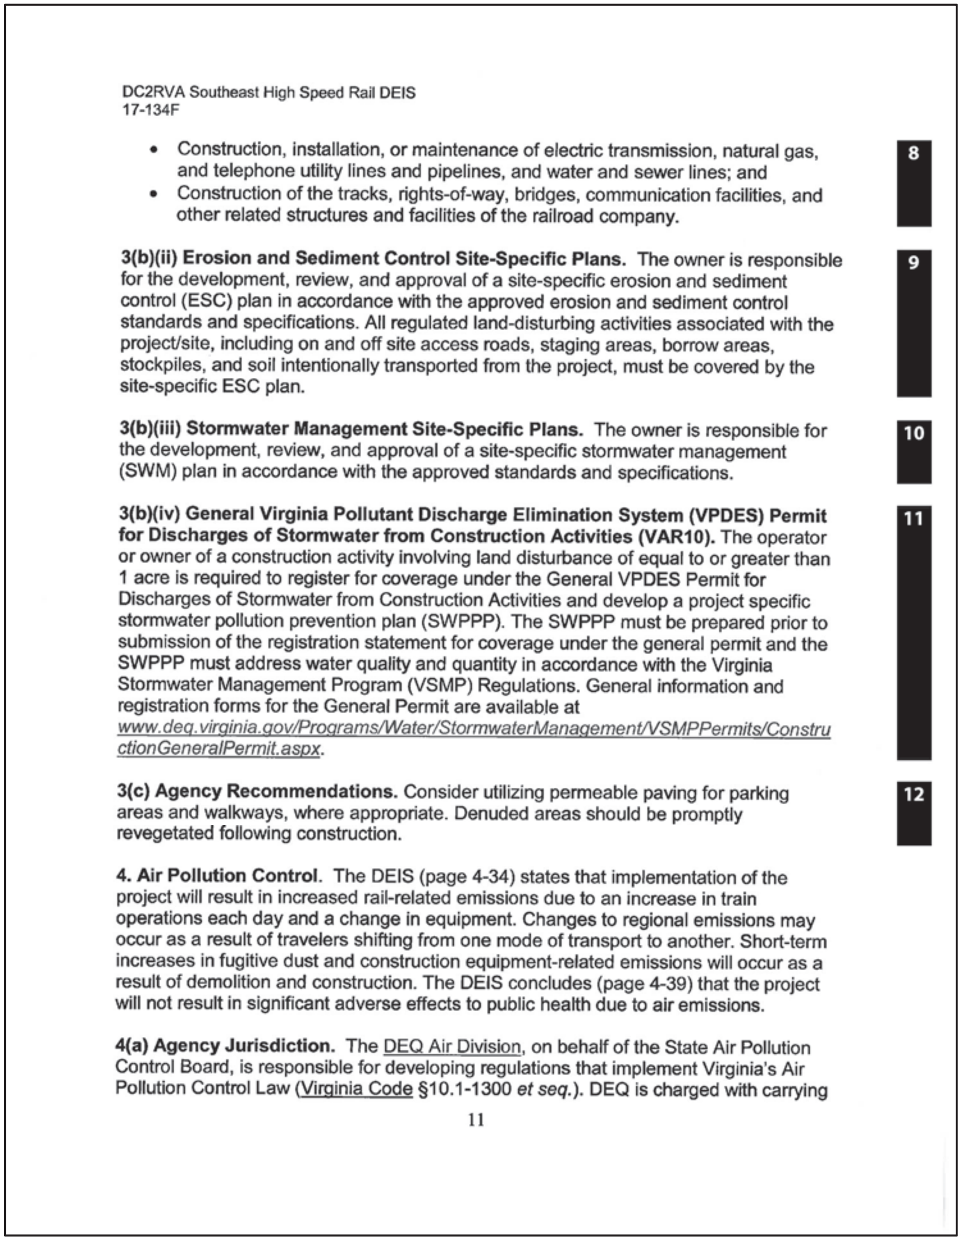
3(b) Agency Requirements.

8 **3(b)(i) Erosion and Sediment Control Annual Specifications and Stormwater Management.** In accordance with §62.1-44.15 *et seq.*, electric, natural gas and telephone utility companies, interstate and intrastate natural gas pipeline companies, and railroad companies shall, and authorities created pursuant to § 15.2-5102 may, file general erosion and sediment control standards and specifications annually with DEQ for review and approval. Such standards and specifications shall be consistent with the requirements of this article and associated regulations and the Erosion and Sediment Control Law and Stormwater Management Act (§ 62.1-44.15:24 *et seq.*) and associated regulations where applicable. The specifications shall apply to:

VIRGINIA DEQ (continued)

6. and 7. Refer to DRPT-numbered statements #2 through #4 for response. Additionally, Section 5.1.5 of the Final EIS identifies permit authority by VMRC for activities in, on, or over subaqueous lands in Virginia.

8. DRPT will file erosion and sediment control standards and specifications with DEQ for review and approval in accordance with the Virginia Erosion and Sediment Control (ESC) Law (§ 62. 1-44. 15:51 et seq.), the Virginia Stormwater Management Act (§ 62. 1-44. 15:24 et seq.) and associated regulations, where applicable and as required at the time of submittal, during final design after funding becomes available and incremental improvements are scheduled.



DC2RVA Southeast High Speed Rail DEIS
17-134F

8
- Construction, installation, or maintenance of electric transmission, natural gas, and telephone utility lines and pipelines, and water and sewer lines; and
- Construction of the tracks, rights-of-way, bridges, communication facilities, and other related structures and facilities of the railroad company.

9 **3(b)(ii) Erosion and Sediment Control Site-Specific Plans.** The owner is responsible for the development, review, and approval of a site-specific erosion and sediment control (ESC) plan in accordance with the approved erosion and sediment control standards and specifications. All regulated land-disturbing activities associated with the project/site, including on and off site access roads, staging areas, borrow areas, stockpiles, and soil intentionally transported from the project, must be covered by the site-specific ESC plan.

10 **3(b)(iii) Stormwater Management Site-Specific Plans.** The owner is responsible for the development, review, and approval of a site-specific stormwater management (SWM) plan in accordance with the approved standards and specifications.

11 **3(b)(iv) General Virginia Pollutant Discharge Elimination System (VPDES) Permit for Discharges of Stormwater from Construction Activities (VAR10).** The operator or owner of a construction activity involving land disturbance of equal to or greater than 1 acre is required to register for coverage under the General VPDES Permit for Discharges of Stormwater from Construction Activities and develop a project specific stormwater pollution prevention plan (SWPPP). The SWPPP must be prepared prior to submission of the registration statement for coverage under the general permit and the SWPPP must address water quality and quantity in accordance with the Virginia Stormwater Management Program (VSMP) Regulations. General information and registration forms for the General Permit are available at *www.deq.virginia.gov/Programs/Water/StormwaterManagement/VSMPPermits/ConstructionGeneralPermit.aspx*.

12 **3(c) Agency Recommendations.** Consider utilizing permeable paving for parking areas and walkways, where appropriate. Denuded areas should be promptly revegetated following construction.

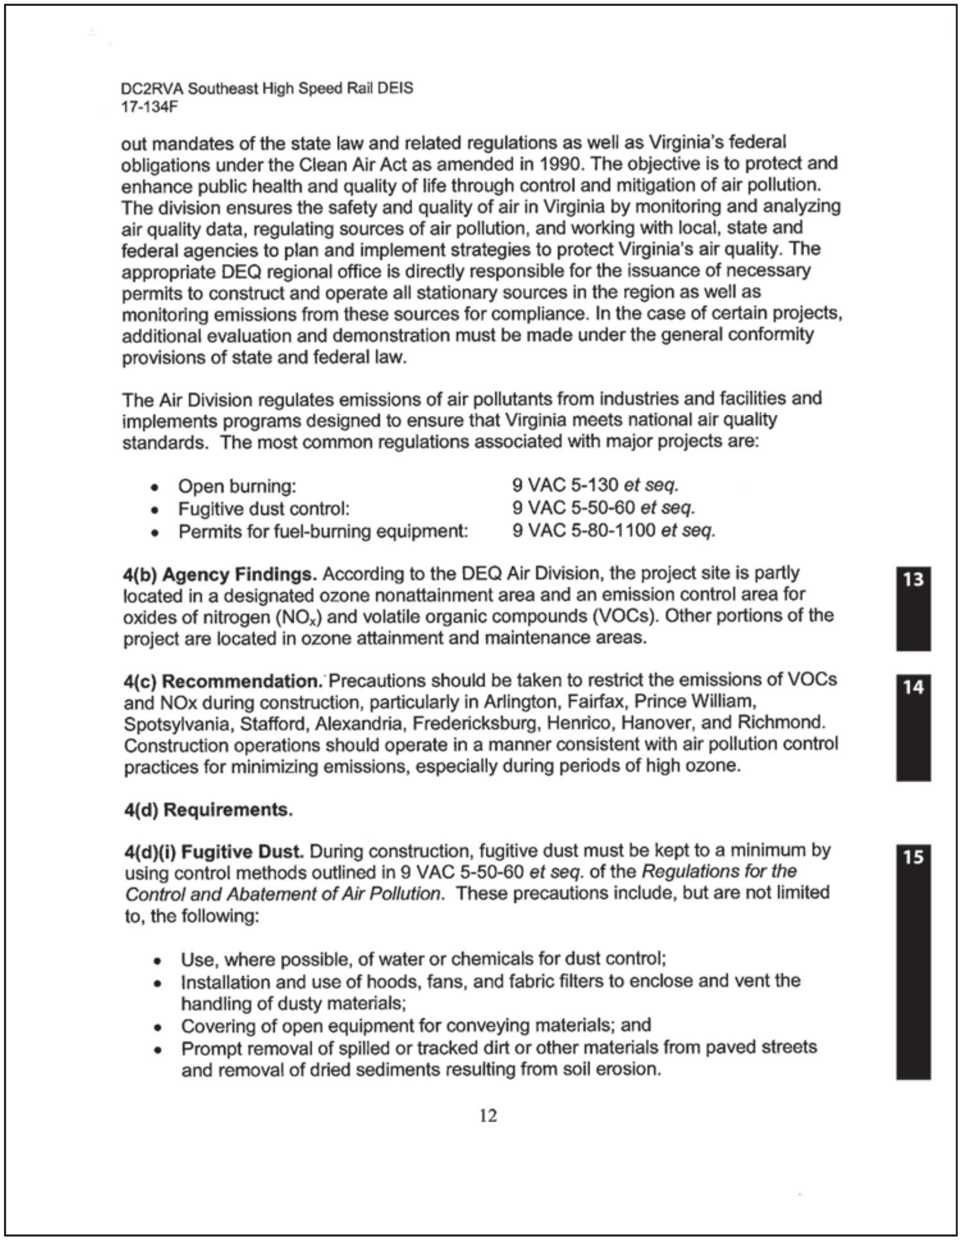
4. Air Pollution Control. The DEIS (page 4-34) states that implementation of the project will result in increased rail-related emissions due to an increase in train operations each day and a change in equipment. Changes to regional emissions may occur as a result of travelers shifting from one mode of transport to another. Short-term increases in fugitive dust and construction equipment-related emissions will occur as a result of demolition and construction. The DEIS concludes (page 4-39) that the project will not result in significant adverse effects to public health due to air emissions.

4(a) Agency Jurisdiction. The DEQ Air Division, on behalf of the State Air Pollution Control Board, is responsible for developing regulations that implement Virginia's Air Pollution Control Law (Virginia Code §10.1-1300 *et seq.*). DEQ is charged with carrying

VIRGINIA DEQ (continued)

(Response to comment 8 on previous page)

9. DRPT will develop and submit to DEQ a site-specific ESC plan in accordance with the approved erosion and sediment control standards and specifications, as required at the time of submittal, during final design after funding becomes available and incremental improvements are scheduled. All regulated land-disturbing activities associated with the Project will be covered by the site-specific ESC plan.
10. DRPT will develop and submit to DEQ a site-specific stormwater management (SWM) plan in accordance with the approved standards and specifications, as required at the time of submittal, during final design after funding becomes available and incremental improvements are scheduled.
11. DRPT will register for coverage under the General VPDES Permit for Discharges of Stormwater from Construction Activities and develop a Project-specific stormwater pollution prevention plan (SWPPP), as required at the time of submittal, during final design after funding becomes available and incremental improvements are scheduled.
12. DRPT will consider utilizing permeable paving for parking areas and walkways, where practicable, during final design, after funding becomes available and incremental improvements are scheduled. DRPT will revegetate denuded areas, after construction.



DC2RVA Southeast High Speed Rail DEIS
17-134F

out mandates of the state law and related regulations as well as Virginia's federal obligations under the Clean Air Act as amended in 1990. The objective is to protect and enhance public health and quality of life through control and mitigation of air pollution. The division ensures the safety and quality of air in Virginia by monitoring and analyzing air quality data, regulating sources of air pollution, and working with local, state and federal agencies to plan and implement strategies to protect Virginia's air quality. The appropriate DEQ regional office is directly responsible for the issuance of necessary permits to construct and operate all stationary sources in the region as well as monitoring emissions from these sources for compliance. In the case of certain projects, additional evaluation and demonstration must be made under the general conformity provisions of state and federal law.

The Air Division regulates emissions of air pollutants from industries and facilities and implements programs designed to ensure that Virginia meets national air quality standards. The most common regulations associated with major projects are:

• Open burning:	9 VAC 5-130 *et seq.*
• Fugitive dust control:	9 VAC 5-50-60 *et seq.*
• Permits for fuel-burning equipment:	9 VAC 5-80-1100 *et seq.*

4(b) Agency Findings. According to the DEQ Air Division, the project site is partly located in a designated ozone nonattainment area and an emission control area for oxides of nitrogen (NO_x) and volatile organic compounds (VOCs). Other portions of the project are located in ozone attainment and maintenance areas. 13

4(c) Recommendation. Precautions should be taken to restrict the emissions of VOCs and NOx during construction, particularly in Arlington, Fairfax, Prince William, Spotsylvania, Stafford, Alexandria, Fredericksburg, Henrico, Hanover, and Richmond. Construction operations should operate in a manner consistent with air pollution control practices for minimizing emissions, especially during periods of high ozone. 14

4(d) Requirements.

4(d)(i) Fugitive Dust. During construction, fugitive dust must be kept to a minimum by using control methods outlined in 9 VAC 5-50-60 *et seq.* of the *Regulations for the Control and Abatement of Air Pollution*. These precautions include, but are not limited to, the following: 15

- Use, where possible, of water or chemicals for dust control;
- Installation and use of hoods, fans, and fabric filters to enclose and vent the handling of dusty materials;
- Covering of open equipment for conveying materials; and
- Prompt removal of spilled or tracked dirt or other materials from paved streets and removal of dried sediments resulting from soil erosion.

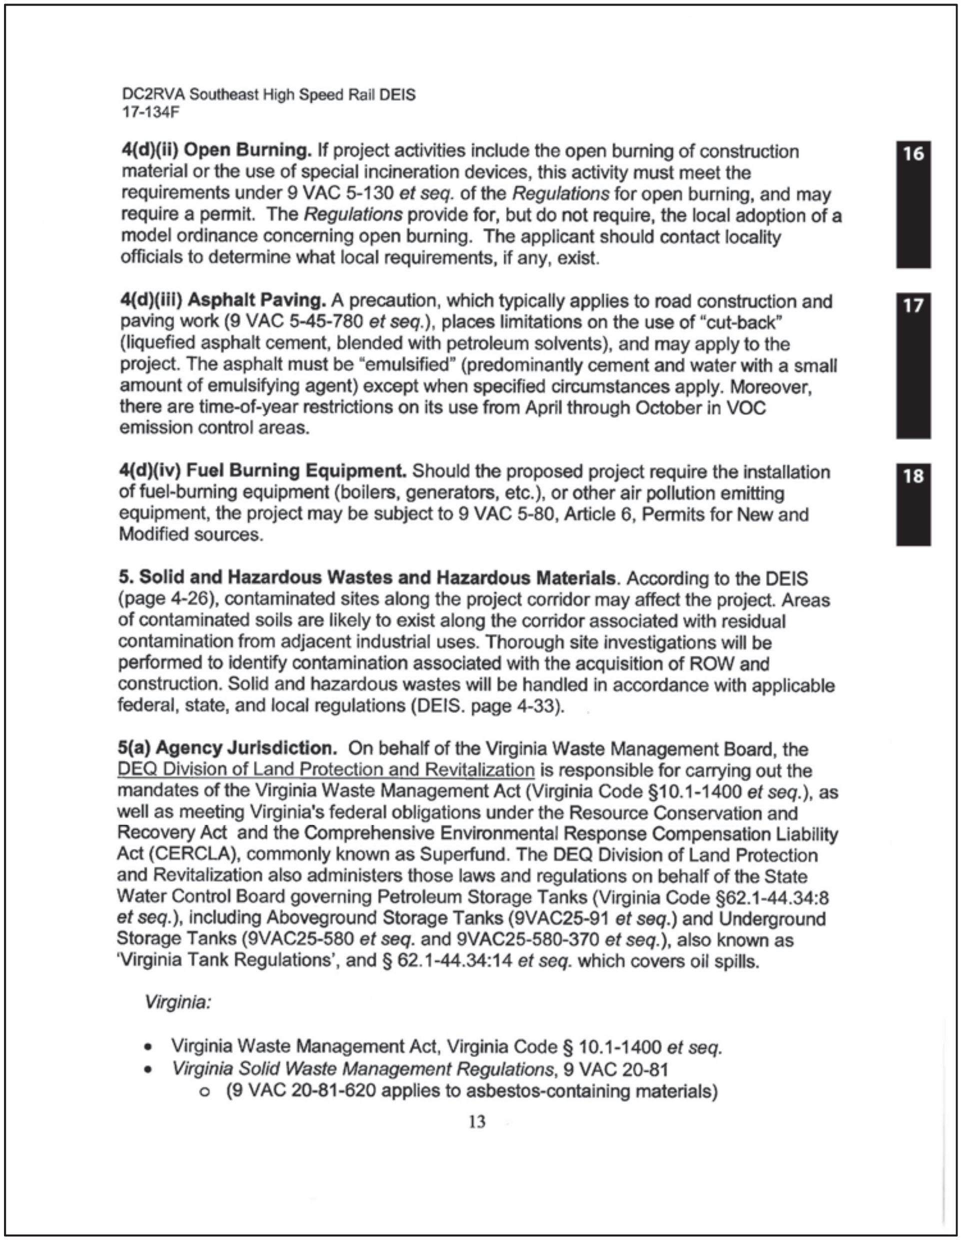
12

VIRGINIA DEQ (continued)

13. The Draft EIS identified the Washington, DC-MD-VA marginal ozone nonattainment area in Table 3.6-2 and in Figure 3.6-1, and it is reflected in the air quality analysis for the Preferred Alternative (refer to Section 5.6 of the Final EIS).

14. DRPT will take all reasonable precautions during Project construction to limit the emissions of VOC and NOx. A statement to this effect has been added to Section 5.19 of the Final EIS.

15. Draft EIS Section 4.19.2.3 addresses measures to control fugitive dust during construction, including methods outlined in 9 VAC 5-50-60 *et seq*. of the *Regulations for the Control and Abatement of Air Pollution*. Reference to these regulations has been added to Section 5.19 of the Final EIS.



DC2RVA Southeast High Speed Rail DEIS
17-134F

16 **4(d)(ii) Open Burning.** If project activities include the open burning of construction material or the use of special incineration devices, this activity must meet the requirements under 9 VAC 5-130 *et seq.* of the *Regulations* for open burning, and may require a permit. The *Regulations* provide for, but do not require, the local adoption of a model ordinance concerning open burning. The applicant should contact locality officials to determine what local requirements, if any, exist.

17 **4(d)(iii) Asphalt Paving.** A precaution, which typically applies to road construction and paving work (9 VAC 5-45-780 *et seq.*), places limitations on the use of "cut-back" (liquefied asphalt cement, blended with petroleum solvents), and may apply to the project. The asphalt must be "emulsified" (predominantly cement and water with a small amount of emulsifying agent) except when specified circumstances apply. Moreover, there are time-of-year restrictions on its use from April through October in VOC emission control areas.

18 **4(d)(iv) Fuel Burning Equipment.** Should the proposed project require the installation of fuel-burning equipment (boilers, generators, etc.), or other air pollution emitting equipment, the project may be subject to 9 VAC 5-80, Article 6, Permits for New and Modified sources.

5. Solid and Hazardous Wastes and Hazardous Materials. According to the DEIS (page 4-26), contaminated sites along the project corridor may affect the project. Areas of contaminated soils are likely to exist along the corridor associated with residual contamination from adjacent industrial uses. Thorough site investigations will be performed to identify contamination associated with the acquisition of ROW and construction. Solid and hazardous wastes will be handled in accordance with applicable federal, state, and local regulations (DEIS. page 4-33).

5(a) Agency Jurisdiction. On behalf of the Virginia Waste Management Board, the DEQ Division of Land Protection and Revitalization is responsible for carrying out the mandates of the Virginia Waste Management Act (Virginia Code §10.1-1400 *et seq.*), as well as meeting Virginia's federal obligations under the Resource Conservation and Recovery Act and the Comprehensive Environmental Response Compensation Liability Act (CERCLA), commonly known as Superfund. The DEQ Division of Land Protection and Revitalization also administers those laws and regulations on behalf of the State Water Control Board governing Petroleum Storage Tanks (Virginia Code §62.1-44.34:8 *et seq.*), including Aboveground Storage Tanks (9VAC25-91 *et seq.*) and Underground Storage Tanks (9VAC25-580 *et seq.* and 9VAC25-580-370 *et seq.*), also known as 'Virginia Tank Regulations', and § 62.1-44.34:14 *et seq.* which covers oil spills.

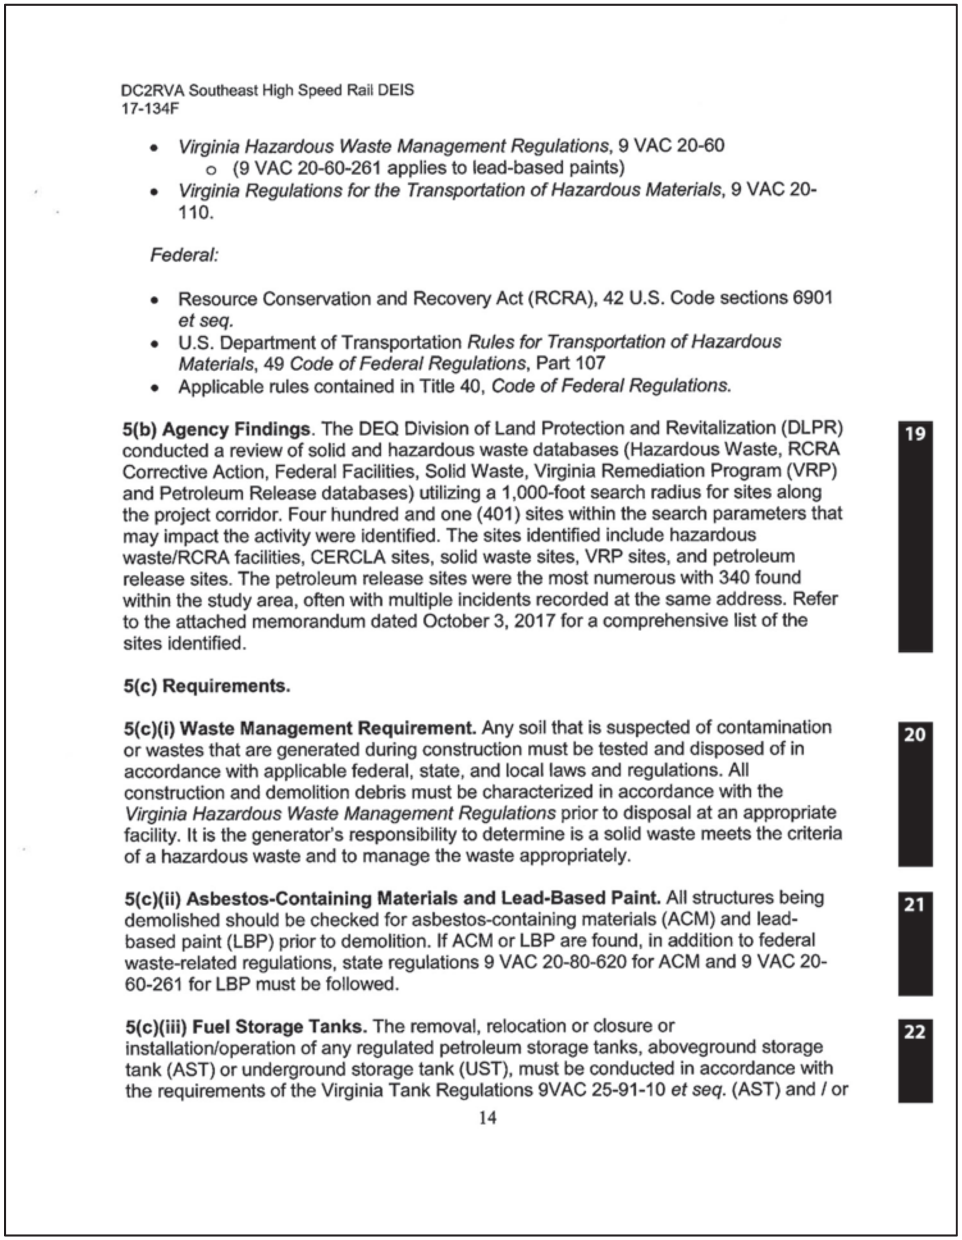
Virginia:

- Virginia Waste Management Act, Virginia Code § 10.1-1400 *et seq.*
- *Virginia Solid Waste Management Regulations*, 9 VAC 20-81
    - (9 VAC 20-81-620 applies to asbestos-containing materials)

13

VIRGINIA DEQ (continued)

16. If open burning or use of incineration devices are to be used during construction, DRPT would comply with 9 VAC 5-130 et seq. of the Regulations for open burning and coordinate with DEQ and local officials to determine whether permits or other requirements are applicable. A statement to this effect has been added to Section 5.19 of the Final EIS.
17. DRPT will adhere to limitations on the use of "cut-back" during construction consistent with 9 VAC 5-45-780 *et seq*. A statement to this effect has been added to Section 5.19 of the Final EIS.
18. DRPT will adhere to requirements of 9 VAC 5-80, Article 6, Permits for New and Modified Sources, for the installation of fuel-burning equipment or other air pollution generating equipment during construction. A statement to this effect has been added to Section 5.19.2.3 of the Final EIS.



DC2RVA Southeast High Speed Rail DEIS
17-134F

- *Virginia Hazardous Waste Management Regulations*, 9 VAC 20-60
    - (9 VAC 20-60-261 applies to lead-based paints)
- *Virginia Regulations for the Transportation of Hazardous Materials*, 9 VAC 20-110.

Federal:

- Resource Conservation and Recovery Act (RCRA), 42 U.S. Code sections 6901 *et seq.*
- U.S. Department of Transportation *Rules for Transportation of Hazardous Materials*, 49 *Code of Federal Regulations*, Part 107
- Applicable rules contained in Title 40, *Code of Federal Regulations.*

5(b) Agency Findings. The DEQ Division of Land Protection and Revitalization (DLPR) conducted a review of solid and hazardous waste databases (Hazardous Waste, RCRA Corrective Action, Federal Facilities, Solid Waste, Virginia Remediation Program (VRP) and Petroleum Release databases) utilizing a 1,000-foot search radius for sites along the project corridor. Four hundred and one (401) sites within the search parameters that may impact the activity were identified. The sites identified include hazardous waste/RCRA facilities, CERCLA sites, solid waste sites, VRP sites, and petroleum release sites. The petroleum release sites were the most numerous with 340 found within the study area, often with multiple incidents recorded at the same address. Refer to the attached memorandum dated October 3, 2017 for a comprehensive list of the sites identified. 19

5(c) Requirements.

5(c)(i) Waste Management Requirement. Any soil that is suspected of contamination or wastes that are generated during construction must be tested and disposed of in accordance with applicable federal, state, and local laws and regulations. All construction and demolition debris must be characterized in accordance with the *Virginia Hazardous Waste Management Regulations* prior to disposal at an appropriate facility. It is the generator's responsibility to determine is a solid waste meets the criteria of a hazardous waste and to manage the waste appropriately. 20

5(c)(ii) Asbestos-Containing Materials and Lead-Based Paint. All structures being demolished should be checked for asbestos-containing materials (ACM) and lead-based paint (LBP) prior to demolition. If ACM or LBP are found, in addition to federal waste-related regulations, state regulations 9 VAC 20-80-620 for ACM and 9 VAC 20-60-261 for LBP must be followed. 21

5(c)(iii) Fuel Storage Tanks. The removal, relocation or closure or installation/operation of any regulated petroleum storage tanks, aboveground storage tank (AST) or underground storage tank (UST), must be conducted in accordance with the requirements of the Virginia Tank Regulations 9VAC 25-91-10 *et seq.* (AST) and / or 22

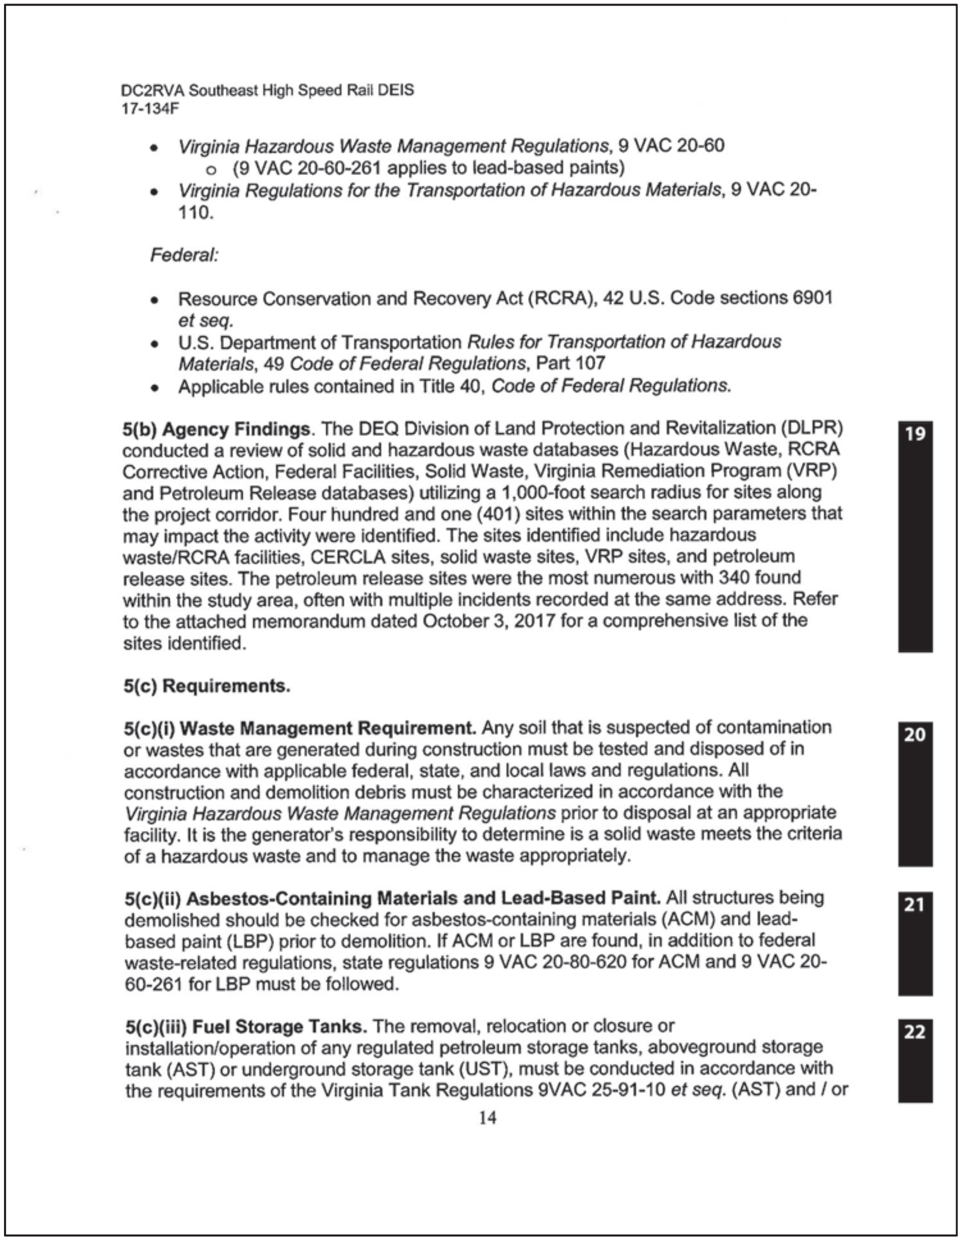
14

VIRGINIA DEQ (continued)

19. Comment noted. DRPT appreciates the list of hazardous materials sites provided by the DEQ Division of Land Protection and Revitalization (DLPR). As described in Draft EIS Section 3.5, a database search was conducted for hazardous materials sites within 500 feet of existing or proposed rail line. Draft EIS Table 3.5-1 lists the databases included in the search and Table 3.5-3 summarizes the sites by type within each of the six alternative areas. Maps in Draft EIS Appendix O show the locations of the sites and tables in Draft EIS Appendix O provide information on individual sites. As noted in Section 3.5.3 of the Draft EIS, the search revealed 1,034 mapped hazardous materials sites/facilities within the study area, most of which (702) are either Petroleum Registered Facilities or Petroleum Release Sites. Finally, further investigation of hazardous material sites/facilities that could potentially be affected by the Project will be completed in a Phase I Environmental Site Assessment (ESA) that will occur prior to any property acquisition.

    Final EIS Section 5.5.1 describes potential hazardous materials sites impacts based on limits of disturbance for the Preferred Alternative, which have been updated since the Draft EIS. Appendix M of the Final EIS also provides updated mapping of the critical hazardous materials sites in relation to the Preferred Alternative limits of disturbance.

(Responses are continued on next page)



DC2RVA Southeast High Speed Rail DEIS
17-134F

- *Virginia Hazardous Waste Management Regulations*, 9 VAC 20-60
    - (9 VAC 20-60-261 applies to lead-based paints)
- *Virginia Regulations for the Transportation of Hazardous Materials*, 9 VAC 20-110.

Federal:

- Resource Conservation and Recovery Act (RCRA), 42 U.S. Code sections 6901 *et seq.*
- U.S. Department of Transportation *Rules for Transportation of Hazardous Materials*, 49 *Code of Federal Regulations*, Part 107
- Applicable rules contained in Title 40, *Code of Federal Regulations.*

5(b) Agency Findings. The DEQ Division of Land Protection and Revitalization (DLPR) conducted a review of solid and hazardous waste databases (Hazardous Waste, RCRA Corrective Action, Federal Facilities, Solid Waste, Virginia Remediation Program (VRP) and Petroleum Release databases) utilizing a 1,000-foot search radius for sites along the project corridor. Four hundred and one (401) sites within the search parameters that may impact the activity were identified. The sites identified include hazardous waste/RCRA facilities, CERCLA sites, solid waste sites, VRP sites, and petroleum release sites. The petroleum release sites were the most numerous with 340 found within the study area, often with multiple incidents recorded at the same address. Refer to the attached memorandum dated October 3, 2017 for a comprehensive list of the sites identified. 19

5(c) Requirements.

5(c)(i) Waste Management Requirement. Any soil that is suspected of contamination or wastes that are generated during construction must be tested and disposed of in accordance with applicable federal, state, and local laws and regulations. All construction and demolition debris must be characterized in accordance with the *Virginia Hazardous Waste Management Regulations* prior to disposal at an appropriate facility. It is the generator's responsibility to determine is a solid waste meets the criteria of a hazardous waste and to manage the waste appropriately. 20

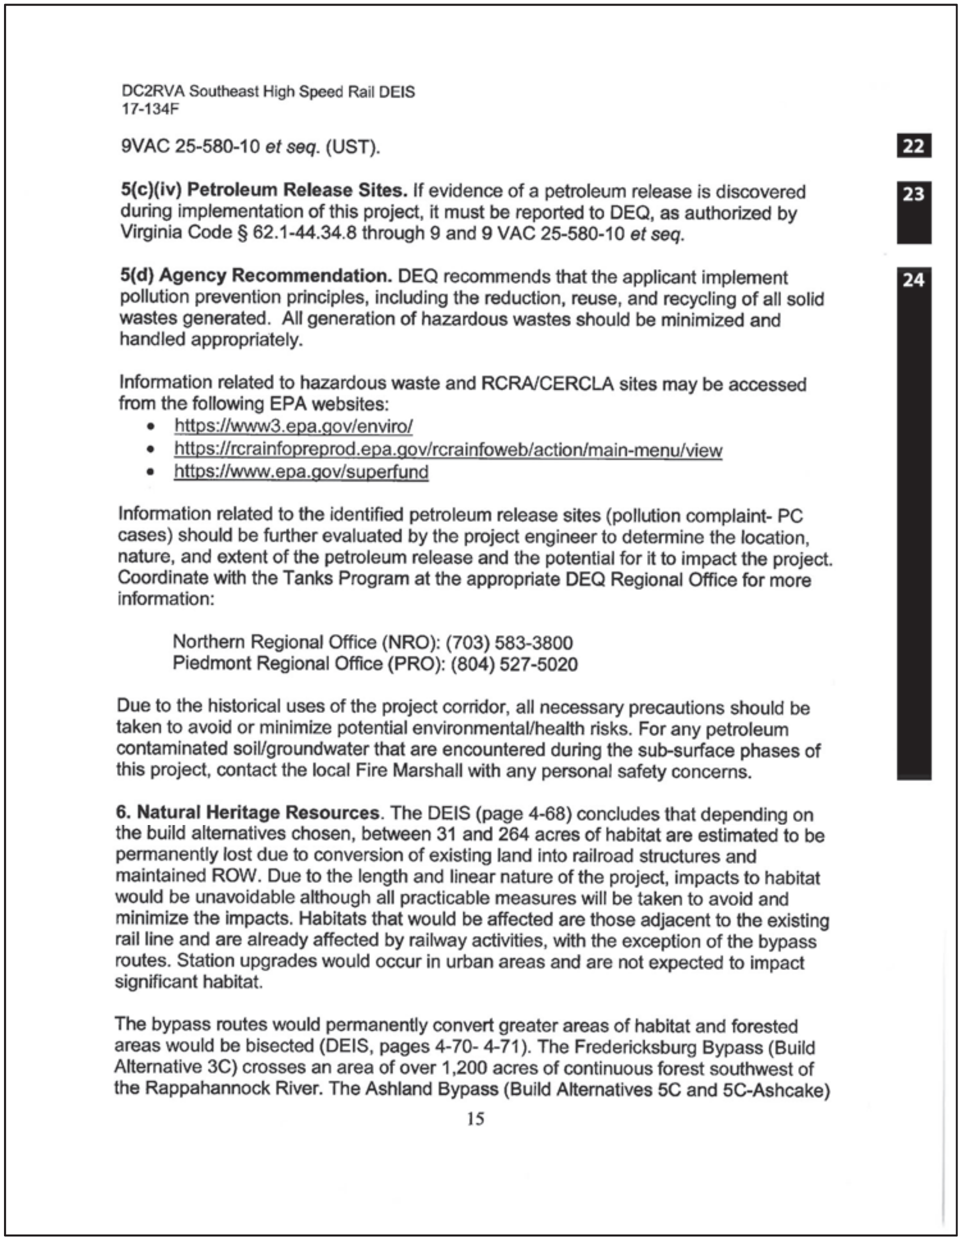
5(c)(ii) Asbestos-Containing Materials and Lead-Based Paint. All structures being demolished should be checked for asbestos-containing materials (ACM) and lead-based paint (LBP) prior to demolition. If ACM or LBP are found, in addition to federal waste-related regulations, state regulations 9 VAC 20-80-620 for ACM and 9 VAC 20-60-261 for LBP must be followed. 21

5(c)(iii) Fuel Storage Tanks. The removal, relocation or closure or installation/operation of any regulated petroleum storage tanks, aboveground storage tank (AST) or underground storage tank (UST), must be conducted in accordance with the requirements of the Virginia Tank Regulations 9VAC 25-91-10 *et seq.* (AST) and / or 22

14

VIRGINIA DEQ (continued)

20. to 23. DRPT will comply with the requirements for solid and hazardous wastes and hazardous materials specified by DEQ during construction. Section 5.5.2 of the Final EIS addresses the testing, removal and disposal of solid waste and hazardous waste during construction in accordance with the Virginia Solid Waste Management Regulations and Virginia Hazardous Waste Management Regulations. Prior to the acquisition of right-of-way and construction, thorough site investigations will be conducted, as required, to determine whether any of the sites are contaminated, and, if so, the nature and extent of that contamination. Any additional hazardous material sites discovered during construction will be removed and disposed of in compliance with all applicable federal, state, and local regulations. All structures being demolished, renovated, and/or removed will be inspected for asbestos containing materials (ACM) and lead-based paint (LBP) prior to demolition. If ACM or LBP are found, in addition to the federal waste-related regulations, state regulations for ACM and for LBP will be followed. All necessary remediation will be conducted in compliance with applicable federal, state, and local environmental laws and will be coordinated with the EPA, DEQ, and other federal or state or local agencies as necessary.



DC2RVA Southeast High Speed Rail DEIS
17-134F

9VAC 25-580-10 *et seq.* (UST). 22

23 **5(c)(iv) Petroleum Release Sites.** If evidence of a petroleum release is discovered during implementation of this project, it must be reported to DEQ, as authorized by Virginia Code § 62.1-44.34.8 through 9 and 9 VAC 25-580-10 *et seq.*

24 **5(d) Agency Recommendation.** DEQ recommends that the applicant implement pollution prevention principles, including the reduction, reuse, and recycling of all solid wastes generated. All generation of hazardous wastes should be minimized and handled appropriately.

Information related to hazardous waste and RCRA/CERCLA sites may be accessed from the following EPA websites:

- https://www3.epa.gov/enviro/
- https://rcrainfopreprod.epa.gov/rcrainfoweb/action/main-menu/view
- https://www.epa.gov/superfund

Information related to the identified petroleum release sites (pollution complaint- PC cases) should be further evaluated by the project engineer to determine the location, nature, and extent of the petroleum release and the potential for it to impact the project. Coordinate with the Tanks Program at the appropriate DEQ Regional Office for more information:

Northern Regional Office (NRO): (703) 583-3800
Piedmont Regional Office (PRO): (804) 527-5020

Due to the historical uses of the project corridor, all necessary precautions should be taken to avoid or minimize potential environmental/health risks. For any petroleum contaminated soil/groundwater that are encountered during the sub-surface phases of this project, contact the local Fire Marshall with any personal safety concerns.

6. Natural Heritage Resources. The DEIS (page 4-68) concludes that depending on the build alternatives chosen, between 31 and 264 acres of habitat are estimated to be permanently lost due to conversion of existing land into railroad structures and maintained ROW. Due to the length and linear nature of the project, impacts to habitat would be unavoidable although all practicable measures will be taken to avoid and minimize the impacts. Habitats that would be affected are those adjacent to the existing rail line and are already affected by railway activities, with the exception of the bypass routes. Station upgrades would occur in urban areas and are not expected to impact significant habitat.

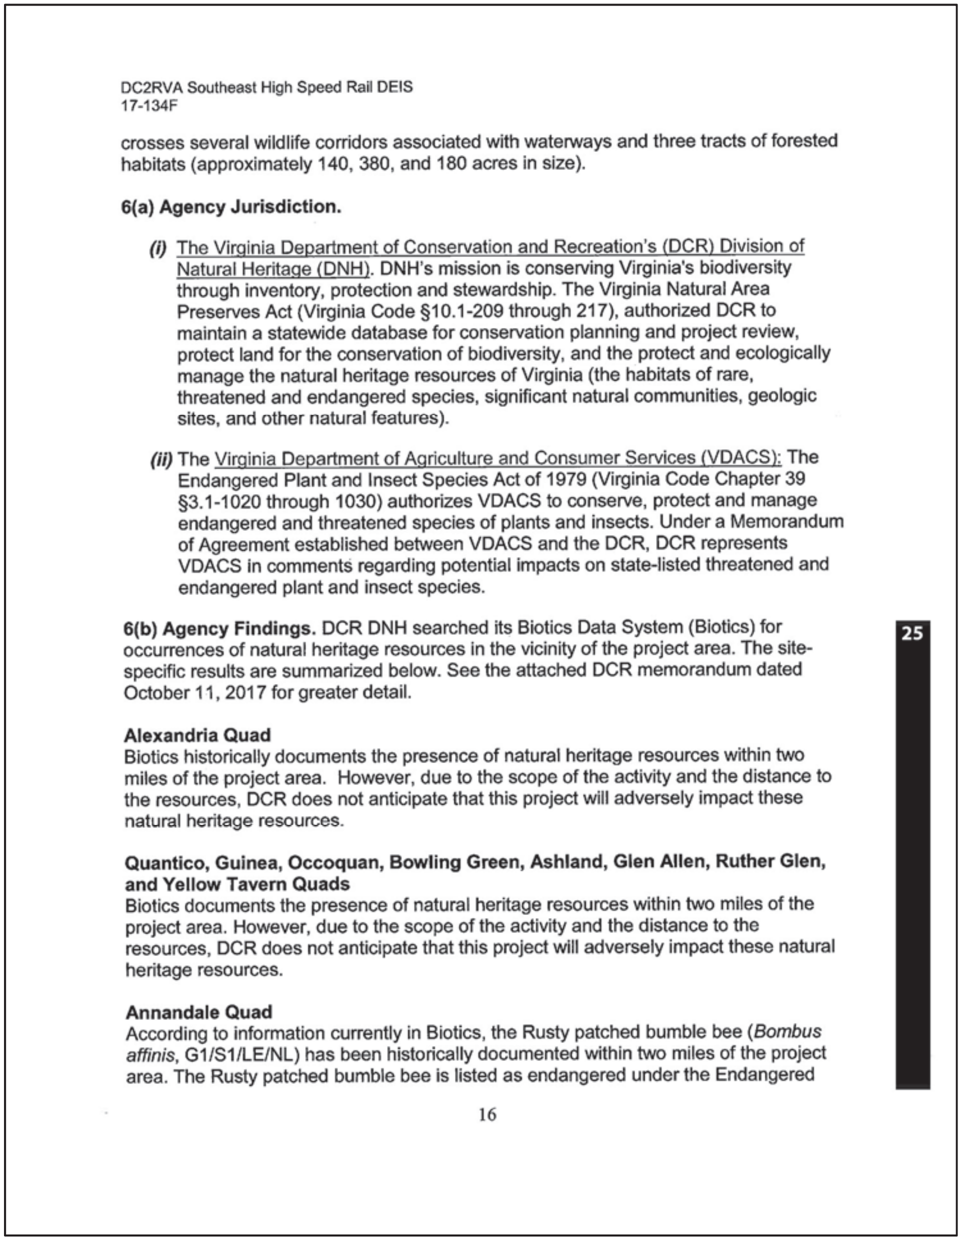
The bypass routes would permanently convert greater areas of habitat and forested areas would be bisected (DEIS, pages 4-70- 4-71). The Fredericksburg Bypass (Build Alternative 3C) crosses an area of over 1,200 acres of continuous forest southwest of the Rappahannock River. The Ashland Bypass (Build Alternatives 5C and 5C-Ashcake)

15

VIRGINIA DEQ (continued)

(Response to comments 22 and 23 on previous page)

24. DRPT will reduce, reuse, and recycle solid waste generated by the Project to the extent practicable. See response to comment #19 regarding the database search for hazardous materials sites reported in the Draft EIS and the Phase I ESA investigation that will be conducted prior to any property acquisition.



crosses several wildlife corridors associated with waterways and three tracts of forested habitats (approximately 140, 380, and 180 acres in size).

6(a) Agency Jurisdiction.

(i) The Virginia Department of Conservation and Recreation's (DCR) Division of Natural Heritage (DNH). DNH's mission is conserving Virginia's biodiversity through inventory, protection and stewardship. The Virginia Natural Area Preserves Act (Virginia Code §10.1-209 through 217), authorized DCR to maintain a statewide database for conservation planning and project review, protect land for the conservation of biodiversity, and the protect and ecologically manage the natural heritage resources of Virginia (the habitats of rare, threatened and endangered species, significant natural communities, geologic sites, and other natural features).

(ii) The Virginia Department of Agriculture and Consumer Services (VDACS): The Endangered Plant and Insect Species Act of 1979 (Virginia Code Chapter 39 §3.1-1020 through 1030) authorizes VDACS to conserve, protect and manage endangered and threatened species of plants and insects. Under a Memorandum of Agreement established between VDACS and the DCR, DCR represents VDACS in comments regarding potential impacts on state-listed threatened and endangered plant and insect species.

6(b) Agency Findings. DCR DNH searched its Biotics Data System (Biotics) for occurrences of natural heritage resources in the vicinity of the project area. The site-specific results are summarized below. See the attached DCR memorandum dated October 11, 2017 for greater detail.

25

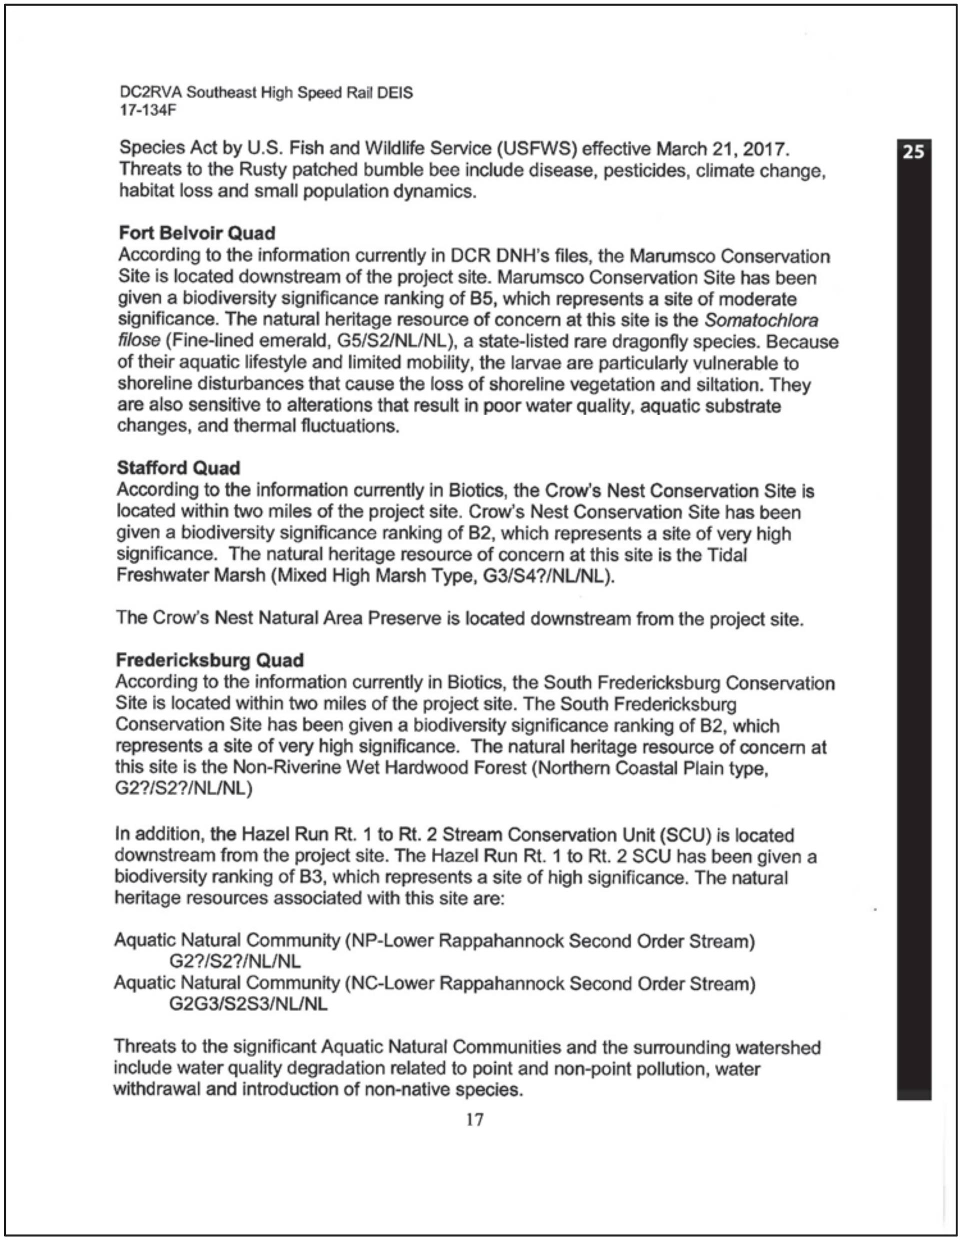
Alexandria Quad
Biotics historically documents the presence of natural heritage resources within two miles of the project area. However, due to the scope of the activity and the distance to the resources, DCR does not anticipate that this project will adversely impact these natural heritage resources.

Quantico, Guinea, Occoquan, Bowling Green, Ashland, Glen Allen, Ruther Glen, and Yellow Tavern Quads
Biotics documents the presence of natural heritage resources within two miles of the project area. However, due to the scope of the activity and the distance to the resources, DCR does not anticipate that this project will adversely impact these natural heritage resources.

Annandale Quad
According to information currently in Biotics, the Rusty patched bumble bee (*Bombus affinis*, G1/S1/LE/NL) has been historically documented within two miles of the project area. The Rusty patched bumble bee is listed as endangered under the Endangered

VIRGINIA DEQ (continued)

25. Refer to the referenced attached Virginia Department of Conservation and Recreation (DCR) memorandum (DRPT-numbered statements #103 through #126) for responses to detailed comments that are summarized here.



Species Act by U.S. Fish and Wildlife Service (USFWS) effective March 21, 2017. Threats to the Rusty patched bumble bee include disease, pesticides, climate change, habitat loss and small population dynamics.

Fort Belvoir Quad

According to the information currently in DCR DNH's files, the Marumsco Conservation Site is located downstream of the project site. Marumsco Conservation Site has been given a biodiversity significance ranking of B5, which represents a site of moderate significance. The natural heritage resource of concern at this site is the *Somatochlora filose* (Fine-lined emerald, G5/S2/NL/NL), a state-listed rare dragonfly species. Because of their aquatic lifestyle and limited mobility, the larvae are particularly vulnerable to shoreline disturbances that cause the loss of shoreline vegetation and siltation. They are also sensitive to alterations that result in poor water quality, aquatic substrate changes, and thermal fluctuations.

Stafford Quad

According to the information currently in Biotics, the Crow's Nest Conservation Site is located within two miles of the project site. Crow's Nest Conservation Site has been given a biodiversity significance ranking of B2, which represents a site of very high significance. The natural heritage resource of concern at this site is the Tidal Freshwater Marsh (Mixed High Marsh Type, G3/S4?/NL/NL).

The Crow's Nest Natural Area Preserve is located downstream from the project site.

Fredericksburg Quad

According to the information currently in Biotics, the South Fredericksburg Conservation Site is located within two miles of the project site. The South Fredericksburg Conservation Site has been given a biodiversity significance ranking of B2, which represents a site of very high significance. The natural heritage resource of concern at this site is the Non-Riverine Wet Hardwood Forest (Northern Coastal Plain type, G2?/S2?/NL/NL)

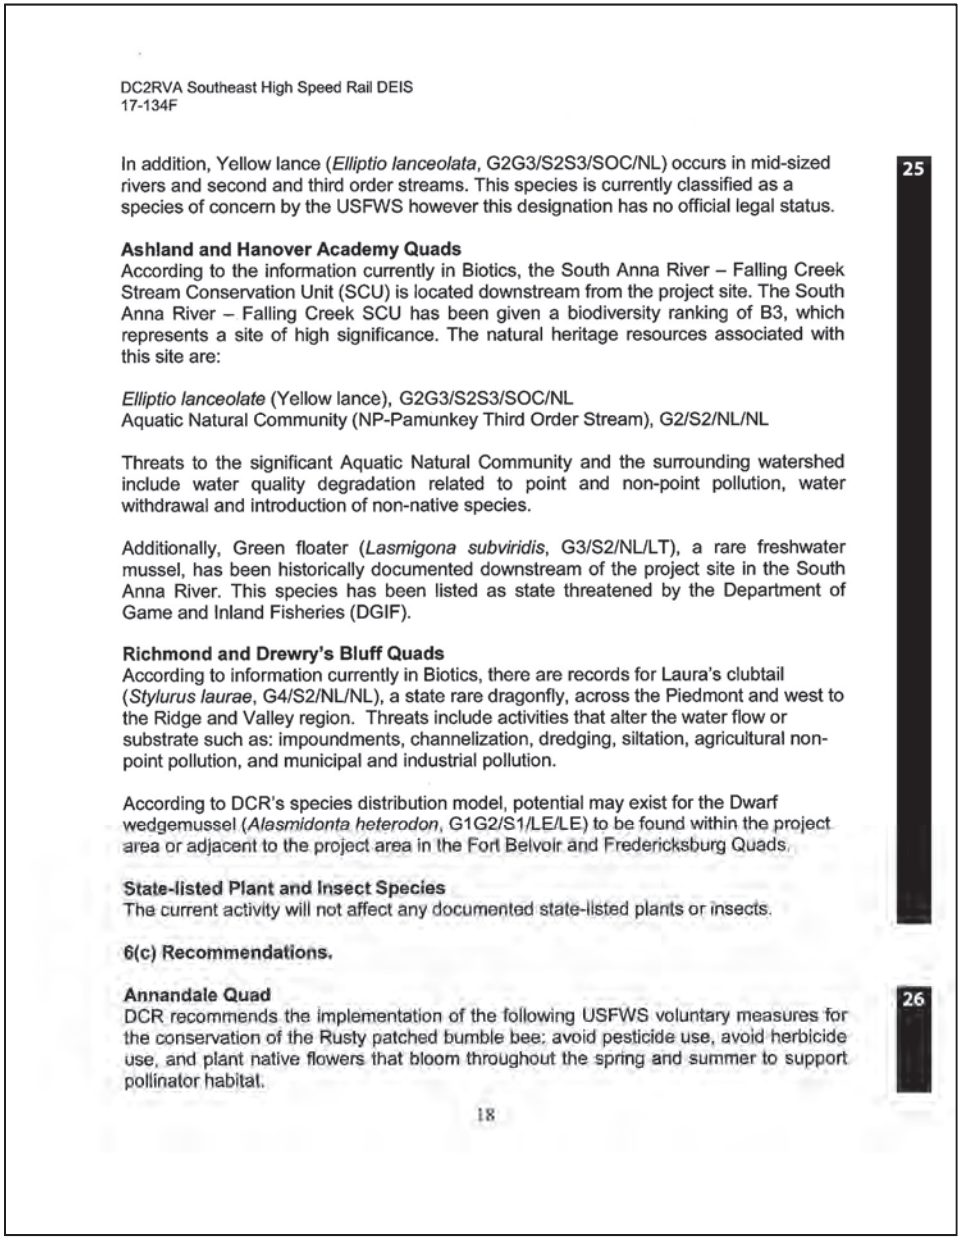
In addition, the Hazel Run Rt. 1 to Rt. 2 Stream Conservation Unit (SCU) is located downstream from the project site. The Hazel Run Rt. 1 to Rt. 2 SCU has been given a biodiversity ranking of B3, which represents a site of high significance. The natural heritage resources associated with this site are:

Aquatic Natural Community (NP-Lower Rappahannock Second Order Stream)
G2?/S2?/NL/NL
Aquatic Natural Community (NC-Lower Rappahannock Second Order Stream)
G2G3/S2S3/NL/NL

Threats to the significant Aquatic Natural Communities and the surrounding watershed include water quality degradation related to point and non-point pollution, water withdrawal and introduction of non-native species.

VIRGINIA DEQ (continued)

(Response to comment 25 on previous page)



DC2RVA Southeast High Speed Rail DEIS
17-134F

25

In addition, Yellow lance (*Elliptio lanceolata*, G2G3/S2S3/SOC/NL) occurs in mid-sized rivers and second and third order streams. This species is currently classified as a species of concern by the USFWS however this designation has no official legal status.

Ashland and Hanover Academy Quads
According to the information currently in Biotics, the South Anna River – Falling Creek Stream Conservation Unit (SCU) is located downstream from the project site. The South Anna River – Falling Creek SCU has been given a biodiversity ranking of B3, which represents a site of high significance. The natural heritage resources associated with this site are:

Elliptio lanceolate (Yellow lance), G2G3/S2S3/SOC/NL
Aquatic Natural Community (NP-Pamunkey Third Order Stream), G2/S2/NL/NL

Threats to the significant Aquatic Natural Community and the surrounding watershed include water quality degradation related to point and non-point pollution, water withdrawal and introduction of non-native species.

Additionally, Green floater (*Lasmigona subviridis*, G3/S2/NL/LT), a rare freshwater mussel, has been historically documented downstream of the project site in the South Anna River. This species has been listed as state threatened by the Department of Game and Inland Fisheries (DGIF).

Richmond and Drewry's Bluff Quads
According to information currently in Biotics, there are records for Laura's clubtail (*Stylurus laurae*, G4/S2/NL/NL), a state rare dragonfly, across the Piedmont and west to the Ridge and Valley region. Threats include activities that alter the water flow or substrate such as: impoundments, channelization, dredging, siltation, agricultural non-point pollution, and municipal and industrial pollution.

According to DCR's species distribution model, potential may exist for the Dwarf wedgemussel (*Alasmidonta heterodon*, G1G2/S1/LE/LE) to be found within the project area or adjacent to the project area in the Fort Belvoir and Fredericksburg Quads.

State-listed Plant and Insect Species
The current activity will not affect any documented state-listed plants or insects.

6(c) Recommendations.

26

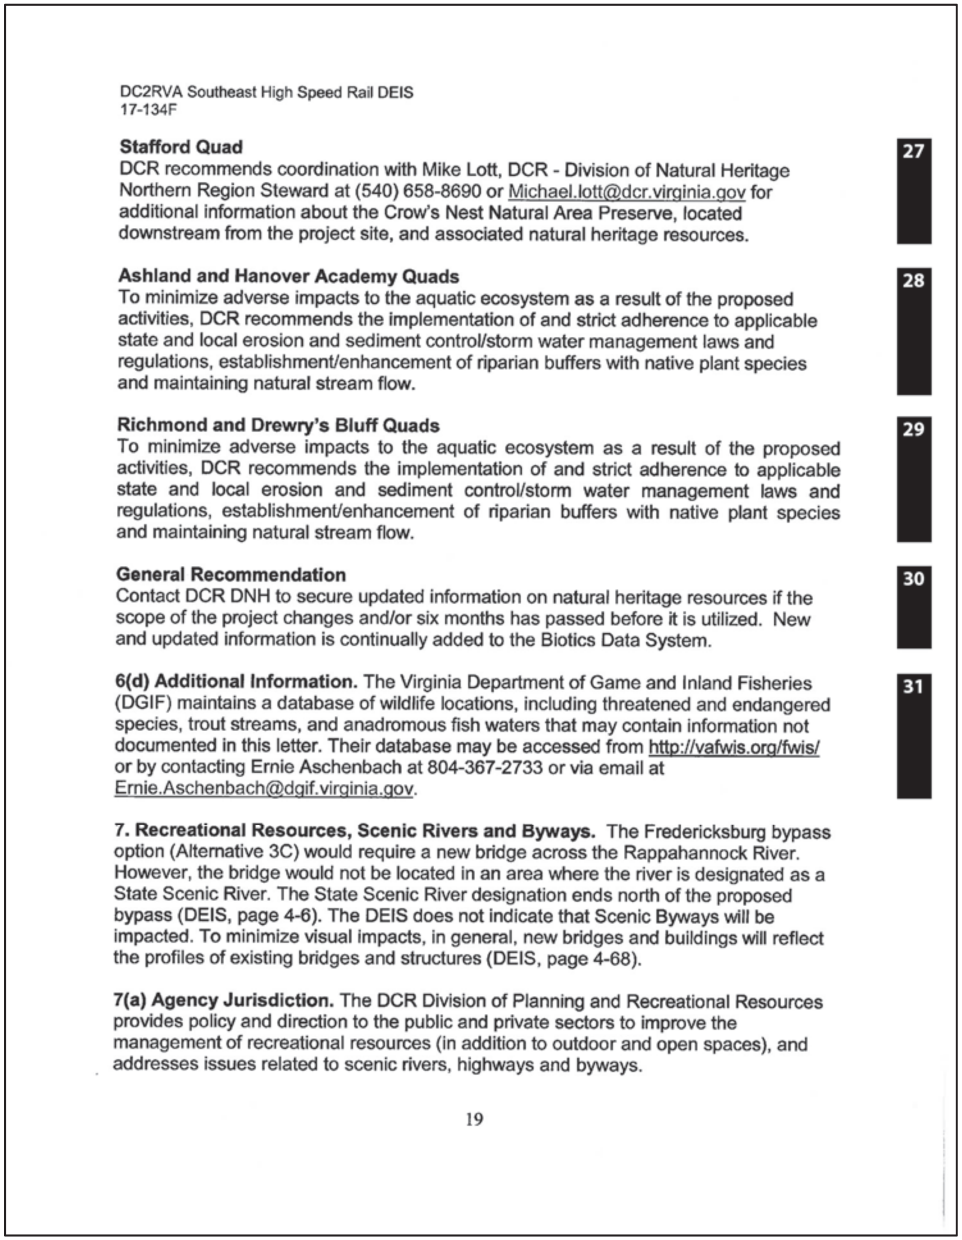
Annandale Quad
DCR recommends the implementation of the following USFWS voluntary measures for the conservation of the Rusty patched bumble bee: avoid pesticide use, avoid herbicide use, and plant native flowers that bloom throughout the spring and summer to support pollinator habitat.

18

VIRGINIA DEQ (continued)

(For response to comment 25, refer to pages B-74)

26. DRPT does not anticipate use of pesticides or herbicides as part of Project construction or operating the proposed additional intercity passenger trains. As noted in Section 5.10.3.2 of the Final EIS, during construction, DRPT will reduce the likelihood of adverse effects to rare, threatened and endangered species, and other wildlife through reseeding of disturbed areas with native plants.



DC2RVA Southeast High Speed Rail DEIS
17-134F

27 **Stafford Quad**
DCR recommends coordination with Mike Lott, DCR - Division of Natural Heritage Northern Region Steward at (540) 658-8690 or Michael.lott@dcr.virginia.gov for additional information about the Crow's Nest Natural Area Preserve, located downstream from the project site, and associated natural heritage resources.

28 **Ashland and Hanover Academy Quads**
To minimize adverse impacts to the aquatic ecosystem as a result of the proposed activities, DCR recommends the implementation of and strict adherence to applicable state and local erosion and sediment control/storm water management laws and regulations, establishment/enhancement of riparian buffers with native plant species and maintaining natural stream flow.

29 **Richmond and Drewry's Bluff Quads**
To minimize adverse impacts to the aquatic ecosystem as a result of the proposed activities, DCR recommends the implementation of and strict adherence to applicable state and local erosion and sediment control/storm water management laws and regulations, establishment/enhancement of riparian buffers with native plant species and maintaining natural stream flow.

30 **General Recommendation**
Contact DCR DNH to secure updated information on natural heritage resources if the scope of the project changes and/or six months has passed before it is utilized. New and updated information is continually added to the Biotics Data System.

31 **6(d) Additional Information.** The Virginia Department of Game and Inland Fisheries (DGIF) maintains a database of wildlife locations, including threatened and endangered species, trout streams, and anadromous fish waters that may contain information not documented in this letter. Their database may be accessed from http://vafwis.org/fwis/ or by contacting Ernie Aschenbach at 804-367-2733 or via email at Ernie.Aschenbach@dgif.virginia.gov.

7. Recreational Resources, Scenic Rivers and Byways. The Fredericksburg bypass option (Alternative 3C) would require a new bridge across the Rappahannock River. However, the bridge would not be located in an area where the river is designated as a State Scenic River. The State Scenic River designation ends north of the proposed bypass (DEIS, page 4-6). The DEIS does not indicate that Scenic Byways will be impacted. To minimize visual impacts, in general, new bridges and buildings will reflect the profiles of existing bridges and structures (DEIS, page 4-68).

7(a) Agency Jurisdiction. The DCR Division of Planning and Recreational Resources provides policy and direction to the public and private sectors to improve the management of recreational resources (in addition to outdoor and open spaces), and addresses issues related to scenic rivers, highways and byways.

19

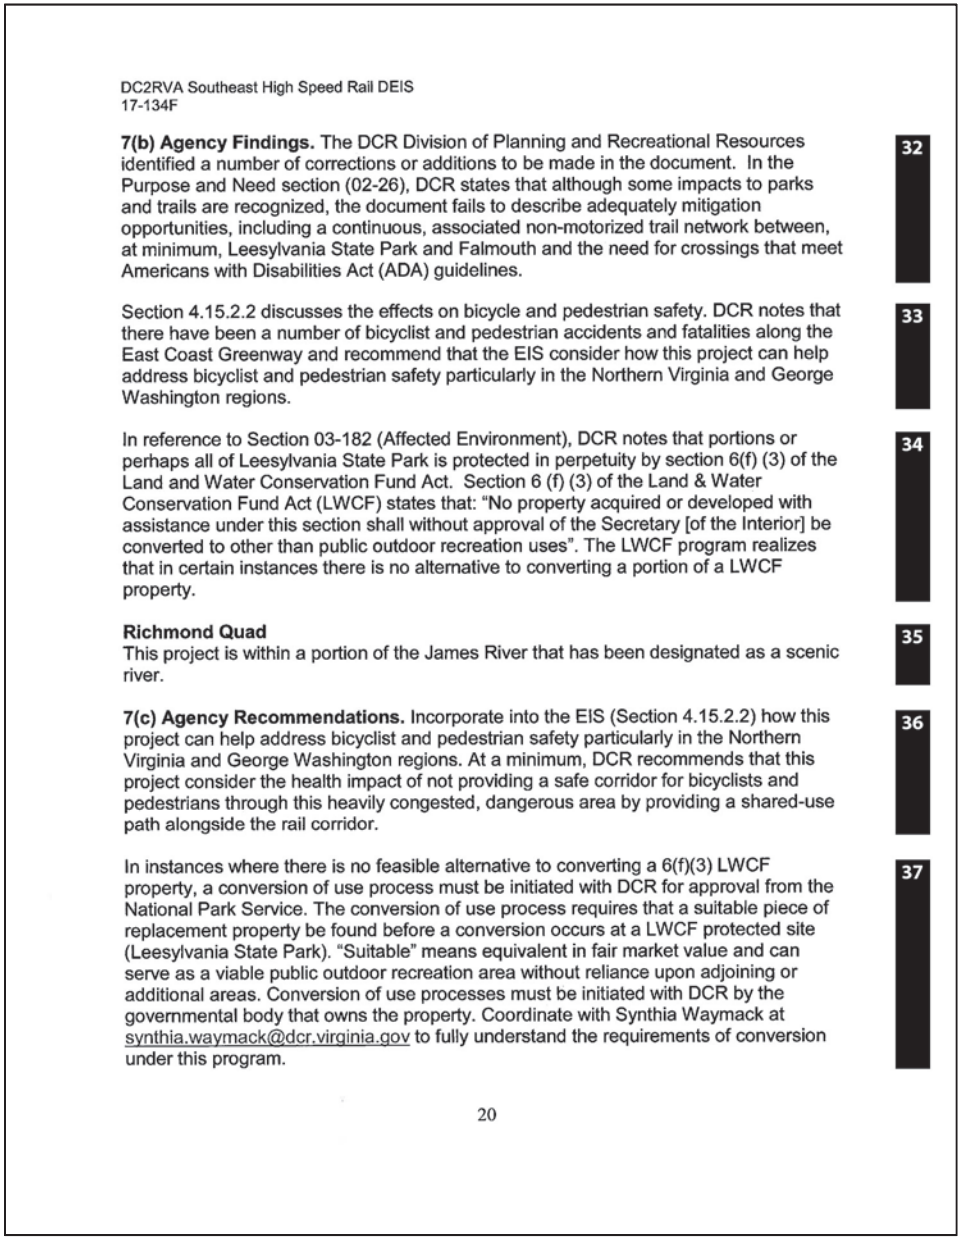
VIRGINIA DEQ (continued)

27. DRPT does not anticipate the need for further coordination with DCR concerning the Crow's Nest Natural Area preserve; however, DRPT will coordinate as recommended, if required.

28. and 29. As noted in Section 5.1.6.3 of the Final EIS, DRPT will implement appropriate erosion and sediment control practices as required, in accordance with the Virginia Erosion and Sediment Control Regulations and the Virginia Stormwater Management Law and regulations.

30. DRPT will coordinate with resource agencies to obtain updated sensitive resources information in the event of significant changes in Project scope and during final design, after funding becomes available and incremental improvements are scheduled.

31. DRPT searched VDGIF's Virginia Fish and Wildlife Information Service (VaFWIS) as part of the Draft EIS inventory of wildlife resources (see Draft EIS Section 3.10.5).



DC2RVA Southeast High Speed Rail DEIS
17-134F

32 **7(b) Agency Findings.** The DCR Division of Planning and Recreational Resources identified a number of corrections or additions to be made in the document. In the Purpose and Need section (02-26), DCR states that although some impacts to parks and trails are recognized, the document fails to describe adequately mitigation opportunities, including a continuous, associated non-motorized trail network between, at minimum, Leesylvania State Park and Falmouth and the need for crossings that meet Americans with Disabilities Act (ADA) guidelines.

33 Section 4.15.2.2 discusses the effects on bicycle and pedestrian safety. DCR notes that there have been a number of bicyclist and pedestrian accidents and fatalities along the East Coast Greenway and recommend that the EIS consider how this project can help address bicyclist and pedestrian safety particularly in the Northern Virginia and George Washington regions.

34 In reference to Section 03-182 (Affected Environment), DCR notes that portions or perhaps all of Leesylvania State Park is protected in perpetuity by section 6(f) (3) of the Land and Water Conservation Fund Act. Section 6 (f) (3) of the Land & Water Conservation Fund Act (LWCF) states that: “No property acquired or developed with assistance under this section shall without approval of the Secretary [of the Interior] be converted to other than public outdoor recreation uses”. The LWCF program realizes that in certain instances there is no alternative to converting a portion of a LWCF property.

35 **Richmond Quad**
This project is within a portion of the James River that has been designated as a scenic river.

36 **7(c) Agency Recommendations.** Incorporate into the EIS (Section 4.15.2.2) how this project can help address bicyclist and pedestrian safety particularly in the Northern Virginia and George Washington regions. At a minimum, DCR recommends that this project consider the health impact of not providing a safe corridor for bicyclists and pedestrians through this heavily congested, dangerous area by providing a shared-use path alongside the rail corridor.

37 In instances where there is no feasible alternative to converting a 6(f)(3) LWCF property, a conversion of use process must be initiated with DCR for approval from the National Park Service. The conversion of use process requires that a suitable piece of replacement property be found before a conversion occurs at a LWCF protected site (Leesylvania State Park). “Suitable” means equivalent in fair market value and can serve as a viable public outdoor recreation area without reliance upon adjoining or additional areas. Conversion of use processes must be initiated with DCR by the governmental body that owns the property. Coordinate with Synthia Waymack at synthia.waymack@dcr.virginia.gov to fully understand the requirements of conversion under this program.

VIRGINIA DEQ (continued)

32. As discussed throughout the Draft and Final EIS documentation, the addition of one track will primarily be within the existing CSXT right-of-way. DRPT will preserve the continuity of all trail crossings by extending the existing crossing over the new track (provided in-kind, to the current design specifications). Additional vehicle and pedestrian warning devices will be modified, as appropriate, for the new track and any change in authorized track speed. The details of these will be determined during final design after funding becomes available and incremental improvements are scheduled.

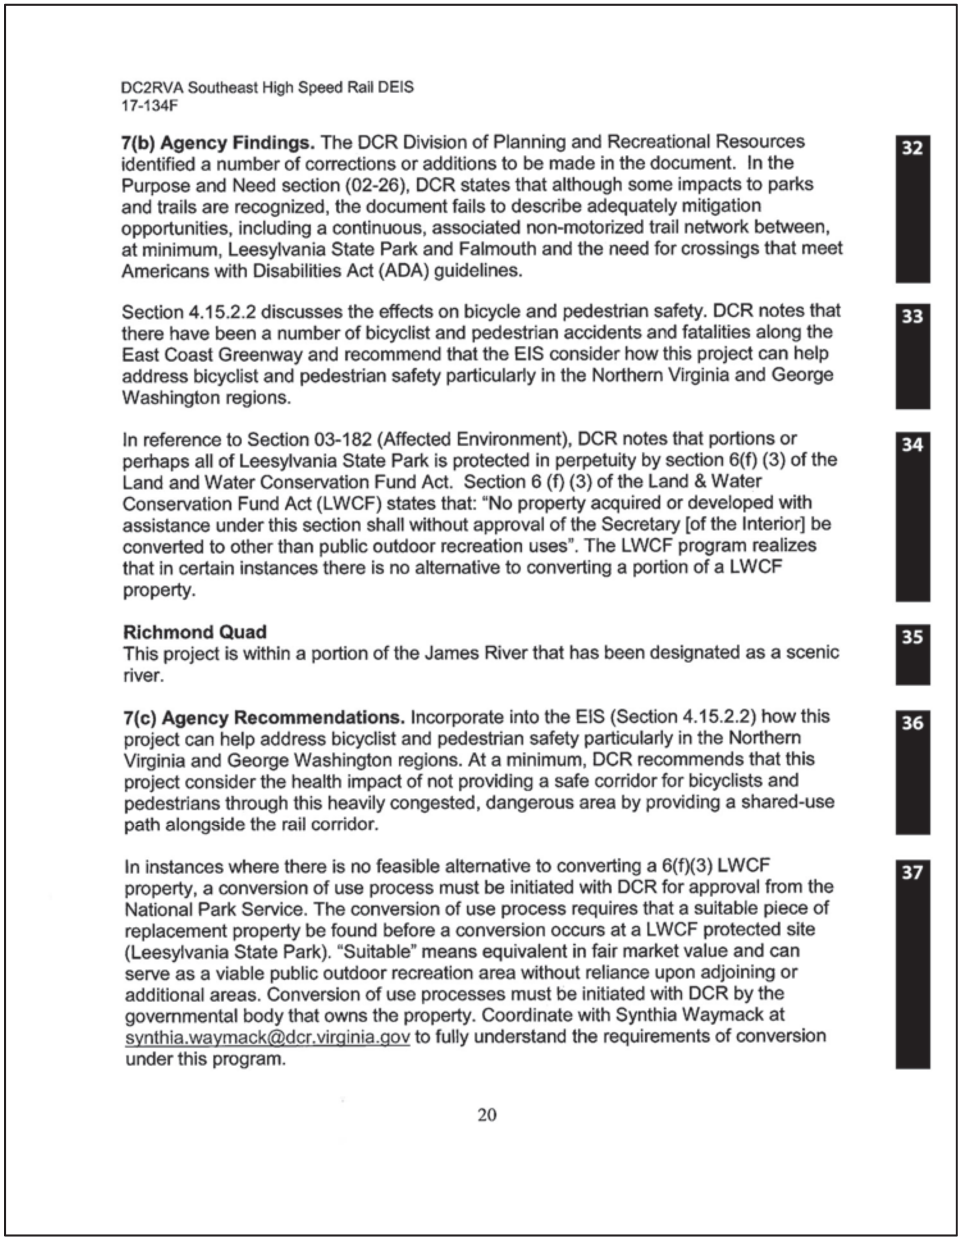
    DRPT has not identified any impacts to the trail system which would require the addition of a greenway along the corridor from Leesylvania State Park to Falmouth as a mitigation measure.

33. Addressing bicyclist and pedestrian safety specifically on the East Coast Greenway is beyond the Purpose and Need of the DC2RVA Project, however, the DC2RVA Project will address and improve, as necessary, bike/pedestrian safety warning devices at all public crossings along the DC2RVA rail corridor, in keeping with the Project’s Basis of Design and applicable FRA, Amtrak, CSXT, and VDOT safety standards.

34. No property will need to be acquired from Leesylvania State Park as part of the Preferred Alternative.

35. DRPT concurs; scenic rivers are presented in Section 3.1.3.2 of the Draft EIS. Potential effects on scenic rivers for the Preferred Alternative are presented in Section 5.1.1 of the Final EIS.

(Responses are continued on next page)



DC2RVA Southeast High Speed Rail DEIS
17-134F

7(b) Agency Findings. The DCR Division of Planning and Recreational Resources identified a number of corrections or additions to be made in the document. In the Purpose and Need section (02-26), DCR states that although some impacts to parks and trails are recognized, the document fails to describe adequately mitigation opportunities, including a continuous, associated non-motorized trail network between, at minimum, Leesylvania State Park and Falmouth and the need for crossings that meet Americans with Disabilities Act (ADA) guidelines. 32

Section 4.15.2.2 discusses the effects on bicycle and pedestrian safety. DCR notes that there have been a number of bicyclist and pedestrian accidents and fatalities along the East Coast Greenway and recommend that the EIS consider how this project can help address bicyclist and pedestrian safety particularly in the Northern Virginia and George Washington regions. 33

In reference to Section 03-182 (Affected Environment), DCR notes that portions or perhaps all of Leesylvania State Park is protected in perpetuity by section 6(f) (3) of the Land and Water Conservation Fund Act. Section 6 (f) (3) of the Land & Water Conservation Fund Act (LWCF) states that: "No property acquired or developed with assistance under this section shall without approval of the Secretary [of the Interior] be converted to other than public outdoor recreation uses". The LWCF program realizes that in certain instances there is no alternative to converting a portion of a LWCF property. 34

Richmond Quad
This project is within a portion of the James River that has been designated as a scenic river. 35

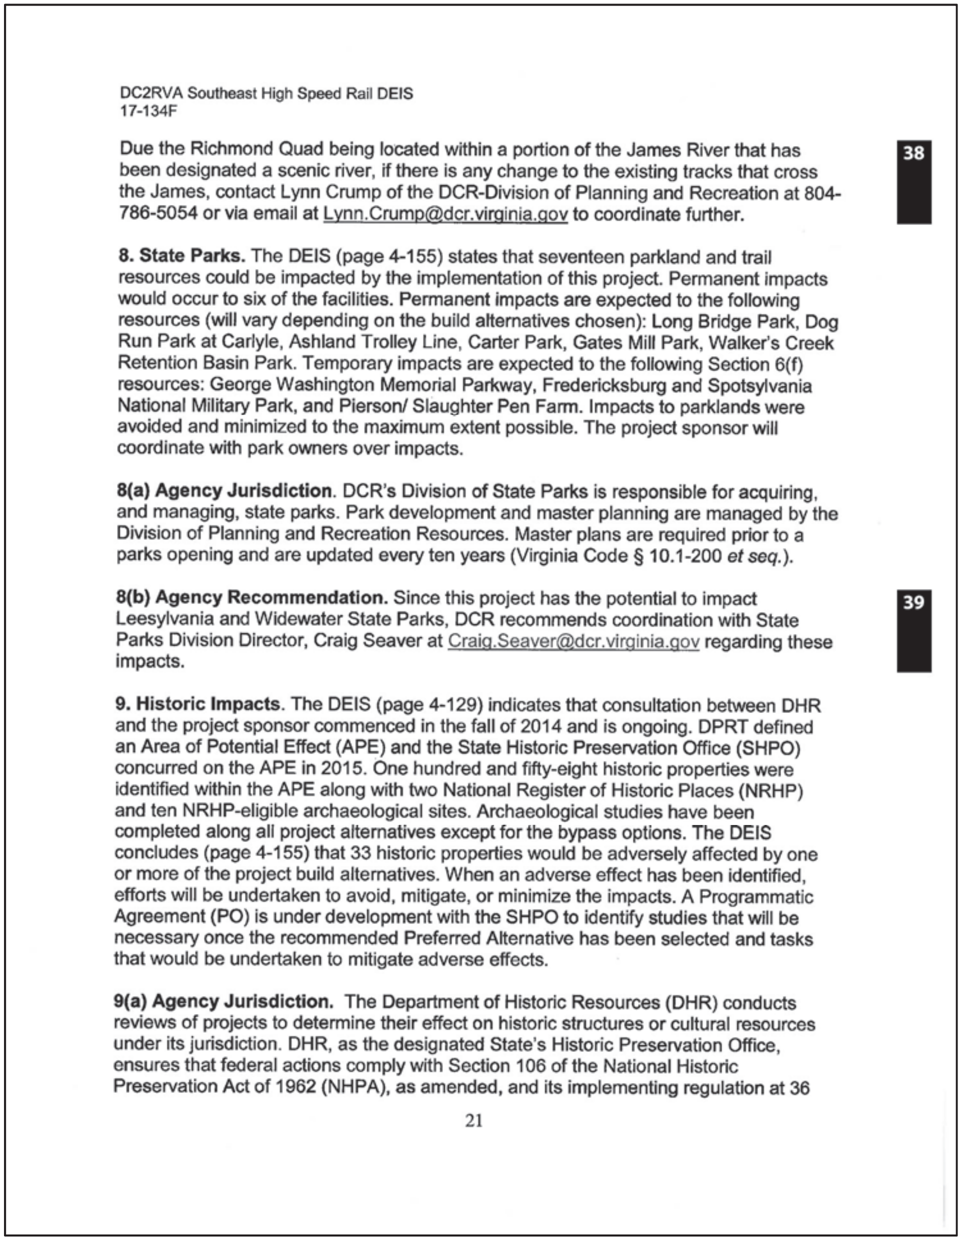
7(c) Agency Recommendations. Incorporate into the EIS (Section 4.15.2.2) how this project can help address bicyclist and pedestrian safety particularly in the Northern Virginia and George Washington regions. At a minimum, DCR recommends that this project consider the health impact of not providing a safe corridor for bicyclists and pedestrians through this heavily congested, dangerous area by providing a shared-use path alongside the rail corridor. 36

In instances where there is no feasible alternative to converting a 6(f)(3) LWCF property, a conversion of use process must be initiated with DCR for approval from the National Park Service. The conversion of use process requires that a suitable piece of replacement property be found before a conversion occurs at a LWCF protected site (Leesylvania State Park). "Suitable" means equivalent in fair market value and can serve as a viable public outdoor recreation area without reliance upon adjoining or additional areas. Conversion of use processes must be initiated with DCR by the governmental body that owns the property. Coordinate with Synthia Waymack at synthia.waymack@dcr.virginia.gov to fully understand the requirements of conversion under this program. 37

20

VIRGINIA DEQ (continued)

36. Provision of a new shared use path within the railroad right-of-way is beyond the Purpose and Need of the Project and CSXT policies currently do not allow recreational uses within their right-of-way. As indicated in Section 5.15.2.2 of the Final EIS, all existing bicycle and pedestrian facilities will be maintained (provided in-kind) as part of the Build Alternatives and will be designed to current safety standards. Opportunities for additional bicycle and pedestrian accessibility improvements, including updates to facilities to meet Americans with Disabilities Act of 1990 (ADA) requirements, could be incorporated during final design in coordination with FRA, after funding becomes available and incremental improvements are scheduled.
37. Replacement requirements for conversion of Section 6(f) lands as part of the Preferred Alternative are addressed in Section 5.14.1 of the Final EIS. As indicated in that section, DRPT does not anticipate permanent impacts to Section 6(f) lands for any Build Alternatives, including the Preferred Alternative as identified in the Final EIS. Temporary impacts during Project construction will not require replacement lands.



DC2RVA Southeast High Speed Rail DEIS
17-134F

38

Due the Richmond Quad being located within a portion of the James River that has been designated a scenic river, if there is any change to the existing tracks that cross the James, contact Lynn Crump of the DCR-Division of Planning and Recreation at 804-786-5054 or via email at Lynn.Crump@dcr.virginia.gov to coordinate further.

8. State Parks. The DEIS (page 4-155) states that seventeen parkland and trail resources could be impacted by the implementation of this project. Permanent impacts would occur to six of the facilities. Permanent impacts are expected to the following resources (will vary depending on the build alternatives chosen): Long Bridge Park, Dog Run Park at Carlyle, Ashland Trolley Line, Carter Park, Gates Mill Park, Walker's Creek Retention Basin Park. Temporary impacts are expected to the following Section 6(f) resources: George Washington Memorial Parkway, Fredericksburg and Spotsylvania National Military Park, and Pierson/ Slaughter Pen Farm. Impacts to parklands were avoided and minimized to the maximum extent possible. The project sponsor will coordinate with park owners over impacts.

8(a) Agency Jurisdiction. DCR's Division of State Parks is responsible for acquiring, and managing, state parks. Park development and master planning are managed by the Division of Planning and Recreation Resources. Master plans are required prior to a parks opening and are updated every ten years (Virginia Code § 10.1-200 *et seq.*).

39

8(b) Agency Recommendation. Since this project has the potential to impact Leesylvania and Widewater State Parks, DCR recommends coordination with State Parks Division Director, Craig Seaver at Craig.Seaver@dcr.virginia.gov regarding these impacts.

9. Historic Impacts. The DEIS (page 4-129) indicates that consultation between DHR and the project sponsor commenced in the fall of 2014 and is ongoing. DPRT defined an Area of Potential Effect (APE) and the State Historic Preservation Office (SHPO) concurred on the APE in 2015. One hundred and fifty-eight historic properties were identified within the APE along with two National Register of Historic Places (NRHP) and ten NRHP-eligible archaeological sites. Archaeological studies have been completed along all project alternatives except for the bypass options. The DEIS concludes (page 4-155) that 33 historic properties would be adversely affected by one or more of the project build alternatives. When an adverse effect has been identified, efforts will be undertaken to avoid, mitigate, or minimize the impacts. A Programmatic Agreement (PO) is under development with the SHPO to identify studies that will be necessary once the recommended Preferred Alternative has been selected and tasks that would be undertaken to mitigate adverse effects.

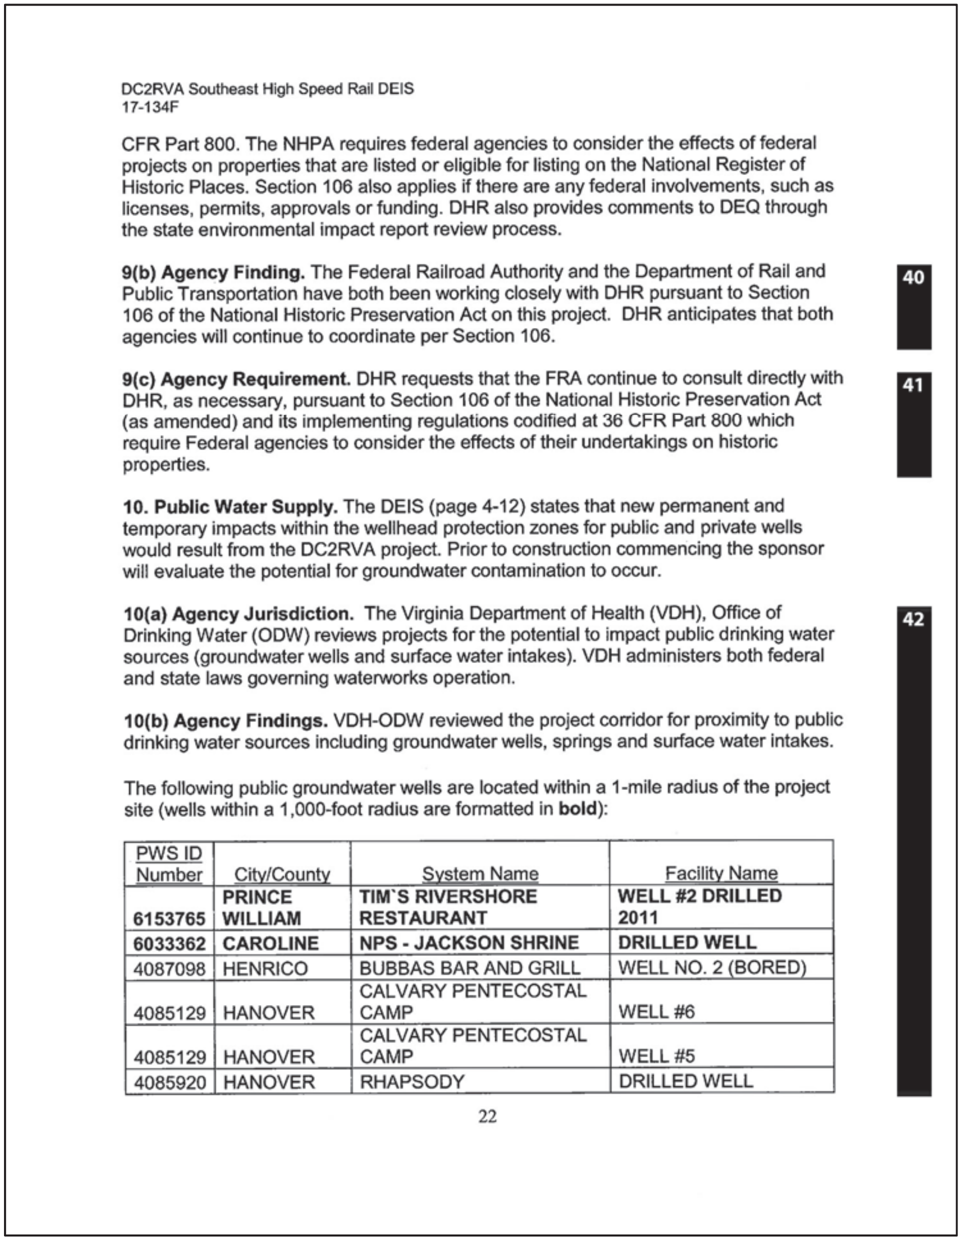
9(a) Agency Jurisdiction. The Department of Historic Resources (DHR) conducts reviews of projects to determine their effect on historic structures or cultural resources under its jurisdiction. DHR, as the designated State's Historic Preservation Office, ensures that federal actions comply with Section 106 of the National Historic Preservation Act of 1962 (NHPA), as amended, and its implementing regulation at 36

21

VIRGINIA DEQ (continued)

38. DRPT will coordinate with DCR regarding bridge design at scenic river crossings during final design, after funding becomes available and incremental improvements are scheduled. As discussed in Section 5.1.1.1 of the Final EIS, new bridges will generally reflect the horizontal and vertical profiles of existing structures and therefore DRPT anticipates that the landscape and viewsheds from scenic rivers will be similar in context to existing conditions.

39. Table 5.14-1 of the Final EIS identifies the permanent and temporary impacts of the Preferred Alternative to parkland resources. Leesylvania and Widewater State Parks are not among the parklands affected by the Preferred Alternative, either for temporary or permanent use.



CFR Part 800. The NHPA requires federal agencies to consider the effects of federal projects on properties that are listed or eligible for listing on the National Register of Historic Places. Section 106 also applies if there are any federal involvements, such as licenses, permits, approvals or funding. DHR also provides comments to DEQ through the state environmental impact report review process.

9(b) Agency Finding. The Federal Railroad Authority and the Department of Rail and Public Transportation have both been working closely with DHR pursuant to Section 106 of the National Historic Preservation Act on this project. DHR anticipates that both agencies will continue to coordinate per Section 106. **40**

9(c) Agency Requirement. DHR requests that the FRA continue to consult directly with DHR, as necessary, pursuant to Section 106 of the National Historic Preservation Act (as amended) and its implementing regulations codified at 36 CFR Part 800 which require Federal agencies to consider the effects of their undertakings on historic properties. **41**

10. Public Water Supply. The DEIS (page 4-12) states that new permanent and temporary impacts within the wellhead protection zones for public and private wells would result from the DC2RVA project. Prior to construction commencing the sponsor will evaluate the potential for groundwater contamination to occur.

10(a) Agency Jurisdiction. The Virginia Department of Health (VDH), Office of Drinking Water (ODW) reviews projects for the potential to impact public drinking water sources (groundwater wells and surface water intakes). VDH administers both federal and state laws governing waterworks operation. **42**

10(b) Agency Findings. VDH-ODW reviewed the project corridor for proximity to public drinking water sources including groundwater wells, springs and surface water intakes.

The following public groundwater wells are located within a 1-mile radius of the project site (wells within a 1,000-foot radius are formatted in **bold**):

PWS ID Number	City/County	System Name	Facility Name
6153765	**PRINCE WILLIAM**	**TIM`S RIVERSHORE RESTAURANT**	**WELL #2 DRILLED 2011**
6033362	**CAROLINE**	**NPS - JACKSON SHRINE**	**DRILLED WELL**
4087098	HENRICO	BUBBAS BAR AND GRILL	WELL NO. 2 (BORED)
4085129	HANOVER	CALVARY PENTECOSTAL CAMP	WELL #6
4085129	HANOVER	CALVARY PENTECOSTAL CAMP	WELL #5
4085920	HANOVER	RHAPSODY	DRILLED WELL

VIRGINIA DEQ (continued)

40. and 41. Close consultation with the Virginia Department of Historic Resources (DHR) commenced in November 2014. Pursuant to Section 106 of the National Historic Preservation Act (as amended), DRPT will continue to coordinate all cultural resource components with DHR during final design, after funding becomes available and incremental improvements are scheduled.

42. Refer to DRPT-numbered statements #129 through #131 for detailed lists provided by Virginia Department of Health (VDH), and DRPT's responses.

3670800	VIRGINIA-AMERICAN WATER CO	APPOMATTOX RIVER

43

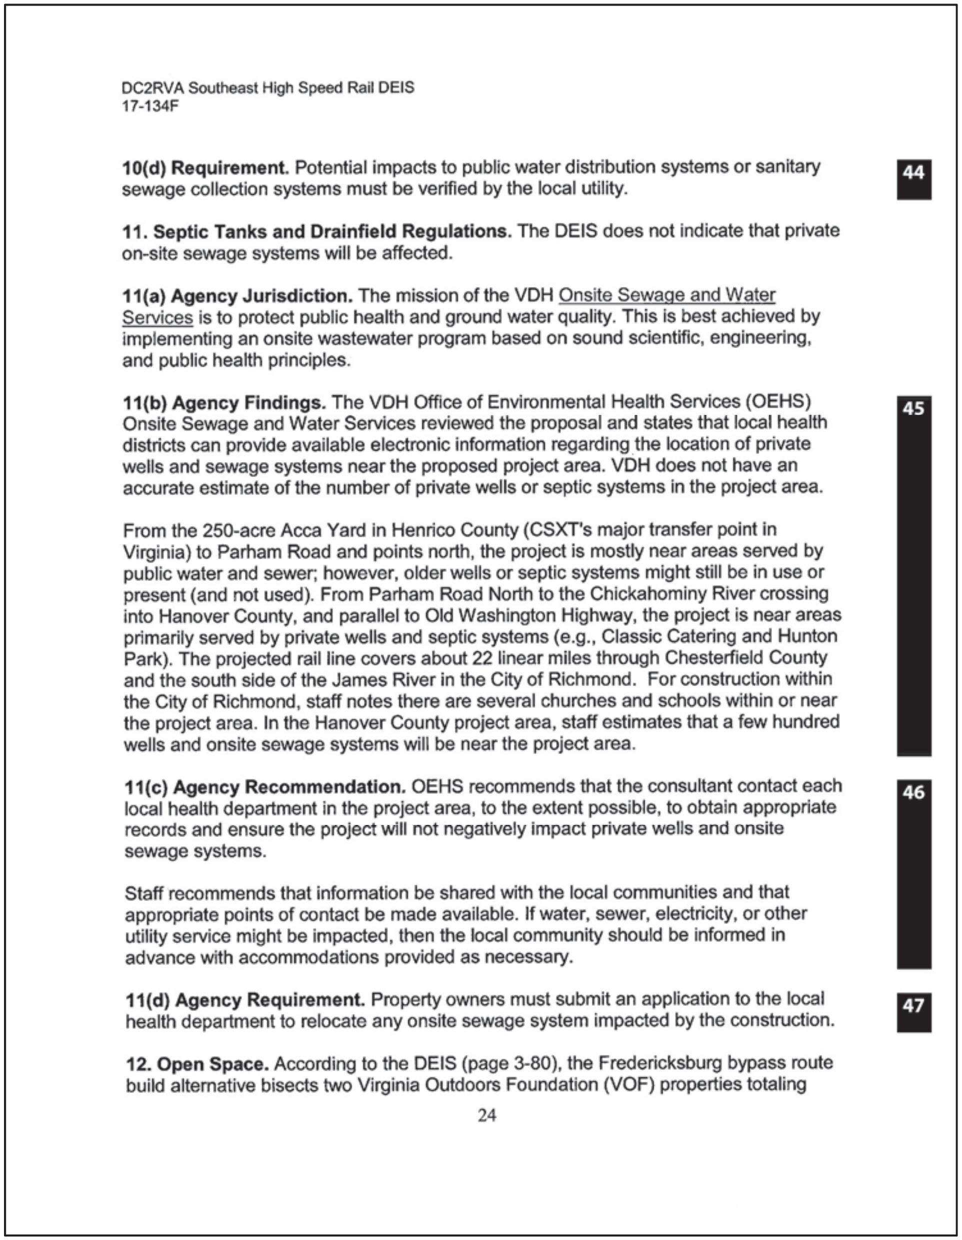
10(c) Agency Recommendation. Utilize Best Management Practices including Erosion and Sedimentation Controls and Spill Prevention Controls & Countermeasures on the project site. Field mark well(s) within a 1,000-foot radius from the project site to protect them from accidental damage during construction. Properly manage material on site and during transport to prevent impacts to nearby surface waters.

23

VIRGINIA DEQ (continued)

(Response to comment 42 on previous page)

43. As noted in Section 5.1.6.3 of the Final EIS, appropriate erosion and sediment control practices will be implemented during construction in accordance with the Virginia Erosion and Sediment Control Regulations and the Virginia Stormwater Management Law and regulations. During construction, wells within or adjacent to the Project Limits of Disturbance (LOD) will be field marked to protect them from accidental damage.



DC2RVA Southeast High Speed Rail DEIS
17-134F

10(d) Requirement. Potential impacts to public water distribution systems or sanitary sewage collection systems must be verified by the local utility. 44

11. Septic Tanks and Drainfield Regulations. The DEIS does not indicate that private on-site sewage systems will be affected.

11(a) Agency Jurisdiction. The mission of the VDH Onsite Sewage and Water Services is to protect public health and ground water quality. This is best achieved by implementing an onsite wastewater program based on sound scientific, engineering, and public health principles.

11(b) Agency Findings. The VDH Office of Environmental Health Services (OEHS) Onsite Sewage and Water Services reviewed the proposal and states that local health districts can provide available electronic information regarding the location of private wells and sewage systems near the proposed project area. VDH does not have an accurate estimate of the number of private wells or septic systems in the project area. 45

From the 250-acre Acca Yard in Henrico County (CSXT's major transfer point in Virginia) to Parham Road and points north, the project is mostly near areas served by public water and sewer; however, older wells or septic systems might still be in use or present (and not used). From Parham Road North to the Chickahominy River crossing into Hanover County, and parallel to Old Washington Highway, the project is near areas primarily served by private wells and septic systems (e.g., Classic Catering and Hunton Park). The projected rail line covers about 22 linear miles through Chesterfield County and the south side of the James River in the City of Richmond. For construction within the City of Richmond, staff notes there are several churches and schools within or near the project area. In the Hanover County project area, staff estimates that a few hundred wells and onsite sewage systems will be near the project area.

11(c) Agency Recommendation. OEHS recommends that the consultant contact each local health department in the project area, to the extent possible, to obtain appropriate records and ensure the project will not negatively impact private wells and onsite sewage systems. 46

Staff recommends that information be shared with the local communities and that appropriate points of contact be made available. If water, sewer, electricity, or other utility service might be impacted, then the local community should be informed in advance with accommodations provided as necessary.

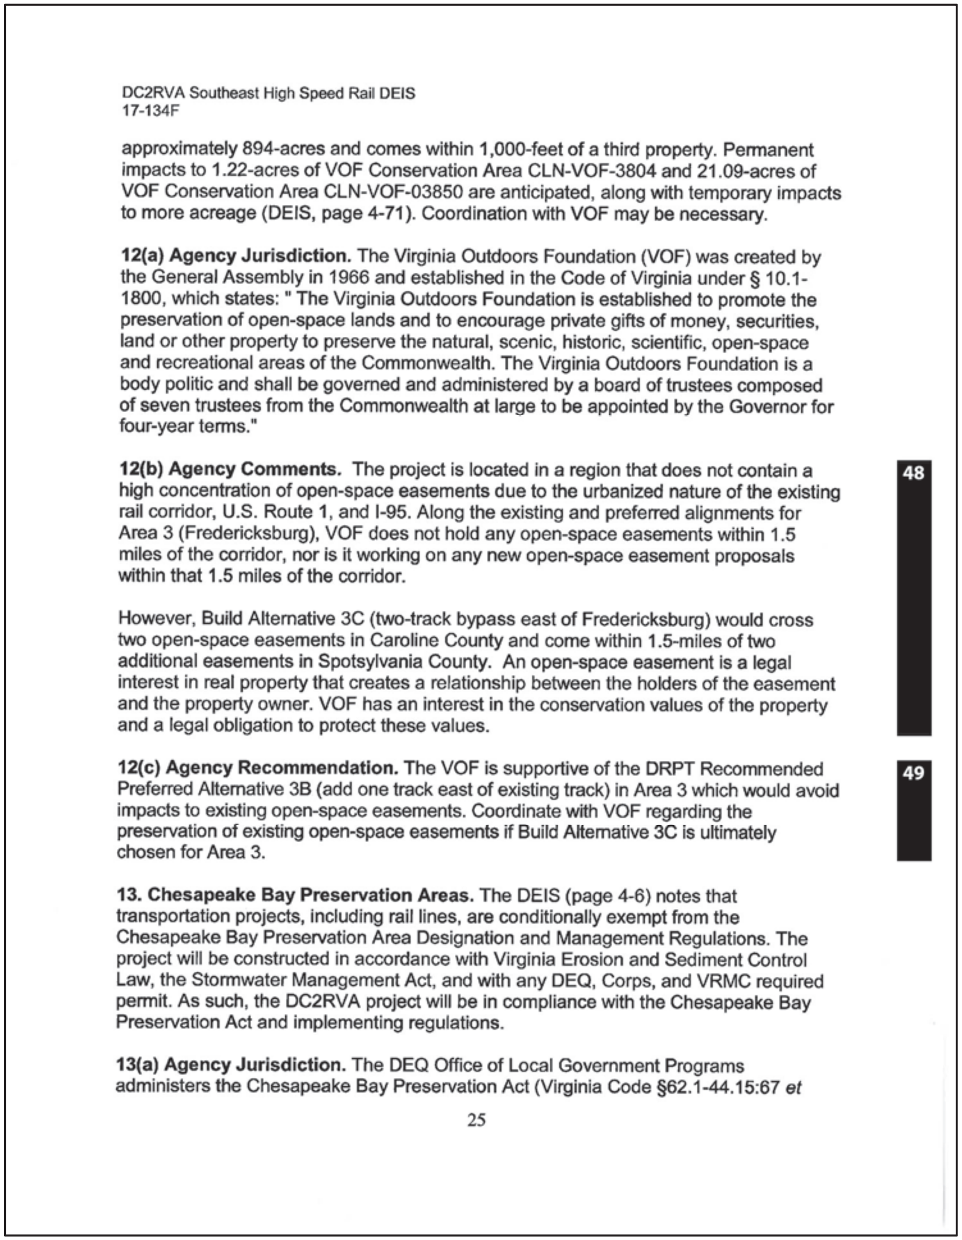
11(d) Agency Requirement. Property owners must submit an application to the local health department to relocate any onsite sewage system impacted by the construction. 47

12. Open Space. According to the DEIS (page 3-80), the Fredericksburg bypass route build alternative bisects two Virginia Outdoors Foundation (VOF) properties totaling

24

VIRGINIA DEQ (continued)

44. DRPT will coordinate with local utilities to identify potential impacts to public water distribution systems or sanitary sewage collection systems during final design, after funding becomes available and incremental improvements are scheduled.
45. DRPT will contact local health districts to identify locations of private wells and sewage systems within the Limits of Disturbance during final design, after funding becomes available and incremental improvements are scheduled. The number of churches and schools within 500 feet of the DC2RVA rail line are listed for each jurisdiction in Table 3.11-5 of the Draft EIS. Among the listed facilities are 13 religious facilities and 10 schools within the City of Richmond.
46. See response to DRPT-numbered statement #45. Prior to construction, DRPT will inform local communities regarding utility impacts and will develop appropriate measures to minimize or mitigate impacts to the community, in coordination with local health departments.
47. During final design, after funding becomes available and incremental improvements are scheduled, DRPT will submit an application to the local health department to relocate any onsite sewage system that will be impacted by construction.



approximately 894-acres and comes within 1,000-feet of a third property. Permanent impacts to 1.22-acres of VOF Conservation Area CLN-VOF-3804 and 21.09-acres of VOF Conservation Area CLN-VOF-03850 are anticipated, along with temporary impacts to more acreage (DEIS, page 4-71). Coordination with VOF may be necessary.

12(a) Agency Jurisdiction. The Virginia Outdoors Foundation (VOF) was created by the General Assembly in 1966 and established in the Code of Virginia under § 10.1-1800, which states: " The Virginia Outdoors Foundation is established to promote the preservation of open-space lands and to encourage private gifts of money, securities, land or other property to preserve the natural, scenic, historic, scientific, open-space and recreational areas of the Commonwealth. The Virginia Outdoors Foundation is a body politic and shall be governed and administered by a board of trustees composed of seven trustees from the Commonwealth at large to be appointed by the Governor for four-year terms."

48

12(b) Agency Comments. The project is located in a region that does not contain a high concentration of open-space easements due to the urbanized nature of the existing rail corridor, U.S. Route 1, and I-95. Along the existing and preferred alignments for Area 3 (Fredericksburg), VOF does not hold any open-space easements within 1.5 miles of the corridor, nor is it working on any new open-space easement proposals within that 1.5 miles of the corridor.

However, Build Alternative 3C (two-track bypass east of Fredericksburg) would cross two open-space easements in Caroline County and come within 1.5-miles of two additional easements in Spotsylvania County. An open-space easement is a legal interest in real property that creates a relationship between the holders of the easement and the property owner. VOF has an interest in the conservation values of the property and a legal obligation to protect these values.

49

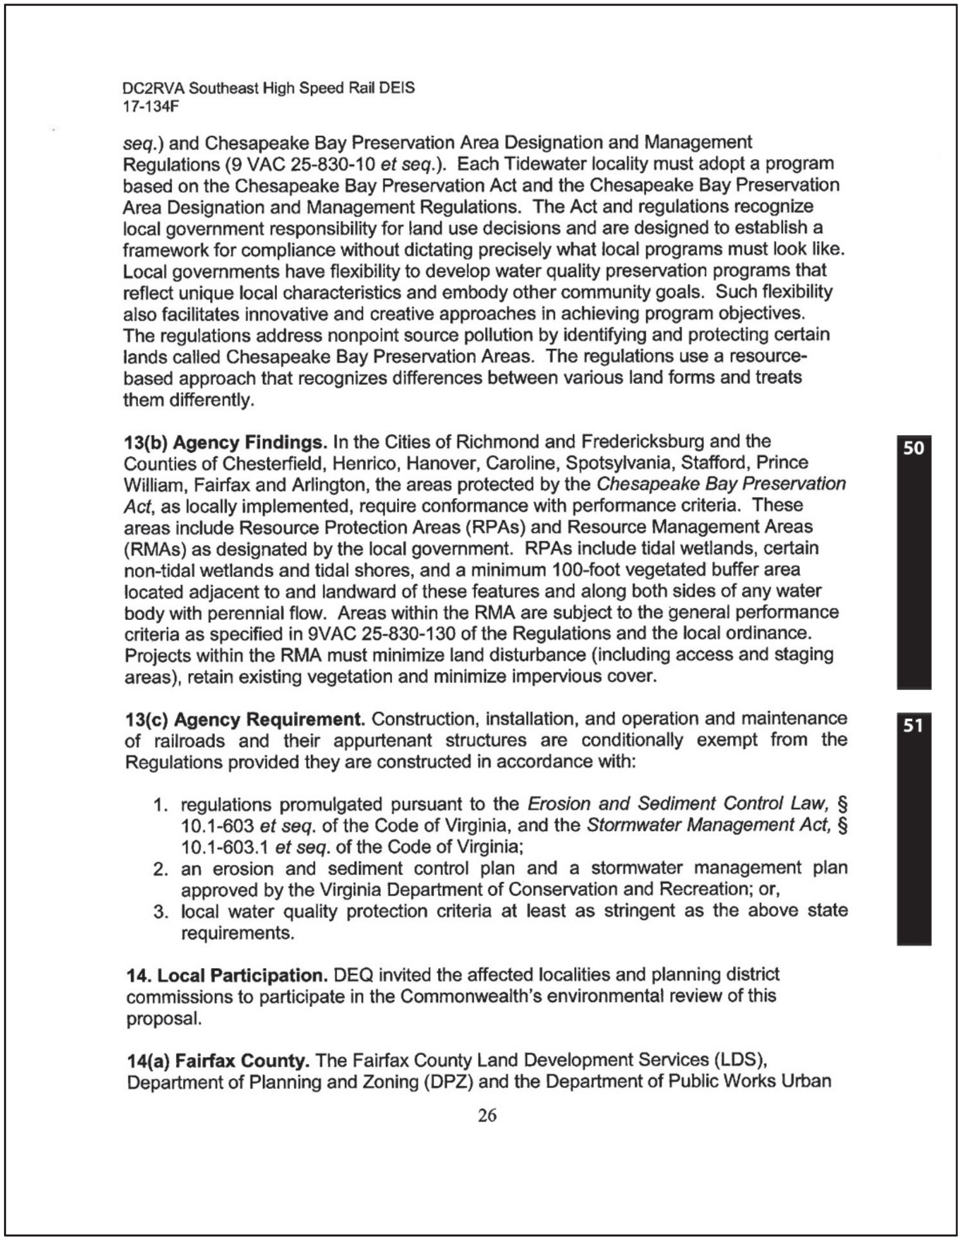
12(c) Agency Recommendation. The VOF is supportive of the DRPT Recommended Preferred Alternative 3B (add one track east of existing track) in Area 3 which would avoid impacts to existing open-space easements. Coordinate with VOF regarding the preservation of existing open-space easements if Build Alternative 3C is ultimately chosen for Area 3.

13. Chesapeake Bay Preservation Areas. The DEIS (page 4-6) notes that transportation projects, including rail lines, are conditionally exempt from the Chesapeake Bay Preservation Area Designation and Management Regulations. The project will be constructed in accordance with Virginia Erosion and Sediment Control Law, the Stormwater Management Act, and with any DEQ, Corps, and VRMC required permit. As such, the DC2RVA project will be in compliance with the Chesapeake Bay Preservation Act and implementing regulations.

13(a) Agency Jurisdiction. The DEQ Office of Local Government Programs administers the Chesapeake Bay Preservation Act (Virginia Code §62.1-44.15:67 *et*

VIRGINIA DEQ (continued)

48. and 49. Build Alternative 3C: Add Two-Track Bypass (East of Fredericksburg) was not selected as part of the Preferred Alternative (refer to Final EIS Section 4.3.3 for details). For Area 3, the Preferred Alternative is Alternative 3B: Add One Track East of Existing, which does not involve any Virginia Outdoors Foundation (VOF) easements, so DRPT does not anticipate any impacts to VOF easements.



DC2RVA Southeast High Speed Rail DEIS
17-134F

seq.) and Chesapeake Bay Preservation Area Designation and Management Regulations (9 VAC 25-830-10 *et seq.*). Each Tidewater locality must adopt a program based on the Chesapeake Bay Preservation Act and the Chesapeake Bay Preservation Area Designation and Management Regulations. The Act and regulations recognize local government responsibility for land use decisions and are designed to establish a framework for compliance without dictating precisely what local programs must look like. Local governments have flexibility to develop water quality preservation programs that reflect unique local characteristics and embody other community goals. Such flexibility also facilitates innovative and creative approaches in achieving program objectives. The regulations address nonpoint source pollution by identifying and protecting certain lands called Chesapeake Bay Preservation Areas. The regulations use a resource-based approach that recognizes differences between various land forms and treats them differently.

13(b) Agency Findings. In the Cities of Richmond and Fredericksburg and the Counties of Chesterfield, Henrico, Hanover, Caroline, Spotsylvania, Stafford, Prince William, Fairfax and Arlington, the areas protected by the *Chesapeake Bay Preservation Act*, as locally implemented, require conformance with performance criteria. These areas include Resource Protection Areas (RPAs) and Resource Management Areas (RMAs) as designated by the local government. RPAs include tidal wetlands, certain non-tidal wetlands and tidal shores, and a minimum 100-foot vegetated buffer area located adjacent to and landward of these features and along both sides of any water body with perennial flow. Areas within the RMA are subject to the general performance criteria as specified in 9VAC 25-830-130 of the Regulations and the local ordinance. Projects within the RMA must minimize land disturbance (including access and staging areas), retain existing vegetation and minimize impervious cover. 50

13(c) Agency Requirement. Construction, installation, and operation and maintenance of railroads and their appurtenant structures are conditionally exempt from the Regulations provided they are constructed in accordance with: 51

1. regulations promulgated pursuant to the *Erosion and Sediment Control Law*, § 10.1-603 *et seq*. of the Code of Virginia, and the *Stormwater Management Act*, § 10.1-603.1 *et seq*. of the Code of Virginia;
2. an erosion and sediment control plan and a stormwater management plan approved by the Virginia Department of Conservation and Recreation; or,
3. local water quality protection criteria at least as stringent as the above state requirements.

14. Local Participation. DEQ invited the affected localities and planning district commissions to participate in the Commonwealth's environmental review of this proposal.

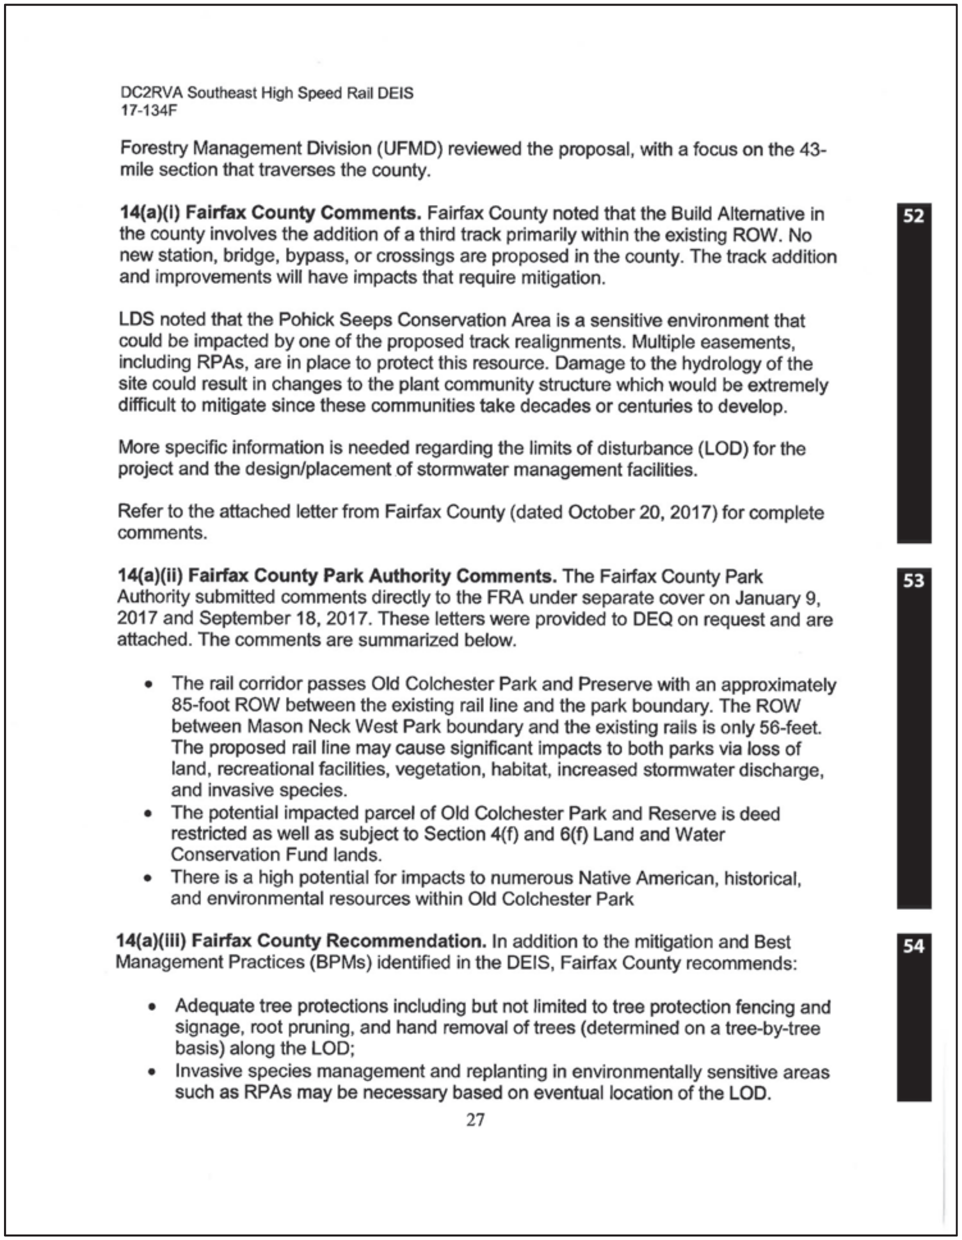
14(a) Fairfax County. The Fairfax County Land Development Services (LDS), Department of Planning and Zoning (DPZ) and the Department of Public Works Urban

26

VIRGINIA DEQ (continued)

50. During final design, after funding becomes available and incremental improvements are scheduled, DRPT will ensure Project conformance with applicable performance criteria for areas protected by the Chesapeake Bay Preservation Act as specified in 9VAC 25-830-130 of the Chesapeake Bay Preservation Area Designation and Management Regulations and local ordinances, including minimizing land disturbance and impervious cover.

51. As discussed in Section 5.1.1.1 of the Final EIS, the Project will be constructed in accordance with the Virginia Erosion and Sediment Control Law (§10.1-560 et seq. of the Code of Virginia) and the Stormwater Management Act (§10.1-603. 1 et seq. of the Code of Virginia); the terms and conditions of water quality permits required by USACE, Virginia DEQ, and VMRC; and an erosion and sediment control plan and a SWM plan approved by Virginia DEQ.



DC2RVA Southeast High Speed Rail DEIS
17-134F

Forestry Management Division (UFMD) reviewed the proposal, with a focus on the 43-mile section that traverses the county.

52 **14(a)(i) Fairfax County Comments.** Fairfax County noted that the Build Alternative in the county involves the addition of a third track primarily within the existing ROW. No new station, bridge, bypass, or crossings are proposed in the county. The track addition and improvements will have impacts that require mitigation.

LDS noted that the Pohick Seeps Conservation Area is a sensitive environment that could be impacted by one of the proposed track realignments. Multiple easements, including RPAs, are in place to protect this resource. Damage to the hydrology of the site could result in changes to the plant community structure which would be extremely difficult to mitigate since these communities take decades or centuries to develop.

More specific information is needed regarding the limits of disturbance (LOD) for the project and the design/placement of stormwater management facilities.

Refer to the attached letter from Fairfax County (dated October 20, 2017) for complete comments.

53 **14(a)(ii) Fairfax County Park Authority Comments.** The Fairfax County Park Authority submitted comments directly to the FRA under separate cover on January 9, 2017 and September 18, 2017. These letters were provided to DEQ on request and are attached. The comments are summarized below.

- The rail corridor passes Old Colchester Park and Preserve with an approximately 85-foot ROW between the existing rail line and the park boundary. The ROW between Mason Neck West Park boundary and the existing rails is only 56-feet. The proposed rail line may cause significant impacts to both parks via loss of land, recreational facilities, vegetation, habitat, increased stormwater discharge, and invasive species.
- The potential impacted parcel of Old Colchester Park and Reserve is deed restricted as well as subject to Section 4(f) and 6(f) Land and Water Conservation Fund lands.
- There is a high potential for impacts to numerous Native American, historical, and environmental resources within Old Colchester Park

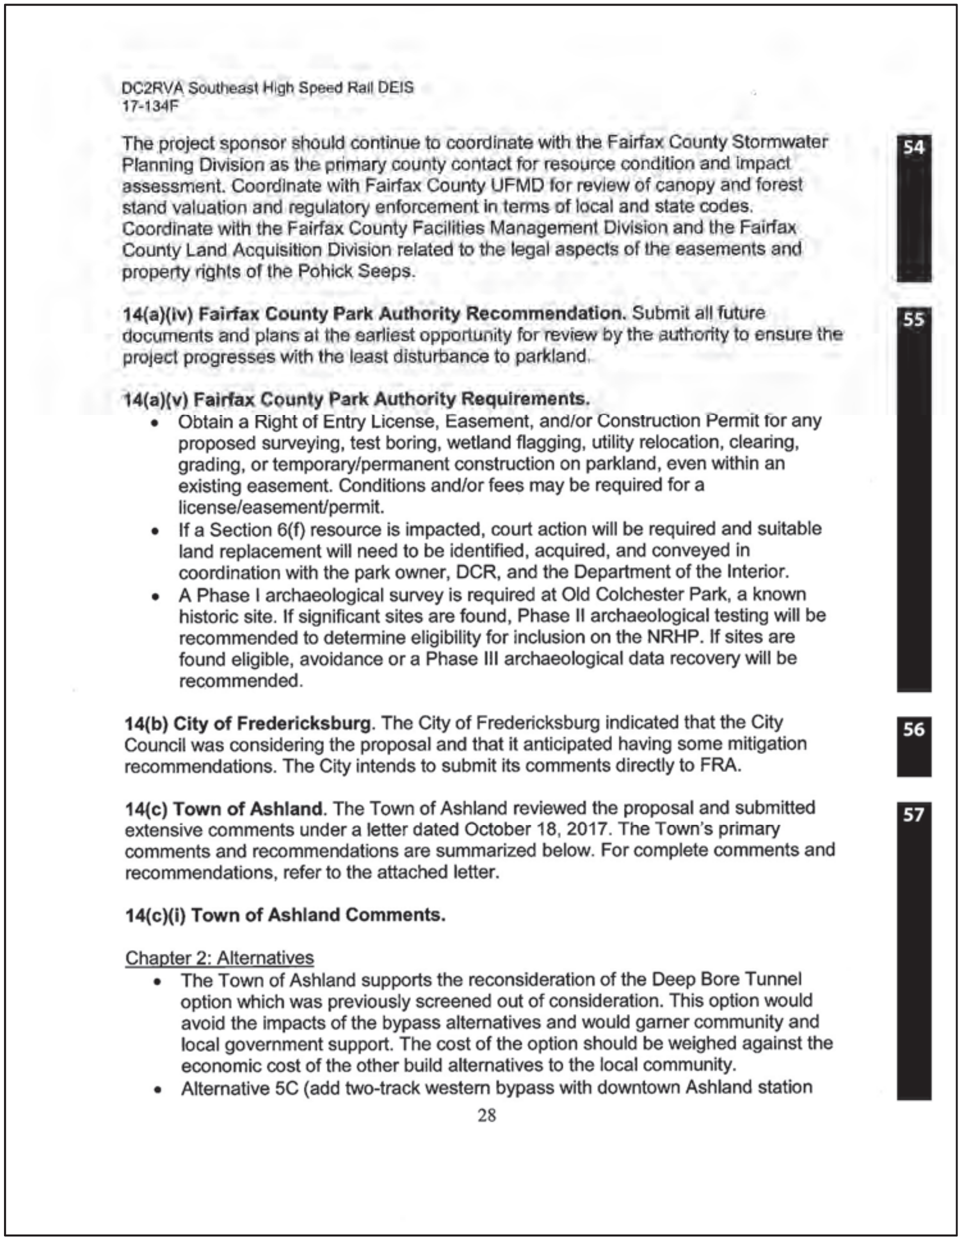
54 **14(a)(iii) Fairfax County Recommendation.** In addition to the mitigation and Best Management Practices (BPMs) identified in the DEIS, Fairfax County recommends:

- Adequate tree protections including but not limited to tree protection fencing and signage, root pruning, and hand removal of trees (determined on a tree-by-tree basis) along the LOD;
- Invasive species management and replanting in environmentally sensitive areas such as RPAs may be necessary based on eventual location of the LOD.

27

VIRGINIA DEQ (continued)

52. Refer to the referenced attached Fairfax County letter (DRPT-numbered statements #136 to #138) for responses to the detailed comments that are summarized here.
53. Refer to the referenced attached Fairfax County Park Authority letter (DRPT-numbered statements #139 and #140) for responses to the detailed comments that are summarized here.
54. Refer to the referenced attached Fairfax County letter (DRPT-numbered statements #136 to #138) for responses to the detailed recommendations that are summarized here.



DC2RVA Southeast High Speed Rail DEIS
17-134F

The project sponsor should continue to coordinate with the Fairfax County Stormwater Planning Division as the primary county contact for resource condition and impact assessment. Coordinate with Fairfax County UFMD for review of canopy and forest stand valuation and regulatory enforcement in terms of local and state codes. Coordinate with the Fairfax County Facilities Management Division and the Fairfax County Land Acquisition Division related to the legal aspects of the easements and property rights of the Pohick Seeps. 54

14(a)(iv) Fairfax County Park Authority Recommendation. Submit all future documents and plans at the earliest opportunity for review by the authority to ensure the project progresses with the least disturbance to parkland. 55

14(a)(v) Fairfax County Park Authority Requirements.

- Obtain a Right of Entry License, Easement, and/or Construction Permit for any proposed surveying, test boring, wetland flagging, utility relocation, clearing, grading, or temporary/permanent construction on parkland, even within an existing easement. Conditions and/or fees may be required for a license/easement/permit.
- If a Section 6(f) resource is impacted, court action will be required and suitable land replacement will need to be identified, acquired, and conveyed in coordination with the park owner, DCR, and the Department of the Interior.
- A Phase I archaeological survey is required at Old Colchester Park, a known historic site. If significant sites are found, Phase II archaeological testing will be recommended to determine eligibility for inclusion on the NRHP. If sites are found eligible, avoidance or a Phase III archaeological data recovery will be recommended.

14(b) City of Fredericksburg. The City of Fredericksburg indicated that the City Council was considering the proposal and that it anticipated having some mitigation recommendations. The City intends to submit its comments directly to FRA. 56

14(c) Town of Ashland. The Town of Ashland reviewed the proposal and submitted extensive comments under a letter dated October 18, 2017. The Town's primary comments and recommendations are summarized below. For complete comments and recommendations, refer to the attached letter. 57

14(c)(i) Town of Ashland Comments.

Chapter 2: Alternatives

- The Town of Ashland supports the reconsideration of the Deep Bore Tunnel option which was previously screened out of consideration. This option would avoid the impacts of the bypass alternatives and would garner community and local government support. The cost of the option should be weighed against the economic cost of the other build alternatives to the local community.
- Alternative 5C (add two-track western bypass with downtown Ashland station

28

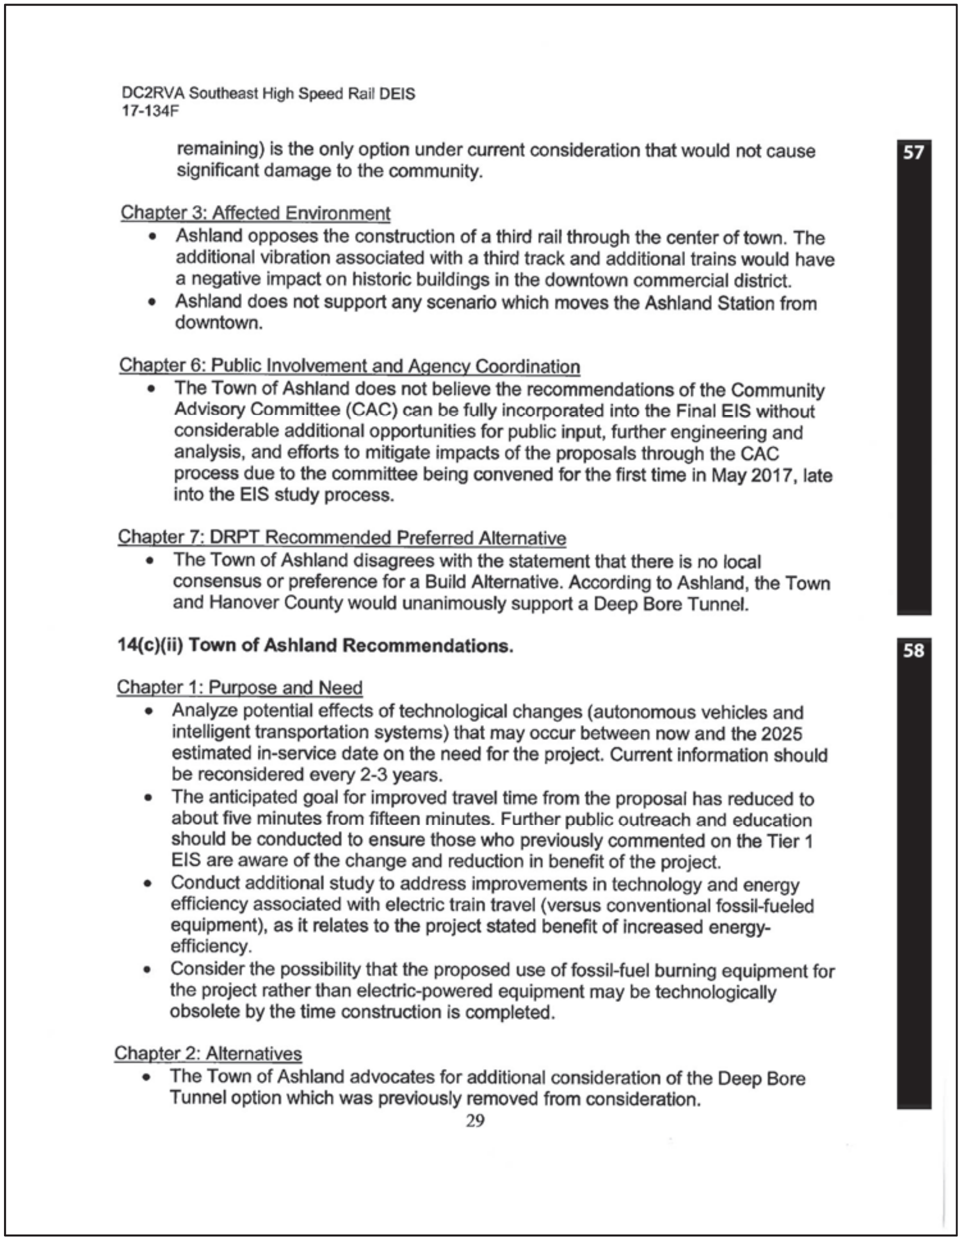
VIRGINIA DEQ (continued)

(Response to comment 54 on previous page)

55. Refer to the referenced attached Fairfax County Park Authority letter (DRPT-numbered statements #139 and #140) for responses to the detailed recommendations that are summarized here.

56. DRPT received and has responded to comments from City of Fredericksburg under separate cover; the City's letter and DRPT's responses are included as part of the Final EIS.

57. and 58. Refer to the referenced attached Town of Ashland letter (DRPT-numbered statements #142 through #195) for responses to the detailed comments and recommendations that are summarized here.



57

remaining) is the only option under current consideration that would not cause significant damage to the community.

Chapter 3: Affected Environment

- Ashland opposes the construction of a third rail through the center of town. The additional vibration associated with a third track and additional trains would have a negative impact on historic buildings in the downtown commercial district.
- Ashland does not support any scenario which moves the Ashland Station from downtown.

Chapter 6: Public Involvement and Agency Coordination

- The Town of Ashland does not believe the recommendations of the Community Advisory Committee (CAC) can be fully incorporated into the Final EIS without considerable additional opportunities for public input, further engineering and analysis, and efforts to mitigate impacts of the proposals through the CAC process due to the committee being convened for the first time in May 2017, late into the EIS study process.

Chapter 7: DRPT Recommended Preferred Alternative

- The Town of Ashland disagrees with the statement that there is no local consensus or preference for a Build Alternative. According to Ashland, the Town and Hanover County would unanimously support a Deep Bore Tunnel.

58

14(c)(ii) Town of Ashland Recommendations.

Chapter 1: Purpose and Need

- Analyze potential effects of technological changes (autonomous vehicles and intelligent transportation systems) that may occur between now and the 2025 estimated in-service date on the need for the project. Current information should be reconsidered every 2-3 years.
- The anticipated goal for improved travel time from the proposal has reduced to about five minutes from fifteen minutes. Further public outreach and education should be conducted to ensure those who previously commented on the Tier 1 EIS are aware of the change and reduction in benefit of the project.
- Conduct additional study to address improvements in technology and energy efficiency associated with electric train travel (versus conventional fossil-fueled equipment), as it relates to the project stated benefit of increased energy-efficiency.
- Consider the possibility that the proposed use of fossil-fuel burning equipment for the project rather than electric-powered equipment may be technologically obsolete by the time construction is completed.

Chapter 2: Alternatives

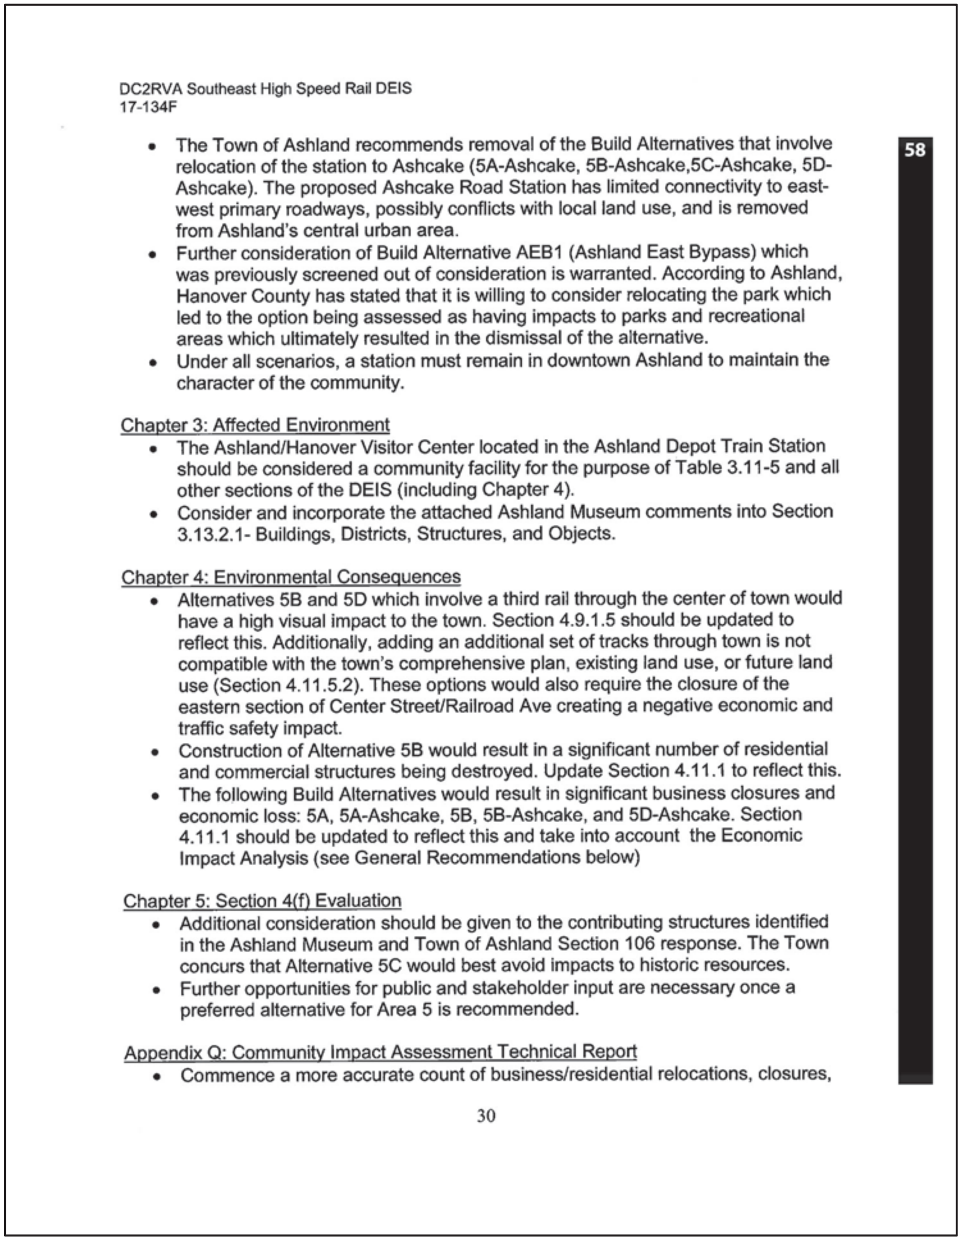
- The Town of Ashland advocates for additional consideration of the Deep Bore Tunnel option which was previously removed from consideration.

VIRGINIA DEQ (continued)

(Response to comments 57 and 58 on previous page)

VIRGINIA DEQ (continued)

(For response to comments 58, refer to pages B-87)



DC2RVA Southeast High Speed Rail DEIS
17-134F

58

- The Town of Ashland recommends removal of the Build Alternatives that involve relocation of the station to Ashcake (5A-Ashcake, 5B-Ashcake,5C-Ashcake, 5D-Ashcake). The proposed Ashcake Road Station has limited connectivity to east-west primary roadways, possibly conflicts with local land use, and is removed from Ashland's central urban area.
- Further consideration of Build Alternative AEB1 (Ashland East Bypass) which was previously screened out of consideration is warranted. According to Ashland, Hanover County has stated that it is willing to consider relocating the park which led to the option being assessed as having impacts to parks and recreational areas which ultimately resulted in the dismissal of the alternative.
- Under all scenarios, a station must remain in downtown Ashland to maintain the character of the community.

Chapter 3: Affected Environment

- The Ashland/Hanover Visitor Center located in the Ashland Depot Train Station should be considered a community facility for the purpose of Table 3.11-5 and all other sections of the DEIS (including Chapter 4).
- Consider and incorporate the attached Ashland Museum comments into Section 3.13.2.1- Buildings, Districts, Structures, and Objects.

Chapter 4: Environmental Consequences

- Alternatives 5B and 5D which involve a third rail through the center of town would have a high visual impact to the town. Section 4.9.1.5 should be updated to reflect this. Additionally, adding an additional set of tracks through town is not compatible with the town's comprehensive plan, existing land use, or future land use (Section 4.11.5.2). These options would also require the closure of the eastern section of Center Street/Railroad Ave creating a negative economic and traffic safety impact.
- Construction of Alternative 5B would result in a significant number of residential and commercial structures being destroyed. Update Section 4.11.1 to reflect this.
- The following Build Alternatives would result in significant business closures and economic loss: 5A, 5A-Ashcake, 5B, 5B-Ashcake, and 5D-Ashcake. Section 4.11.1 should be updated to reflect this and take into account the Economic Impact Analysis (see General Recommendations below)

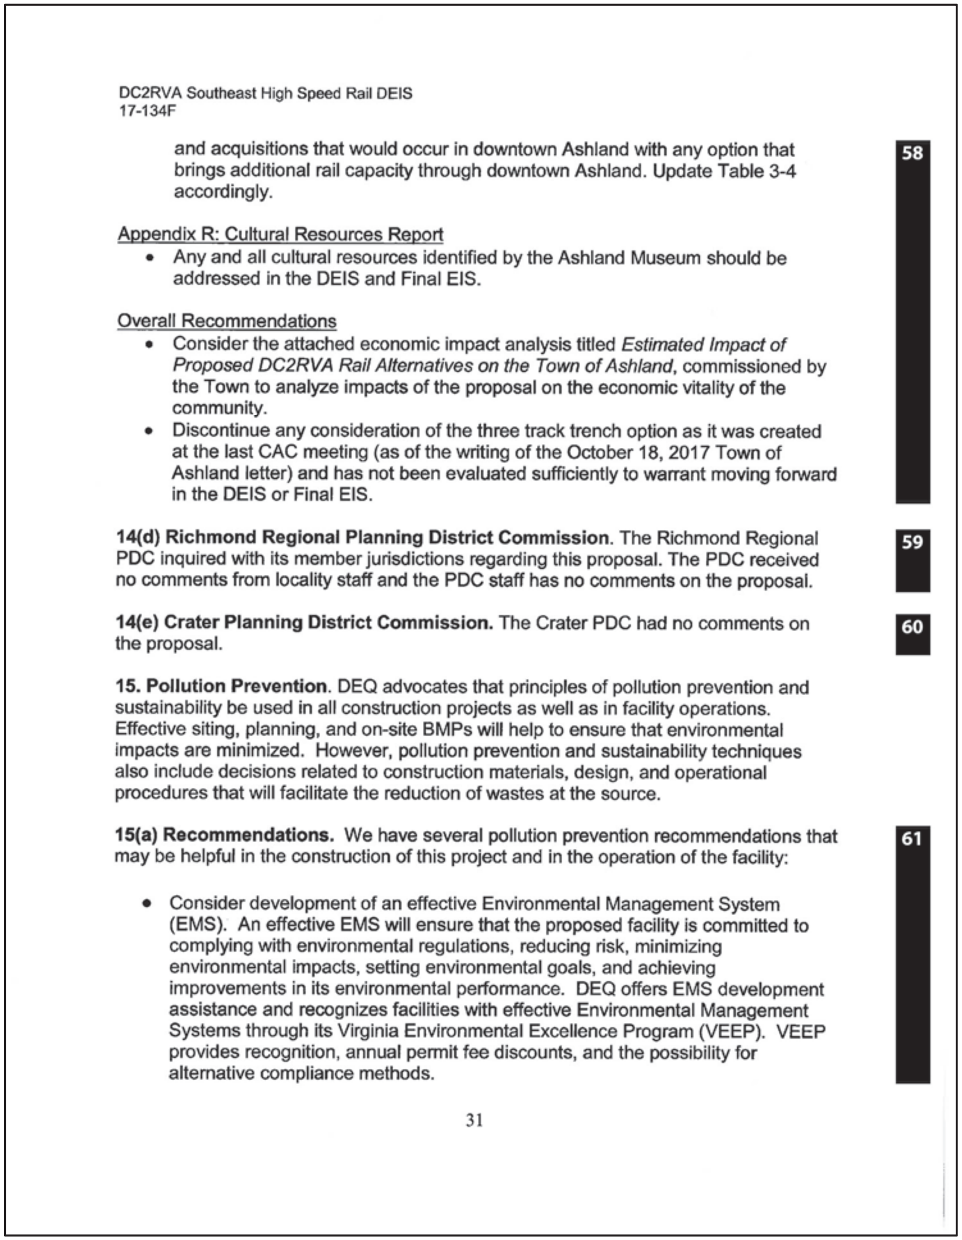
Chapter 5: Section 4(f) Evaluation

- Additional consideration should be given to the contributing structures identified in the Ashland Museum and Town of Ashland Section 106 response. The Town concurs that Alternative 5C would best avoid impacts to historic resources.
- Further opportunities for public and stakeholder input are necessary once a preferred alternative for Area 5 is recommended.

Appendix Q: Community Impact Assessment Technical Report

- Commence a more accurate count of business/residential relocations, closures,

30



58 and acquisitions that would occur in downtown Ashland with any option that brings additional rail capacity through downtown Ashland. Update Table 3-4 accordingly.

Appendix R: Cultural Resources Report

- Any and all cultural resources identified by the Ashland Museum should be addressed in the DEIS and Final EIS.

Overall Recommendations

- Consider the attached economic impact analysis titled *Estimated Impact of Proposed DC2RVA Rail Alternatives on the Town of Ashland*, commissioned by the Town to analyze impacts of the proposal on the economic vitality of the community.
- Discontinue any consideration of the three track trench option as it was created at the last CAC meeting (as of the writing of the October 18, 2017 Town of Ashland letter) and has not been evaluated sufficiently to warrant moving forward in the DEIS or Final EIS.

59 **14(d) Richmond Regional Planning District Commission.** The Richmond Regional PDC inquired with its member jurisdictions regarding this proposal. The PDC received no comments from locality staff and the PDC staff has no comments on the proposal.

60 **14(e) Crater Planning District Commission.** The Crater PDC had no comments on the proposal.

15. Pollution Prevention. DEQ advocates that principles of pollution prevention and sustainability be used in all construction projects as well as in facility operations. Effective siting, planning, and on-site BMPs will help to ensure that environmental impacts are minimized. However, pollution prevention and sustainability techniques also include decisions related to construction materials, design, and operational procedures that will facilitate the reduction of wastes at the source.

61 **15(a) Recommendations.** We have several pollution prevention recommendations that may be helpful in the construction of this project and in the operation of the facility:

- Consider development of an effective Environmental Management System (EMS). An effective EMS will ensure that the proposed facility is committed to complying with environmental regulations, reducing risk, minimizing environmental impacts, setting environmental goals, and achieving improvements in its environmental performance. DEQ offers EMS development assistance and recognizes facilities with effective Environmental Management Systems through its Virginia Environmental Excellence Program (VEEP). VEEP provides recognition, annual permit fee discounts, and the possibility for alternative compliance methods.

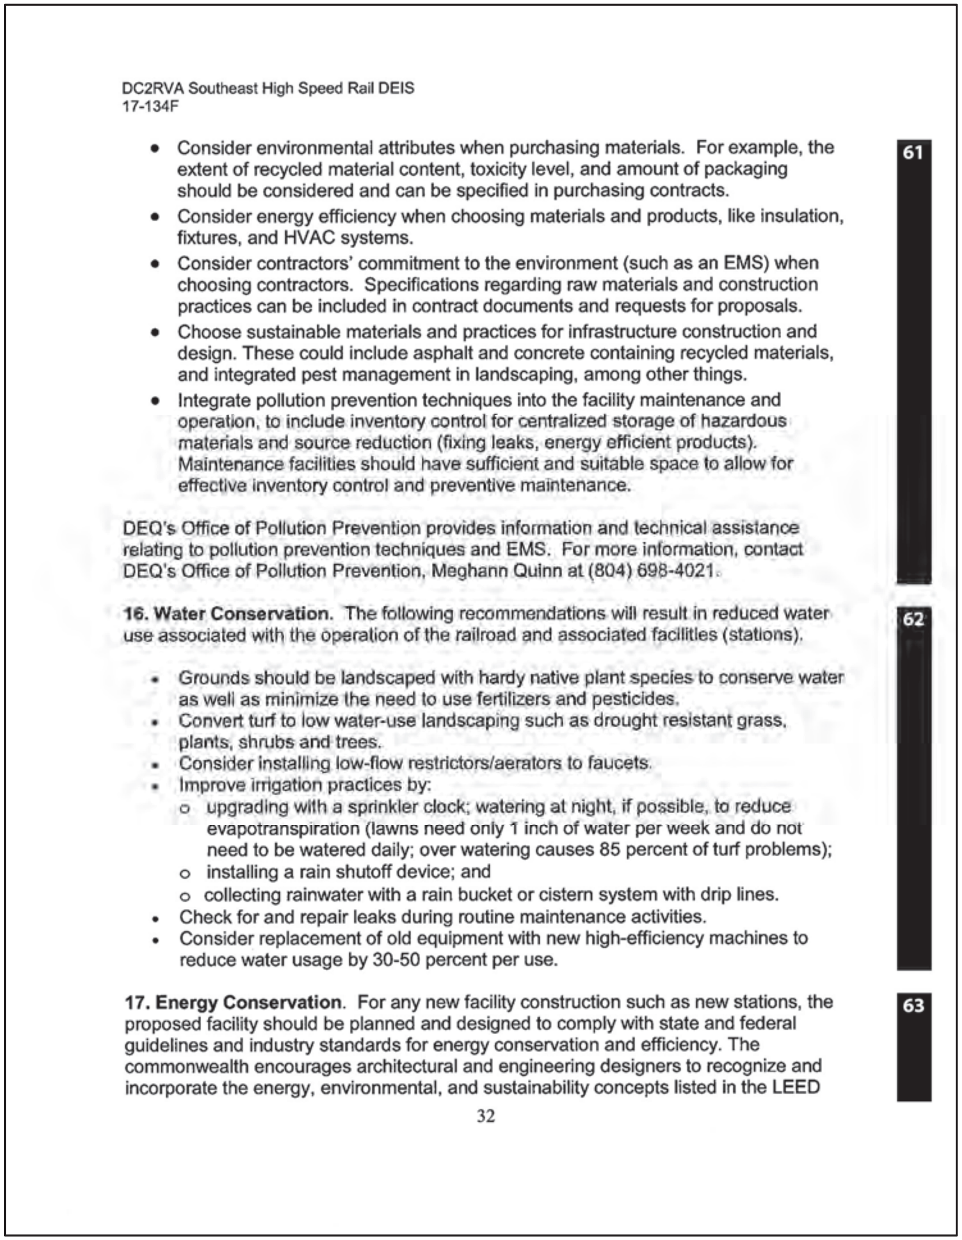
VIRGINIA DEQ (continued)

(Response to comment 58 on page B-87)

59. Comment noted; DRPT did not receive comments directly from the Richmond Regional PDC.

60. Comment noted; DRPT did not receive comments directly from the Crater PDC.

61. Railroad operators maintain their own environmental management systems. For example, Amtrak's *Environmental Management System Manual* (issued September 2001, revised March 2004) and CSX's *Public Safety, Health & Environment Management System* (https://www.csx.com/index.cfm/responsibility/environment-and-efficiency/environmental-management-system/) have been designed to ensure compliance with environmental regulations and minimize environmental impacts. DRPT will consider sustainable materials and practices for construction and operation of the Project to the extent practicable.



DC2RVA Southeast High Speed Rail DEIS
17-134F

61

- Consider environmental attributes when purchasing materials. For example, the extent of recycled material content, toxicity level, and amount of packaging should be considered and can be specified in purchasing contracts.
- Consider energy efficiency when choosing materials and products, like insulation, fixtures, and HVAC systems.
- Consider contractors' commitment to the environment (such as an EMS) when choosing contractors. Specifications regarding raw materials and construction practices can be included in contract documents and requests for proposals.
- Choose sustainable materials and practices for infrastructure construction and design. These could include asphalt and concrete containing recycled materials, and integrated pest management in landscaping, among other things.
- Integrate pollution prevention techniques into the facility maintenance and operation, to include inventory control for centralized storage of hazardous materials and source reduction (fixing leaks, energy efficient products). Maintenance facilities should have sufficient and suitable space to allow for effective inventory control and preventive maintenance.

DEQ's Office of Pollution Prevention provides information and technical assistance relating to pollution prevention techniques and EMS. For more information, contact DEQ's Office of Pollution Prevention, Meghann Quinn at (804) 698-4021.

62

16. Water Conservation. The following recommendations will result in reduced water use associated with the operation of the railroad and associated facilities (stations).

- Grounds should be landscaped with hardy native plant species to conserve water as well as minimize the need to use fertilizers and pesticides.
- Convert turf to low water-use landscaping such as drought resistant grass, plants, shrubs and trees.
- Consider installing low-flow restrictors/aerators to faucets.
- Improve irrigation practices by:
  - upgrading with a sprinkler clock; watering at night, if possible, to reduce evapotranspiration (lawns need only 1 inch of water per week and do not need to be watered daily; over watering causes 85 percent of turf problems);
  - installing a rain shutoff device; and
  - collecting rainwater with a rain bucket or cistern system with drip lines.
- Check for and repair leaks during routine maintenance activities.
- Consider replacement of old equipment with new high-efficiency machines to reduce water usage by 30-50 percent per use.

63

17. Energy Conservation. For any new facility construction such as new stations, the proposed facility should be planned and designed to comply with state and federal guidelines and industry standards for energy conservation and efficiency. The commonwealth encourages architectural and engineering designers to recognize and incorporate the energy, environmental, and sustainability concepts listed in the LEED

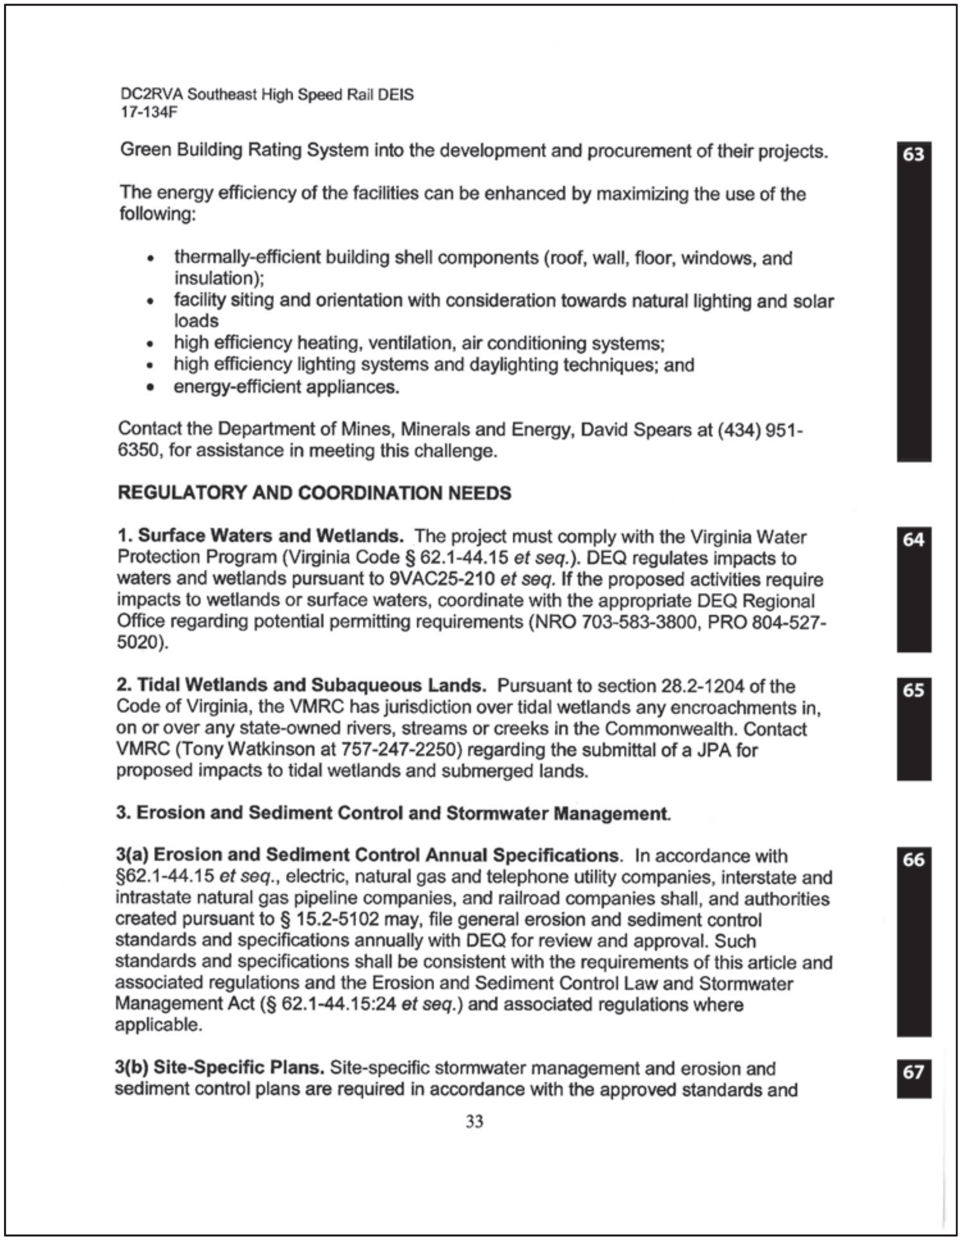
32

VIRGINIA DEQ (continued)

(Response to comment 61 on previous page)

62. During final design, after funding becomes available and incremental improvements are scheduled, DRPT will consider incorporating water-reducing measures into facilities design, where practicable. Maintenance procedures will be determined by the facilities operator following construction.

63. Final design, after funding becomes available and incremental improvements are scheduled, will comply with state and federal guidelines and industry standards for energy conservation and efficiency. DRPT will consider energy, environmental, and sustainability concepts listed in the LEED Green Building Rating System for facilities during final design.



DC2RVA Southeast High Speed Rail DEIS
17-134F

63 Green Building Rating System into the development and procurement of their projects.

The energy efficiency of the facilities can be enhanced by maximizing the use of the following:

- thermally-efficient building shell components (roof, wall, floor, windows, and insulation);
- facility siting and orientation with consideration towards natural lighting and solar loads
- high efficiency heating, ventilation, air conditioning systems;
- high efficiency lighting systems and daylighting techniques; and
- energy-efficient appliances.

Contact the Department of Mines, Minerals and Energy, David Spears at (434) 951-6350, for assistance in meeting this challenge.

REGULATORY AND COORDINATION NEEDS

64 **1. Surface Waters and Wetlands.** The project must comply with the Virginia Water Protection Program (Virginia Code § 62.1-44.15 *et seq*.). DEQ regulates impacts to waters and wetlands pursuant to 9VAC25-210 *et seq*. If the proposed activities require impacts to wetlands or surface waters, coordinate with the appropriate DEQ Regional Office regarding potential permitting requirements (NRO 703-583-3800, PRO 804-527-5020).

65 **2. Tidal Wetlands and Subaqueous Lands.** Pursuant to section 28.2-1204 of the Code of Virginia, the VMRC has jurisdiction over tidal wetlands any encroachments in, on or over any state-owned rivers, streams or creeks in the Commonwealth. Contact VMRC (Tony Watkinson at 757-247-2250) regarding the submittal of a JPA for proposed impacts to tidal wetlands and submerged lands.

3. Erosion and Sediment Control and Stormwater Management.

66 **3(a) Erosion and Sediment Control Annual Specifications.** In accordance with §62.1-44.15 *et seq*., electric, natural gas and telephone utility companies, interstate and intrastate natural gas pipeline companies, and railroad companies shall, and authorities created pursuant to § 15.2-5102 may, file general erosion and sediment control standards and specifications annually with DEQ for review and approval. Such standards and specifications shall be consistent with the requirements of this article and associated regulations and the Erosion and Sediment Control Law and Stormwater Management Act (§ 62.1-44.15:24 *et seq*.) and associated regulations where applicable.

67 **3(b) Site-Specific Plans.** Site-specific stormwater management and erosion and sediment control plans are required in accordance with the approved standards and

33

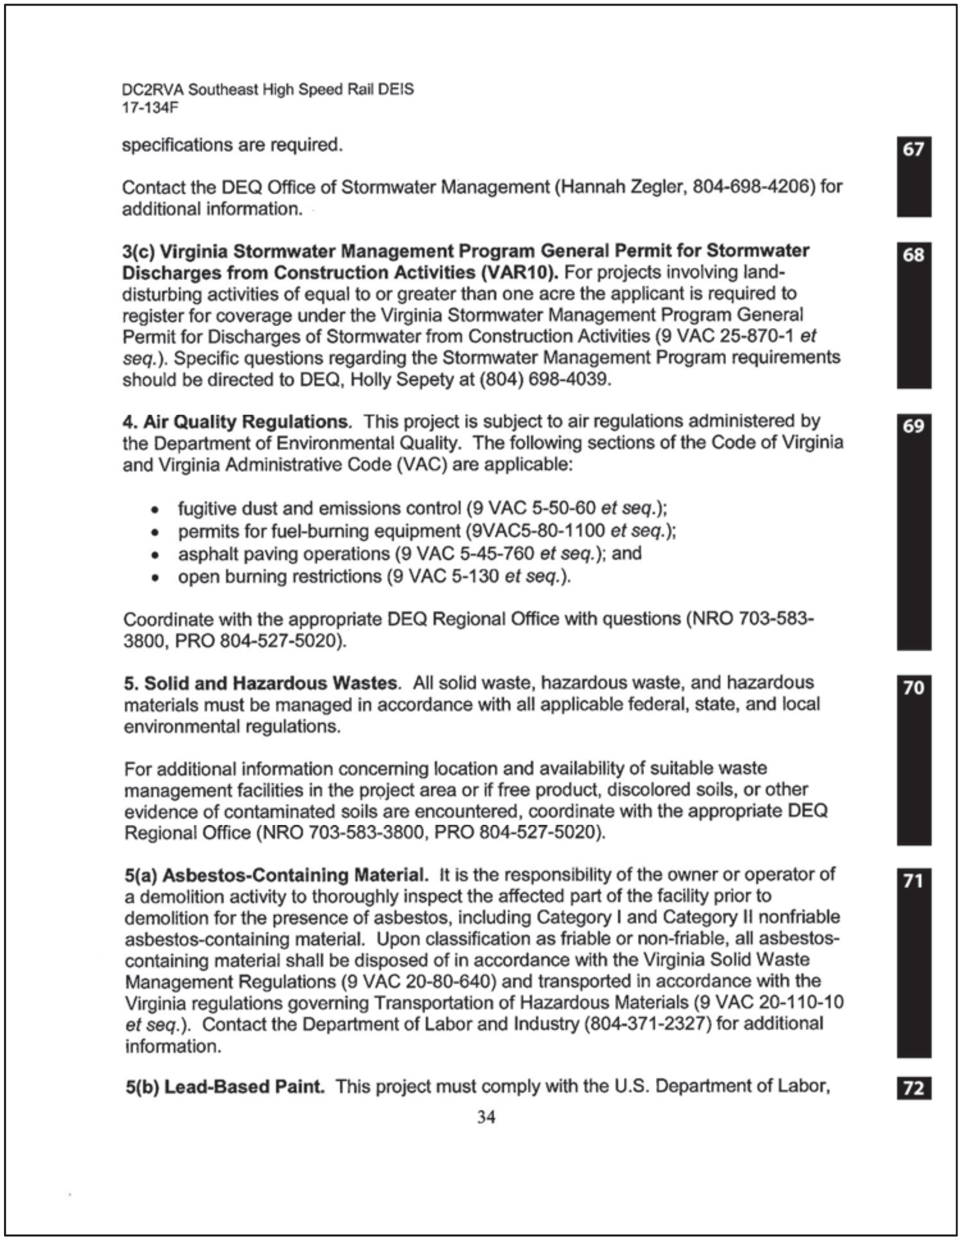
VIRGINIA DEQ (continued)

(Response to comment 63 on previous page)

64. and 65. Permit requirements and mitigations are discussed in Sections 5.1.5 and 5.1.6 of the Final EIS. DRPT will continue coordination with the federal and state regulatory agencies during the final design and construction phases of the Project, after funding becomes available and incremental improvements are scheduled. For proposed activities that impact wetlands and/or surface waters, DRPT will prepare a JPA to be submitted to the DEQ, VMRC, USACE and local wetland boards.

66. It is the responsibility of CSXT, as owner of the rail line and operator of freight service, to file general erosion and sediment control standards and specifications annually with DEQ for review and approval.

67. DRPT will develop site-specific SWM and erosion and sediment control plans as part of the Project's final design phase, after funding becomes available and incremental improvements are scheduled. DRPT will continue coordination at that time with the DEQ and will develop plans in accordance with the approved standards and specifications.



DC2RVA Southeast High Speed Rail DEIS

specifications are required. 67

Contact the DEQ Office of Stormwater Management (Hannah Zegler, 804-698-4206) for additional information.

68 **3(c) Virginia Stormwater Management Program General Permit for Stormwater Discharges from Construction Activities (VAR10).** For projects involving land-disturbing activities of equal to or greater than one acre the applicant is required to register for coverage under the Virginia Stormwater Management Program General Permit for Discharges of Stormwater from Construction Activities (9 VAC 25-870-1 *et seq.*). Specific questions regarding the Stormwater Management Program requirements should be directed to DEQ, Holly Sepety at (804) 698-4039.

69 **4. Air Quality Regulations.** This project is subject to air regulations administered by the Department of Environmental Quality. The following sections of the Code of Virginia and Virginia Administrative Code (VAC) are applicable:

- fugitive dust and emissions control (9 VAC 5-50-60 *et seq.*);
- permits for fuel-burning equipment (9VAC5-80-1100 *et seq.*);
- asphalt paving operations (9 VAC 5-45-760 *et seq.*); and
- open burning restrictions (9 VAC 5-130 *et seq.*).

Coordinate with the appropriate DEQ Regional Office with questions (NRO 703-583-3800, PRO 804-527-5020).

70 **5. Solid and Hazardous Wastes.** All solid waste, hazardous waste, and hazardous materials must be managed in accordance with all applicable federal, state, and local environmental regulations.

For additional information concerning location and availability of suitable waste management facilities in the project area or if free product, discolored soils, or other evidence of contaminated soils are encountered, coordinate with the appropriate DEQ Regional Office (NRO 703-583-3800, PRO 804-527-5020).

71 **5(a) Asbestos-Containing Material.** It is the responsibility of the owner or operator of a demolition activity to thoroughly inspect the affected part of the facility prior to demolition for the presence of asbestos, including Category I and Category II nonfriable asbestos-containing material. Upon classification as friable or non-friable, all asbestos-containing material shall be disposed of in accordance with the Virginia Solid Waste Management Regulations (9 VAC 20-80-640) and transported in accordance with the Virginia regulations governing Transportation of Hazardous Materials (9 VAC 20-110-10 *et seq.*). Contact the Department of Labor and Industry (804-371-2327) for additional information.

72 **5(b) Lead-Based Paint.** This project must comply with the U.S. Department of Labor,

34

VIRGINIA DEQ (continued)

(Response to comment 67 on previous page)

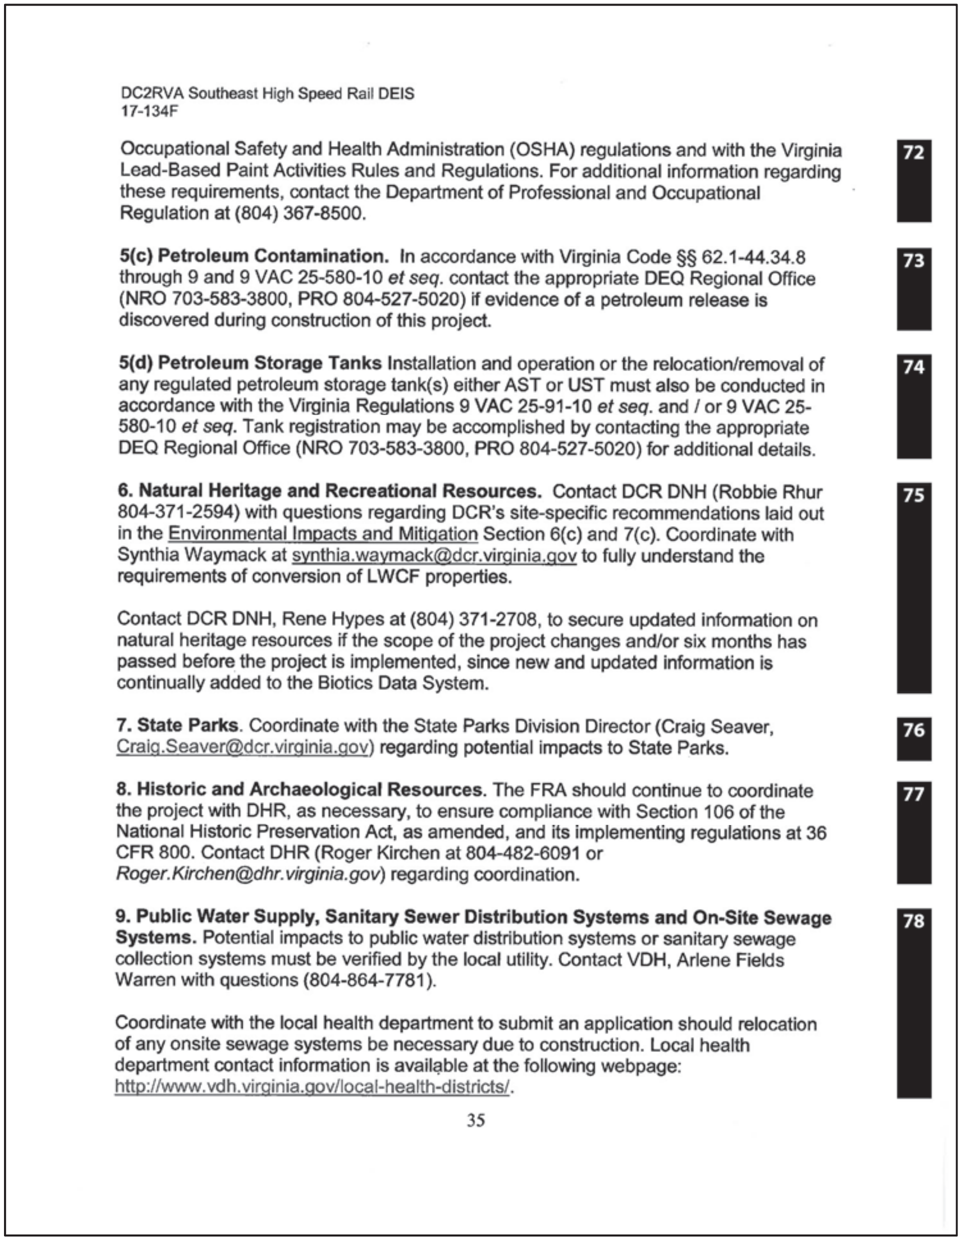
68. Construction activities associated with several of the proposed improvement elements will disturb more than one acre of land. These improvements include straightening of curves, new mainline track and crossovers, station and station area improvements, new sidings and signals, and safety improvements at grade-crossings. DRPT will develop SWM plans for these improvements to be registered for coverage under the Virginia Stormwater Management Program General Permit for Discharges of Stormwater Activities, during the final design phase of the Project, after funding becomes available and incremental improvements are scheduled. See Sections 5.1.6 and 5.19.2 of the Final EIS.

69. Demolition and construction activities can result in short-term increases in air pollutants. DPRT will minimize potential negative effects during construction (through the contractor at that time) with the application of appropriate BMP's. See Sections 5.1.6 and 5.19.2 of the Final EIS.

70. All solid waste, hazardous waste, and hazardous materials generated by the Project will be handled and managed in accordance with federal, state and local regulations, including the Virginia Solid Waste Management Regulations (VSWMR). Impacts from the Preferred Alternative to known (or potential) hazardous material sites have been identified and discussed in Section 5.5 of the Final EIS.

71. Any asbestos, lead, or contaminated residues generated by construction of the Project will be handled in accordance with the VSWMR and transported in accordance with the Virginia regulations governing the Transportation of Hazardous Materials. DRPT will continue coordination with the DEQ and the Virginia Department of Labor and Industry during final design, after funding becomes available and incremental improvements are scheduled. See Sections 5.5 and 5.18 of the Final EIS.

72. Any use of lead-based paints during construction will be performed in accordance with Occupational Safety and Health Administration (OSHA) regulations and with the Virginia Lead-Based Paint Activities Rules and Regulations.



72 Occupational Safety and Health Administration (OSHA) regulations and with the Virginia Lead-Based Paint Activities Rules and Regulations. For additional information regarding these requirements, contact the Department of Professional and Occupational Regulation at (804) 367-8500.

73 **5(c) Petroleum Contamination.** In accordance with Virginia Code §§ 62.1-44.34.8 through 9 and 9 VAC 25-580-10 *et seq*. contact the appropriate DEQ Regional Office (NRO 703-583-3800, PRO 804-527-5020) if evidence of a petroleum release is discovered during construction of this project.

74 **5(d) Petroleum Storage Tanks** Installation and operation or the relocation/removal of any regulated petroleum storage tank(s) either AST or UST must also be conducted in accordance with the Virginia Regulations 9 VAC 25-91-10 *et seq*. and / or 9 VAC 25-580-10 *et seq*. Tank registration may be accomplished by contacting the appropriate DEQ Regional Office (NRO 703-583-3800, PRO 804-527-5020) for additional details.

75 **6. Natural Heritage and Recreational Resources.** Contact DCR DNH (Robbie Rhur 804-371-2594) with questions regarding DCR's site-specific recommendations laid out in the Environmental Impacts and Mitigation Section 6(c) and 7(c). Coordinate with Synthia Waymack at synthia.waymack@dcr.virginia.gov to fully understand the requirements of conversion of LWCF properties.

Contact DCR DNH, Rene Hypes at (804) 371-2708, to secure updated information on natural heritage resources if the scope of the project changes and/or six months has passed before the project is implemented, since new and updated information is continually added to the Biotics Data System.

76 **7. State Parks**. Coordinate with the State Parks Division Director (Craig Seaver, Craig.Seaver@dcr.virginia.gov) regarding potential impacts to State Parks.

77 **8. Historic and Archaeological Resources.** The FRA should continue to coordinate the project with DHR, as necessary, to ensure compliance with Section 106 of the National Historic Preservation Act, as amended, and its implementing regulations at 36 CFR 800. Contact DHR (Roger Kirchen at 804-482-6091 or *Roger.Kirchen@dhr.virginia.gov*) regarding coordination.

78 **9. Public Water Supply, Sanitary Sewer Distribution Systems and On-Site Sewage Systems.** Potential impacts to public water distribution systems or sanitary sewage collection systems must be verified by the local utility. Contact VDH, Arlene Fields Warren with questions (804-864-7781).

Coordinate with the local health department to submit an application should relocation of any onsite sewage systems be necessary due to construction. Local health department contact information is available at the following webpage: http://www.vdh.virginia.gov/local-health-districts/.

VIRGINIA DEQ (continued)

(Response to comment 72 on previous page)

73. Any environmental release (e.g., petroleum, hydraulic fluids, etc.) during construction will be immediately remediated on-site and the appropriate DEQ Regional Office will be contacted.

74. The installation and operation or the relocation/removal of any regulated petroleum storage tanks (above ground or underground) during construction will be conducted in accordance with Virginia Regulations 9 VAC 25-91-10 et seq. and/or 9 VAC 25-580-10 et seq.

75. See responses to DRPT-numbered statements #26, #36, #37 and #38.

76. DRPT will continue to coordinate with the Department of Conservation and Recreation – State Parks Division, through final design, after funding becomes available and incremental improvements are scheduled.

77. DRPT will continue to coordinate with DHR to ensure compliance with requirements of Section 106 of the National Historic Preservation Act. DRPT received notification from DHR under separate cover; refer to DHR's letter, which is included as part of the agency responses in the Final EIS.

78. Final confirmation of all public utilities will be performed during the final design phase of the Project, after funding becomes available and incremental improvements are scheduled.

10. Open Space. Contact the VOF (Brian Fuller, 434-906-0879) for additional coordination regarding the preservation of existing open-space easements if Build Alternative 3C is ultimately chosen for Area 3. **79**

11. Chesapeake Bay Preservation Areas. The project must satisfy the applicable Chesapeake Bay Preservation Act (Virginia Code 62.1-44.15 *et seq.*) and the Chesapeake Bay Preservation Area Designation and Management Regulations (9VAC25-830 *et. seq.*) (Regulations). Section 9VAC25-830-150 of the Regulations exempt railroads and their appurtenant structures on the condition that the construction, installation, operation and maintenance of such railroads and structures are in accord with the following: **80**

1. Regulations promulgated pursuant to the Virginia Erosion and Sediment Control Law and the Virginia Stormwater Management Act;
2. An erosion and sediment control plan and a stormwater management approved by the Virginia Department of Environmental Quality and
3. Local water quality protection criteria at least as stringent as the above state requirements.

Contact the DEQ Office of Local Government Assistance Programs Daniel Moore (804-698-4520) with questions.

12. Fairfax County. Coordinate with the Fairfax County Department of Planning and Zoning (Erin Haley, 703-324-1380) regarding the comments and recommendations outlined in the Environmental Impacts and Mitigation Section 14(a)(i) and 14(a)(iii). **81**

Coordinate with the Fairfax County Park Authority Easement Coordinator (703-324-8741) to obtain an application for a Right of Entry License, Easement, and/or Construction Permit, as necessary, for access to Park Authority owned property.

Contact Andy Galusha (Senior Landscape Architect, 703-324-8755) with questions regarding the Fairfax County Park Authority's comments, recommendations, and requirements found in the Environmental Impacts and Mitigation Sections 14(a)(ii), 14(a)(iv), and 14(a)(v).

13. Town of Ashland. Coordinate with the Town of Ashland Town Manager (Joshua Farrar, 804-798-9219) regarding the Town's extensive comments and recommendations related to the proposed Build Alternatives within Area 5 of the project corridor. **82**

14. Federal Consistency. The FRA must submit a Federal Consistency Determination pursuant to the Coastal Zone Management Act (CZMA) of 1972, as amended (16 USCA, CZMA § 307, § 1456(c)(3)(A)) and its implementing federal consistency regulations (15 CFR Part 930, subpart C). Coordinate directly with OEIR for the **83**

36

VIRGINIA DEQ (continued)

79. Build Alternative 3C – Add Two-Track Bypass (East of Fredericksburg) was not selected as part of the Preferred Alternative. (refer to Final EIS Section 4.3.3 for details). For Area 3, the Preferred Alternative is Alternative 3B: Add One Track East of Existing.

80. The DC2RVA Project is conditionally exempt from the Chesapeake Bay Preservation Act regulations. All construction will be in accordance with erosion and sediment control requirements and water quality protection criteria (see DRPT-numbered statements #66, #67 and #68 above).

81. See responses to DRPT-numbered statements #52 through #55.

82. DRPT coordinated with the Town of Ashland throughout selection of the Preferred Alternative of the Final EIS. Refer to DRPT-numbered statements #142 through #197 for responses to comments submitted by the Town.

83. As part of final design after funding becomes available and incremental improvements are scheduled, the sponsoring agency will submit a Federal Consistency Determination for the recommended Preferred Alternative that analyzes the coastal effects of the Project in light of the enforceable policies of the Virginia CZMA program and provides commitment to comply with those policies.

Thanks! Would the language for the VAR10 permit be appropriate to include as well?

3(b)(ii) General Virginia Pollutant Discharge Elimination System (VPDES) Permit for Discharges of Stormwater from Construction Activities (VAR10). The operator or owner of a construction activity involving land disturbance of equal to or greater than 1 acre is required to register for coverage under the General VPDES Permit for Discharges of Stormwater from Construction Activities and develop a project specific stormwater pollution prevention plan (SWPPP). The SWPPP must be prepared prior to submission of the registration statement for coverage under the general permit and the SWPPP must address water quality and quantity in accordance with the Virginia Stormwater Management Program (VSMP) Regulations. General information and registration forms for the General Permit are available at *www.deq.virginia.gov/Programs/Water/StormwaterManagement/VSMPPermits/ConstructionGeneralPermit.aspx*.

Subject: FW: NEW PROJECT FRA DC to Richmond Rail 17-134F

Hannah and Larry,

I'd like your input on this project. The proposal is for new rail lines on a 123-mile existing rail corridor that is owned by CSX Transportation, Inc. Bypass options around Ashland and Fredericksburg will require new ROW if chosen. The project is a joint state and federal venture undertaken by the Federal Rail Administration and the Virginia Department of Rail and Public Transportation. My understanding is that both federal and state funding will be utilized and the project will be implemented incrementally, with an in service date of 2025. The condensed executive summary for the project is available at the link below.

The latest spreadsheet that I have from Hannah shows that CSX has approved AS&S. However, since many years will pass before any construction happens I thought I'd use the below language. Let me know if this is correct/appropriate for this project.

(i) Erosion and Sediment Control Annual Specifications and Stormwater Management. In accordance with §62.1-44.15 *et seq.*, electric, natural gas and telephone utility companies, interstate and intrastate natural gas pipeline companies, and railroad companies shall, and authorities created pursuant to § 15.2-5102 may, file general erosion and sediment control standards and specifications annually with DEQ for review and approval. Such standards and specifications shall be consistent with the requirements of this article and associated regulations and the Erosion and Sediment Control Law and Stormwater Management Act (§ 62.1-44.15:24 *et seq.*) and associated regulations where applicable. The specifications shall apply to:

- Construction, installation, or maintenance of electric transmission, natural gas, and telephone utility lines and pipelines, and water and sewer lines; and
- Construction of the tracks, rights-of-way, bridges, communication facilities, and other related structures and facilities of the railroad company.

(ii) Erosion and Sediment Control Site-Specific Plans. The owner is responsible for the development, review, and approval of a site-specific erosion and sediment control (ESC) plan in accordance with the approved erosion and sediment control standards and specifications. All regulated land-disturbing activities associated with the project/site, including on and off site access roads, staging areas, borrow areas, stockpiles, and soil intentionally transported from the project, must be covered by the site-specific ESC plan.

(iii) Stormwater Management Site-Specific Plans. The owner is responsible for the development, review, and approval of a site-specific stormwater management (SWM) plan in accordance with the approved standards and specifications.

Also, some of the alternative include either renovation of existing train stations or construction of new stations. Would the AS&S cover land disturbance associated with station construction (i.e. do stations count as "other related structures and facilities of the railroad company"?

Thanks,

Janine Howard
Environmental Impact Review Coordinator

To: Howard, Janine (DEQ)
Subject: Re: Federal Railroad Administration: DC to Richmond Southeast High Speed Rail Project, DEQ #17-134F - Review

86

NRO comments regarding the Draft EIS for the Federal Railroad Administration: DC to Richmond Southeast High Speed Rail Project, DEQ #17-134F, located in the City of Fredericksburg, and Caroline, Spotsylvania, Stafford, Prince William, Fairfax, and Arlington Counties, Virginia are as follows:

Land Protection Division – The project manager is reminded that if any solid or hazardous waste is generated/encountered during construction, the project manager would follow applicable federal, state, and county regulations for their disposal.

Air Compliance/Permitting - The project manager is reminded that during the construction phases that occur with this project; the project is subject to the Fugitive Dust/Fugitive Emissions Rule 9 VAC 5-50-60 through 9 VAC 5-50-120. In addition, should any open burning or use of special incineration devices be employed in the disposal of land clearing debris during demolition and construction, the operation would be subject to the Open Burning Regulation 9 VAC 5-130-10 through 9 VAC 5-130-60 and 9 VAC 5-130-100.

Virginia Water Protection Permit (VWPP) Program – According to the submission, impacts to surface waters will be necessary. DEQ VWP staff recommends that the avoidance and minimization of surface water impacts to the maximum extent practicable as well as coordination with the US Army Corps of Engineers. Upon receipt of a Joint Permit Application for the proposed surface water impacts, DEQ VWP Permit staff will review the proposed project in accordance with the VWP permit program regulations and current VWP permit program guidance.

Erosion and Sediment Control and Storm Water Management: DEQ has regulatory authority for the Virginia Pollutant Discharge Elimination System (VPDES) programs related to municipal separate storm sewer systems (MS4s) and construction activities. Erosion and sediment control measures are addressed in local ordinances and State regulations. Additional information is available at http://www.deq.virginia.gov/Programs/Water/StormwaterManagement.aspx. Non-point source pollution resulting from this project should be minimized by using effective erosion and sediment control practices and structures. Consideration should also be given to using permeable paving for parking areas and walkways where appropriate, and denuded areas should be promptly revegetated following construction work. If the total land disturbance exceeds 10,000 square feet, an erosion and sediment control plan will be required. Some localities also require an E&S plan for disturbances less than 10,000 square feet. A stormwater management plan may also be required. For any land disturbing activities equal to one acre or more, you are required to apply for coverage under the VPDES General Permit for Discharges of Storm Water from Construction Activities. The Virginia Stormwater Management Permit Authority may be DEQ or the locality.

MEMORANDUM

TO: Janine Howard, DEQ/EIR Environmental Program Planner

FROM: Katy Dacey, Division of Land Protection & Revitalization Review Coordinator

DATE: October 3, 2017

COPIES: Sanjay Thirunagari, Division of Land Protection & Revitalization Review Manager; file

SUBJECT: Environmental Impact Review: EIR Project No 17-134F DC to Richmond Southeast High Speed Rail, Cities of Richmond and Fredericksburg, Chesterfield, Henrico, Hanover, Caroline, Spotsylvania, Stafford, Prince William, Fairfax and Arlington Counties, VA

The Division of Land Protection & Revitalization (DLPR) has completed its review of the September 2017 Draft EIR for the DC to Richmond Southeast High Speed Rail project located within the Cities of Richmond and Fredericksburg and the Counties of Chesterfield, Henrico, Hanover, Caroline, Spotsylvania, Stafford, Prince William, Fairfax and Arlington in Virginia

Project Scope: construction of a passenger rail service and infrastructure improvements to north-south travel corridor between Washington, DC and Richmond, VA

This submittal indicated that solid and hazardous waste issues were addressed and that a search of Federal and State environmental databases was conducted. DLPR staff with Geographical Information Systems conducted a 1000-foot radius search of Hazardous Waste, RCRA Corrective Action, Federal Facilities, Solid Waste, Virginia Remediation Program and Petroleum Release databases for sites along the entire project corridor in Virginia. DLPR staff identified four-hundred one sites within the search parameters which may impact the project activity. DLPR staff has reviewed the submittal and offers the following comments: **87**

Hazardous Waste/RCRA Facilities ***– thirty-nine in close proximity to project corridor*** **88**

VIRGINIA DEQ (continued)

87. through 93. DRPT appreciates the list of hazardous materials sites provided by DLPR. The extent of DLPR's list (401 sites) is comparable to the number of sites identified in Section 3.5.3 of the Draft EIS that have the potential to affect the Project, i.e. 484 sites, including CERCLA, potential or known hazardous material releases/contamination, and petroleum release sites. Section 5.5 of the Final EIS lists those sites which are within the permanent Limits of Disturbance (LOD) of the Preferred Alternative; updated mapping of critical hazardous materials sites in relation to that LOD are included in Appendix M.

VIRGINIA DEQ (continued)

(For response to comments 87 through 93, refer to page B-102)

93

20073056	Purvis Steve Residence	14708 Featherstone Rd	Woodbridge	VA	22191	12/15/2005	Closed
19860823	Modern Transportation Services	15481 Farm Creek Dr	Woodbridge	VA	22191	6/13/1986	Closed
19860589	United Fiberglass	Insulation Ave	Woodbridge	VA	22191	3/16/1986	Closed

94 Please note that the DEQ's Pollution Complaint (PC) cases identified should be further evaluated by the ACP project engineer or manager to establish the exact location, nature and extent of the petroleum release and the potential to impact the proposed project. Also, the project engineer or manager should contact the Tank Programs at the corresponding DEQ Regional Offices as listed below:

Northern Virginia Regional Office (703) 583-3800
Piedmont Regional Office (804) 527-5020

GENERAL COMMENTS

95 Applicable state laws and regulations include: Virginia Waste Management Act, Code of Virginia Section 10.1-1400 *et seq.*; Virginia Hazardous Waste Management Regulations (VHWMR) (9VAC 20-60); Virginia Solid Waste Management Regulations (VSWMR) (9VAC 20-81); Virginia Regulations for the Transportation of Hazardous Materials (9VAC 20-110). Applicable Federal laws and regulations include: the Resource Conservation and Recovery Act (RCRA), 42 U.S.C. Section 6901 *et seq.*, and the applicable regulations contained in Title 40 of the Code of Federal Regulations; and the U.S. Department of Transportation Rules for Transportation of Hazardous Materials, 49 CFR Part 107.

Asbestos and/or Lead-based Paint

96 All structures being demolished/renovated/removed should be checked for asbestos-containing materials (ACM) and lead-based paint (LBP) prior to demolition. If ACM or LBP are found, in addition to the federal waste-related regulations mentioned above, state regulations 9VAC 20-81-620 for ACM and 9VAC 20-60-261 for LBP must be followed. Questions may be directed to the following person at the locations listed below:

Northern Virginia Regional Office, Kathryn Perszyk (703) 583-3856
Piedmont Regional Office, Jason Miller (804) 527-5028

Pollution Prevention – Reuse - Recycling

97 Please note that DEQ encourages all construction projects and facilities to implement pollution prevention principles, including the reduction, reuse, and recycling of all solid wastes generated. All generation or discovery of hazardous wastes should be minimized and handled appropriately.

If you have any questions or need further information, please contact Katy Dacey at (804) 698-4274.

VIRGINIA DEQ (continued)

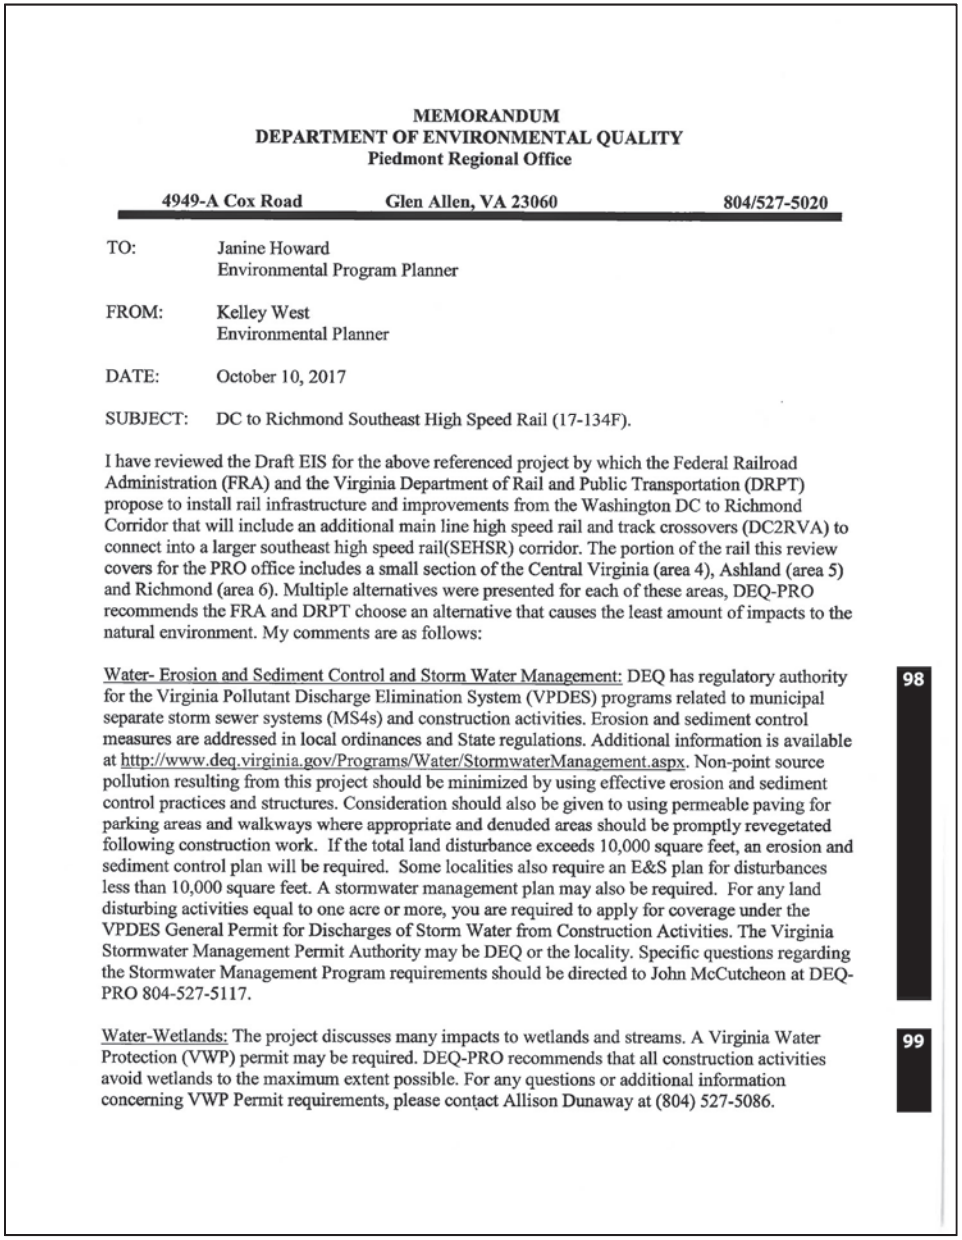
(For response to comment 93, refer to page B-102)

94. Further evaluation of hazardous sites/facilities, including Pollution Complaint cases, that could potentially affect the Project, will be completed in a Phase I Environmental Site Assessment (ESA) prior to property acquisition, if required. At that time, Phase I ESA investigators will contact the Tank Programs at the DEQ Regional Offices to gather information on sites of concern.

95. As noted in Section 3.5.1 of the Draft EIS, the federal government and the Commonwealth of Virginia regulate hazardous materials under multiple statutes. Project construction and operation will comply with the requirements of all applicable federal and state laws and regulations for hazardous materials.

96. This requirement is contained within Section 5 ("Solid and Hazardous Wastes and Hazardous Materials") of DEQ's main letter. Refer to DRPT-numbered statement #21.

97. This statement is contained within Section 15 ("Pollution Prevention") of DEQ's main letter. Refer to DRPT-numbered statement #61.



MEMORANDUM
DEPARTMENT OF ENVIRONMENTAL QUALITY
Piedmont Regional Office

4949-A Cox Road Glen Allen, VA 23060 804/527-5020

TO: Janine Howard
Environmental Program Planner

FROM: Kelley West
Environmental Planner

DATE: October 10, 2017

SUBJECT: DC to Richmond Southeast High Speed Rail (17-134F).

I have reviewed the Draft EIS for the above referenced project by which the Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) propose to install rail infrastructure and improvements from the Washington DC to Richmond Corridor that will include an additional main line high speed rail and track crossovers (DC2RVA) to connect into a larger southeast high speed rail(SEHSR) corridor. The portion of the rail this review covers for the PRO office includes a small section of the Central Virginia (area 4), Ashland (area 5) and Richmond (area 6). Multiple alternatives were presented for each of these areas, DEQ-PRO recommends the FRA and DRPT choose an alternative that causes the least amount of impacts to the natural environment. My comments are as follows:

98

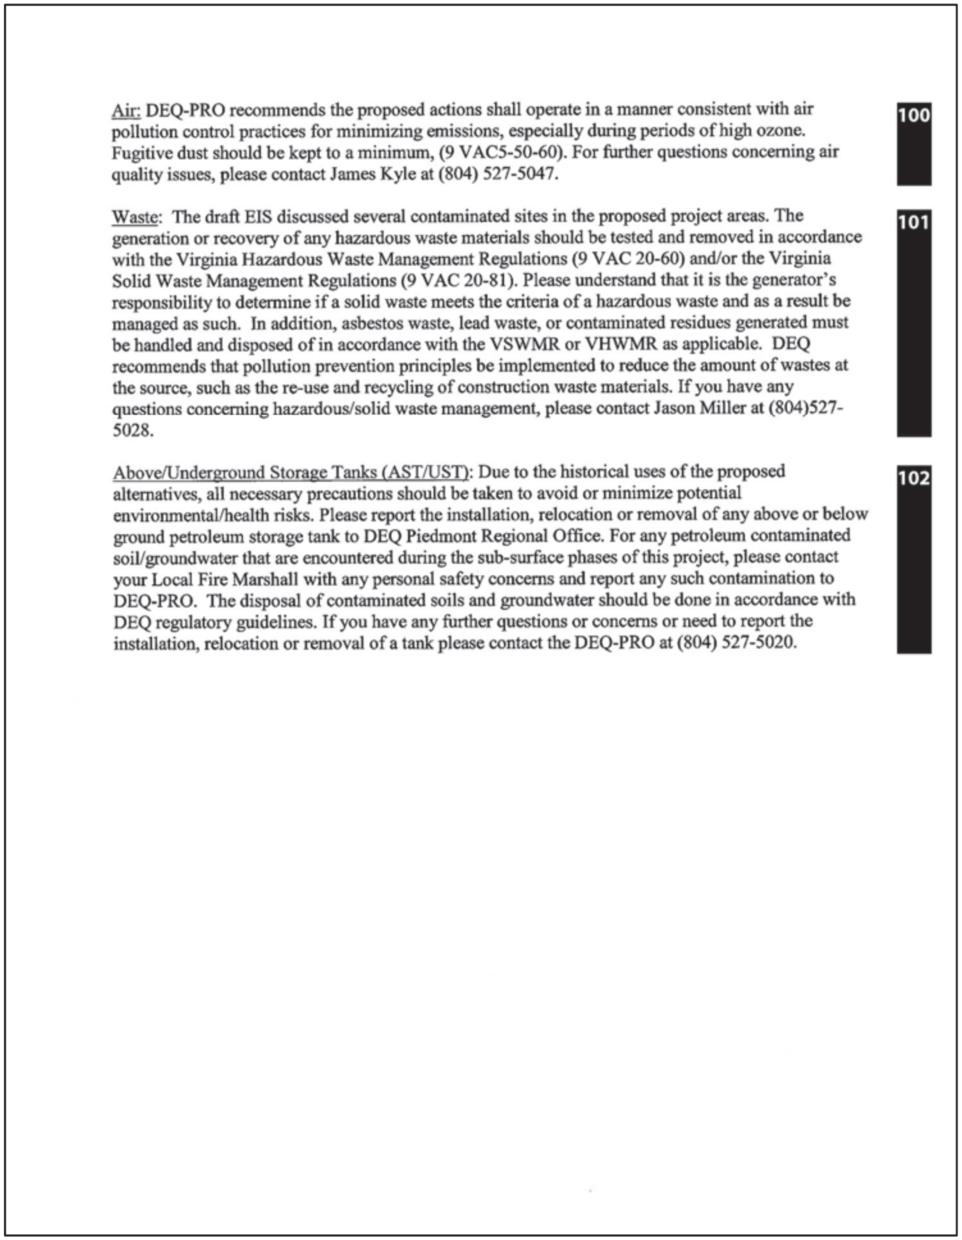
Water- Erosion and Sediment Control and Storm Water Management: DEQ has regulatory authority for the Virginia Pollutant Discharge Elimination System (VPDES) programs related to municipal separate storm sewer systems (MS4s) and construction activities. Erosion and sediment control measures are addressed in local ordinances and State regulations. Additional information is available at http://www.deq.virginia.gov/Programs/Water/StormwaterManagement.aspx. Non-point source pollution resulting from this project should be minimized by using effective erosion and sediment control practices and structures. Consideration should also be given to using permeable paving for parking areas and walkways where appropriate and denuded areas should be promptly revegetated following construction work. If the total land disturbance exceeds 10,000 square feet, an erosion and sediment control plan will be required. Some localities also require an E&S plan for disturbances less than 10,000 square feet. A stormwater management plan may also be required. For any land disturbing activities equal to one acre or more, you are required to apply for coverage under the VPDES General Permit for Discharges of Storm Water from Construction Activities. The Virginia Stormwater Management Permit Authority may be DEQ or the locality. Specific questions regarding the Stormwater Management Program requirements should be directed to John McCutcheon at DEQ-PRO 804-527-5117.

99

Water-Wetlands: The project discusses many impacts to wetlands and streams. A Virginia Water Protection (VWP) permit may be required. DEQ-PRO recommends that all construction activities avoid wetlands to the maximum extent possible. For any questions or additional information concerning VWP Permit requirements, please contact Allison Dunaway at (804) 527-5086.

VIRGINIA DEQ (continued)

98. This content is addressed within Section 3 ("Erosion and Sediment Control and Stormwater Management") of DEQ's main letter. Refer to DRPT-numbered statements #8 through #12.
99. This content is addressed within Section 1 ("Water Quality and Wetlands") of DEQ's main letter. Refer to DRPT-numbered statements #2 through #4.



100 Air: DEQ-PRO recommends the proposed actions shall operate in a manner consistent with air pollution control practices for minimizing emissions, especially during periods of high ozone. Fugitive dust should be kept to a minimum, (9 VAC5-50-60). For further questions concerning air quality issues, please contact James Kyle at (804) 527-5047.

101 Waste: The draft EIS discussed several contaminated sites in the proposed project areas. The generation or recovery of any hazardous waste materials should be tested and removed in accordance with the Virginia Hazardous Waste Management Regulations (9 VAC 20-60) and/or the Virginia Solid Waste Management Regulations (9 VAC 20-81). Please understand that it is the generator's responsibility to determine if a solid waste meets the criteria of a hazardous waste and as a result be managed as such. In addition, asbestos waste, lead waste, or contaminated residues generated must be handled and disposed of in accordance with the VSWMR or VHWMR as applicable. DEQ recommends that pollution prevention principles be implemented to reduce the amount of wastes at the source, such as the re-use and recycling of construction waste materials. If you have any questions concerning hazardous/solid waste management, please contact Jason Miller at (804)527-5028.

102 Above/Underground Storage Tanks (AST/UST): Due to the historical uses of the proposed alternatives, all necessary precautions should be taken to avoid or minimize potential environmental/health risks. Please report the installation, relocation or removal of any above or below ground petroleum storage tank to DEQ Piedmont Regional Office. For any petroleum contaminated soil/groundwater that are encountered during the sub-surface phases of this project, please contact your Local Fire Marshall with any personal safety concerns and report any such contamination to DEQ-PRO. The disposal of contaminated soils and groundwater should be done in accordance with DEQ regulatory guidelines. If you have any further questions or concerns or need to report the installation, relocation or removal of a tank please contact the DEQ-PRO at (804) 527-5020.

VIRGINIA DEQ (continued)

100. This content is addressed within Section 4 ("Air Pollution Control") of DEQ's main letter. Refer to DRPT-numbered statements #13 through #18.

101. This content is addressed within Section 5 ("Solid and Hazardous Wastes and Hazardous Materials") of DEQ's main letter. Refer to DRPT-numbered statements #19 through #24.

102. This content is addressed within Section 5 ("Solid and Hazardous Wastes and Hazardous Materials") of DEQ's main letter. Refer to DRPT-numbered statements #19 through #24.

MEMORANDUM

DATE: October 11, 2017

TO: Janine Howard, DEQ

FROM: Roberta Rhur, Environmental Impact Review Coordinator

SUBJECT: DEQ 17-134F, DC to Richmond Southeast High Speed Rail

Division of Planning and Recreation Resources

The Department of Conservation and Recreation (DCR), Division of Planning and Recreation Resources (PRR), develops the *Virginia Outdoors Plan* and coordinates a broad range of recreational and environmental programs throughout Virginia. These include the Virginia Scenic Rivers program; Trails, Greenways, and Blueways; Virginia State Park Master Planning and State Park Design and Construction.

103 **02-26 Purpose and Need** The "Purpose and Need" should recognize the inter-connected and multi-modal character of transportation in the 21st century and, in the Tier II DEIS, recognize ways in which rail stations associated with a potential high speed rail line would serve as trailheads for domestic and international travelers and as gateways to outdoor recreational experiences, including local and long-distance bicycling, hiking and paddling. While recognizing some impacts to parks and trails, the document fails to describe adequately mitigation opportunities, including a continuous, associated non-motorized trail network between, at minimum, Leesylvania State Park and Falmouth and the need for crossings that meet ADA guidelines.

104 **Section 3.9.2 Aesthetics and Visual Environment,**
Consider adding the Potomac Heritage National Scenic Trail (PHNST) viewshed to the "Sensitive Resources" sidebar under the VAUs

105 **Table 3.14-3** (page 3-176): Add PHNST to "Features" cell for Veterans Memorial Park, Leesylvania, and Cockpit Point (and any other relevant local/state jurisdiction parks), as a feature of the parks that may be impacted.

106 **Section 4.15.2.2** (page 4-199) – Effects on Bicycle and Pedestrian Connectivity: This section states that "Opportunities for additional bicycle and pedestrian accessibility improvements, including updates to ADA facilities, would be incorporated during final design in coordination with FRA after the Draft EIS." Since there have been a number of bike/ped accidents and fatalities along the East Coast Greenway, please consider how this project can help address bike-ped safety—particularly in the Northern Virginia and George Washington regions. This project can help address major waterway barriers that preclude the development of safe passage for bicyclists and pedestrians through this heavily travelled region.

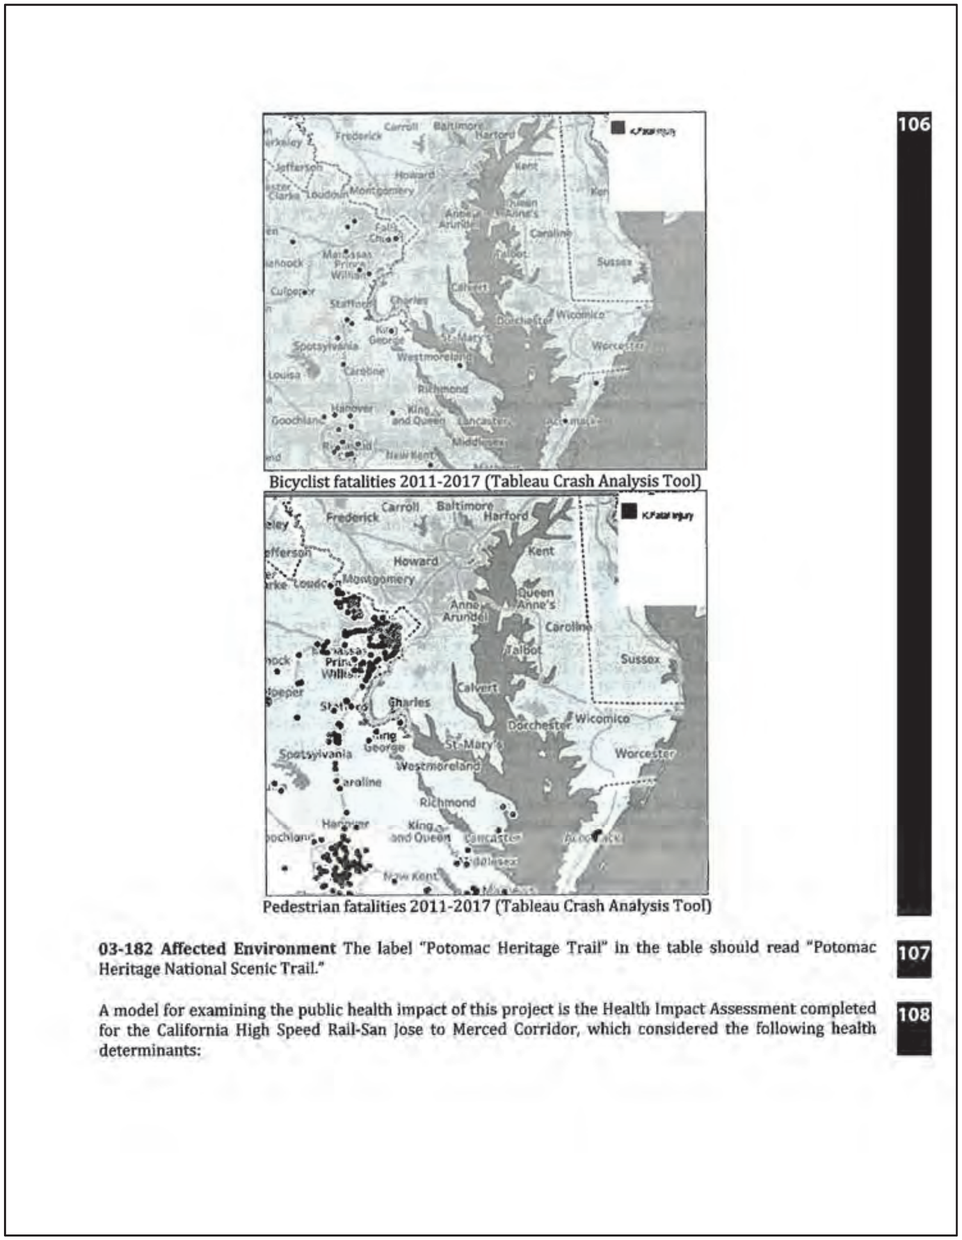
VIRGINIA DEQ (continued)

103. This topic is covered in Section 7 ("Recreational Resources, Scenic Rivers and Byways") in DEQ's main letter. Refer to DRPT-numbered statement #32.

104. Viewsheds from the Potomac Heritage National Scenic Trail have been clarified as sensitive visual resources, where applicable; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

105. The requested clarifications have been addressed in the errata table for the Draft EIS, which is Appendix A to the Final EIS.

106. This topic is covered in Section 7 ("Recreational Resources, Scenic Rivers and Byways") in DEQ's main letter. Refer to DRPT-numbered statement #33.



Bicyclist fatalities 2011-2017 (Tableau Crash Analysis Tool)

Pedestrian fatalities 2011-2017 (Tableau Crash Analysis Tool)

106

03-182 Affected Environment The label "Potomac Heritage Trail" in the table should read "Potomac Heritage National Scenic Trail." 107

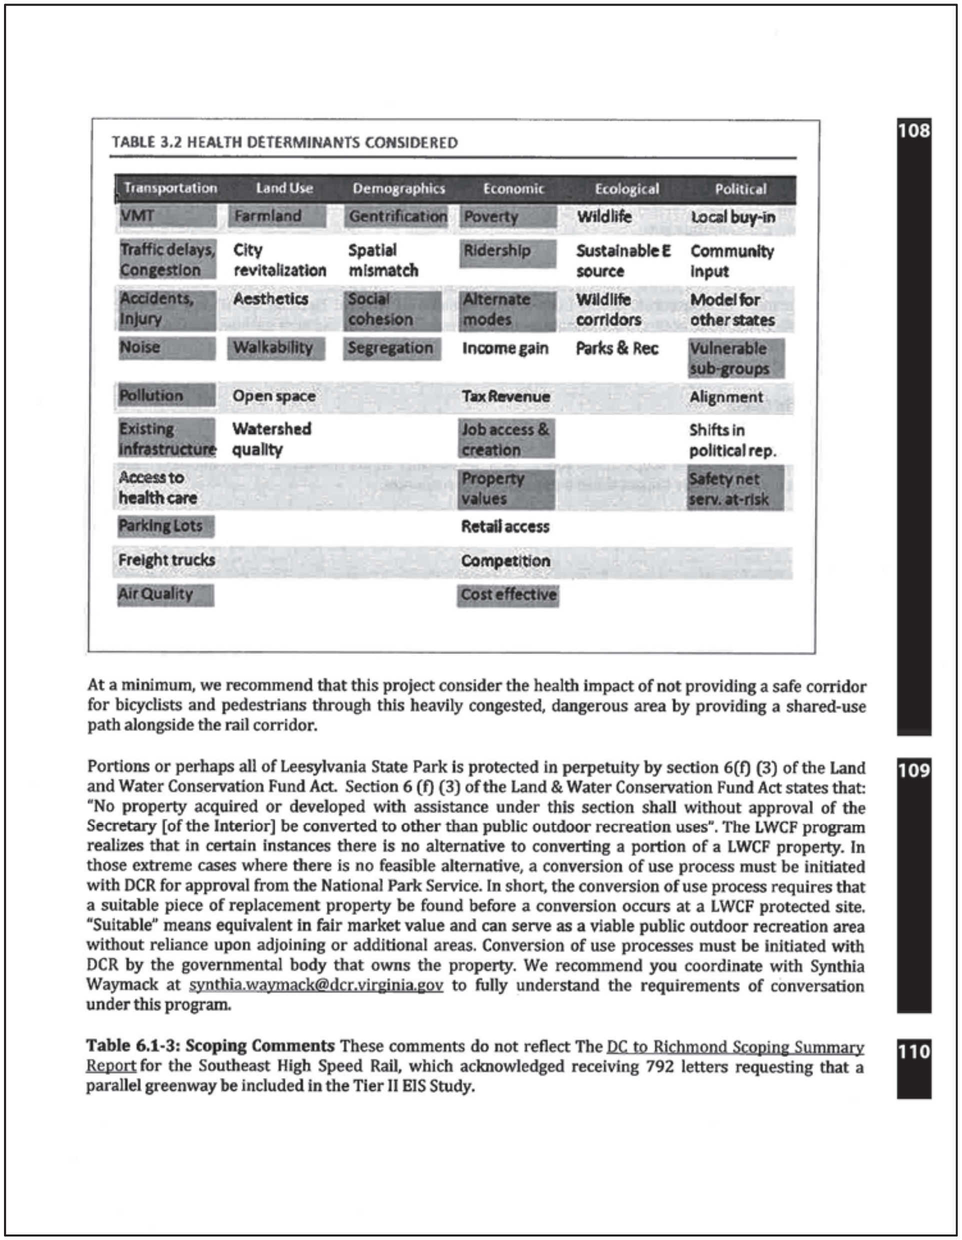
A model for examining the public health impact of this project is the Health Impact Assessment completed for the California High Speed Rail-San Jose to Merced Corridor, which considered the following health determinants: 108

VIRGINIA DEQ (continued)

(Response to comment 106 on previous page)

107. The requested modifications were addressed in the Final EIS. The requested clarification has been addressed in the errata table for the Draft EIS, which is Appendix A to the Final EIS.

108. An updated discussion of public health and safety is provided in Final EIS Section 5.18. A shared-use path within the Project right-of-way is beyond the Purpose and Need of the DC2RVA Project. The DC2RVA Project will address bike/pedestrian safety at public at-grade crossings along the DC2RVA rail corridor, in keeping with the Project's Basis of Design and applicable FRA, Amtrak, CSXT, and VDOT safety standards.



108

TABLE 3.2 HEALTH DETERMINANTS CONSIDERED

Transportation	Land Use	Demographics	Economic	Ecological	Political
VMT	Farmland	Gentrification	Poverty	Wildlife	Local buy-in
Traffic delays, Congestion	City revitalization	Spatial mismatch	Ridership	Sustainable E source	Community input
Accidents, Injury	Aesthetics	Social cohesion	Alternate modes	Wildlife corridors	Model for other states
Noise	Walkability	Segregation	Income gain	Parks & Rec	Vulnerable sub-groups
Pollution	Open space		Tax Revenue		Alignment
Existing infrastructure	Watershed quality		Job access & creation		Shifts in political rep.
Access to health care			Property values		Safety net serv. at-risk
Parking Lots			Retail access		
Freight trucks			Competition		
Air Quality			Cost effective		

At a minimum, we recommend that this project consider the health impact of not providing a safe corridor for bicyclists and pedestrians through this heavily congested, dangerous area by providing a shared-use path alongside the rail corridor.

109

Portions or perhaps all of Leesylvania State Park is protected in perpetuity by section 6(f) (3) of the Land and Water Conservation Fund Act. Section 6 (f) (3) of the Land & Water Conservation Fund Act states that: "No property acquired or developed with assistance under this section shall without approval of the Secretary [of the Interior] be converted to other than public outdoor recreation uses". The LWCF program realizes that in certain instances there is no alternative to converting a portion of a LWCF property. In those extreme cases where there is no feasible alternative, a conversion of use process must be initiated with DCR for approval from the National Park Service. In short, the conversion of use process requires that a suitable piece of replacement property be found before a conversion occurs at a LWCF protected site. "Suitable" means equivalent in fair market value and can serve as a viable public outdoor recreation area without reliance upon adjoining or additional areas. Conversion of use processes must be initiated with DCR by the governmental body that owns the property. We recommend you coordinate with Synthia Waymack at synthia.waymack@dcr.virginia.gov to fully understand the requirements of conversation under this program.

110

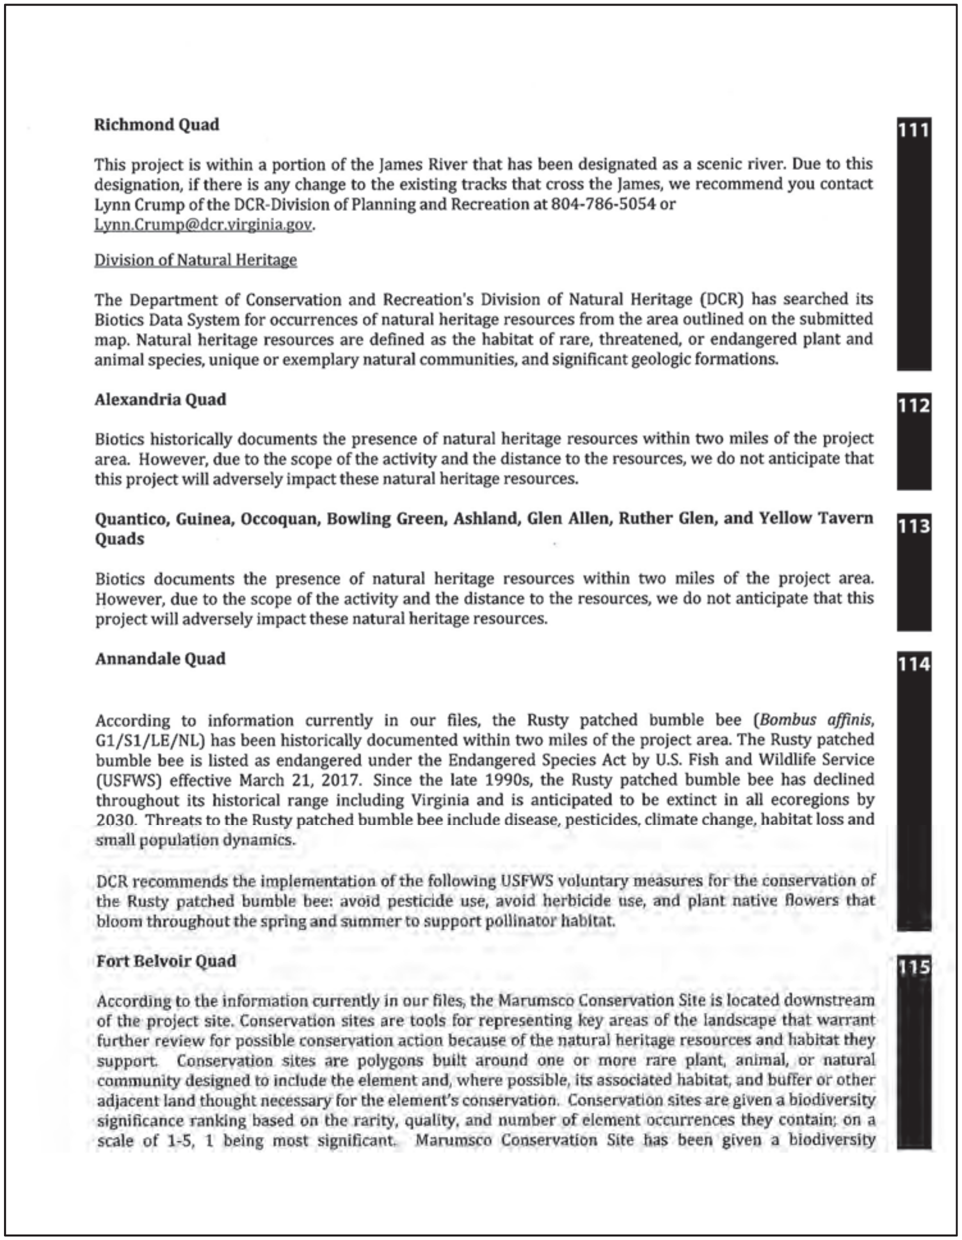
Table 6.1-3: Scoping Comments These comments do not reflect The DC to Richmond Scoping Summary Report for the Southeast High Speed Rail, which acknowledged receiving 792 letters requesting that a parallel greenway be included in the Tier II EIS Study.

VIRGINIA DEQ (continued)

(Response to comment 108 on previous page)

109. This topic is covered in Section 7 ("Recreational Resources, Scenic Rivers and Byways") in DEQ's main letter. Refer to DRPT-numbered statement #34 and #37.

110. Section 4.2 of the Scoping Report explains that 1,220 of the 1,614 public scoping letters received were form letters, one form letter from Virginians for High Speed Rail, and another from the East Coast Greenway Alliance. These letters were summarized in the scoping report, and a full response was provided for each one. The information from the scoping report has been clarified in the Final EIS; refer to the errata table for the Draft EIS, which is Appendix A to the Final EIS.



Richmond Quad

111 This project is within a portion of the James River that has been designated as a scenic river. Due to this designation, if there is any change to the existing tracks that cross the James, we recommend you contact Lynn Crump of the DCR-Division of Planning and Recreation at 804-786-5054 or Lynn.Crump@dcr.virginia.gov.

Division of Natural Heritage

The Department of Conservation and Recreation's Division of Natural Heritage (DCR) has searched its Biotics Data System for occurrences of natural heritage resources from the area outlined on the submitted map. Natural heritage resources are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, and significant geologic formations.

Alexandria Quad

112 Biotics historically documents the presence of natural heritage resources within two miles of the project area. However, due to the scope of the activity and the distance to the resources, we do not anticipate that this project will adversely impact these natural heritage resources.

Quantico, Guinea, Occoquan, Bowling Green, Ashland, Glen Allen, Ruther Glen, and Yellow Tavern Quads

113 Biotics documents the presence of natural heritage resources within two miles of the project area. However, due to the scope of the activity and the distance to the resources, we do not anticipate that this project will adversely impact these natural heritage resources.

Annandale Quad

114 According to information currently in our files, the Rusty patched bumble bee (*Bombus affinis*, G1/S1/LE/NL) has been historically documented within two miles of the project area. The Rusty patched bumble bee is listed as endangered under the Endangered Species Act by U.S. Fish and Wildlife Service (USFWS) effective March 21, 2017. Since the late 1990s, the Rusty patched bumble bee has declined throughout its historical range including Virginia and is anticipated to be extinct in all ecoregions by 2030. Threats to the Rusty patched bumble bee include disease, pesticides, climate change, habitat loss and small population dynamics.

DCR recommends the implementation of the following USFWS voluntary measures for the conservation of the Rusty patched bumble bee: avoid pesticide use, avoid herbicide use, and plant native flowers that bloom throughout the spring and summer to support pollinator habitat.

Fort Belvoir Quad

115 According to the information currently in our files, the Marumsco Conservation Site is located downstream of the project site. Conservation sites are tools for representing key areas of the landscape that warrant further review for possible conservation action because of the natural heritage resources and habitat they support. Conservation sites are polygons built around one or more rare plant, animal, or natural community designed to include the element and, where possible, its associated habitat, and buffer or other adjacent land thought necessary for the element's conservation. Conservation sites are given a biodiversity significance ranking based on the rarity, quality, and number of element occurrences they contain; on a scale of 1-5, 1 being most significant. Marumsco Conservation Site has been given a biodiversity

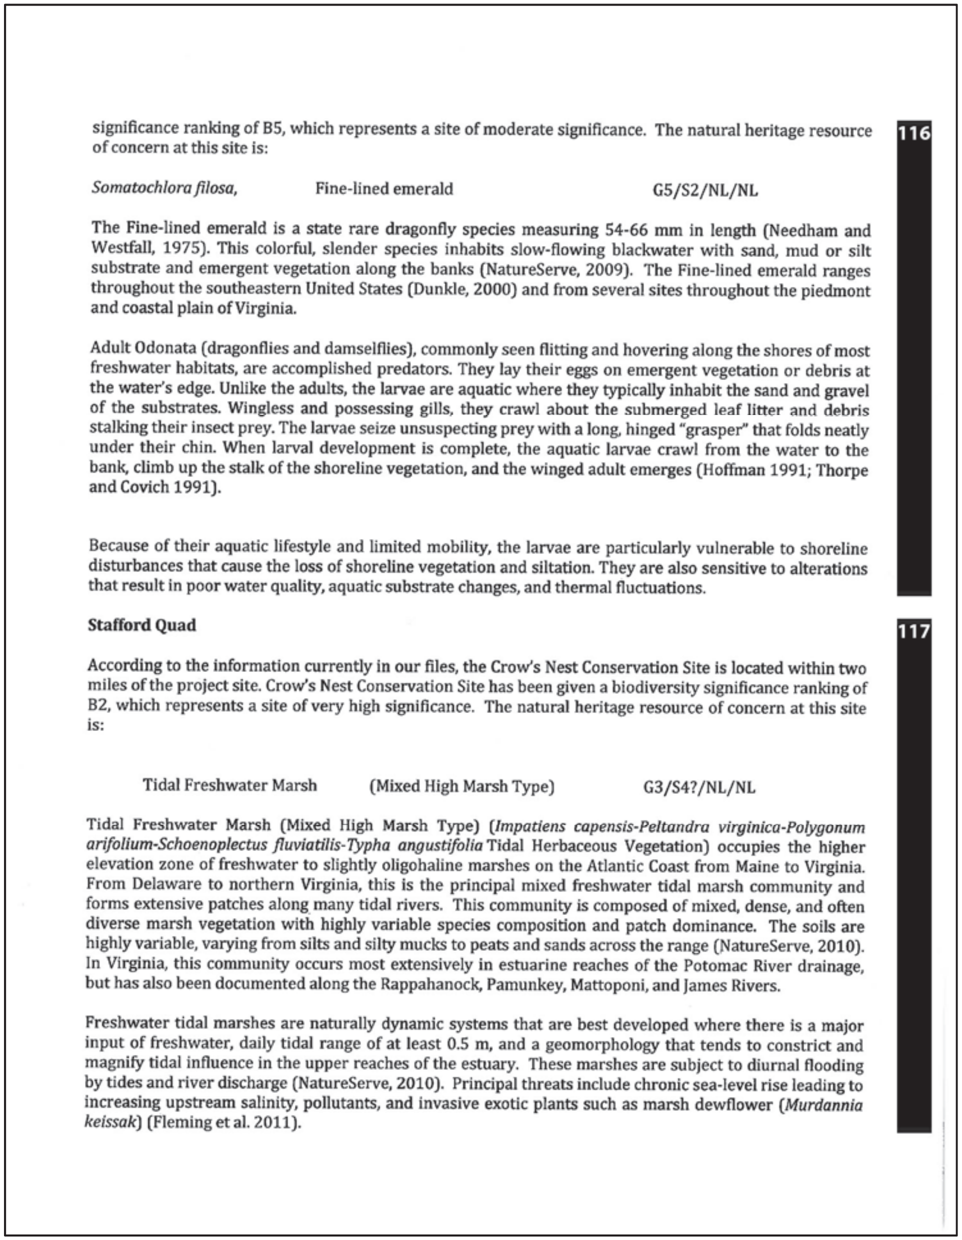
VIRGINIA DEQ (continued)

111. Comment noted. The Preferred Alternative as analyzed in the Final EIS is based on construction of substructure/foundation for a new two-track rail bridge on the S-Line across the James River, parallel and adjacent to the existing CSXT James River Bridge connecting to Main Street Station, on the downstream (eastern) side; however, the Project will only construct a single-track bridge with space to add a second track, if required for future capacity. DRPT will continue to coordinate with DCR during final design, after funding becomes available and incremental improvements are scheduled.

112. and 113. Table 5.10-2 of the Final EIS documents the estimated acreage of permanent and temporary impacts of the Preferred Alternative to Priority Conservation Areas, which include VDCR-DNH-Natural Heritage Plan Conservation Sites and Stream Conservation Units, and sites identified in the Priority Wildlife Conservation Areas dataset.

114. The species list for the analyses conducted for the Draft EIS was provided by the USFWS on October 19, 2015, prior to listing of the Rusty patched bumble bee (*Bombus affinis*). The Final EIS (Section 5.10.3) has been updated to include a discussion of the Rusty patched bumble bee.

115. This recommendation is provided within Section 6 ("Natural Heritage Resources") of DEQ's main letter. Refer to DRPT-numbered statement #26.



116 significance ranking of B5, which represents a site of moderate significance. The natural heritage resource of concern at this site is:

Somatochlora filosa,	Fine-lined emerald	G5/S2/NL/NL

The Fine-lined emerald is a state rare dragonfly species measuring 54-66 mm in length (Needham and Westfall, 1975). This colorful, slender species inhabits slow-flowing blackwater with sand, mud or silt substrate and emergent vegetation along the banks (NatureServe, 2009). The Fine-lined emerald ranges throughout the southeastern United States (Dunkle, 2000) and from several sites throughout the piedmont and coastal plain of Virginia.

Adult Odonata (dragonflies and damselflies), commonly seen flitting and hovering along the shores of most freshwater habitats, are accomplished predators. They lay their eggs on emergent vegetation or debris at the water's edge. Unlike the adults, the larvae are aquatic where they typically inhabit the sand and gravel of the substrates. Wingless and possessing gills, they crawl about the submerged leaf litter and debris stalking their insect prey. The larvae seize unsuspecting prey with a long, hinged "grasper" that folds neatly under their chin. When larval development is complete, the aquatic larvae crawl from the water to the bank, climb up the stalk of the shoreline vegetation, and the winged adult emerges (Hoffman 1991; Thorpe and Covich 1991).

Because of their aquatic lifestyle and limited mobility, the larvae are particularly vulnerable to shoreline disturbances that cause the loss of shoreline vegetation and siltation. They are also sensitive to alterations that result in poor water quality, aquatic substrate changes, and thermal fluctuations.

117 **Stafford Quad**

According to the information currently in our files, the Crow's Nest Conservation Site is located within two miles of the project site. Crow's Nest Conservation Site has been given a biodiversity significance ranking of B2, which represents a site of very high significance. The natural heritage resource of concern at this site is:

Tidal Freshwater Marsh	(Mixed High Marsh Type)	G3/S4?/NL/NL

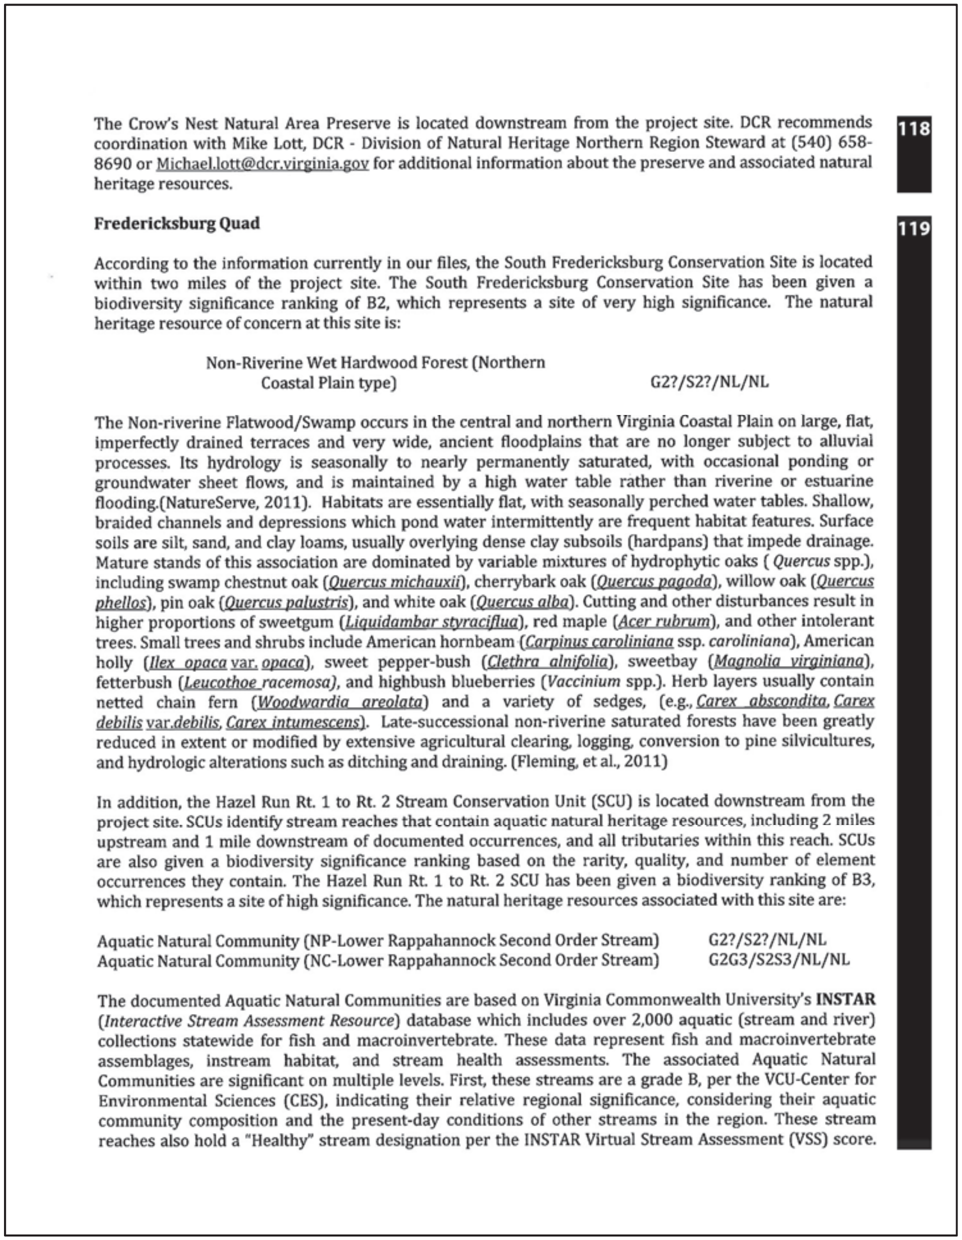
Tidal Freshwater Marsh (Mixed High Marsh Type) (*Impatiens capensis-Peltandra virginica-Polygonum arifolium-Schoenoplectus fluviatilis-Typha angustifolia* Tidal Herbaceous Vegetation) occupies the higher elevation zone of freshwater to slightly oligohaline marshes on the Atlantic Coast from Maine to Virginia. From Delaware to northern Virginia, this is the principal mixed freshwater tidal marsh community and forms extensive patches along many tidal rivers. This community is composed of mixed, dense, and often diverse marsh vegetation with highly variable species composition and patch dominance. The soils are highly variable, varying from silts and silty mucks to peats and sands across the range (NatureServe, 2010). In Virginia, this community occurs most extensively in estuarine reaches of the Potomac River drainage, but has also been documented along the Rappahanock, Pamunkey, Mattoponi, and James Rivers.

Freshwater tidal marshes are naturally dynamic systems that are best developed where there is a major input of freshwater, daily tidal range of at least 0.5 m, and a geomorphology that tends to constrict and magnify tidal influence in the upper reaches of the estuary. These marshes are subject to diurnal flooding by tides and river discharge (NatureServe, 2010). Principal threats include chronic sea-level rise leading to increasing upstream salinity, pollutants, and invasive exotic plants such as marsh dewflower (*Murdannia keissak*) (Fleming et al. 2011).

VIRGINIA DEQ (continued)

116. DRPT appreciates the information provided by DCR concerning the Marumsco Conservation Site and the fine-lined emerald (*Somatochlora filosa*). As noted in Section 5.10.2.3 of the Final EIS, DRPT anticipates that the proposed Project will not adversely affect downstream aquatic species with implementation of Best Management Practices, including use of silt curtains and limiting overflow from dredging equipment, and other erosion and sediment control measures. DRPT will continue to work with VDGIF, NMFS, and USFWS to develop specific measures for avoidance, minimization, and mitigation of impacts to aquatic wildlife during final design, after funding becomes available and incremental improvements are scheduled.

117. Information regarding Crow's Nest Natural Area Preserve and its sensitive habitats is presented in Section 3.10.1.2 of the Draft EIS. As noted in Section 5.10.1.1 of the Final EIS, the Preferred Alternative will avoid direct impacts to existing state and county wildlife conservation areas, except for the Mattaponi Wildlife Management Area. Potential indirect impacts to downstream aquatic habitats are addressed in Section 5.20.1.6 of the Final EIS. As noted in Section 5.20.1.7 of the Final EIS, indirect impacts of the Project can be minimized with implementation of temporary and permanent stormwater management features and erosion and sediment controls. BMPs for avoidance of introducing new invasive species and preventing the spread of existing populations will also help minimize impacts to downstream aquatic habitats.



118 The Crow's Nest Natural Area Preserve is located downstream from the project site. DCR recommends coordination with Mike Lott, DCR - Division of Natural Heritage Northern Region Steward at (540) 658-8690 or Michael.lott@dcr.virginia.gov for additional information about the preserve and associated natural heritage resources.

Fredericksburg Quad

119 According to the information currently in our files, the South Fredericksburg Conservation Site is located within two miles of the project site. The South Fredericksburg Conservation Site has been given a biodiversity significance ranking of B2, which represents a site of very high significance. The natural heritage resource of concern at this site is:

Non-Riverine Wet Hardwood Forest (Northern Coastal Plain type)	G2?/S2?/NL/NL

The Non-riverine Flatwood/Swamp occurs in the central and northern Virginia Coastal Plain on large, flat, imperfectly drained terraces and very wide, ancient floodplains that are no longer subject to alluvial processes. Its hydrology is seasonally to nearly permanently saturated, with occasional ponding or groundwater sheet flows, and is maintained by a high water table rather than riverine or estuarine flooding.(NatureServe, 2011). Habitats are essentially flat, with seasonally perched water tables. Shallow, braided channels and depressions which pond water intermittently are frequent habitat features. Surface soils are silt, sand, and clay loams, usually overlying dense clay subsoils (hardpans) that impede drainage. Mature stands of this association are dominated by variable mixtures of hydrophytic oaks (*Quercus* spp.), including swamp chestnut oak (*Quercus michauxii*), cherrybark oak (*Quercus pagoda*), willow oak (*Quercus phellos*), pin oak (*Quercus palustris*), and white oak (*Quercus alba*). Cutting and other disturbances result in higher proportions of sweetgum (*Liquidambar styraciflua*), red maple (*Acer rubrum*), and other intolerant trees. Small trees and shrubs include American hornbeam (*Carpinus caroliniana* ssp. *caroliniana*), American holly (*Ilex opaca* var. *opaca*), sweet pepper-bush (*Clethra alnifolia*), sweetbay (*Magnolia virginiana*), fetterbush (*Leucothoe racemosa)*, and highbush blueberries (*Vaccinium* spp.). Herb layers usually contain netted chain fern (*Woodwardia areolata*) and a variety of sedges, (e.g., *Carex abscondita*, *Carex debilis* var.*debilis*, *Carex intumescens*). Late-successional non-riverine saturated forests have been greatly reduced in extent or modified by extensive agricultural clearing, logging, conversion to pine silvicultures, and hydrologic alterations such as ditching and draining. (Fleming, et al., 2011)

In addition, the Hazel Run Rt. 1 to Rt. 2 Stream Conservation Unit (SCU) is located downstream from the project site. SCUs identify stream reaches that contain aquatic natural heritage resources, including 2 miles upstream and 1 mile downstream of documented occurrences, and all tributaries within this reach. SCUs are also given a biodiversity significance ranking based on the rarity, quality, and number of element occurrences they contain. The Hazel Run Rt. 1 to Rt. 2 SCU has been given a biodiversity ranking of B3, which represents a site of high significance. The natural heritage resources associated with this site are:

Aquatic Natural Community (NP-Lower Rappahannock Second Order Stream)	G2?/S2?/NL/NL
Aquatic Natural Community (NC-Lower Rappahannock Second Order Stream)	G2G3/S2S3/NL/NL

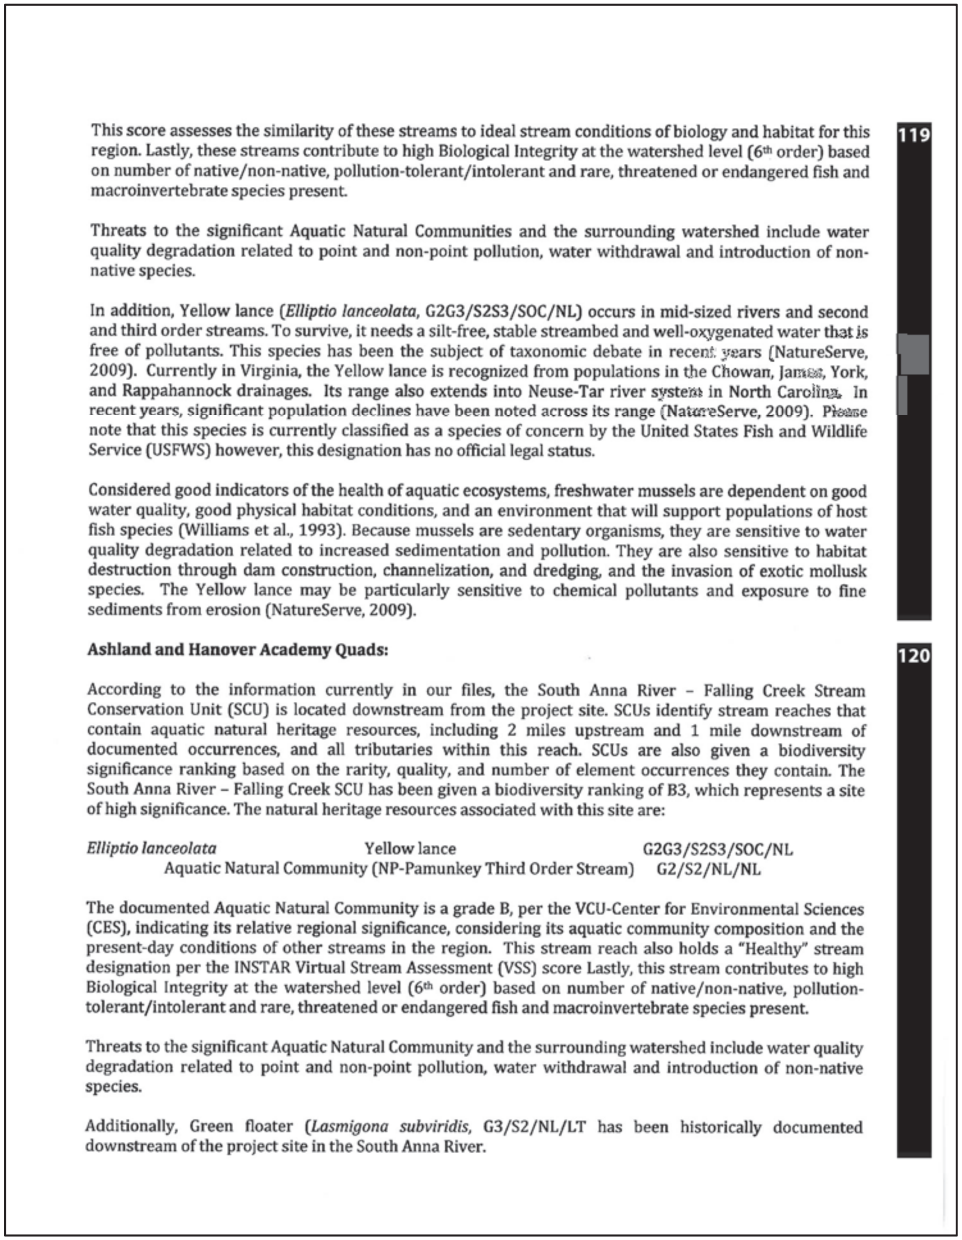
The documented Aquatic Natural Communities are based on Virginia Commonwealth University's **INSTAR** (*Interactive Stream Assessment Resource*) database which includes over 2,000 aquatic (stream and river) collections statewide for fish and macroinvertebrate. These data represent fish and macroinvertebrate assemblages, instream habitat, and stream health assessments. The associated Aquatic Natural Communities are significant on multiple levels. First, these streams are a grade B, per the VCU-Center for Environmental Sciences (CES), indicating their relative regional significance, considering their aquatic community composition and the present-day conditions of other streams in the region. These stream reaches also hold a "Healthy" stream designation per the INSTAR Virtual Stream Assessment (VSS) score.

VIRGINIA DEQ (continued)

118. This recommendation is provided within Section 6 ("Natural Heritage Resources") of DEQ's main letter. Refer to DRPT-numbered statement #27.

119. Information regarding the South Fredericksburg Conservation Site and the Hazel Run Stream Conservation Unit (SCU), and the natural communities associated with these sites is presented in Table 3.10-2 of the Draft EIS. Table 5.10-2 of the Final EIS documents the estimated acreage of permanent and temporary impacts of the Preferred Alternative (as updated since the Draft EIS) to Priority Conservation Areas, which include VDCR-DNH-Natural Heritage Plan Conservation Sites and Stream Conservation Units, and sites identified in the Priority Wildlife Conservation Areas dataset. Outside of the CSXT right-of-way, approximately 0.04 acres of permanent impacts, and 0.35 acres of temporary impacts are anticipated at the South Fredericksburg Conservation Site under the Preferred Alternative 3B.

     Refer to DRPT-numbered statement #117 regarding potential indirect impacts to downstream aquatic habitats and measures to minimize impacts.



This score assesses the similarity of these streams to ideal stream conditions of biology and habitat for this region. Lastly, these streams contribute to high Biological Integrity at the watershed level (6th order) based on number of native/non-native, pollution-tolerant/intolerant and rare, threatened or endangered fish and macroinvertebrate species present. 119

Threats to the significant Aquatic Natural Communities and the surrounding watershed include water quality degradation related to point and non-point pollution, water withdrawal and introduction of non-native species.

In addition, Yellow lance (*Elliptio lanceolata*, G2G3/S2S3/SOC/NL) occurs in mid-sized rivers and second and third order streams. To survive, it needs a silt-free, stable streambed and well-oxygenated water that is free of pollutants. This species has been the subject of taxonomic debate in recent years (NatureServe, 2009). Currently in Virginia, the Yellow lance is recognized from populations in the Chowan, James, York, and Rappahannock drainages. Its range also extends into Neuse-Tar river system in North Carolina. In recent years, significant population declines have been noted across its range (NatureServe, 2009). Please note that this species is currently classified as a species of concern by the United States Fish and Wildlife Service (USFWS) however, this designation has no official legal status.

Considered good indicators of the health of aquatic ecosystems, freshwater mussels are dependent on good water quality, good physical habitat conditions, and an environment that will support populations of host fish species (Williams et al., 1993). Because mussels are sedentary organisms, they are sensitive to water quality degradation related to increased sedimentation and pollution. They are also sensitive to habitat destruction through dam construction, channelization, and dredging, and the invasion of exotic mollusk species. The Yellow lance may be particularly sensitive to chemical pollutants and exposure to fine sediments from erosion (NatureServe, 2009).

Ashland and Hanover Academy Quads: 120

According to the information currently in our files, the South Anna River – Falling Creek Stream Conservation Unit (SCU) is located downstream from the project site. SCUs identify stream reaches that contain aquatic natural heritage resources, including 2 miles upstream and 1 mile downstream of documented occurrences, and all tributaries within this reach. SCUs are also given a biodiversity significance ranking based on the rarity, quality, and number of element occurrences they contain. The South Anna River – Falling Creek SCU has been given a biodiversity ranking of B3, which represents a site of high significance. The natural heritage resources associated with this site are:

Elliptio lanceolata	Yellow lance	G2G3/S2S3/SOC/NL
Aquatic Natural Community (NP-Pamunkey Third Order Stream)		G2/S2/NL/NL

The documented Aquatic Natural Community is a grade B, per the VCU-Center for Environmental Sciences (CES), indicating its relative regional significance, considering its aquatic community composition and the present-day conditions of other streams in the region. This stream reach also holds a "Healthy" stream designation per the INSTAR Virtual Stream Assessment (VSS) score Lastly, this stream contributes to high Biological Integrity at the watershed level (6th order) based on number of native/non-native, pollution-tolerant/intolerant and rare, threatened or endangered fish and macroinvertebrate species present.

Threats to the significant Aquatic Natural Community and the surrounding watershed include water quality degradation related to point and non-point pollution, water withdrawal and introduction of non-native species.

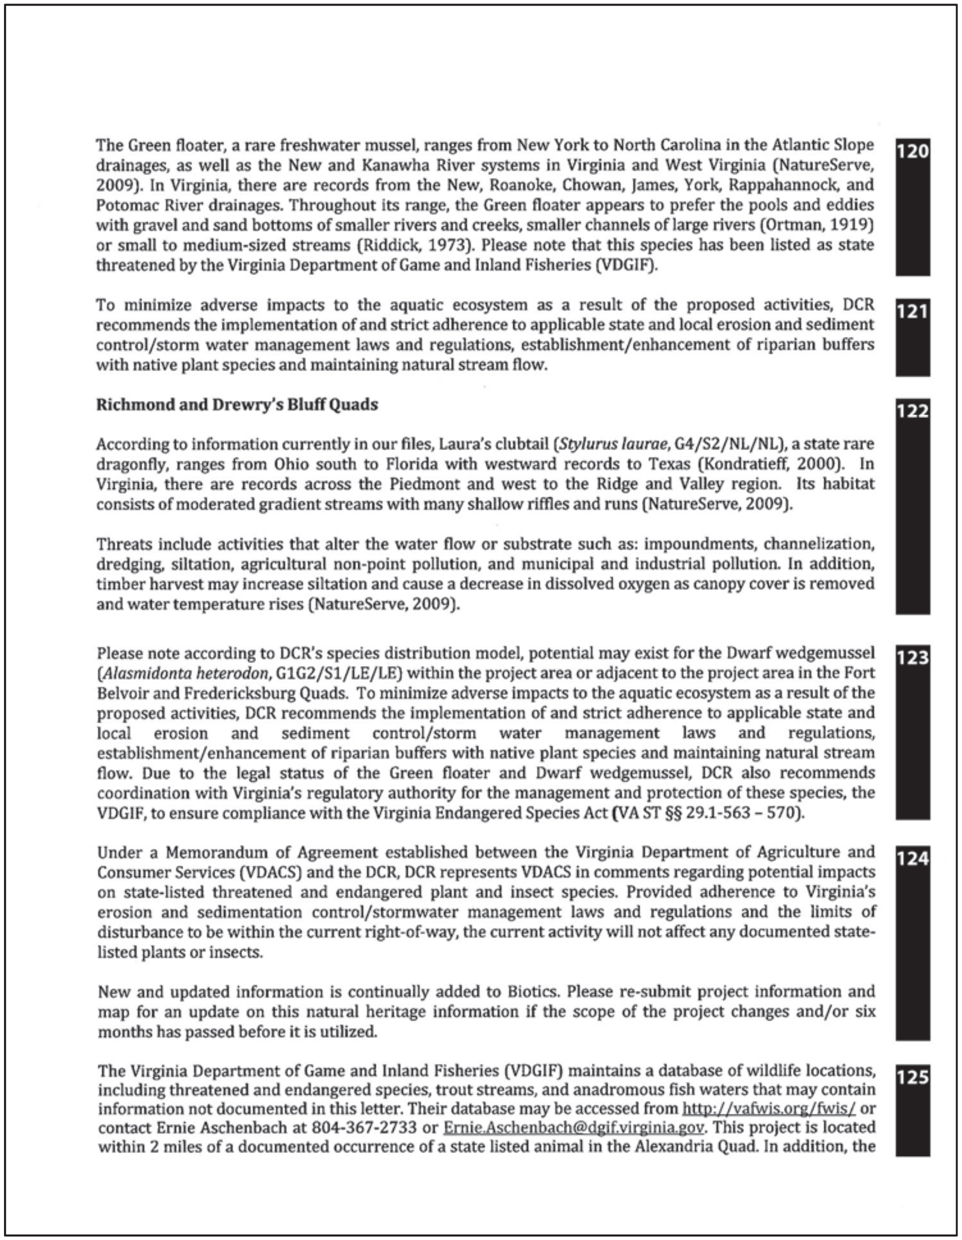
Additionally, Green floater (*Lasmigona subviridis*, G3/S2/NL/LT has been historically documented downstream of the project site in the South Anna River.

VIRGINIA DEQ (continued)

(Response to comment 119 on previous page)

120. Information regarding the South Anna River – Falling Creek SCU is presented in Table 3.10-2 of the Draft EIS. Table 5.10-2 of the Final EIS documents the estimated acreage of permanent and temporary impacts of the Preferred Alternative to Priority Conservation Areas, which include VDCR-DNH-Natural Heritage Plan Conservation Sites and Stream Conservation Units, and sites identified in the Priority Wildlife Conservation Areas dataset. The estimated acreage of impacts to specific Natural Heritage Conservation Sites and Stream Conservation Units, are identified in Table 4-7 of Appendix M Natural Resources Technical Report of the Draft EIS. As noted there, the only impacts to the South Anna River – Falling Creek SCU are under Build Alternatives 5C and 5C – Ashcake, neither of which were selected as the Preferred Alternative. In Area 5, Alternative 5A was selected as the Preferred Alternative (refer to Section 4.3.5 of the Final EIS for details).

The state threatened green floater (*Lasmigonia subviridis*) is identified in Table 3.10-8 of the Draft EIS as being among species that may occur within the vicinity of the study area. A description of this species is provided in Section 3.10.5.3 of the Draft EIS. Potential direct impacts to this species from the Preferred Alternative are identified in Table 5.10-6 of the Final EIS. Indirect impacts to aquatic habitats, which are addressed in Section 5.20.1.6 of the Final EIS, are applicable to downstream populations of green floater and other aquatic species.



120 The Green floater, a rare freshwater mussel, ranges from New York to North Carolina in the Atlantic Slope drainages, as well as the New and Kanawha River systems in Virginia and West Virginia (NatureServe, 2009). In Virginia, there are records from the New, Roanoke, Chowan, James, York, Rappahannock, and Potomac River drainages. Throughout its range, the Green floater appears to prefer the pools and eddies with gravel and sand bottoms of smaller rivers and creeks, smaller channels of large rivers (Ortman, 1919) or small to medium-sized streams (Riddick, 1973). Please note that this species has been listed as state threatened by the Virginia Department of Game and Inland Fisheries (VDGIF).

121 To minimize adverse impacts to the aquatic ecosystem as a result of the proposed activities, DCR recommends the implementation of and strict adherence to applicable state and local erosion and sediment control/storm water management laws and regulations, establishment/enhancement of riparian buffers with native plant species and maintaining natural stream flow.

122 **Richmond and Drewry's Bluff Quads**

According to information currently in our files, Laura's clubtail (*Stylurus laurae*, G4/S2/NL/NL), a state rare dragonfly, ranges from Ohio south to Florida with westward records to Texas (Kondratieff, 2000). In Virginia, there are records across the Piedmont and west to the Ridge and Valley region. Its habitat consists of moderated gradient streams with many shallow riffles and runs (NatureServe, 2009).

Threats include activities that alter the water flow or substrate such as: impoundments, channelization, dredging, siltation, agricultural non-point pollution, and municipal and industrial pollution. In addition, timber harvest may increase siltation and cause a decrease in dissolved oxygen as canopy cover is removed and water temperature rises (NatureServe, 2009).

123 Please note according to DCR's species distribution model, potential may exist for the Dwarf wedgemussel (*Alasmidonta heterodon*, G1G2/S1/LE/LE) within the project area or adjacent to the project area in the Fort Belvoir and Fredericksburg Quads. To minimize adverse impacts to the aquatic ecosystem as a result of the proposed activities, DCR recommends the implementation of and strict adherence to applicable state and local erosion and sediment control/storm water management laws and regulations, establishment/enhancement of riparian buffers with native plant species and maintaining natural stream flow. Due to the legal status of the Green floater and Dwarf wedgemussel, DCR also recommends coordination with Virginia's regulatory authority for the management and protection of these species, the VDGIF, to ensure compliance with the Virginia Endangered Species Act (VA ST §§ 29.1-563 – 570).

124 Under a Memorandum of Agreement established between the Virginia Department of Agriculture and Consumer Services (VDACS) and the DCR, DCR represents VDACS in comments regarding potential impacts on state-listed threatened and endangered plant and insect species. Provided adherence to Virginia's erosion and sedimentation control/stormwater management laws and regulations and the limits of disturbance to be within the current right-of-way, the current activity will not affect any documented state-listed plants or insects.

New and updated information is continually added to Biotics. Please re-submit project information and map for an update on this natural heritage information if the scope of the project changes and/or six months has passed before it is utilized.

125 The Virginia Department of Game and Inland Fisheries (VDGIF) maintains a database of wildlife locations, including threatened and endangered species, trout streams, and anadromous fish waters that may contain information not documented in this letter. Their database may be accessed from http://vafwis.org/fwis/ or contact Ernie Aschenbach at 804-367-2733 or Ernie.Aschenbach@dgif.virginia.gov. This project is located within 2 miles of a documented occurrence of a state listed animal in the Alexandria Quad. In addition, the

VIRGINIA DEQ (continued)

(Response to comment 120 on previous page)

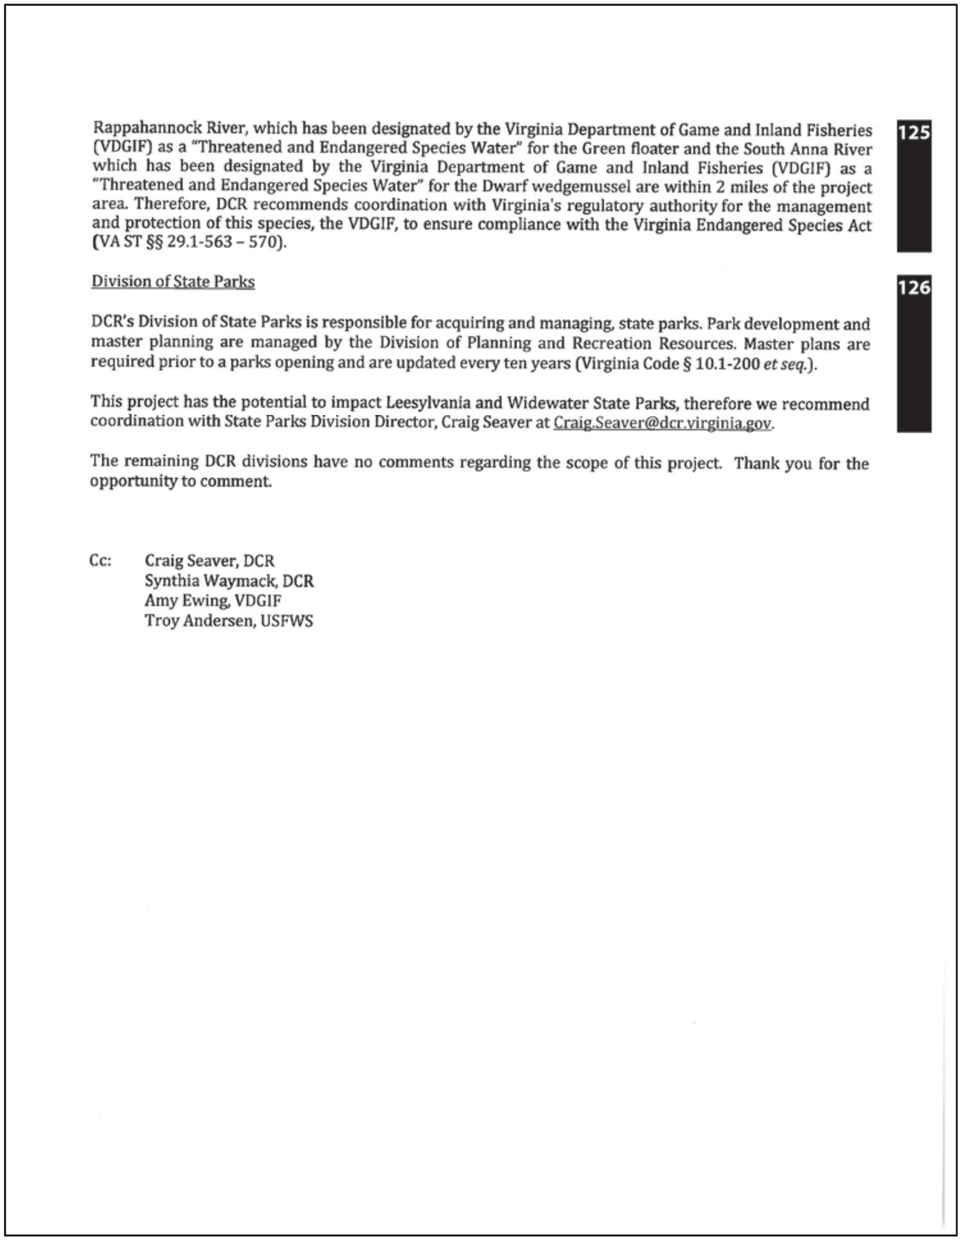
121. This recommendation is provided within Section 6 ("Natural Heritage Resources") of DEQ's main letter. Refer to DRPT-numbered statement #28.

122. DRPT appreciates the information provided by DCR concerning the Laura's clubtail (*Stylurus laurae*). The Draft EIS analysis of potential Project effects on sensitive species focuses on federal and state listed threatened and endangered species. Potential Project effects on other wildlife species are addressed in Section 5.10.2 of the Final EIS. Other applicable impacts analyses in the Final EIS include the discussions of impacts to streams (Section 5.1.1), wetlands (Section 5.1.2) and water quality (Section 5.1.3).

123. The Dwarf Wedgemussel (*Alasmidonta heterodon*) is identified in Table 5.10-5 of the Final EIS as having the potential to be affected by the Preferred Alternative within Areas 2 through 5 (i.e. Northern Virginia through Ashland). See response to DRPT-numbered statement #28 for a discussion of erosion and sediment control, stormwater management, and other measures to minimize impacts to aquatic habitats. DRPT will coordinate with VDGIF in accordance with the Virginia Endangered Species Act during final design and Project permitting, after funding becomes available and incremental improvements are scheduled.

124. This recommendation is provided within Section 6 ("Natural Heritage Resources") of DEQ's main letter. Refer to DRPT-numbered statement #30.

125. This recommendation is provided within Section 6 ("Natural Heritage Resources") of DEQ's main letter. Refer to DRPT-numbered statement #31.



125 Rappahannock River, which has been designated by the Virginia Department of Game and Inland Fisheries (VDGIF) as a "Threatened and Endangered Species Water" for the Green floater and the South Anna River which has been designated by the Virginia Department of Game and Inland Fisheries (VDGIF) as a "Threatened and Endangered Species Water" for the Dwarf wedgemussel are within 2 miles of the project area. Therefore, DCR recommends coordination with Virginia's regulatory authority for the management and protection of this species, the VDGIF, to ensure compliance with the Virginia Endangered Species Act (VA ST §§ 29.1-563 – 570).

126 Division of State Parks

DCR's Division of State Parks is responsible for acquiring and managing, state parks. Park development and master planning are managed by the Division of Planning and Recreation Resources. Master plans are required prior to a parks opening and are updated every ten years (Virginia Code § 10.1-200 *et seq.*).

This project has the potential to impact Leesylvania and Widewater State Parks, therefore we recommend coordination with State Parks Division Director, Craig Seaver at Craig.Seaver@dcr.virginia.gov.

The remaining DCR divisions have no comments regarding the scope of this project. Thank you for the opportunity to comment.

Cc: Craig Seaver, DCR
Synthia Waymack, DCR
Amy Ewing, VDGIF
Troy Andersen, USFWS

VIRGINIA DEQ (continued)

(Response to comment 125 on previous page)

126. This topic and recommendation are addressed within Section 8 ("State Parks") of DEQ's main letter. Refer to DRPT-numbered statement #39.

Howard, Janine (DEQ)

From: Holma, Marc (DHR)
Sent: Thursday, September 14, 2017 9:18 AM
To: Howard, Janine (DEQ)
Subject: SEHSR DC2RVA Environmental Impact Report (DHR #2014-0666/DEQ #17-134F)

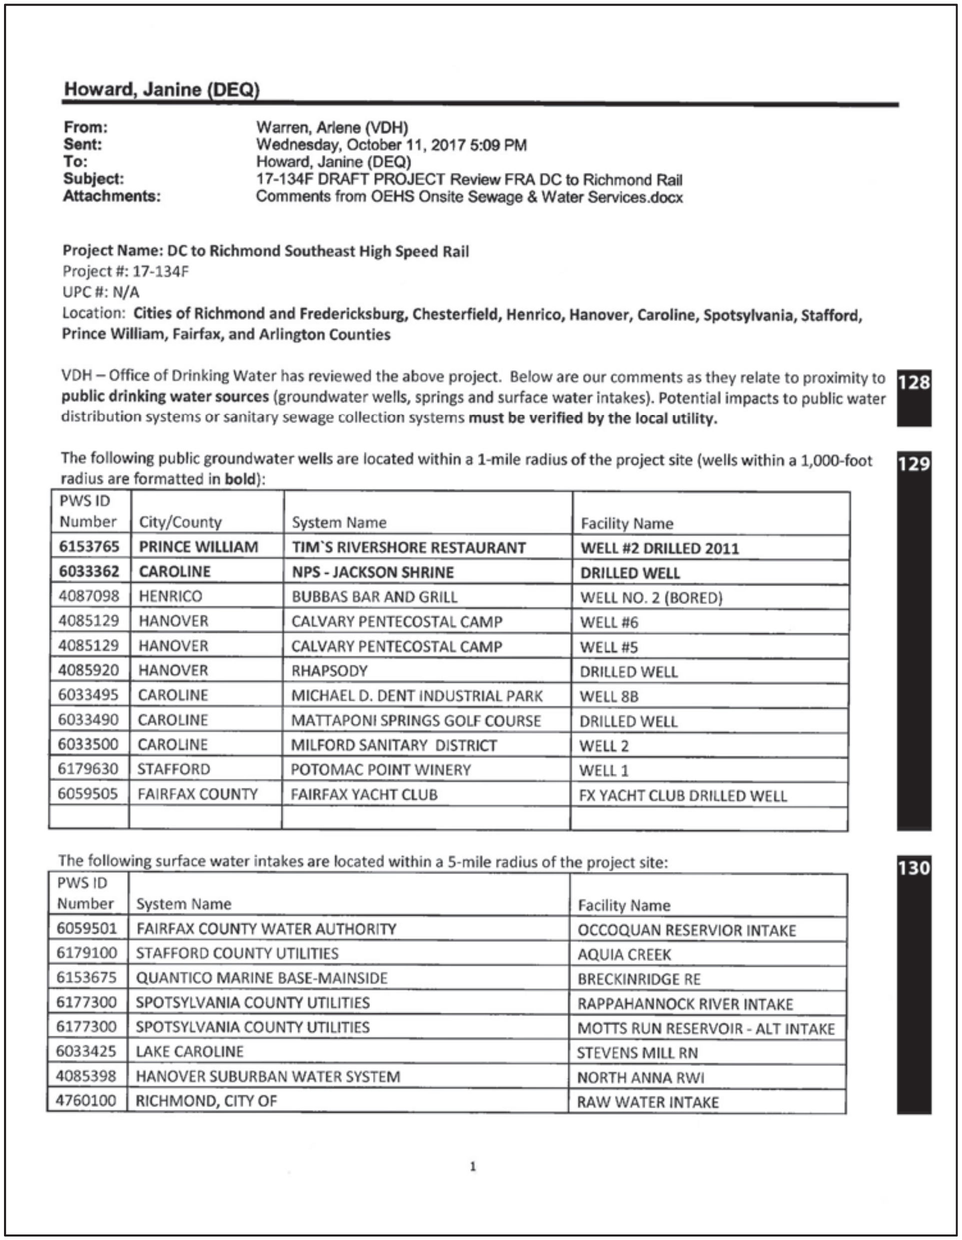
Janine,

Please accept this email as DHR's response to DEQ's request for our review of the EIR for the above referenced project. The Federal Railroad Authority and the Department of Rail and Public Transportation have both been working closely with DHR pursuant to Section 106 of the National Historic Preservation Act on this project. We anticipate that both agencies will continue to coordinate with use per Section 106 and would request DEQ in its response to encourage them to do so. 127

Sincerely,
Marc Holma

VIRGINIA DEQ (continued)

127. DRPT received notification from DHR under separate cover; refer to DHR's letter, which is included as part of the agency responses in the Final EIS, for comment/response.



Howard, Janine (DEQ)

From:	Warren, Arlene (VDH)
Sent:	Wednesday, October 11, 2017 5:09 PM
To:	Howard, Janine (DEQ)
Subject:	17-134F DRAFT PROJECT Review FRA DC to Richmond Rail
Attachments:	Comments from OEHS Onsite Sewage & Water Services.docx

Project Name: DC to Richmond Southeast High Speed Rail
Project #: 17-134F
UPC #: N/A
Location: **Cities of Richmond and Fredericksburg, Chesterfield, Henrico, Hanover, Caroline, Spotsylvania, Stafford, Prince William, Fairfax, and Arlington Counties**

128

VDH – Office of Drinking Water has reviewed the above project. Below are our comments as they relate to proximity to **public drinking water sources** (groundwater wells, springs and surface water intakes). Potential impacts to public water distribution systems or sanitary sewage collection systems **must be verified by the local utility.**

129

The following public groundwater wells are located within a 1-mile radius of the project site (wells within a 1,000-foot radius are formatted in **bold**):

PWS ID Number	City/County	System Name	Facility Name
6153765	**PRINCE WILLIAM**	**TIM`S RIVERSHORE RESTAURANT**	**WELL #2 DRILLED 2011**
6033362	**CAROLINE**	**NPS - JACKSON SHRINE**	**DRILLED WELL**
4087098	HENRICO	BUBBAS BAR AND GRILL	WELL NO. 2 (BORED)
4085129	HANOVER	CALVARY PENTECOSTAL CAMP	WELL #6
4085129	HANOVER	CALVARY PENTECOSTAL CAMP	WELL #5
4085920	HANOVER	RHAPSODY	DRILLED WELL
6033495	CAROLINE	MICHAEL D. DENT INDUSTRIAL PARK	WELL 8B
6033490	CAROLINE	MATTAPONI SPRINGS GOLF COURSE	DRILLED WELL
6033500	CAROLINE	MILFORD SANITARY DISTRICT	WELL 2
6179630	STAFFORD	POTOMAC POINT WINERY	WELL 1
6059505	FAIRFAX COUNTY	FAIRFAX YACHT CLUB	FX YACHT CLUB DRILLED WELL

130

The following surface water intakes are located within a 5-mile radius of the project site:

PWS ID Number	System Name	Facility Name
6059501	FAIRFAX COUNTY WATER AUTHORITY	OCCOQUAN RESERVIOR INTAKE
6179100	STAFFORD COUNTY UTILITIES	AQUIA CREEK
6153675	QUANTICO MARINE BASE-MAINSIDE	BRECKINRIDGE RE
6177300	SPOTSYLVANIA COUNTY UTILITIES	RAPPAHANNOCK RIVER INTAKE
6177300	SPOTSYLVANIA COUNTY UTILITIES	MOTTS RUN RESERVOIR - ALT INTAKE
6033425	LAKE CAROLINE	STEVENS MILL RN
4085398	HANOVER SUBURBAN WATER SYSTEM	NORTH ANNA RWI
4760100	RICHMOND, CITY OF	RAW WATER INTAKE

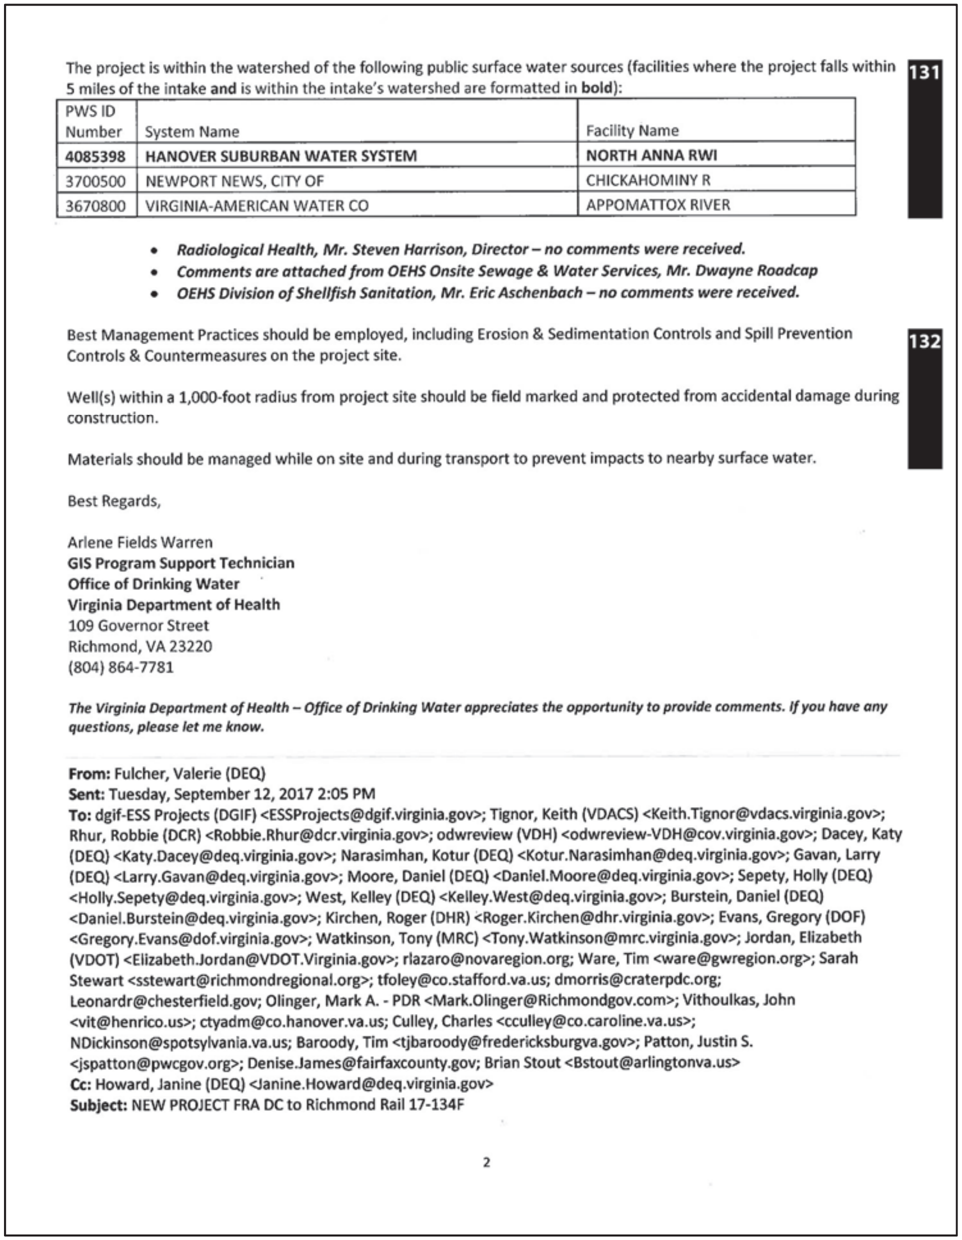
1

VIRGINIA DEQ (continued)

128. This recommendation is provided within Section 10 ("Public Water Supply") of DEQ's main letter. Refer to DRPT-numbered statement #44.

129. DRPT appreciates the list of public groundwater wells provided by VDH – Office of Drinking Water. The extent of VDH's list (11 wells within 1.0 mile of the Project site, two of which are within 1,000 feet of the rail) is comparable to the number of wells identified in Section 5.1.4 of the Final EIS (11 wells within 1.0 mile of the Project rail line, two of which are also within 1,000 feet of the Limits of Disturbance for the Preferred Alternative).

130. DRPT appreciates the list of surface water intakes within a 5-mile radius of the Project site provided by VDH – Office of Drinking Water. Three of the surface water intake systems were identified in Section 4.1.4 of the Draft EIS. DRPT has recently obtained an updated version (February 2018) of VDOT's Comprehensive Environmental Data and Reporting System, which identifies all eight of the surface water intake locations within a 5-mile radius of the Project, as identified from VDH. The additional five locations are located upstream of the Project. This information has been incorporated into Section 5.1.4 of the Final EIS.



131

The project is within the watershed of the following public surface water sources (facilities where the project falls within 5 miles of the intake **and** is within the intake's watershed are formatted in **bold**):

PWS ID Number	System Name	Facility Name
4085398	**HANOVER SUBURBAN WATER SYSTEM**	**NORTH ANNA RWI**
3700500	NEWPORT NEWS, CITY OF	CHICKAHOMINY R
3670800	VIRGINIA-AMERICAN WATER CO	APPOMATTOX RIVER

- ***Radiological Health, Mr. Steven Harrison, Director – no comments were received.***
- ***Comments are attached from OEHS Onsite Sewage & Water Services, Mr. Dwayne Roadcap***
- ***OEHS Division of Shellfish Sanitation, Mr. Eric Aschenbach – no comments were received.***

132

Best Management Practices should be employed, including Erosion & Sedimentation Controls and Spill Prevention Controls & Countermeasures on the project site.

Well(s) within a 1,000-foot radius from project site should be field marked and protected from accidental damage during construction.

Materials should be managed while on site and during transport to prevent impacts to nearby surface water.

Best Regards,

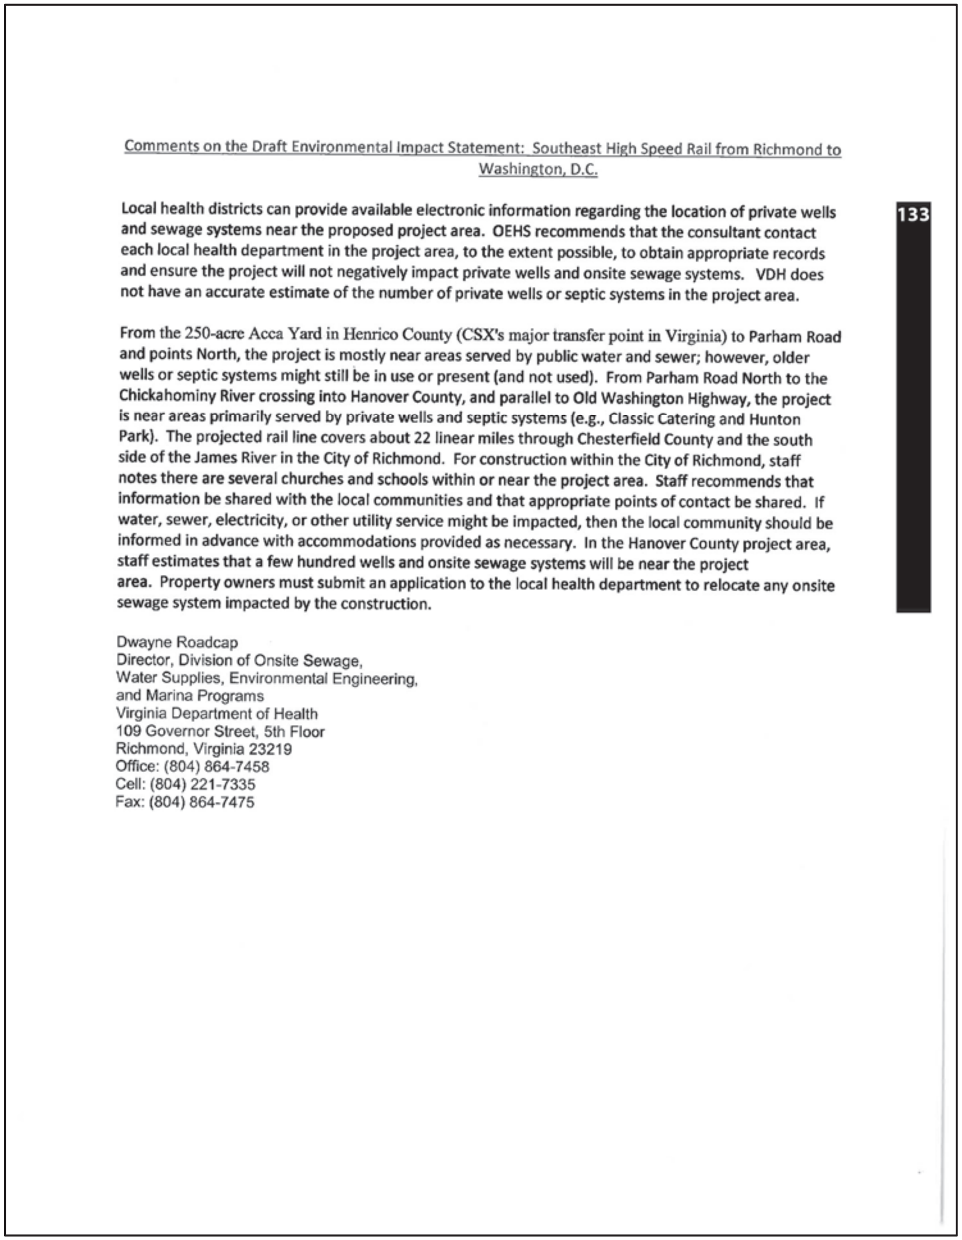
Subject: NEW PROJECT FRA DC to Richmond Rail 17-134F

VIRGINIA DEQ (continued)

131. DRPT appreciates the list of public surface water sources within the same watershed as the Project provided by VDH – Office of Drinking Water. Hanover Suburban Water System, which is identified in Section 5.1.4 of the Final EIS, is the only surface water intake within the watershed that is within 5 miles of the Project.

132. These recommendations are provided within Section 10 ("Public Water Supply") of DEQ's main letter. Refer to DRPT-numbered statement #43.



Comments on the Draft Environmental Impact Statement: Southeast High Speed Rail from Richmond to Washington, D.C.

133

Local health districts can provide available electronic information regarding the location of private wells and sewage systems near the proposed project area. OEHS recommends that the consultant contact each local health department in the project area, to the extent possible, to obtain appropriate records and ensure the project will not negatively impact private wells and onsite sewage systems. VDH does not have an accurate estimate of the number of private wells or septic systems in the project area.

From the 250-acre Acca Yard in Henrico County (CSX's major transfer point in Virginia) to Parham Road and points North, the project is mostly near areas served by public water and sewer; however, older wells or septic systems might still be in use or present (and not used). From Parham Road North to the Chickahominy River crossing into Hanover County, and parallel to Old Washington Highway, the project is near areas primarily served by private wells and septic systems (e.g., Classic Catering and Hunton Park). The projected rail line covers about 22 linear miles through Chesterfield County and the south side of the James River in the City of Richmond. For construction within the City of Richmond, staff notes there are several churches and schools within or near the project area. Staff recommends that information be shared with the local communities and that appropriate points of contact be shared. If water, sewer, electricity, or other utility service might be impacted, then the local community should be informed in advance with accommodations provided as necessary. In the Hanover County project area, staff estimates that a few hundred wells and onsite sewage systems will be near the project area. Property owners must submit an application to the local health department to relocate any onsite sewage system impacted by the construction.

VIRGINIA OUTDOORS
FOUNDATION

October 30, 2017

VIA EMAIL

Ms. Janine Howard
Department of Environmental Quality
Office of Environmental Impact Review
629 E. Main St., 6th Floor
Richmond, VA 23219

RE: DEQ #17-134F (Draft EIS)
D.C. to Richmond Southeast High-Speed Rail Project (DC2RVA)

Dear Ms. Howard:

134 The Virginia Outdoors Foundation (VOF) is in receipt of your email dated October 23, 2017, concerning the above-referenced project. VOF, an agency of the Commonwealth, was established by the General Assembly in 1966 to promote the preservation of Virginia's natural and cultural resources by encouraging private philanthropy in fulfillment of state policy. As a result of Virginia's commitment to ensure a vibrant natural environment for today and future generations, VOF owns thousands of acres managed for public access and holds more than 4,000 easements across the Commonwealth, and these easements protect in perpetuity over 800,000 acres of open-space.

We thank you for the opportunity to provide comments regarding the proposed passenger rail upgrades to the 123-mile CSXT railroad corridor between Long Bridge (Arlington County) and Centralia, Virginia (Chesterfield County). This project is located in a region that does not contain a high concentration of our open-space easements, due to the urbanized nature of the long-existing rail corridor, US Route 1, and Interstate 95 between Washington, D.C. and Richmond, Virginia.

Along the existing and preferred alignments, as outlined in the Tier II Draft Environmental Impact Statement (EIS) Appendix E, Build Alternatives Area 3–Fredericksburg, VOF does not hold any open-space easements within 1.5 miles of the railroad corridor. Furthermore, VOF is not currently working on any new open-space easement proposals within 1.5 miles of the railroad corridor. However, Alternative 3-C would cross 2 open-space easements in Caroline County and come within 1.5 miles of 2 additional open-space easements in Spotsylvania County. VOF supports the preferred Alternative 3-B as an avoidance to impacting existing easements.

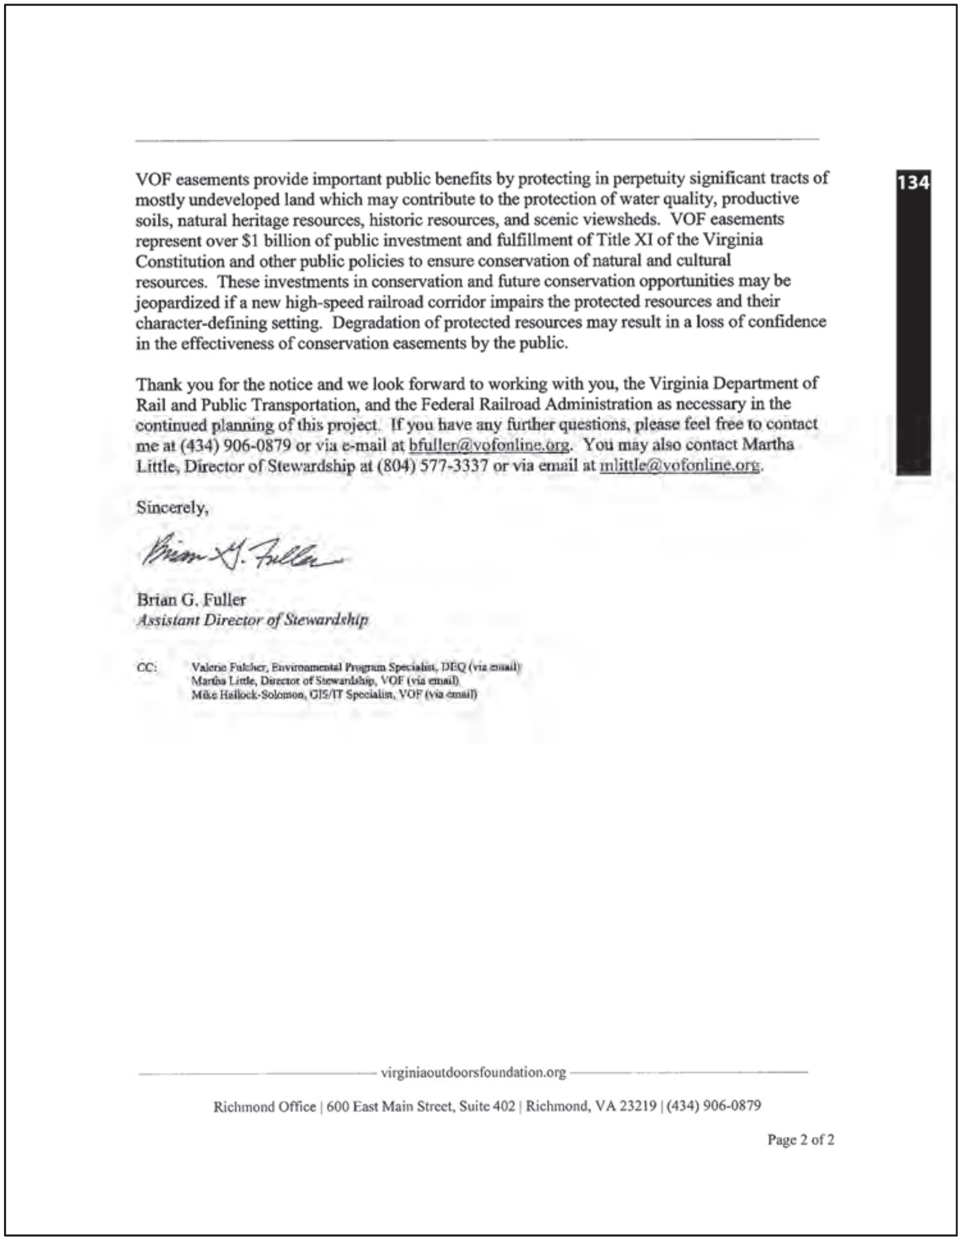
In considering the potential impact that Alternative 3-C might have on conservation lands, an open-space easement is a legal interest in real property that creates a relationship between the holders of the easement and the property owner. By means of the easement, VOF has an interest in specific conservation values of the property and a legal obligation to protect these values.

virginiaoutdoorsfoundation.org

600 East Main Street, Suite 402 | Richmond, VA 23219 | (434) 906-0879

VIRGINIA DEQ (continued)

134. This topic and its recommendations are addressed within Section 12 ("Open Space") of DEQ's main letter. Refer to DRPT-numbered statements #48 and #49.



134 VOF easements provide important public benefits by protecting in perpetuity significant tracts of mostly undeveloped land which may contribute to the protection of water quality, productive soils, natural heritage resources, historic resources, and scenic viewsheds. VOF easements represent over $1 billion of public investment and fulfillment of Title XI of the Virginia Constitution and other public policies to ensure conservation of natural and cultural resources. These investments in conservation and future conservation opportunities may be jeopardized if a new high-speed railroad corridor impairs the protected resources and their character-defining setting. Degradation of protected resources may result in a loss of confidence in the effectiveness of conservation easements by the public.

Thank you for the notice and we look forward to working with you, the Virginia Department of Rail and Public Transportation, and the Federal Railroad Administration as necessary in the continued planning of this project. If you have any further questions, please feel free to contact me at (434) 906-0879 or via e-mail at bfuller@vofonline.org. You may also contact Martha Little, Director of Stewardship at (804) 577-3337 or via email at mlittle@vofonline.org.

Sincerely,

Brian G. Fuller

MEMORANDUM

TO: Janine Howard, DEQ EIR Coordinator

FROM: Daniel Moore, Principal Environmental Planner

DATE: September 13, 2017

SUBJECT: DEQ # 17-134F: FRA: DC to Richmond Southeast High Speed Rail, Cities of Richmond and Fredericksburg, Chesterfield, Henrico, Hanover, Caroline, Spotsylvania, Stafford, Prince William, Fairfax and Arlington Counties

135

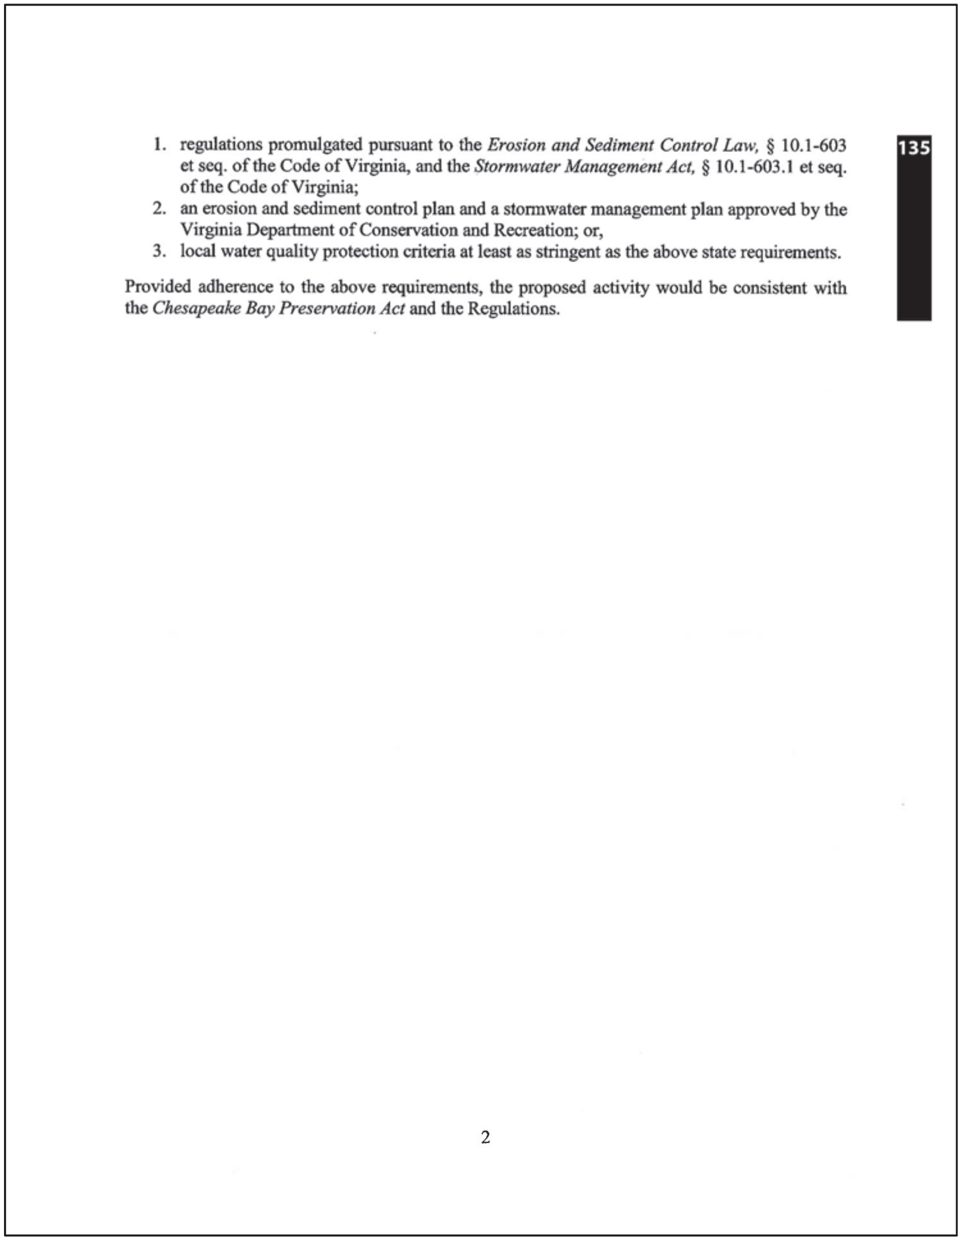
We have reviewed the Draft Environmental Impact Statement (EIS) for the proposed project and offer the following comments regarding consistency with the provisions of the *Chesapeake Bay Preservation Area Designation and Management Regulations* (Regulations):

In the Cities of Richmond and Fredericksburg and the Counties of Chesterfield, Henrico, Hanover, Caroline, Spotsylvania, Stafford, Prince William, Fairfax and Arlington, the areas protected by the *Chesapeake Bay Preservation Act*, as locally implemented, require conformance with performance criteria. These areas include Resource Protection Areas (RPAs) and Resource Management Areas (RMAs) as designated by the local government. RPAs include tidal wetlands, certain non-tidal wetlands and tidal shores, and a minimum 100-foot vegetated buffer area located adjacent to and landward of these features and along both sides of any water body with perennial flow. Areas within the RMA are subject to the general performance criteria as specified in § 9VAC 25-830-130 of the Regulations and the local ordinance. Projects within the RMA must minimize land disturbance (including access and staging areas), retain existing vegetation and minimize impervious cover.

The project involves improvements to a 123 mile section of existing CRX railway, generally parallel to the I-95 corridor from Long Bridge in Arlington County to Centralia in Chesterfield County to increase rail capacity and rail speed between Washington DC and Richmond. Construction, installation, and operation and maintenance of railroads and their appurtenant structures are conditionally exempt from the Regulations provided they are constructed in accordance with:

VIRGINIA DEQ (continued)

135. This topic and its recommendations are addressed within Section 13 ("Chesapeake Bay Preservation Areas") of DEQ's main letter. Refer to DRPT-numbered statements #50 and #51.



135

1. regulations promulgated pursuant to the *Erosion and Sediment Control Law,* § 10.1-603 et seq. of the Code of Virginia, and the *Stormwater Management Act,* § 10.1-603.1 et seq. of the Code of Virginia;
2. an erosion and sediment control plan and a stormwater management plan approved by the Virginia Department of Conservation and Recreation; or,
3. local water quality protection criteria at least as stringent as the above state requirements.

Provided adherence to the above requirements, the proposed activity would be consistent with the *Chesapeake Bay Preservation Act* and the Regulations.

RECEIVED
OCT 30 2017
DEQ-Office of Environmental Impact Review

Janine Howard
Environmental Impact Review Coordinator
Virginia Department of Environmental Quality
629 East Main Street
Richmond, VA 23219

Re: Project Number: DEQ #17-134F

Dear Ms. Howard:

In consultation with staff from the Fairfax County Land Development Services (LDS) and the Department of Public Works Urban Forestry Management Division (UFMD), the Department of Planning and Zoning (DPZ) offers the following comments on the Draft Environmental Impact Statement (EIS) for the 123-mile segment of the Southeast High Speed Rail project from Washington, DC to Richmond, Virginia, specifically for the approximately 43 mile section of the rail project which traverses Fairfax County.

136

As I understand it, the Build Alternative identified for the portion of the project within Fairfax County is the addition of a third track and other rail improvements which are largely within the existing rail right-of-way. No new station, bridge, bypass, or crossings are proposed within the County. However, the track addition and other improvements will have impacts that require mitigation. In addition to the mitigations and Best Management Practices (BMPs) identified in the EIS, UFMD recommends:

- Adequate tree protections, including but not limited to tree protection fencing, tree protection signage, root pruning, and hand removal of trees (determined on a tree-by-tree basis) all along the limits of disturbance (LOD).
- Invasive species management and replanting in environmentally sensitive areas such as Resource Protection Areas may also be required based on eventual location of LOD and site conditions.

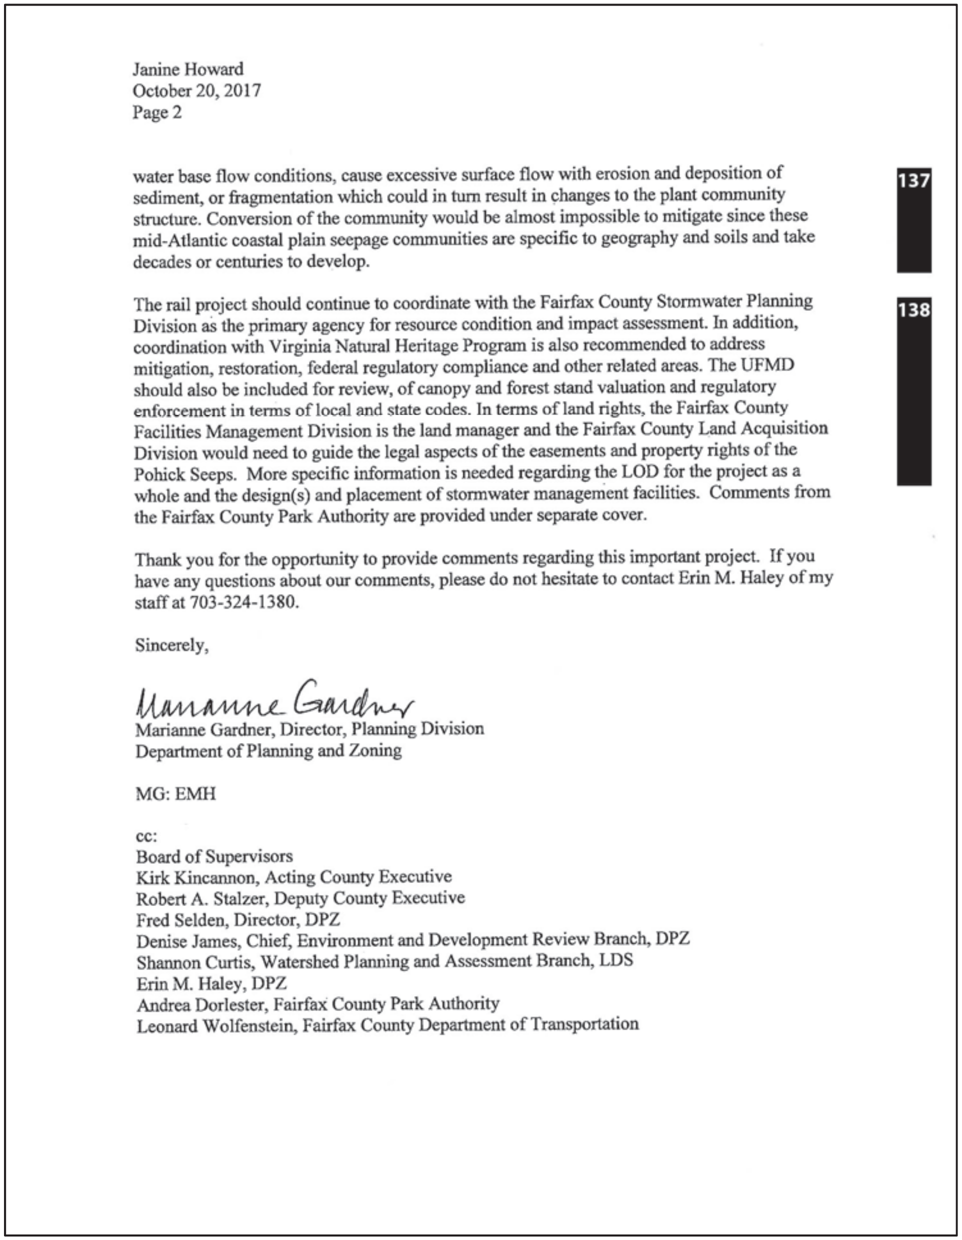
137

Specific impacts have also been noted by LDS. The Draft EIS states that the Pohick Seeps conservation area is a sensitive environment that could potentially be impacted by one of the proposed track realignments. Multiple easements – both Stormwater and Conservation – as well as Resource Protection Areas protect portions of the site. Impacts to this site from construction, placement of Stormwater BMPs, or alternative alignments, could be devastating if they touch the core community footprint. Damage the hydrology could change the ground

VIRGINIA DEQ (continued)

136. As indicated in Section 5.10.1.4 of the Final EIS, minimization and mitigation measures could include minimizing clearing and grubbing (including tree removal), development of a mitigation plan that includes landscaping and planting detail for onsite replacement of any trees removed, and native revegetation, including native shrub plantings and native reseeding of disturbed areas to prevent the spread of invasive species. Construction contract documents will include appropriate measures to protect trees along the limits of disturbance. These minimization and mitigation measures will be applicable to all vegetation communities within the limits of disturbance, not just environmentally sensitive areas.

137. Fairfax County submitted comments directly to DRPT on November 6, 2017, which included comments on Pohick Seeps; refer to Fairfax County's letter, which is included as part of the agency responses in the Final EIS, for DRPT responses to their comments.



Janine Howard
October 20, 2017
Page 2

water base flow conditions, cause excessive surface flow with erosion and deposition of sediment, or fragmentation which could in turn result in changes to the plant community structure. Conversion of the community would be almost impossible to mitigate since these mid-Atlantic coastal plain seepage communities are specific to geography and soils and take decades or centuries to develop. 137

The rail project should continue to coordinate with the Fairfax County Stormwater Planning Division as the primary agency for resource condition and impact assessment. In addition, coordination with Virginia Natural Heritage Program is also recommended to address mitigation, restoration, federal regulatory compliance and other related areas. The UFMD should also be included for review, of canopy and forest stand valuation and regulatory enforcement in terms of local and state codes. In terms of land rights, the Fairfax County Facilities Management Division is the land manager and the Fairfax County Land Acquisition Division would need to guide the legal aspects of the easements and property rights of the Pohick Seeps. More specific information is needed regarding the LOD for the project as a whole and the design(s) and placement of stormwater management facilities. Comments from the Fairfax County Park Authority are provided under separate cover. 138

Thank you for the opportunity to provide comments regarding this important project. If you have any questions about our comments, please do not hesitate to contact Erin M. Haley of my staff at 703-324-1380.

Sincerely,

Marianne Gardner

RE: Washington, D.C. to Richmond Southeast High Speed Rail DEIS

Dear Ms. Stock:

139 Thank you for your letter dated July 31, 2017, advising the Fairfax County Park Authority (FCPA) of the Virginia Department of Rail and Public Transportation (DRPT) Draft Environmental Impact Statement (DEIS) for the Washington, D.C. to Richmond, VA Southeast High Speed Rail Corridor project (DC2RVA). The DEIS states that the project may impact Old Colchester Park and Preserve, but not any other parks. The Park Authority staff offers the following comments:

- The rail corridor passes the northernmost parcel of Old Colchester Park and Preserve with approximately 85 feet of Right Of Way (ROW) between the existing rail line and the park Boundary. Just 1,600 feet to the northeast is Mason Neck West Park where the ROW is reduced to 56 feet between existing rails and the park boundary at its narrowest. Therefore, staff is concerned that if the proposed rail line will impact Old Colchester Park and Preserve with an 85 foot ROW, it will certainly impact nearby Mason Neck West Park that only has a 56 foot wide ROW.

- The above listed Fairfax County Park Authority owned parks could experience direct significant impacts of lost land, recreation facilities, vegetation, and habitat, increased storm water discharge, invasive species, and wildlife habitat impacts. Therefore, we would like to review all future documents and plans at the earliest opportunity as the project progresses. If it is necessary to impact either Old Colchester Park and Preserve or Mason Neck West Park, all comments regarding right of entry permits, archaeological investigation, and mitigation provided in the January 9, 2017 letter still apply (enclosed).

- The potential impacted parcel of Old Colchester Park and Preserve is deed restricted as well as subject to both Section 4(f) and 6(f) Land and Water Conservation Fund lands. If a Section 6(f) resource is impacted, it will require court action and suitable land replacement will need to be identified, acquired, and conveyed in coordination with the park owner(s), the Virginia Department of Conservation (VDCR), and Department of the Interior (DOI).

VIRGINIA DEQ (continued)

139. Fairfax County submitted comments directly to DRPT on November 6, 2017, which included these same topics on Parks; refer to Fairfax County's letter, which is included as part of the agency responses in the Final EIS, for DRPT responses to their comments.

Page 2

139

- Requests for land rights on Park Authority owned property are necessary in order to perform any surveying, test boring, wetland flagging, utility relocation, clearing, grading, construction or other activity, even within an easement of any sort. Please advise any contractors and subcontractors of this requirement. The applicant must first acquire a Right of Entry License, Easement and / or Construction Permit from the Easement Coordinator, Fairfax County Park Authority, Planning and Development Division, 12055 Government Center Parkway, Suite 406, Fairfax, Virginia 22035. The main telephone number is (703) 324-8741. Because of restrictive covenants on some of the Park Authority properties, it may not be possible to approve easements on the park property. Conditions and/or fees may be required for Park Authority permits or easements.

- There is a high potential for impacts to numerous Native American, Historical, and Environmental resources within Old Colchester Park that should be incorporated into the scope of work. The Park Authority will require consultation with the Virginia Department of Heritage Resource (VDHR), as will any federal permitting or funding which will trigger Section 106.

- As this is a known historic site, the Park Authority will require a Phase I archaeological survey. If significant sites are found, Phase II archaeological testing is recommended in order to determine if sites are eligible for inclusion on the National Register of Historic Places. If sites are found eligible, avoidance or Phase III archaeological data recovery is recommended.

- To ensure that the project keeps moving forward with the least disturbance to parkland, the Park Authority requests to review all future plans as soon as they are available.

Our point of contact for this project is Andy Galusha, Senior Landscape Architect, who can be reached at 703-324-8755 or Andrew.Galusha@fairfaxcounty.gov. Thank you for the opportunity to comment on this EIS scope. We look forward to participating in the study as it moves forward.

Sincerely,

Sara Baldwin, Acting Executive Director

RE: DC2RVA Draft EIS Recommendations

Dear Ms. Emily Stock,

Thank you for your email dated December 13, 2016 advising the Fairfax County Park Authority (FCPA) of the Virginia Department of Rail and Public Transportation (DRPT) Environmental Impact Statement for the Washington, D.C. to Richmond, VA Southeast High Speed Rail Corridor project (DC2RVA), being made available for review on the project website. The Park Authority staff has reviewed the project for potential impacts to park facilities and resources, and offers the following comments:

140

- The proposed project is directly adjacent to Accotink Stream Valley, Backlick Stream Valley, Mason Neck West, Old Colchester Park and Preserve, and Pohick Stream Valley Parks, as well as being within close proximity to Franconia Forest Park.
- It is unclear whether or not there will be any surveying, clearing, grading, or temporary/permanent construction, etc. on parkland. However, in order to perform any surveying, clearing, grading, or temporary/permanent construction, etc. on parkland, even in an existing easement, the Applicant must first acquire a Right of Entry License, Easement, and/or Construction Permit from the Fairfax County Park Authority. Due to restrictive covenants on some Park Authority properties, it may not be possible to approve easements on the parkland. Applications are available from the Easement Coordinator, Fairfax County Park Authority, Planning and Development Division, 12055 Government Center Parkway, Suite 406, Fairfax, Virginia 22035; main telephone number (703) 324-8741.

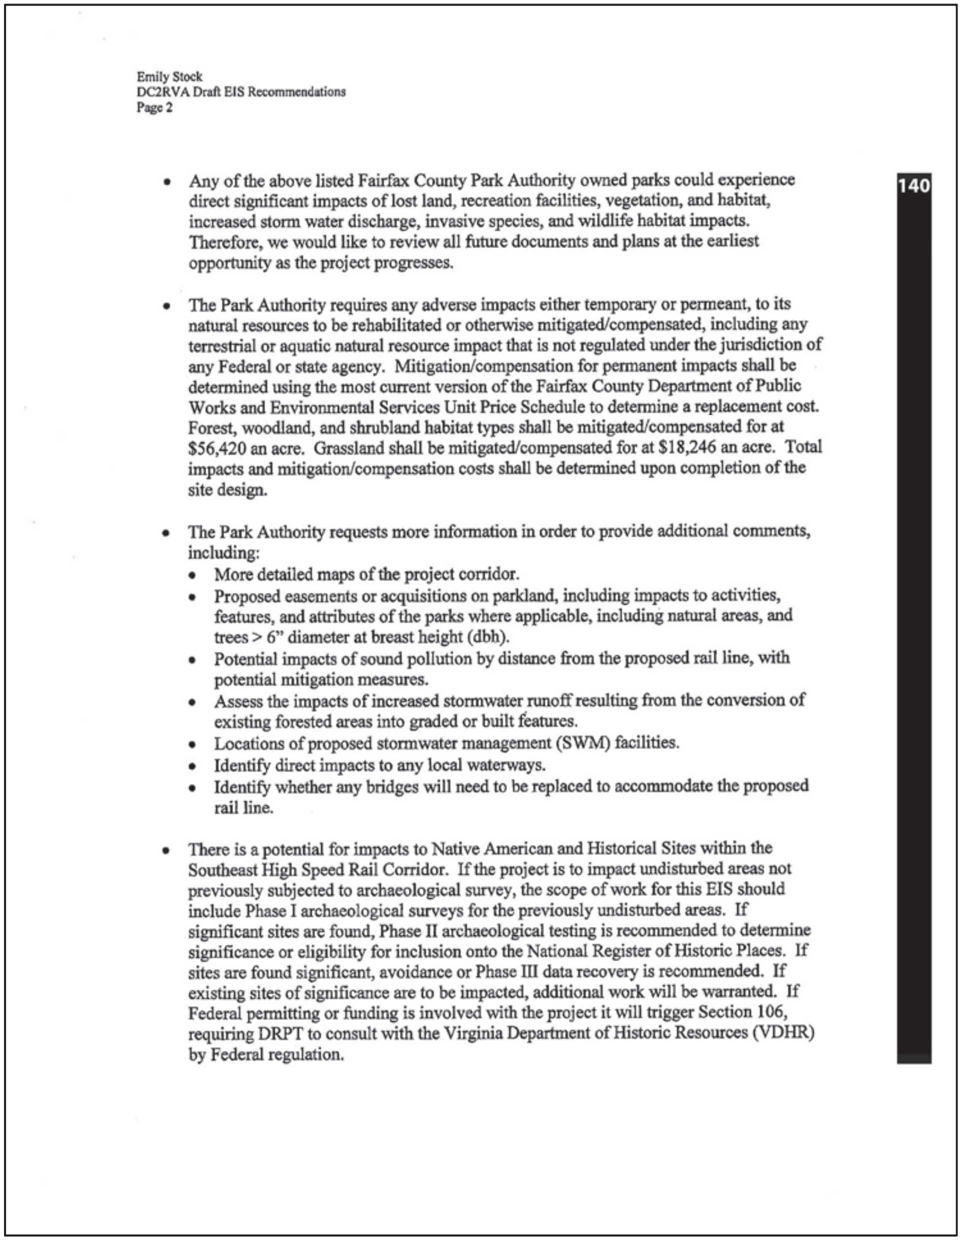
  The Applicant will need to demonstrate that there are no feasible alternatives to impacting parkland and that parkland impacts have been minimized and mitigated. The Park Authority may request additional information (i.e. survey, topography, tree survey, archaeological studies, cultural resource studies, etc.) in order to evaluate an easement or construction permit request. Conditions and/or fees may be required for Park Authority license, easements, or permits.

VIRGINIA DEQ (continued)

140. This letter was provided to DRPT after the preliminary alternative recommendations were made to the Commonwealth Transportation Board in December of 2016, which was ten months prior to the publication of the Draft EIS (on September 8, 2017), and are not specific comments on the content of the Draft EIS. Between receiving this letter and publishing the Draft EIS, DRPT coordinated with Fairfax County, and their comments, including those contained within this letter, are addressed in the analyses and documentation included in the Draft EIS. Detailed mapping of the Project corridor was included in Appendices C through H of the Draft EIS. There will be no acquisitions or easements on Fairfax County Park Authority lands.

    The Project requires compliance with the National Historic Preservation Act of 1966. Since 2014, DRPT has been complying with this legislation, including Project initiation, determination of an area of potential effects (APE), reconnaissance archaeological studies with predictive model, and architectural identification- and evaluation-level surveys of the APE. All studies have been coordinated with DHR and details on these studies and the ensuing coordination can be found in Final EIS Appendix D. National Register of Historic Places (NRHP)-eligible resources recorded to date in the Project APE in Fairfax County include the RF&P Railroad Corridor, Mount Vernon Parkway, Old Colchester Road and Colchester Arms. The FRA has determined that the Project will have an adverse effect on the RF&P Railroad Corridor, no adverse effect on the Mount Vernon Parkway and Colchester Arms, and no effect on Old Colchester Road. The DHR concurred with these determinations. Steps that will be taken to mitigate the adverse effects to the RF&P Railroad Corridor have been outlined in the Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS).

(Responses are continued on next page)



Emily Stock
DC2RVA Draft EIS Recommendations
Page 2

140

- Any of the above listed Fairfax County Park Authority owned parks could experience direct significant impacts of lost land, recreation facilities, vegetation, and habitat, increased storm water discharge, invasive species, and wildlife habitat impacts. Therefore, we would like to review all future documents and plans at the earliest opportunity as the project progresses.
- The Park Authority requires any adverse impacts either temporary or permeant, to its natural resources to be rehabilitated or otherwise mitigated/compensated, including any terrestrial or aquatic natural resource impact that is not regulated under the jurisdiction of any Federal or state agency. Mitigation/compensation for permanent impacts shall be determined using the most current version of the Fairfax County Department of Public Works and Environmental Services Unit Price Schedule to determine a replacement cost. Forest, woodland, and shrubland habitat types shall be mitigated/compensated for at $56,420 an acre. Grassland shall be mitigated/compensated for at $18,246 an acre. Total impacts and mitigation/compensation costs shall be determined upon completion of the site design.
- The Park Authority requests more information in order to provide additional comments, including:
  - More detailed maps of the project corridor.
  - Proposed easements or acquisitions on parkland, including impacts to activities, features, and attributes of the parks where applicable, including natural areas, and trees > 6" diameter at breast height (dbh).
  - Potential impacts of sound pollution by distance from the proposed rail line, with potential mitigation measures.
  - Assess the impacts of increased stormwater runoff resulting from the conversion of existing forested areas into graded or built features.
  - Locations of proposed stormwater management (SWM) facilities.
  - Identify direct impacts to any local waterways.
  - Identify whether any bridges will need to be replaced to accommodate the proposed rail line.
- There is a potential for impacts to Native American and Historical Sites within the Southeast High Speed Rail Corridor. If the project is to impact undisturbed areas not previously subjected to archaeological survey, the scope of work for this EIS should include Phase I archaeological surveys for the previously undisturbed areas. If significant sites are found, Phase II archaeological testing is recommended to determine significance or eligibility for inclusion onto the National Register of Historic Places. If sites are found significant, avoidance or Phase III data recovery is recommended. If existing sites of significance are to be impacted, additional work will be warranted. If Federal permitting or funding is involved with the project it will trigger Section 106, requiring DRPT to consult with the Virginia Department of Historic Resources (VDHR) by Federal regulation.

VIRGINIA DEQ (continued)

Specifically related to subsurface impacts, DRPT carefully evaluated the archaeological APE throughout the corridor, including Fairfax County. Based on DRPT's predictive model and Project plans in the county, no impacts are planned outside of CSXT right-of-way in areas that have the potential to contain archaeological sites. Details on this mapping were discussed with the Fairfax County Parks Authority (FCPA) via telephone and email in October 2015 and careful attention has been rendered to assure that no changes to the area of impact have been made that require additional archaeological study.

Howard, Janine (DEQ)

From: Erik Nelson <enelson@fredericksburgva.gov>
Sent: Tuesday, September 12, 2017 3:34 PM
To: Howard, Janine (DEQ)
Subject: RE: DEIS for rail project

141

Ms. Howard,
Thanks for your quick response. Our schedule is going to be dictated by our City Council's schedule. We are going to brief them in September and ask them to take action on some specific mitigation factors in October. We thought we would submit them directly to the federal agency, but we can certainly keep you apprised of what we do as well.

Erik F. Nelson
Transportation Administrator
City of Fredericksburg

To: Erik Nelson
Subject: FW: DEIS for rail project

Good Afternoon Mr. Nelson,

The DEQ Office of Environmental Impact Review received a copy of the DEIS for the DC to Richmond High Speed Rail project yesterday and is performing a coordinated review of the document in accordance with Virginia Code § 10.1-1183 which requires us to coordinate the Commonwealth's response to documents submitted under the National Environmental Policy Act. Our process is outlined at the following webpage: http://www.deq.virginia.gov/Programs/EnvironmentalImpactReview/NEPADocumentReviews.aspx.

We will submit a report of the Commonwealth's comments to the Federal Railroad Administration by the November 7, 2017 that the federal agency has set. As part of the coordinated review DEQ requests comments from affected localities and regional planning district commissions which is why the City Manager received an email from us today (attached). In order to allow us time to finalize our report we typically request comments back in 30 days. If you would like your comments included in the Commonwealth's report and need more time, I am happy to work with you and will continue to accept comments up until a few days before the report is finalized. You can also opt to send your comments to the federal agency directly.

Please feel free to reach out with any additional questions you may have.

Re: DC to Richmond Southeast High Speed Rail DEQ #17-134F

Ms. Howard,

Thank you for the opportunity to comment on the Draft EIS. The Town of Ashland continues to support the project goals of the DC2RVA project, but has extensive concerns with the analysis and resulting recommendations contained within the Draft EIS.

On behalf of the Town Council please accept the attached list of critiques and comments, as well as a letter from the Ashland Museum which identifies concerns with the Section 106 Cultural Resources evaluation. The Town has also contracted with Mangum Economics to conduct a supplemental Economic Impact Analysis which the Town requests be included as part of this official response and critique. The Economic Impact Analysis will not be complete until October 27, 2017. Once complete I will email it to you and request that it be incorporated into the official response from the Town of Ashland. 142

Please don't hesitate to contact me for questions or clarifications. I look forward to further cooperation on this important project to minimize negative impacts to the Ashland community.

Respectfully,

Joshua S. Farrar
Town Manager
Town of Ashland, VA

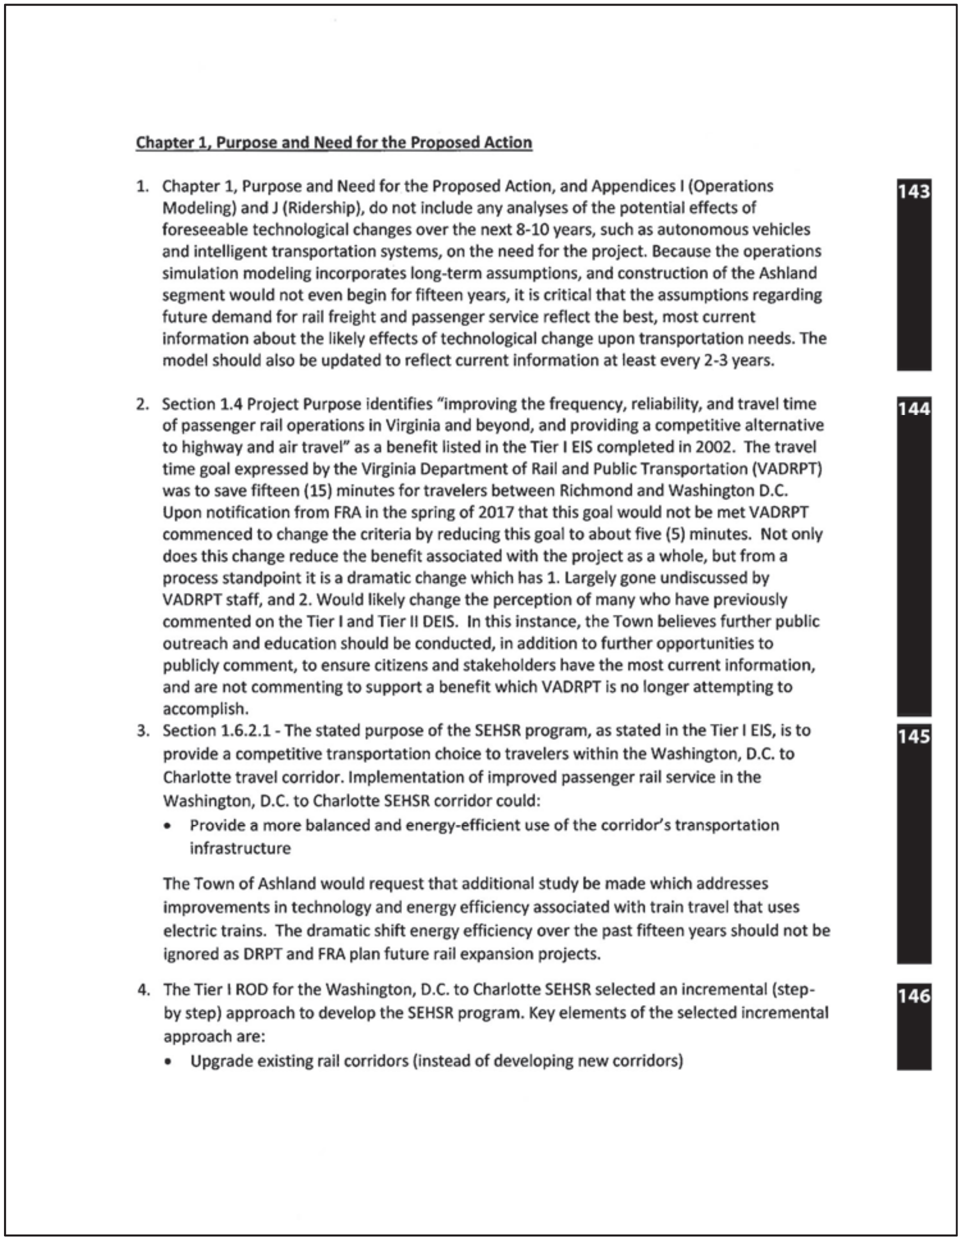
142. DRPT has reviewed all attachments provided by Town of Ashland, including the Ashland Museum and Mangum Economics report, and responded to comments within each attachment; refer to DRPT-numbered statements #143 through #236.



Chapter 1, Purpose and Need for the Proposed Action

143

1. Chapter 1, Purpose and Need for the Proposed Action, and Appendices I (Operations Modeling) and J (Ridership), do not include any analyses of the potential effects of foreseeable technological changes over the next 8-10 years, such as autonomous vehicles and intelligent transportation systems, on the need for the project. Because the operations simulation modeling incorporates long-term assumptions, and construction of the Ashland segment would not even begin for fifteen years, it is critical that the assumptions regarding future demand for rail freight and passenger service reflect the best, most current information about the likely effects of technological change upon transportation needs. The model should also be updated to reflect current information at least every 2-3 years.

144

2. Section 1.4 Project Purpose identifies "improving the frequency, reliability, and travel time of passenger rail operations in Virginia and beyond, and providing a competitive alternative to highway and air travel" as a benefit listed in the Tier I EIS completed in 2002. The travel time goal expressed by the Virginia Department of Rail and Public Transportation (VADRPT) was to save fifteen (15) minutes for travelers between Richmond and Washington D.C. Upon notification from FRA in the spring of 2017 that this goal would not be met VADRPT commenced to change the criteria by reducing this goal to about five (5) minutes. Not only does this change reduce the benefit associated with the project as a whole, but from a process standpoint it is a dramatic change which has 1. Largely gone undiscussed by VADRPT staff, and 2. Would likely change the perception of many who have previously commented on the Tier I and Tier II DEIS. In this instance, the Town believes further public outreach and education should be conducted, in addition to further opportunities to publicly comment, to ensure citizens and stakeholders have the most current information, and are not commenting to support a benefit which VADRPT is no longer attempting to accomplish.

145

3. Section 1.6.2.1 - The stated purpose of the SEHSR program, as stated in the Tier I EIS, is to provide a competitive transportation choice to travelers within the Washington, D.C. to Charlotte travel corridor. Implementation of improved passenger rail service in the Washington, D.C. to Charlotte SEHSR corridor could:
   - Provide a more balanced and energy-efficient use of the corridor's transportation infrastructure

   The Town of Ashland would request that additional study be made which addresses improvements in technology and energy efficiency associated with train travel that uses electric trains. The dramatic shift energy efficiency over the past fifteen years should not be ignored as DRPT and FRA plan future rail expansion projects.

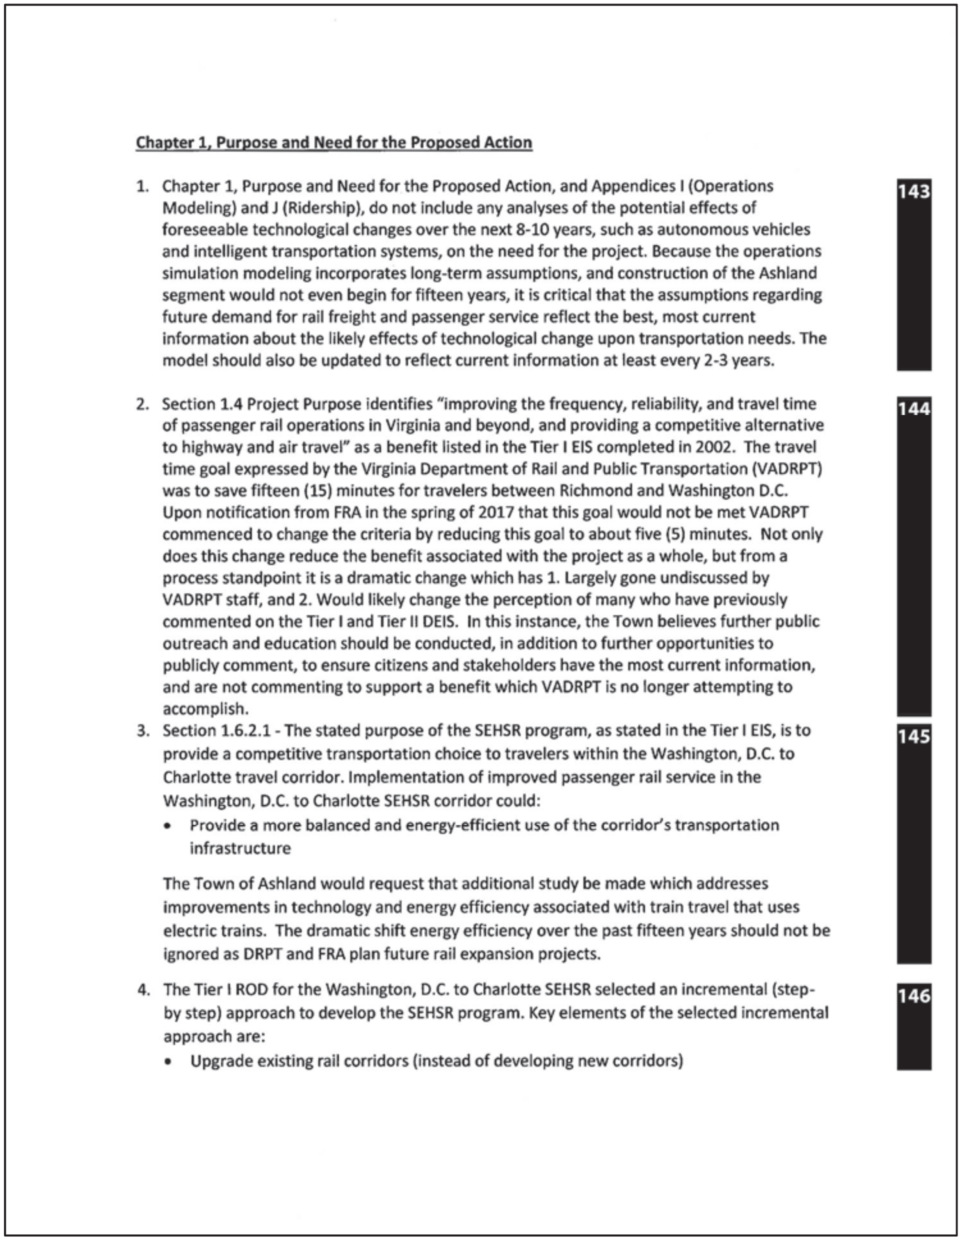
146

4. The Tier I ROD for the Washington, D.C. to Charlotte SEHSR selected an incremental (step-by step) approach to develop the SEHSR program. Key elements of the selected incremental approach are:
   - Upgrade existing rail corridors (instead of developing new corridors)

VIRGINIA DEQ (continued)

143. In 2002, the FRA completed the Tier I EIS for the Southeast High Speed Rail corridor that established the overall purpose and defined the route for providing a competitive transportation choice for travelers within the Washington, D.C. to Richmond, Raleigh, and Charlotte travel corridor. The DC2RVA Tier II EIS carries forward the purpose of the 2002 Tier I EIS within the Washington, D.C. to Richmond portion of the larger SEHSR corridor by identifying the infrastructure improvements necessary to provide a competitive transportation choice for current and future conditions; refer to Section 1.2 of the Final EIS for additional clarification since the Draft EIS FRA projected passenger, commuter, and freight train levels for 20 years (2045) to ensure the proposed infrastructure improvements will be sufficient to meet the Project's Purpose and Need. The DC2RVA Project does not preclude adoption of, or adjustment for, future technological changes. Developing the corridor incrementally based on market demand and/or funding availability allows flexibility to accommodate future technological changes in final design.

(Responses are continued on next page)



Chapter 1, Purpose and Need for the Proposed Action

1. Chapter 1, Purpose and Need for the Proposed Action, and Appendices I (Operations Modeling) and J (Ridership), do not include any analyses of the potential effects of foreseeable technological changes over the next 8-10 years, such as autonomous vehicles and intelligent transportation systems, on the need for the project. Because the operations simulation modeling incorporates long-term assumptions, and construction of the Ashland segment would not even begin for fifteen years, it is critical that the assumptions regarding future demand for rail freight and passenger service reflect the best, most current information about the likely effects of technological change upon transportation needs. The model should also be updated to reflect current information at least every 2-3 years. 143

2. Section 1.4 Project Purpose identifies "improving the frequency, reliability, and travel time of passenger rail operations in Virginia and beyond, and providing a competitive alternative to highway and air travel" as a benefit listed in the Tier I EIS completed in 2002. The travel time goal expressed by the Virginia Department of Rail and Public Transportation (VADRPT) was to save fifteen (15) minutes for travelers between Richmond and Washington D.C. Upon notification from FRA in the spring of 2017 that this goal would not be met VADRPT commenced to change the criteria by reducing this goal to about five (5) minutes. Not only does this change reduce the benefit associated with the project as a whole, but from a process standpoint it is a dramatic change which has 1. Largely gone undiscussed by VADRPT staff, and 2. Would likely change the perception of many who have previously commented on the Tier I and Tier II DEIS. In this instance, the Town believes further public outreach and education should be conducted, in addition to further opportunities to publicly comment, to ensure citizens and stakeholders have the most current information, and are not commenting to support a benefit which VADRPT is no longer attempting to accomplish. 144

3. Section 1.6.2.1 - The stated purpose of the SEHSR program, as stated in the Tier I EIS, is to provide a competitive transportation choice to travelers within the Washington, D.C. to Charlotte travel corridor. Implementation of improved passenger rail service in the Washington, D.C. to Charlotte SEHSR corridor could: 145
   - Provide a more balanced and energy-efficient use of the corridor's transportation infrastructure

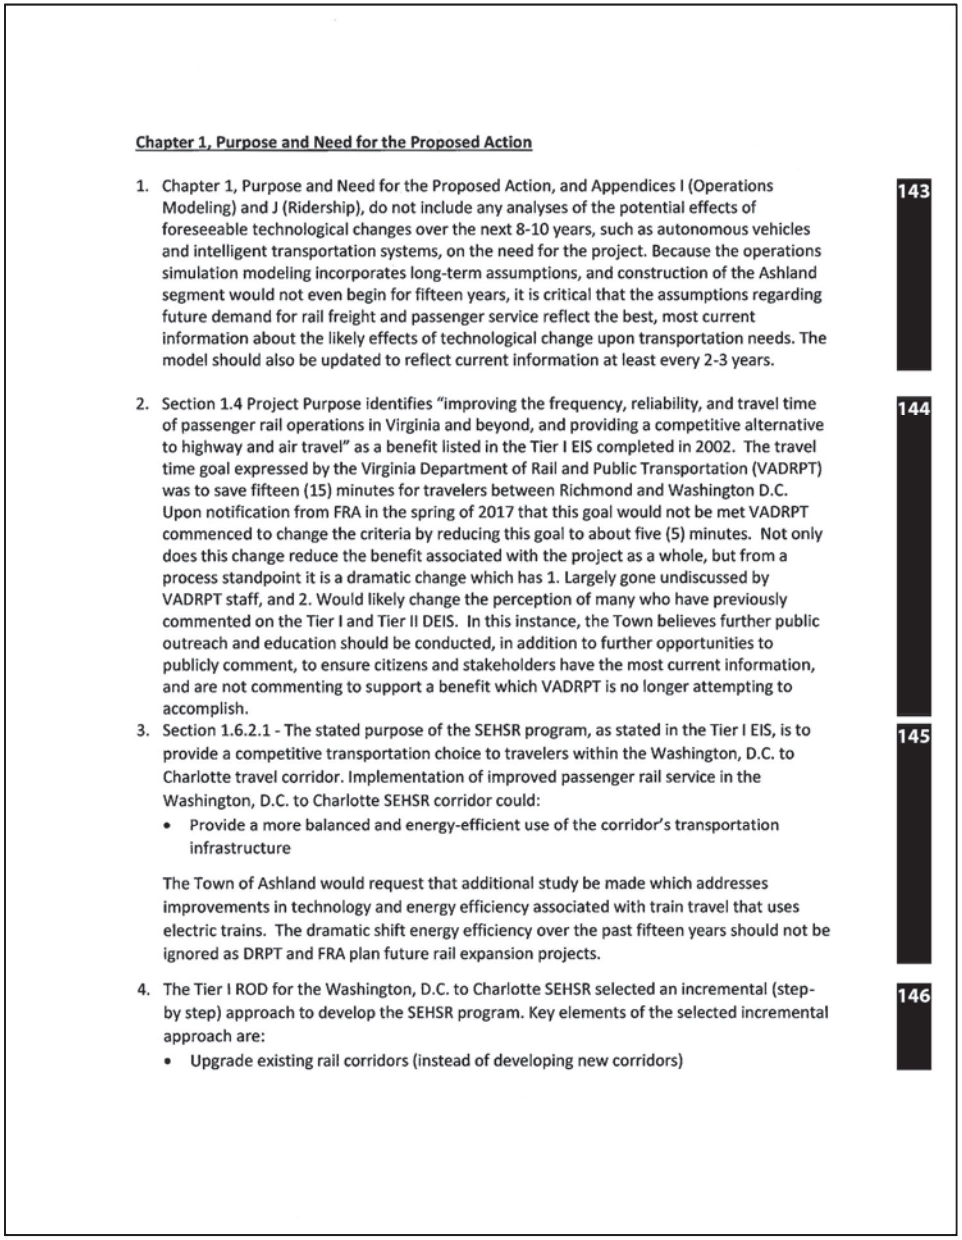
   The Town of Ashland would request that additional study be made which addresses improvements in technology and energy efficiency associated with train travel that uses electric trains. The dramatic shift energy efficiency over the past fifteen years should not be ignored as DRPT and FRA plan future rail expansion projects.

4. The Tier I ROD for the Washington, D.C. to Charlotte SEHSR selected an incremental (step-by step) approach to develop the SEHSR program. Key elements of the selected incremental approach are: 146
   - Upgrade existing rail corridors (instead of developing new corridors)

VIRGINIA DEQ (continued)

144. The 2002 Tier I EIS established the overall purpose for the SEHSR program, which, as stated in the Tier I EIS, is to provide a competitive transportation choice to travelers within the Washington, D.C. to Richmond, Raleigh, and Charlotte travel corridor. The Tier I EIS recognizes that travel time and service reliability are key factors affecting the traveling public's choice of transportation mode. Neither FRA nor DRPT have set a specific goal for reductions in travel time for the Project, nor has a reduction in travel time been applied as a criterion during alternatives screening or other evaluation. Reductions in travel time are anticipated to vary among different trains based on their respective schedules and station stops, as well as the Project's final design. While preparing the Draft EIS, DRPT conducted a survey of rail, bus, air, and automobile passengers traveling between Richmond, Virginia and points north (see Appendix J of the Draft EIS). The central purpose of the survey was to better understand the behavior of travelers along the DC2RVA corridor. Data collected from the survey were used to estimate an initial set of passenger sensitivities to changes in fare, travel time, and other service attributes. DRPT found that the traveling public (e.g., number of riders) was directly responsive to improved reliability and frequency of passenger rail service. Reduced travel time, while a benefit, had less effect on ridership.

(Responses are continued on next page)



Chapter 1, Purpose and Need for the Proposed Action

1. Chapter 1, Purpose and Need for the Proposed Action, and Appendices I (Operations Modeling) and J (Ridership), do not include any analyses of the potential effects of foreseeable technological changes over the next 8-10 years, such as autonomous vehicles and intelligent transportation systems, on the need for the project. Because the operations simulation modeling incorporates long-term assumptions, and construction of the Ashland segment would not even begin for fifteen years, it is critical that the assumptions regarding future demand for rail freight and passenger service reflect the best, most current information about the likely effects of technological change upon transportation needs. The model should also be updated to reflect current information at least every 2-3 years. 143

2. Section 1.4 Project Purpose identifies "improving the frequency, reliability, and travel time of passenger rail operations in Virginia and beyond, and providing a competitive alternative to highway and air travel" as a benefit listed in the Tier I EIS completed in 2002. The travel time goal expressed by the Virginia Department of Rail and Public Transportation (VADRPT) was to save fifteen (15) minutes for travelers between Richmond and Washington D.C. Upon notification from FRA in the spring of 2017 that this goal would not be met VADRPT commenced to change the criteria by reducing this goal to about five (5) minutes. Not only does this change reduce the benefit associated with the project as a whole, but from a process standpoint it is a dramatic change which has 1. Largely gone undiscussed by VADRPT staff, and 2. Would likely change the perception of many who have previously commented on the Tier I and Tier II DEIS. In this instance, the Town believes further public outreach and education should be conducted, in addition to further opportunities to publicly comment, to ensure citizens and stakeholders have the most current information, and are not commenting to support a benefit which VADRPT is no longer attempting to accomplish. 144

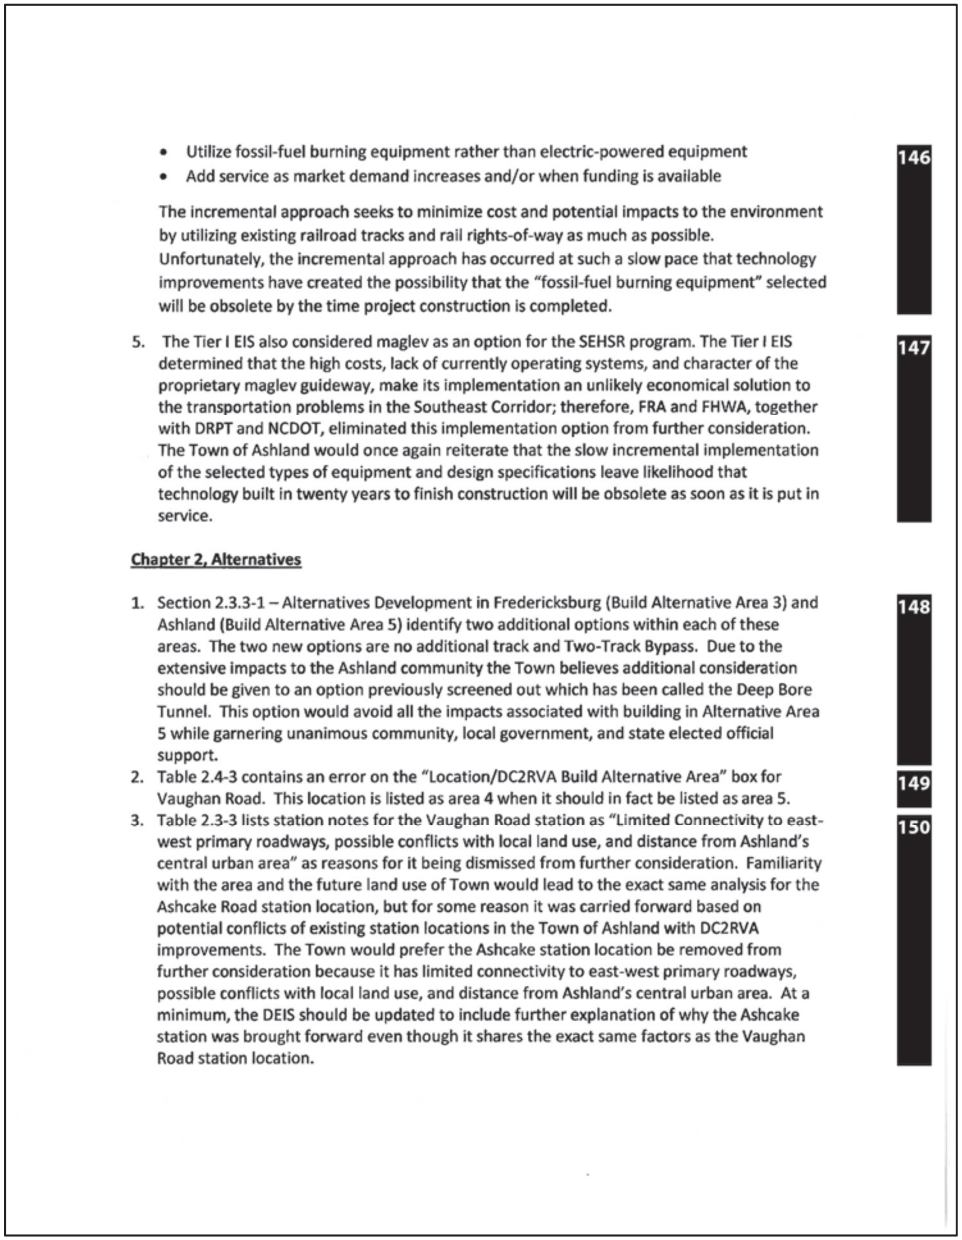
3. Section 1.6.2.1 - The stated purpose of the SEHSR program, as stated in the Tier I EIS, is to provide a competitive transportation choice to travelers within the Washington, D.C. to Charlotte travel corridor. Implementation of improved passenger rail service in the Washington, D.C. to Charlotte SEHSR corridor could: 145
   - Provide a more balanced and energy-efficient use of the corridor's transportation infrastructure

   The Town of Ashland would request that additional study be made which addresses improvements in technology and energy efficiency associated with train travel that uses electric trains. The dramatic shift energy efficiency over the past fifteen years should not be ignored as DRPT and FRA plan future rail expansion projects.

4. The Tier I ROD for the Washington, D.C. to Charlotte SEHSR selected an incremental (step-by step) approach to develop the SEHSR program. Key elements of the selected incremental approach are: 146
   - Upgrade existing rail corridors (instead of developing new corridors)

VIRGINIA DEQ (continued)

145. and 146. The DC2RVA Tier II EIS continues the incremental approach approved in the SEHSR Tier I ROD in the Washington, D.C. to Richmond, VA corridor along the existing rail corridor owned and operated by CSXT. Consistent with FRA's decision in the SEHSR Tier I ROD, DRPT identified and evaluated alternatives to improve and add capacity to the existing rail corridor which utilize fossil-fuel burning equipment. Alternative technologies (such as Maglev or hyperloop technologies or use of electric locomotives) are not consistent with the Purpose and Need defined in the 2002 Tier I EIS and ROD, so do not meet the Purpose and Need of the DC2RVA Project. DRPT does recognize that technologies are changing, and new transportation modes and options may be available in the future. The Project's Basis of Design allows for sufficient clearance on new grade-separated roadway crossings so as not to preclude a potential future electric catenary system. Advancing the DC2RVA Project along the incremental approach selected by FRA does not preclude future applications of hyperloop or other new technologies if or when they become viable, which would be subject to separate environmental documentation at that time.



146

- Utilize fossil-fuel burning equipment rather than electric-powered equipment
- Add service as market demand increases and/or when funding is available

The incremental approach seeks to minimize cost and potential impacts to the environment by utilizing existing railroad tracks and rail rights-of-way as much as possible. Unfortunately, the incremental approach has occurred at such a slow pace that technology improvements have created the possibility that the "fossil-fuel burning equipment" selected will be obsolete by the time project construction is completed.

147

5. The Tier I EIS also considered maglev as an option for the SEHSR program. The Tier I EIS determined that the high costs, lack of currently operating systems, and character of the proprietary maglev guideway, make its implementation an unlikely economical solution to the transportation problems in the Southeast Corridor; therefore, FRA and FHWA, together with DRPT and NCDOT, eliminated this implementation option from further consideration. The Town of Ashland would once again reiterate that the slow incremental implementation of the selected types of equipment and design specifications leave likelihood that technology built in twenty years to finish construction will be obsolete as soon as it is put in service.

Chapter 2, Alternatives

148

1. Section 2.3.3-1 – Alternatives Development in Fredericksburg (Build Alternative Area 3) and Ashland (Build Alternative Area 5) identify two additional options within each of these areas. The two new options are no additional track and Two-Track Bypass. Due to the extensive impacts to the Ashland community the Town believes additional consideration should be given to an option previously screened out which has been called the Deep Bore Tunnel. This option would avoid all the impacts associated with building in Alternative Area 5 while garnering unanimous community, local government, and state elected official support.

149

2. Table 2.4-3 contains an error on the "Location/DC2RVA Build Alternative Area" box for Vaughan Road. This location is listed as area 4 when it should in fact be listed as area 5.

150

3. Table 2.3-3 lists station notes for the Vaughan Road station as "Limited Connectivity to east-west primary roadways, possible conflicts with local land use, and distance from Ashland's central urban area" as reasons for it being dismissed from further consideration. Familiarity with the area and the future land use of Town would lead to the exact same analysis for the Ashcake Road station location, but for some reason it was carried forward based on potential conflicts of existing station locations in the Town of Ashland with DC2RVA improvements. The Town would prefer the Ashcake station location be removed from further consideration because it has limited connectivity to east-west primary roadways, possible conflicts with local land use, and distance from Ashland's central urban area. At a minimum, the DEIS should be updated to include further explanation of why the Ashcake station was brought forward even though it shares the exact same factors as the Vaughan Road station location.

VIRGINIA DEQ (continued)

(Response to comment 146 on previous page)

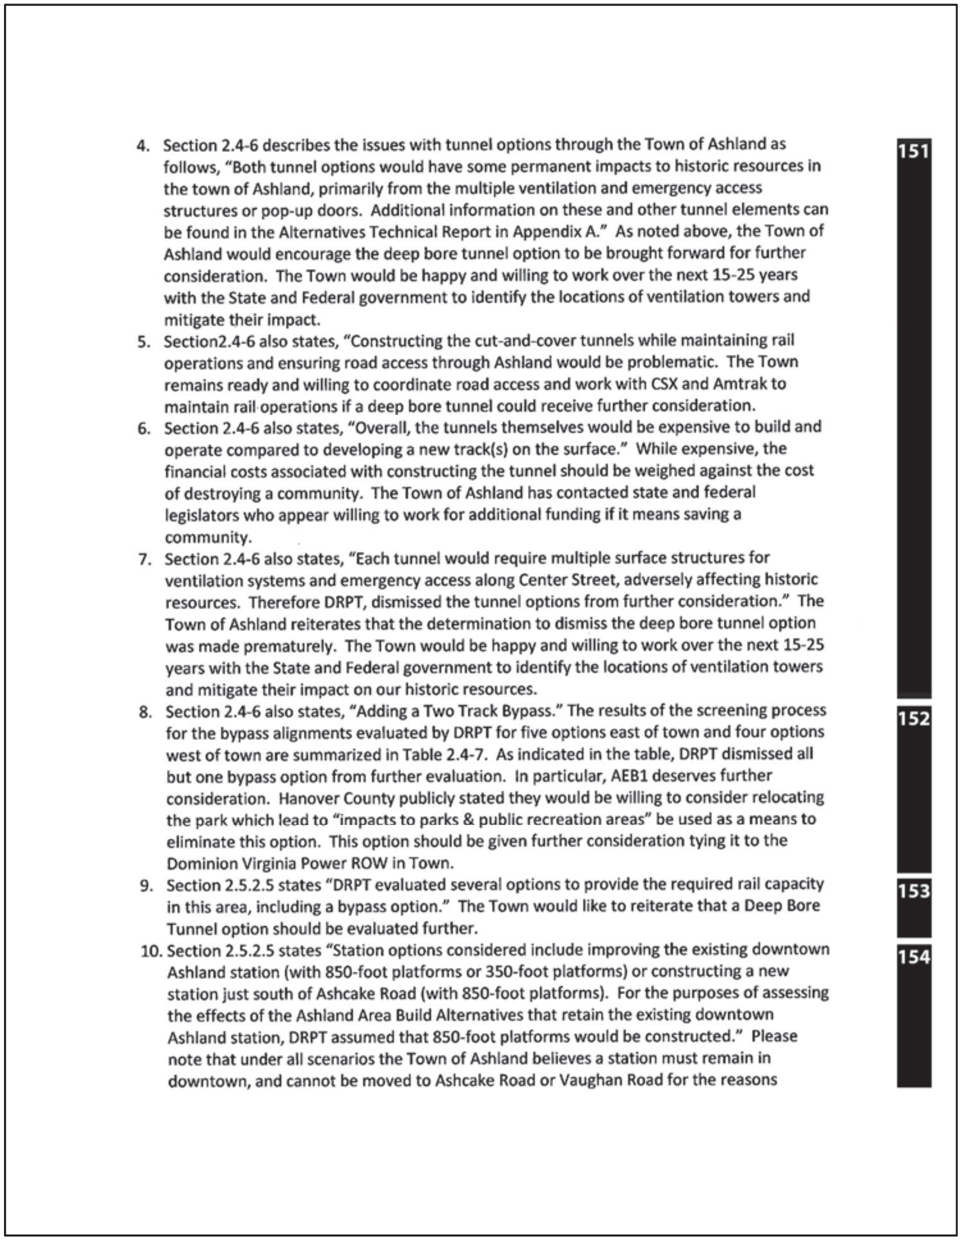
147. Refer to DRPT-numbered statement #143 for response.

148. Refer to DRPT-numbered statement #151 for more Town comments on a deep bore tunnel and DRPT response.

149. The requested correction has been addressed in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

150. DRPT and FRA initially focused review of Ashland Station alternatives on the existing downtown station, which is centrally located to serve Ashland and the Randolph-Macon College campus, and provides easy access to Route 54, the primary east-west road connecting Ashland to Route 1 and I-95 to the east and Hanover County's residential areas to the west. Based on comments from area stakeholders, DRPT conducted a screening evaluation of three alternate station locations: south of Ashcake Road; North of Vaughan Road; and adjacent to Patrick Street. The location adjacent to Patrick Street is reasonably close to downtown Ashland and Randolph-Macon's campus, but would have similar property and traffic impacts to expanding the downtown station and require acquisition of parkland. For these reasons, the Patrick Street location was eliminated from further consideration. Neither the station location north of Vaughan Road nor the location south of Ashcake Road are centrally located to serve downtown Ashland or the campus. The location north of Vaughan Road, while having reasonable road access to the east towards the Route 1 and I-95 corridors, has limited access to the west on narrow roads through a largely residential area before linking to Route 54. In contrast, the location south of Ashcake will have reasonable access to both the east and west via Ashcake Road, the area's other primary east-west corridor. Therefore, a potential station location south of Ashcake Road was carried forward for further consideration as an alternative to developing the downtown station to serve three tracks with 850 feet platforms.

     DRPT notes that there are no improvements to the existing or alternate station location as part of the Preferred Alternative (see Section 4.3.5 of the Final EIS). Refer to DRPT-numbered statement #154.



151

4. Section 2.4-6 describes the issues with tunnel options through the Town of Ashland as follows, "Both tunnel options would have some permanent impacts to historic resources in the town of Ashland, primarily from the multiple ventilation and emergency access structures or pop-up doors. Additional information on these and other tunnel elements can be found in the Alternatives Technical Report in Appendix A." As noted above, the Town of Ashland would encourage the deep bore tunnel option to be brought forward for further consideration. The Town would be happy and willing to work over the next 15-25 years with the State and Federal government to identify the locations of ventilation towers and mitigate their impact.
5. Section2.4-6 also states, "Constructing the cut-and-cover tunnels while maintaining rail operations and ensuring road access through Ashland would be problematic. The Town remains ready and willing to coordinate road access and work with CSX and Amtrak to maintain rail operations if a deep bore tunnel could receive further consideration.
6. Section 2.4-6 also states, "Overall, the tunnels themselves would be expensive to build and operate compared to developing a new track(s) on the surface." While expensive, the financial costs associated with constructing the tunnel should be weighed against the cost of destroying a community. The Town of Ashland has contacted state and federal legislators who appear willing to work for additional funding if it means saving a community.
7. Section 2.4-6 also states, "Each tunnel would require multiple surface structures for ventilation systems and emergency access along Center Street, adversely affecting historic resources. Therefore DRPT, dismissed the tunnel options from further consideration." The Town of Ashland reiterates that the determination to dismiss the deep bore tunnel option was made prematurely. The Town would be happy and willing to work over the next 15-25 years with the State and Federal government to identify the locations of ventilation towers and mitigate their impact on our historic resources.

152

8. Section 2.4-6 also states, "Adding a Two Track Bypass." The results of the screening process for the bypass alignments evaluated by DRPT for five options east of town and four options west of town are summarized in Table 2.4-7. As indicated in the table, DRPT dismissed all but one bypass option from further evaluation. In particular, AEB1 deserves further consideration. Hanover County publicly stated they would be willing to consider relocating the park which lead to "impacts to parks & public recreation areas" be used as a means to eliminate this option. This option should be given further consideration tying it to the Dominion Virginia Power ROW in Town.

153

9. Section 2.5.2.5 states "DRPT evaluated several options to provide the required rail capacity in this area, including a bypass option." The Town would like to reiterate that a Deep Bore Tunnel option should be evaluated further.

154

10. Section 2.5.2.5 states "Station options considered include improving the existing downtown Ashland station (with 850-foot platforms or 350-foot platforms) or constructing a new station just south of Ashcake Road (with 850-foot platforms). For the purposes of assessing the effects of the Ashland Area Build Alternatives that retain the existing downtown Ashland station, DRPT assumed that 850-foot platforms would be constructed." Please note that under all scenarios the Town of Ashland believes a station must remain in downtown, and cannot be moved to Ashcake Road or Vaughan Road for the reasons

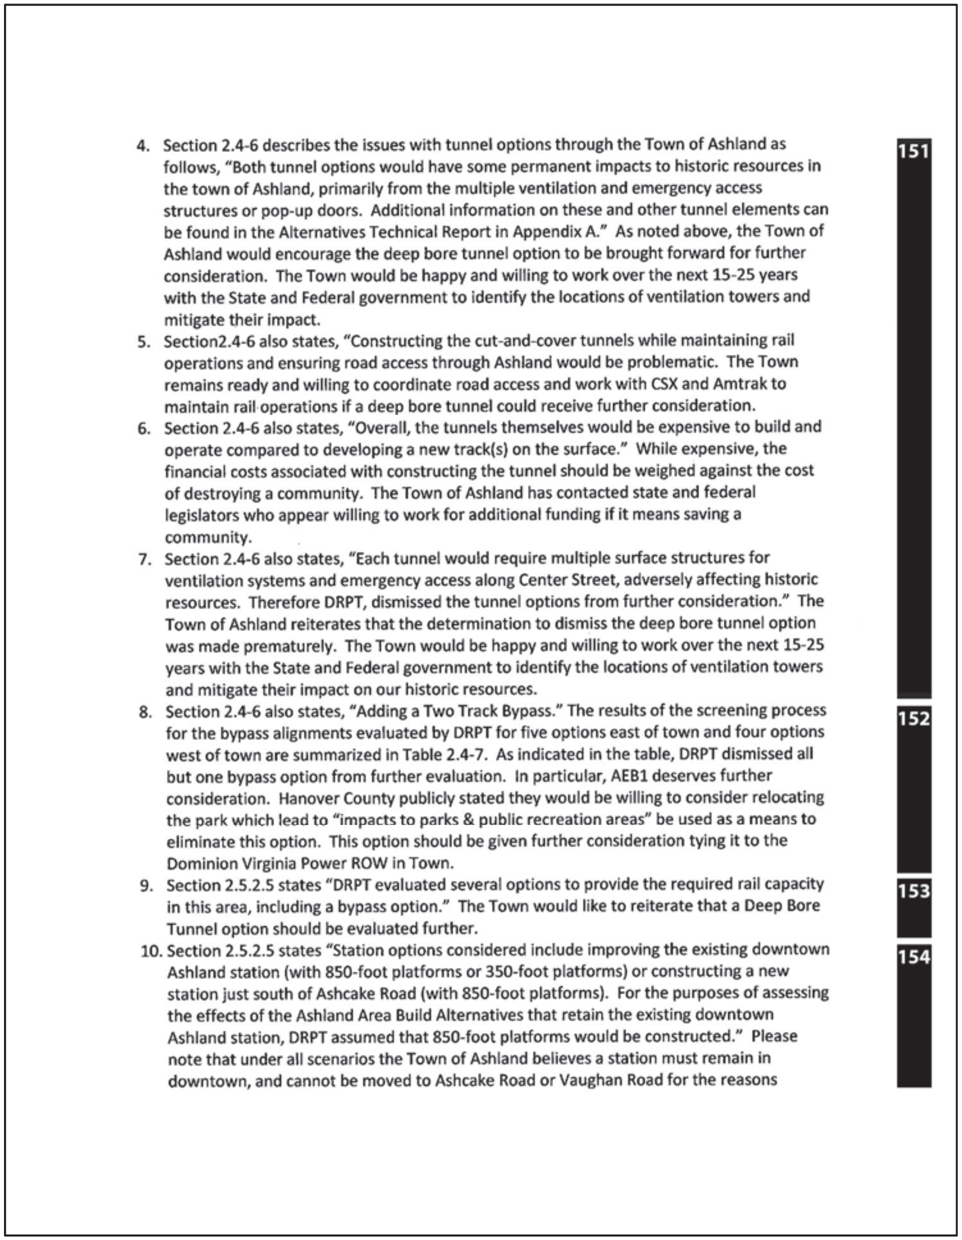
VIRGINIA DEQ (continued)

151. DRPT and FRA considered a deep bore tunnel during the alternatives development and evaluation process, and dismissed the concept from further consideration during screening of potential alternatives (as reported in Alternatives Technical Report, Appendix A of the Draft EIS) due to high costs and potential impacts within the Town of Ashland. The concept of a deep bore tunnel – both a deep hard-rock version and a shallower soft-earth version – was further evaluated and considered by the Town of Ashland/Hanover County Community Advisory Committee (CAC) process (refer to Section 3.3 of the Final EIS for CAC details). The CAC members dismissed the deep bore tunnel as an unlikely alternative due to its anticipated cost, impacts to the Town from ventilation towers and other structures, and potential operational concerns.

152. The FRA and DRPT have identified Alternative 5A, which will maintain two tracks through Ashland, as the Preferred Alternative (refer to Section 4.3.5 of the Final EIS for details on the selection process). DRPT and FRA considered several eastern bypass alignments during the alternatives development and evaluation process, and dismissed the concept from further consideration during screening of potential alternatives (as reported in Alternatives Technical Report, Appendix A of the Draft EIS) due to high costs and potential impacts to parks, property, infrastructure (including Route 1 and I-95), and wetlands. Concept AEB1, in particular would have required additional right-of-way through an existing park. The concept of an eastern bypass, including AEB 1 through the park was further evaluated and considered by the CAC process (refer to Section 3.3 of the Final EIS for CAC details). The CAC dismissed the eastern bypass alternatives due to their high costs and impacts to property, infrastructure, and the park, and identified a western bypass alternative, known as AWB 1, as their "least objectionable" bypass alternative.

153. Refer to DRPT-numbered statement #151 for response.

(Responses are continued on next page)



151

4. Section 2.4-6 describes the issues with tunnel options through the Town of Ashland as follows, "Both tunnel options would have some permanent impacts to historic resources in the town of Ashland, primarily from the multiple ventilation and emergency access structures or pop-up doors. Additional information on these and other tunnel elements can be found in the Alternatives Technical Report in Appendix A." As noted above, the Town of Ashland would encourage the deep bore tunnel option to be brought forward for further consideration. The Town would be happy and willing to work over the next 15-25 years with the State and Federal government to identify the locations of ventilation towers and mitigate their impact.
5. Section2.4-6 also states, "Constructing the cut-and-cover tunnels while maintaining rail operations and ensuring road access through Ashland would be problematic. The Town remains ready and willing to coordinate road access and work with CSX and Amtrak to maintain rail operations if a deep bore tunnel could receive further consideration.
6. Section 2.4-6 also states, "Overall, the tunnels themselves would be expensive to build and operate compared to developing a new track(s) on the surface." While expensive, the financial costs associated with constructing the tunnel should be weighed against the cost of destroying a community. The Town of Ashland has contacted state and federal legislators who appear willing to work for additional funding if it means saving a community.
7. Section 2.4-6 also states, "Each tunnel would require multiple surface structures for ventilation systems and emergency access along Center Street, adversely affecting historic resources. Therefore DRPT, dismissed the tunnel options from further consideration." The Town of Ashland reiterates that the determination to dismiss the deep bore tunnel option was made prematurely. The Town would be happy and willing to work over the next 15-25 years with the State and Federal government to identify the locations of ventilation towers and mitigate their impact on our historic resources.

152

8. Section 2.4-6 also states, "Adding a Two Track Bypass." The results of the screening process for the bypass alignments evaluated by DRPT for five options east of town and four options west of town are summarized in Table 2.4-7. As indicated in the table, DRPT dismissed all but one bypass option from further evaluation. In particular, AEB1 deserves further consideration. Hanover County publicly stated they would be willing to consider relocating the park which lead to "impacts to parks & public recreation areas" be used as a means to eliminate this option. This option should be given further consideration tying it to the Dominion Virginia Power ROW in Town.

153

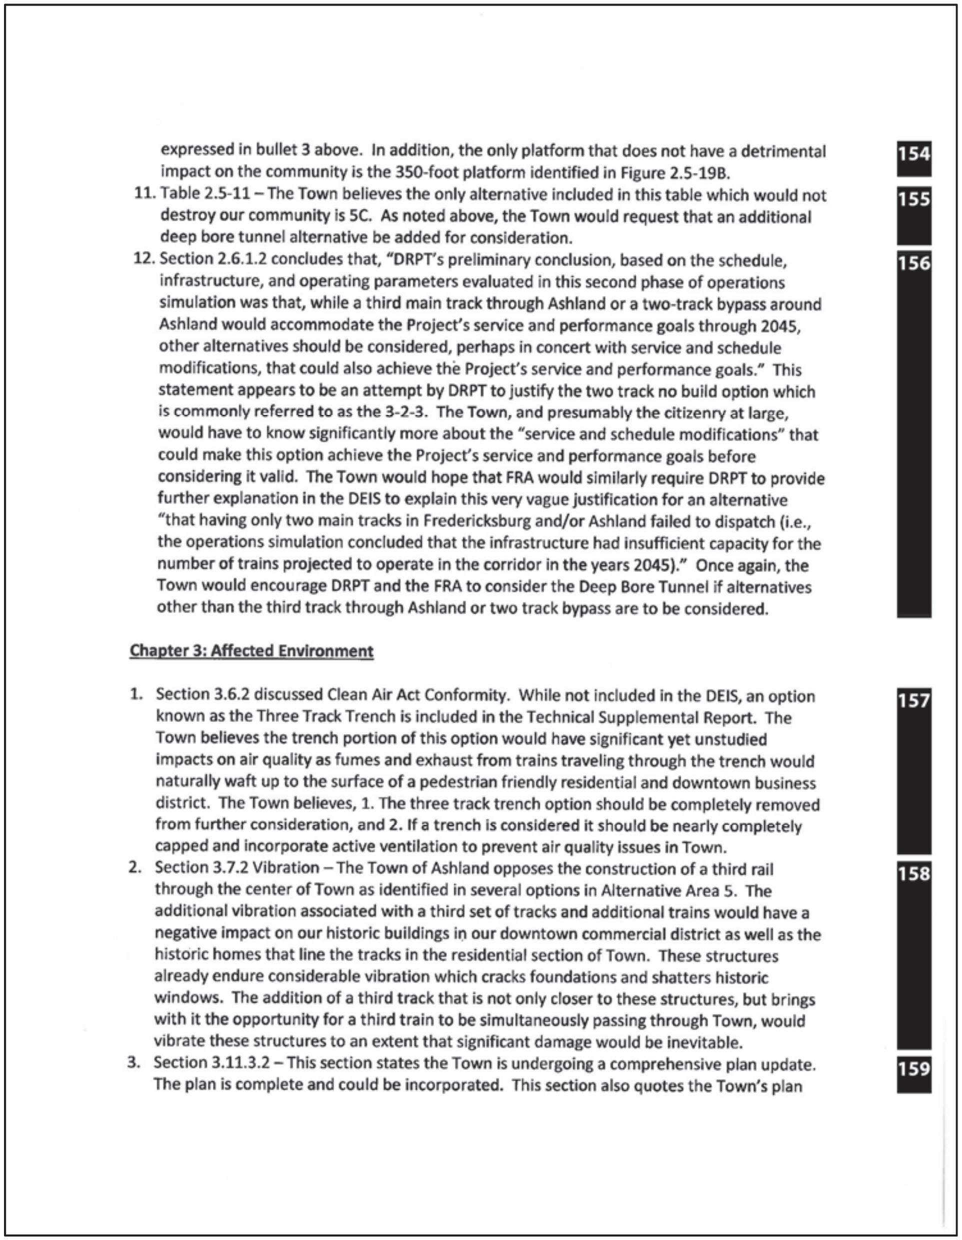
9. Section 2.5.2.5 states "DRPT evaluated several options to provide the required rail capacity in this area, including a bypass option." The Town would like to reiterate that a Deep Bore Tunnel option should be evaluated further.

154

10. Section 2.5.2.5 states "Station options considered include improving the existing downtown Ashland station (with 850-foot platforms or 350-foot platforms) or constructing a new station just south of Ashcake Road (with 850-foot platforms). For the purposes of assessing the effects of the Ashland Area Build Alternatives that retain the existing downtown Ashland station, DRPT assumed that 850-foot platforms would be constructed." Please note that under all scenarios the Town of Ashland believes a station must remain in downtown, and cannot be moved to Ashcake Road or Vaughan Road for the reasons

VIRGINIA DEQ (continued)

154. The Town of Ashland has stated a preference for maintaining the existing station location and improving the station with 350 feet platforms. The FRA and DRPT have identified Alternative 5A, which will maintain two tracks through Ashland, as the Preferred Alternative (refer to Section 4.3.5 of the Final EIS for details on the selection process). No roadway or station improvements will occur as part of the DC2RVA Project between Vaughan Road and Ashcake Road as part of Alternative 5A. Station platform improvements, unrelated to the DC2RVA Project, are being separately negotiated between the Town of Ashland and Amtrak. In this separate ongoing project, Amtrak is working with the Town of Ashland and FRA to improve the existing station platforms to meet ADA requirements. These improvements are independent of the DC2RVA Project and are likely to be in place before construction would start on the DC2RVA Project.



154 expressed in bullet 3 above. In addition, the only platform that does not have a detrimental impact on the community is the 350-foot platform identified in Figure 2.5-19B.

155 11. Table 2.5-11 – The Town believes the only alternative included in this table which would not destroy our community is 5C. As noted above, the Town would request that an additional deep bore tunnel alternative be added for consideration.

156 12. Section 2.6.1.2 concludes that, "DRPT's preliminary conclusion, based on the schedule, infrastructure, and operating parameters evaluated in this second phase of operations simulation was that, while a third main track through Ashland or a two-track bypass around Ashland would accommodate the Project's service and performance goals through 2045, other alternatives should be considered, perhaps in concert with service and schedule modifications, that could also achieve the Project's service and performance goals." This statement appears to be an attempt by DRPT to justify the two track no build option which is commonly referred to as the 3-2-3. The Town, and presumably the citizenry at large, would have to know significantly more about the "service and schedule modifications" that could make this option achieve the Project's service and performance goals before considering it valid. The Town would hope that FRA would similarly require DRPT to provide further explanation in the DEIS to explain this very vague justification for an alternative "that having only two main tracks in Fredericksburg and/or Ashland failed to dispatch (i.e., the operations simulation concluded that the infrastructure had insufficient capacity for the number of trains projected to operate in the corridor in the years 2045)." Once again, the Town would encourage DRPT and the FRA to consider the Deep Bore Tunnel if alternatives other than the third track through Ashland or two track bypass are to be considered.

Chapter 3: Affected Environment

157 1. Section 3.6.2 discussed Clean Air Act Conformity. While not included in the DEIS, an option known as the Three Track Trench is included in the Technical Supplemental Report. The Town believes the trench portion of this option would have significant yet unstudied impacts on air quality as fumes and exhaust from trains traveling through the trench would naturally waft up to the surface of a pedestrian friendly residential and downtown business district. The Town believes, 1. The three track trench option should be completely removed from further consideration, and 2. If a trench is considered it should be nearly completely capped and incorporate active ventilation to prevent air quality issues in Town.

158 2. Section 3.7.2 Vibration – The Town of Ashland opposes the construction of a third rail through the center of Town as identified in several options in Alternative Area 5. The additional vibration associated with a third set of tracks and additional trains would have a negative impact on our historic buildings in our downtown commercial district as well as the historic homes that line the tracks in the residential section of Town. These structures already endure considerable vibration which cracks foundations and shatters historic windows. The addition of a third track that is not only closer to these structures, but brings with it the opportunity for a third train to be simultaneously passing through Town, would vibrate these structures to an extent that significant damage would be inevitable.

159 3. Section 3.11.3.2 – This section states the Town is undergoing a comprehensive plan update. The plan is complete and could be incorporated. This section also quotes the Town's plan

VIRGINIA DEQ (continued)

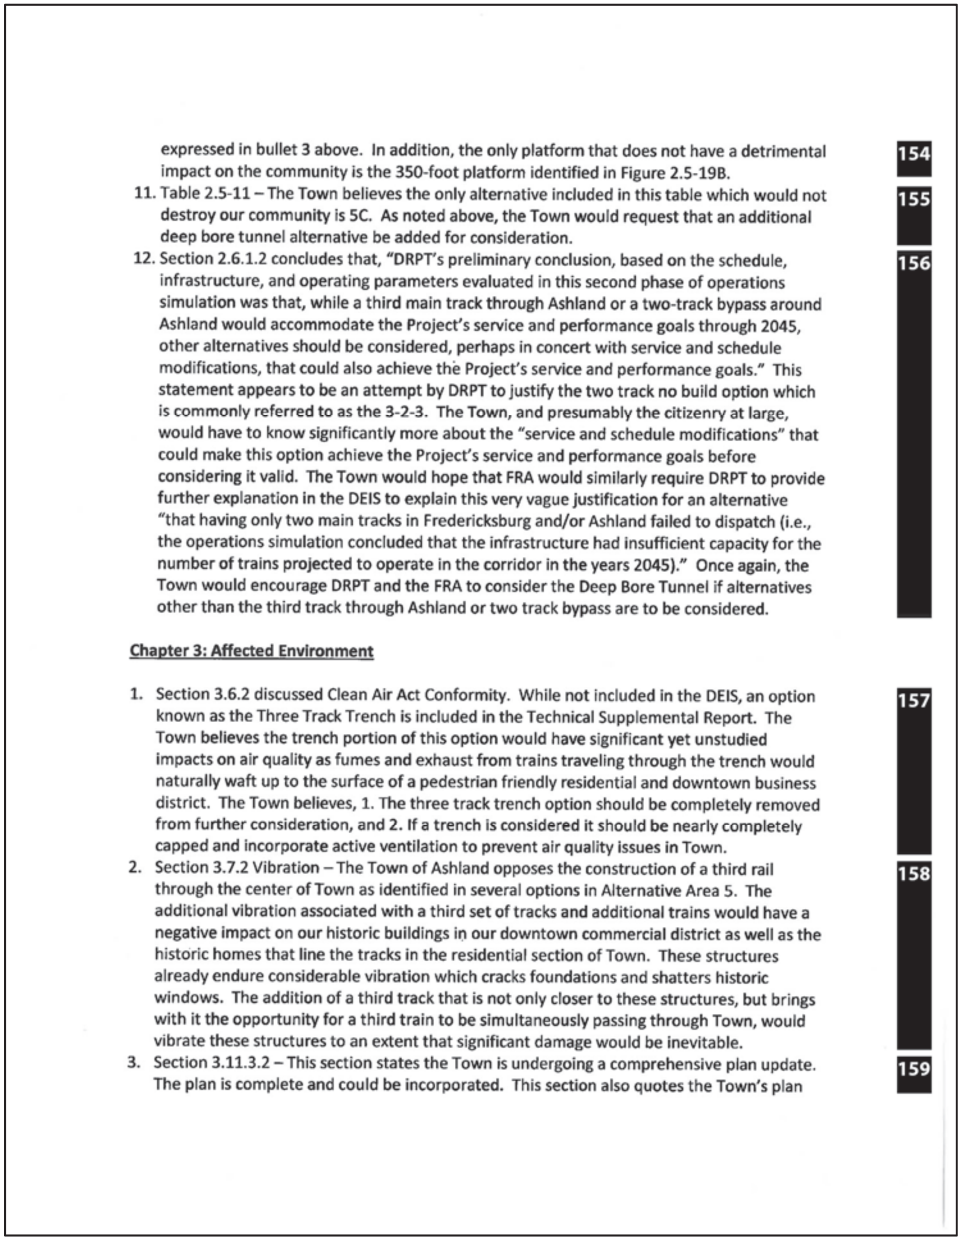
(Response to comment 154 on previous page)

155. Refer to DRPT-numbered statement #151 for response.

156. FRA and DRPT, and the Ashland/Hanover CAC, considered and eliminated a deep bore tunnel alternative for achieving additional rail capacity in Area 5 (see response to DRPT-numbered statement #151). The FRA and DRPT have concluded that Alternative 5A, in which a third track is added north and south of downtown Ashland and two tracks are maintained through Ashland, has sufficient capacity to meet the Project's Purpose and Need. The ability of this alternative, with its reduced footprint and lower impacts to the community, to meet Project performance goals has been established by FRA and DRPT refined operations analysis modeling, as reported in Section 3.2 of the Final EIS.

157. The FRA and DRPT have identified Alternative 5A, which will maintain two tracks through Ashland, as the Preferred Alternative (refer to Section 4.3.5 of the Final EIS for details on the selection process). Trench options were considered during the alternatives development process, but were not carried forward as candidate Build Alternatives in the Draft EIS. A trench option was also considered by the Ashland/Hanover CAC process. The CAC determined a three-track trench through the Town of Ashland would be the "least objectionable" option for adding capacity through town below-grade.

(Responses are continued on next page)



154 expressed in bullet 3 above. In addition, the only platform that does not have a detrimental impact on the community is the 350-foot platform identified in Figure 2.5-19B.

155 11. Table 2.5-11 – The Town believes the only alternative included in this table which would not destroy our community is 5C. As noted above, the Town would request that an additional deep bore tunnel alternative be added for consideration.

156 12. Section 2.6.1.2 concludes that, "DRPT's preliminary conclusion, based on the schedule, infrastructure, and operating parameters evaluated in this second phase of operations simulation was that, while a third main track through Ashland or a two-track bypass around Ashland would accommodate the Project's service and performance goals through 2045, other alternatives should be considered, perhaps in concert with service and schedule modifications, that could also achieve the Project's service and performance goals." This statement appears to be an attempt by DRPT to justify the two track no build option which is commonly referred to as the 3-2-3. The Town, and presumably the citizenry at large, would have to know significantly more about the "service and schedule modifications" that could make this option achieve the Project's service and performance goals before considering it valid. The Town would hope that FRA would similarly require DRPT to provide further explanation in the DEIS to explain this very vague justification for an alternative "that having only two main tracks in Fredericksburg and/or Ashland failed to dispatch (i.e., the operations simulation concluded that the infrastructure had insufficient capacity for the number of trains projected to operate in the corridor in the years 2045)." Once again, the Town would encourage DRPT and the FRA to consider the Deep Bore Tunnel if alternatives other than the third track through Ashland or two track bypass are to be considered.

Chapter 3: Affected Environment

157 1. Section 3.6.2 discussed Clean Air Act Conformity. While not included in the DEIS, an option known as the Three Track Trench is included in the Technical Supplemental Report. The Town believes the trench portion of this option would have significant yet unstudied impacts on air quality as fumes and exhaust from trains traveling through the trench would naturally waft up to the surface of a pedestrian friendly residential and downtown business district. The Town believes, 1. The three track trench option should be completely removed from further consideration, and 2. If a trench is considered it should be nearly completely capped and incorporate active ventilation to prevent air quality issues in Town.

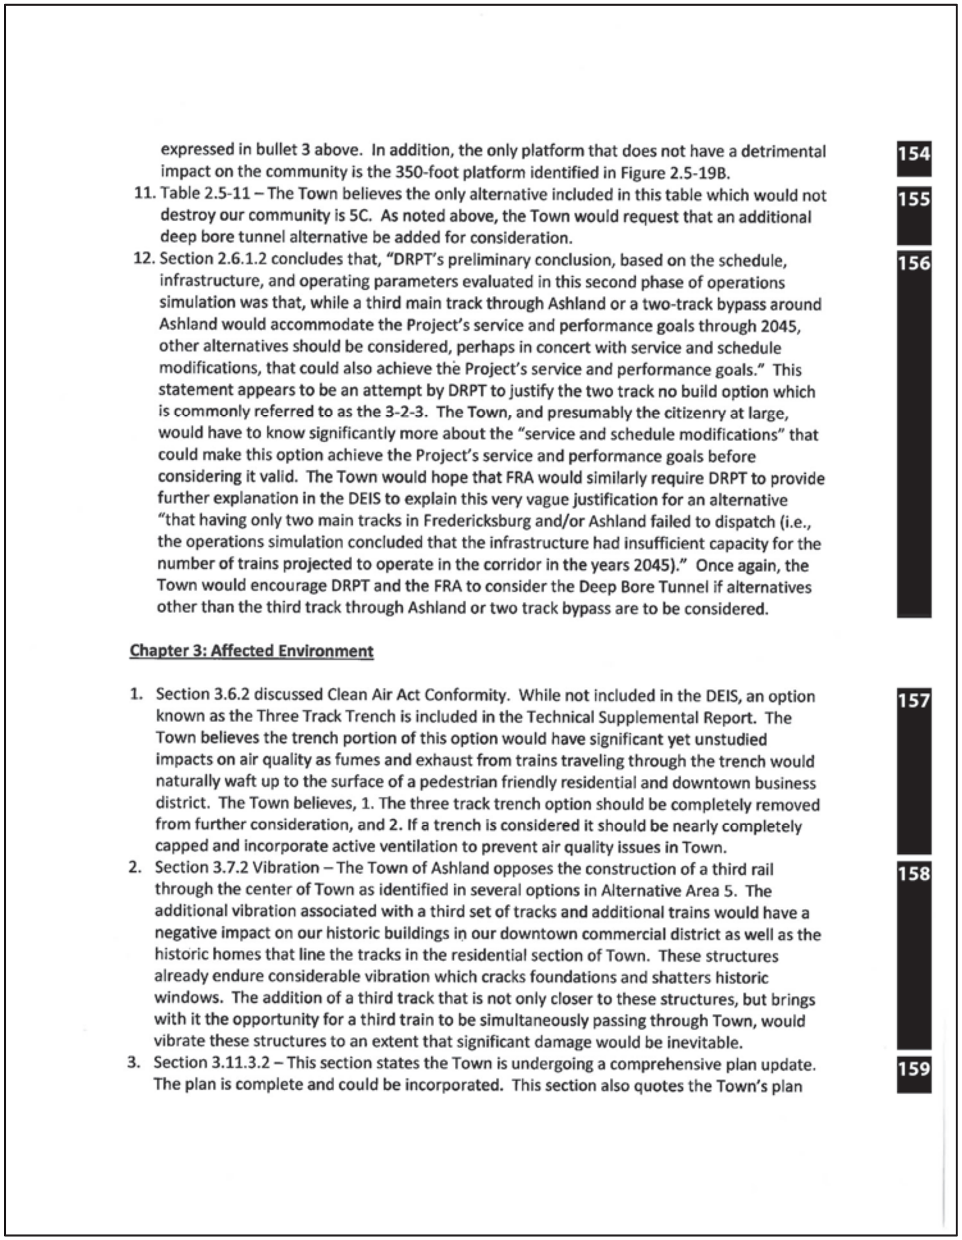
158 2. Section 3.7.2 Vibration – The Town of Ashland opposes the construction of a third rail through the center of Town as identified in several options in Alternative Area 5. The additional vibration associated with a third set of tracks and additional trains would have a negative impact on our historic buildings in our downtown commercial district as well as the historic homes that line the tracks in the residential section of Town. These structures already endure considerable vibration which cracks foundations and shatters historic windows. The addition of a third track that is not only closer to these structures, but brings with it the opportunity for a third train to be simultaneously passing through Town, would vibrate these structures to an extent that significant damage would be inevitable.

159 3. Section 3.11.3.2 – This section states the Town is undergoing a comprehensive plan update. The plan is complete and could be incorporated. This section also quotes the Town's plan

VIRGINIA DEQ (continued)

158. The FRA and DRPT have selected Build Alternative 5A: Maintain Two Tracks Through Town, which will maintain the existing two track railroad through Ashland, as the Preferred Alternative (refer to Section 4.3.5 of the Final EIS for details on the selection process). DRPT has followed FRA guidance for assessing potential ground-borne vibration associated with the proposed intercity passenger trains in the preparation of the Draft and Final EIS. The vibration assessment also followed precedent recently established by the Richmond to Raleigh (R2R) EIS, which was also approved by FRA. Per FRA, train-induced ground-borne vibration is assessed using a threshold for human perception of vibration. The threshold for human perception is much lower than the threshold for structural damage to fragile buildings, so this assessment approach is somewhat conservative with respect to potential building damage due to train-induced ground-borne vibration. Vibration is assessed on a per-event basis, not on a cumulative basis. Therefore, only the highest levels of vibration need to be studied, not the total amount of vibration occurring over a 24-hour period. On that basis, the vibration level from one of the proposed passenger trains is projected to be the same as the vibration level from all of the proposed passenger trains (9 new daily round-trip trains (18 total trains per day) for the Project). The most common source of ground-borne vibration in the study area is freight trains, which operate and may increase or decrease independently of the proposed DC2RVA Project. Freight trains generally produce higher levels (or more) ground-borne vibration than passenger trains because they are heavier. Preferred Alternative 5A will not involve any new tracks or the relocation of the existing tracks through Ashland and therefore vibration levels are expected to be similar to current levels as a result of the DC2RVA Project.

(Responses are continued on next page)



expressed in bullet 3 above. In addition, the only platform that does not have a detrimental impact on the community is the 350-foot platform identified in Figure 2.5-19B. 154

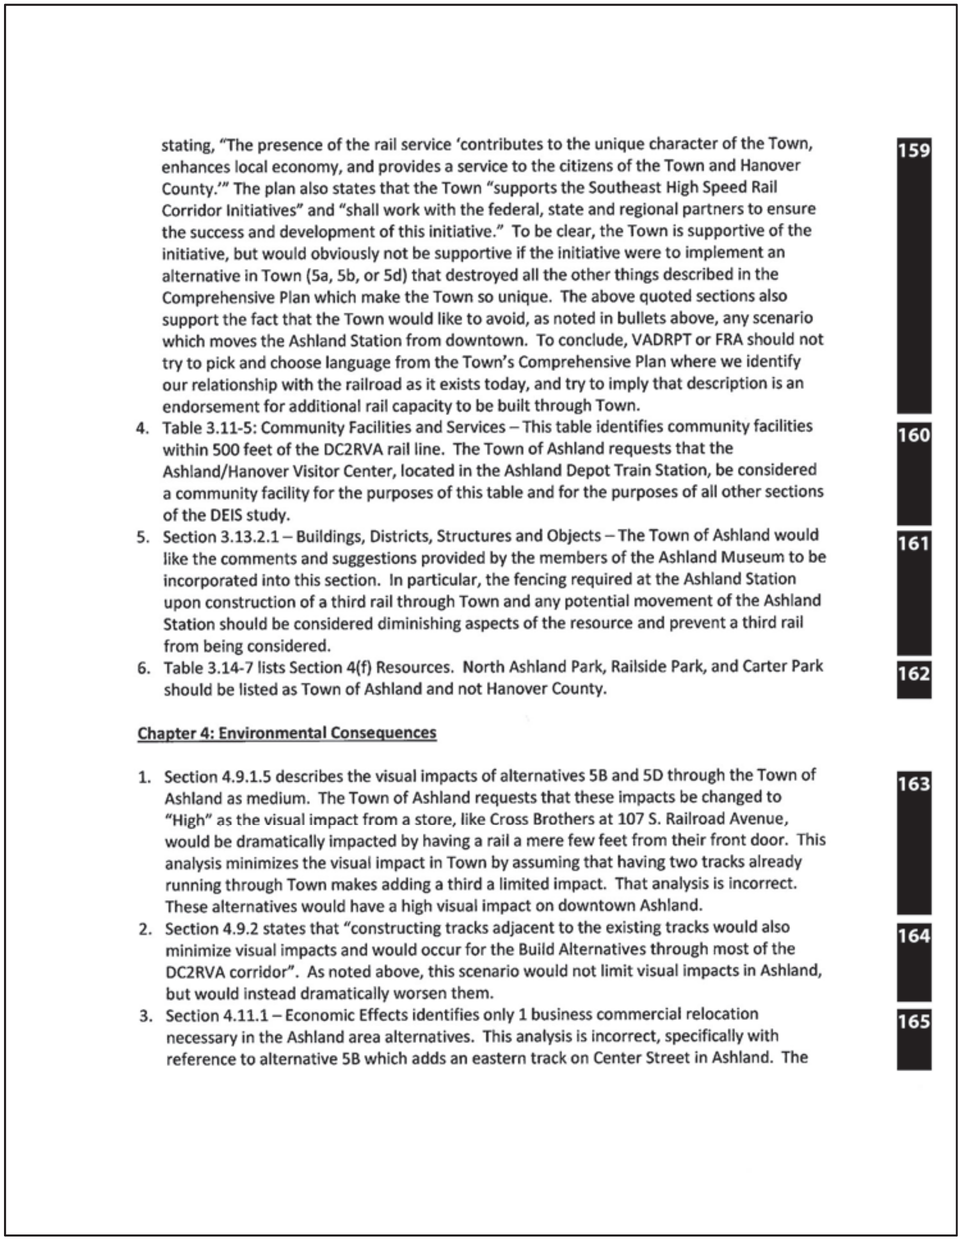
11. Table 2.5-11 – The Town believes the only alternative included in this table which would not destroy our community is 5C. As noted above, the Town would request that an additional deep bore tunnel alternative be added for consideration. 155
12. Section 2.6.1.2 concludes that, "DRPT's preliminary conclusion, based on the schedule, infrastructure, and operating parameters evaluated in this second phase of operations simulation was that, while a third main track through Ashland or a two-track bypass around Ashland would accommodate the Project's service and performance goals through 2045, other alternatives should be considered, perhaps in concert with service and schedule modifications, that could also achieve the Project's service and performance goals." This statement appears to be an attempt by DRPT to justify the two track no build option which is commonly referred to as the 3-2-3. The Town, and presumably the citizenry at large, would have to know significantly more about the "service and schedule modifications" that could make this option achieve the Project's service and performance goals before considering it valid. The Town would hope that FRA would similarly require DRPT to provide further explanation in the DEIS to explain this very vague justification for an alternative "that having only two main tracks in Fredericksburg and/or Ashland failed to dispatch (i.e., the operations simulation concluded that the infrastructure had insufficient capacity for the number of trains projected to operate in the corridor in the years 2045)." Once again, the Town would encourage DRPT and the FRA to consider the Deep Bore Tunnel if alternatives other than the third track through Ashland or two track bypass are to be considered. 156

Chapter 3: Affected Environment

1. Section 3.6.2 discussed Clean Air Act Conformity. While not included in the DEIS, an option known as the Three Track Trench is included in the Technical Supplemental Report. The Town believes the trench portion of this option would have significant yet unstudied impacts on air quality as fumes and exhaust from trains traveling through the trench would naturally waft up to the surface of a pedestrian friendly residential and downtown business district. The Town believes, 1. The three track trench option should be completely removed from further consideration, and 2. If a trench is considered it should be nearly completely capped and incorporate active ventilation to prevent air quality issues in Town. 157
2. Section 3.7.2 Vibration – The Town of Ashland opposes the construction of a third rail through the center of Town as identified in several options in Alternative Area 5. The additional vibration associated with a third set of tracks and additional trains would have a negative impact on our historic buildings in our downtown commercial district as well as the historic homes that line the tracks in the residential section of Town. These structures already endure considerable vibration which cracks foundations and shatters historic windows. The addition of a third track that is not only closer to these structures, but brings with it the opportunity for a third train to be simultaneously passing through Town, would vibrate these structures to an extent that significant damage would be inevitable. 158
3. Section 3.11.3.2 – This section states the Town is undergoing a comprehensive plan update. The plan is complete and could be incorporated. This section also quotes the Town's plan 159

VIRGINIA DEQ (continued)

159. Comment noted. FRA and DRPT began preparing the Tier II Draft EIS for the DC2RVA Project in 2014, and the alternatives development process was underway in December 2016, when the 5-year review of the comprehensive plan was adopted by the Town Council. References to the Town's plan have been modified to address the Comprehensive Plan as of December 2016, and quoted language from the previous plan has been removed in the Final EIS; refer to the errata table for the Draft EIS, which is Appendix A.



159 stating, "The presence of the rail service 'contributes to the unique character of the Town, enhances local economy, and provides a service to the citizens of the Town and Hanover County.'" The plan also states that the Town "supports the Southeast High Speed Rail Corridor Initiatives" and "shall work with the federal, state and regional partners to ensure the success and development of this initiative." To be clear, the Town is supportive of the initiative, but would obviously not be supportive if the initiative were to implement an alternative in Town (5a, 5b, or 5d) that destroyed all the other things described in the Comprehensive Plan which make the Town so unique. The above quoted sections also support the fact that the Town would like to avoid, as noted in bullets above, any scenario which moves the Ashland Station from downtown. To conclude, VADRPT or FRA should not try to pick and choose language from the Town's Comprehensive Plan where we identify our relationship with the railroad as it exists today, and try to imply that description is an endorsement for additional rail capacity to be built through Town.

4. Table 3.11-5: Community Facilities and Services – This table identifies community facilities within 500 feet of the DC2RVA rail line. The Town of Ashland requests that the Ashland/Hanover Visitor Center, located in the Ashland Depot Train Station, be considered a community facility for the purposes of this table and for the purposes of all other sections of the DEIS study. 160
5. Section 3.13.2.1 – Buildings, Districts, Structures and Objects – The Town of Ashland would like the comments and suggestions provided by the members of the Ashland Museum to be incorporated into this section. In particular, the fencing required at the Ashland Station upon construction of a third rail through Town and any potential movement of the Ashland Station should be considered diminishing aspects of the resource and prevent a third rail from being considered. 161
6. Table 3.14-7 lists Section 4(f) Resources. North Ashland Park, Railside Park, and Carter Park should be listed as Town of Ashland and not Hanover County. 162

Chapter 4: Environmental Consequences

1. Section 4.9.1.5 describes the visual impacts of alternatives 5B and 5D through the Town of Ashland as medium. The Town of Ashland requests that these impacts be changed to "High" as the visual impact from a store, like Cross Brothers at 107 S. Railroad Avenue, would be dramatically impacted by having a rail a mere few feet from their front door. This analysis minimizes the visual impact in Town by assuming that having two tracks already running through Town makes adding a third a limited impact. That analysis is incorrect. These alternatives would have a high visual impact on downtown Ashland. 163
2. Section 4.9.2 states that "constructing tracks adjacent to the existing tracks would also minimize visual impacts and would occur for the Build Alternatives through most of the DC2RVA corridor". As noted above, this scenario would not limit visual impacts in Ashland, but would instead dramatically worsen them. 164
3. Section 4.11.1 – Economic Effects identifies only 1 business commercial relocation necessary in the Ashland area alternatives. This analysis is incorrect, specifically with reference to alternative 5B which adds an eastern track on Center Street in Ashland. The 165

VIRGINIA DEQ (continued)

(Response to comment 159 on previous page)

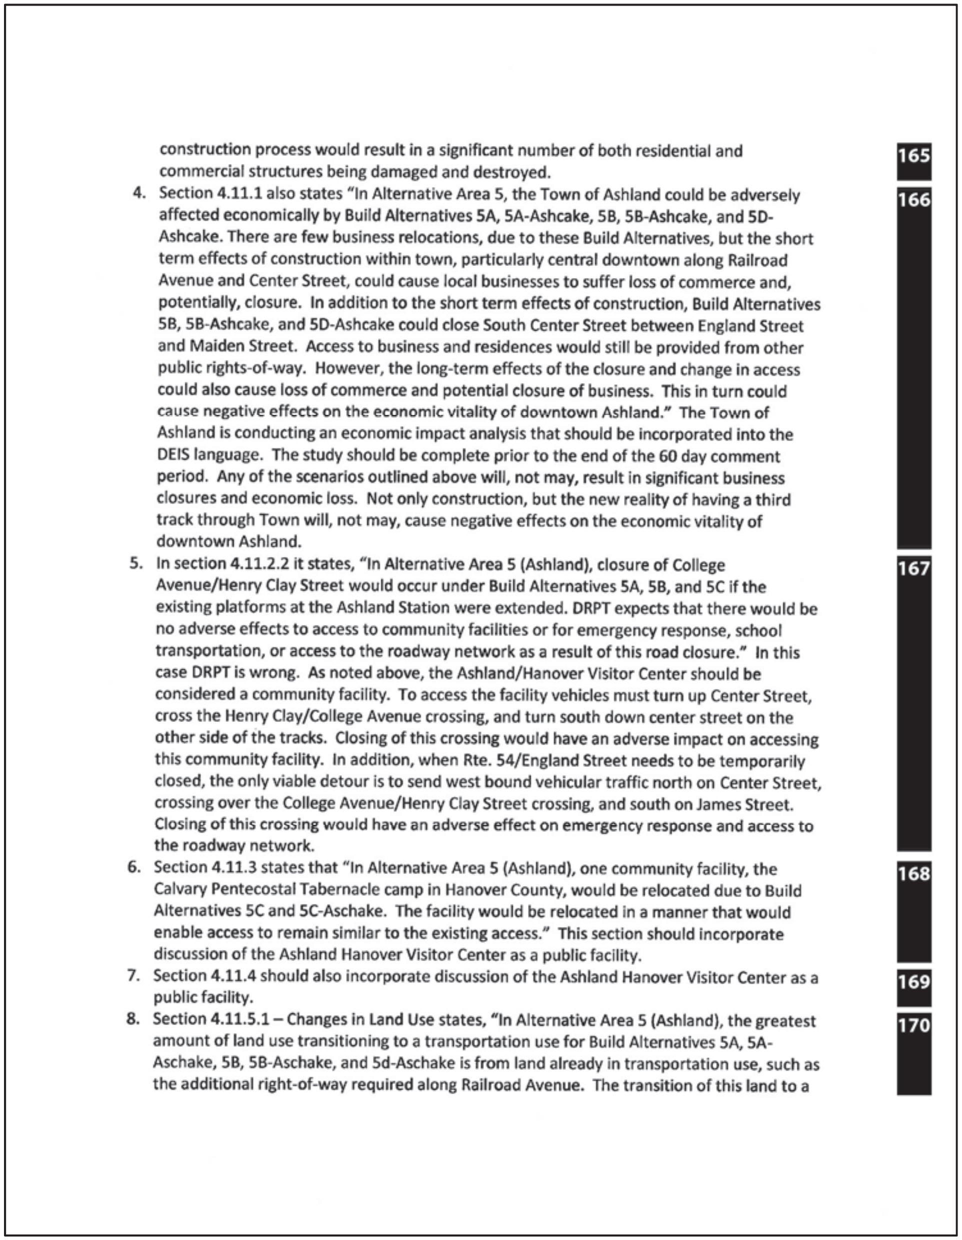
160. The designation of the Ashland/Hanover Visitor Center to a community facility has been corrected; refer to the errata table for the Draft EIS, which is Appendix A to the Final EIS. The FRA and DRPT have selected Alternative 5A: Maintain Two Tracks Through Town, which would will maintain the existing two track railroad through Ashland, as the Preferred Alternative (refer to Section 4.3.5 of the Final EIS for details on the selection process). The Preferred Alternative does not impact this community facility.

161. DRPT has responded to the Ashland Museum comments that the Town provided; refer to DRPT-numbered statements #197 through #235.

162. The requested corrections have been addressed in the errata table for the Draft EIS, which is Appendix A to the Final EIS.

163. and 164. FRA and DRPT have identified Alternative 5A, which will maintain two tracks through Ashland, as the Preferred Alternative (refer to Section 4.3.5 of the Final EIS for details). Section 4.9.1 of the Draft EIS describes the visual assessment methodology. While DRPT understands the Town of Ashland's concern with Build Alternatives 5B and 5D, the "High" visual impact rating does not apply as per the visual assessment methodology because the railroad tracks are already a predominant visual feature through town.

165. DRPT reviewed the business relocation analysis and concluded that the information as presented in Section 4.11.1 of the Draft EIS is correct. However, because Build Alternative 5A: Maintain Two Tracks Through Town was selected as the Preferred Alternative, there will be no permanent or temporary construction impacts to the businesses; refer to Final EIS Section 5.11 for details.



165 construction process would result in a significant number of both residential and commercial structures being damaged and destroyed.

4. 166 Section 4.11.1 also states "In Alternative Area 5, the Town of Ashland could be adversely affected economically by Build Alternatives 5A, 5A-Ashcake, 5B, 5B-Ashcake, and 5D-Ashcake. There are few business relocations, due to these Build Alternatives, but the short term effects of construction within town, particularly central downtown along Railroad Avenue and Center Street, could cause local businesses to suffer loss of commerce and, potentially, closure. In addition to the short term effects of construction, Build Alternatives 5B, 5B-Ashcake, and 5D-Ashcake could close South Center Street between England Street and Maiden Street. Access to business and residences would still be provided from other public rights-of-way. However, the long-term effects of the closure and change in access could also cause loss of commerce and potential closure of business. This in turn could cause negative effects on the economic vitality of downtown Ashland." The Town of Ashland is conducting an economic impact analysis that should be incorporated into the DEIS language. The study should be complete prior to the end of the 60 day comment period. Any of the scenarios outlined above will, not may, result in significant business closures and economic loss. Not only construction, but the new reality of having a third track through Town will, not may, cause negative effects on the economic vitality of downtown Ashland.
5. 167 In section 4.11.2.2 it states, "In Alternative Area 5 (Ashland), closure of College Avenue/Henry Clay Street would occur under Build Alternatives 5A, 5B, and 5C if the existing platforms at the Ashland Station were extended. DRPT expects that there would be no adverse effects to access to community facilities or for emergency response, school transportation, or access to the roadway network as a result of this road closure." In this case DRPT is wrong. As noted above, the Ashland/Hanover Visitor Center should be considered a community facility. To access the facility vehicles must turn up Center Street, cross the Henry Clay/College Avenue crossing, and turn south down center street on the other side of the tracks. Closing of this crossing would have an adverse impact on accessing this community facility. In addition, when Rte. 54/England Street needs to be temporarily closed, the only viable detour is to send west bound vehicular traffic north on Center Street, crossing over the College Avenue/Henry Clay Street crossing, and south on James Street. Closing of this crossing would have an adverse effect on emergency response and access to the roadway network.
6. 168 Section 4.11.3 states that "In Alternative Area 5 (Ashland), one community facility, the Calvary Pentecostal Tabernacle camp in Hanover County, would be relocated due to Build Alternatives 5C and 5C-Aschake. The facility would be relocated in a manner that would enable access to remain similar to the existing access." This section should incorporate discussion of the Ashland Hanover Visitor Center as a public facility.
7. 169 Section 4.11.4 should also incorporate discussion of the Ashland Hanover Visitor Center as a public facility.
8. 170 Section 4.11.5.1 – Changes in Land Use states, "In Alternative Area 5 (Ashland), the greatest amount of land use transitioning to a transportation use for Build Alternatives 5A, 5A-Aschake, 5B, 5B-Aschake, and 5d-Aschake is from land already in transportation use, such as the additional right-of-way required along Railroad Avenue. The transition of this land to a

VIRGINIA DEQ (continued)

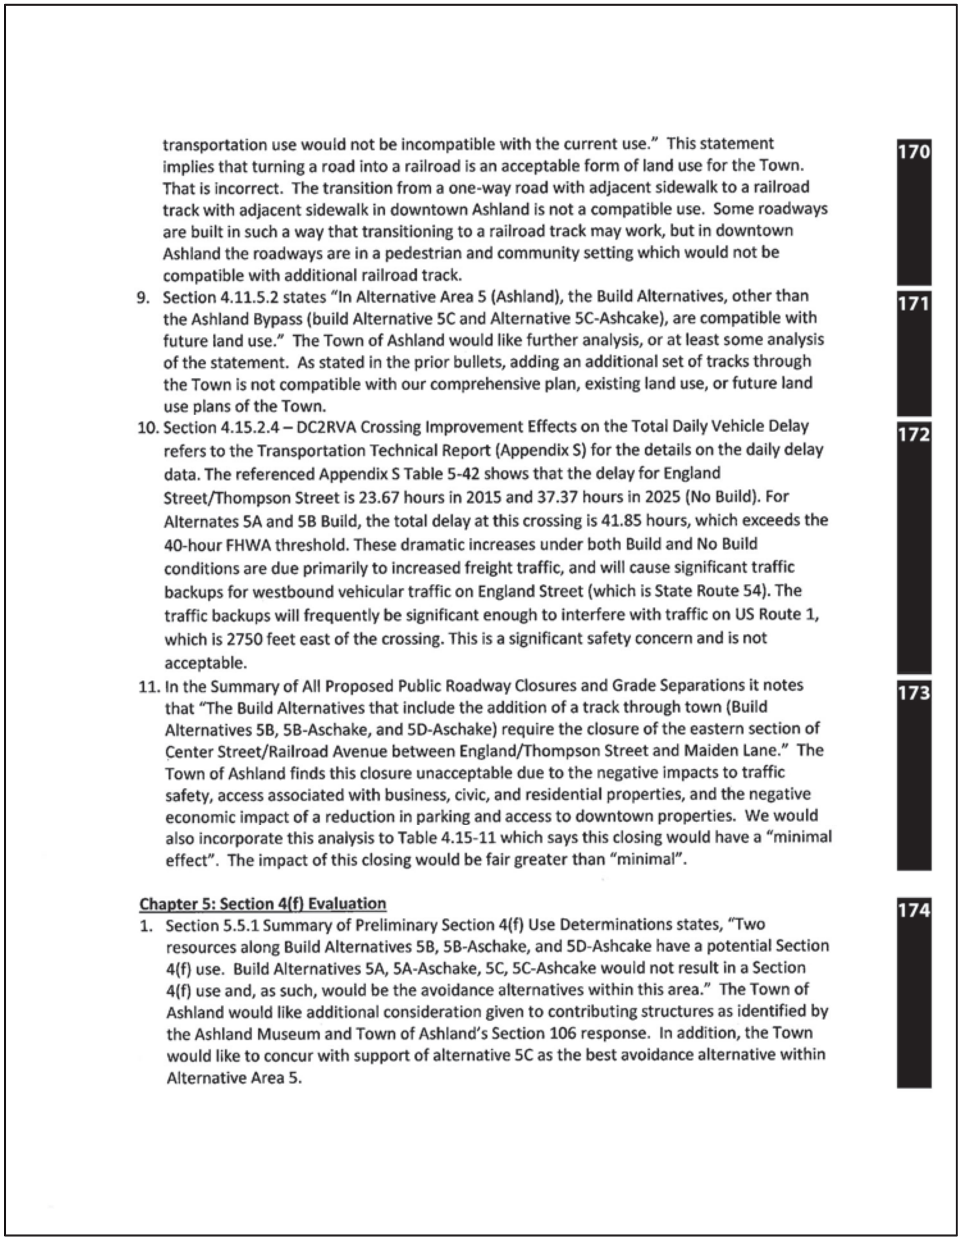
(Response to comment 165 on previous page)

166. DRPT acknowledges the economic impact analysis that was conducted by a third party at the request of the Town, which DEQ has provided as an attachment to this letter. Refer to DRPT-numbered statement #236 for response.

167. FRA and DRPT have identified Alternative 5A, which will maintain two tracks through Ashland, as the Preferred Alternative. As selected, it will not include any roadway or station modifications within downtown Ashland. Platform improvements at the Ashland Station are being negotiated between the Town of Ashland and Amtrak, with no proposed changes under the DC2RVA Project. Similarly, there will be no roadway improvements (including no modifications to existing at-grade crossing treatments) between Vaughan Road and Ashcake Road under the DC2RVA Project. Refer to Section 4.3.5 of the Final EIS for details of the Preferred Alternative in Area 5.

168. and 169. The Ashland/Hanover Visitor Center would be relocated under one option evaluated in the Draft EIS, Build Alternative 5D. However, Alternative 5A is the Preferred Alternative for Area 5, which will not affect the existing Ashland/Hanover Visitor Center.

170. and 171. DRPT acknowledges that the Town of Ashland finds the changes in land use from road to rail transportation to be an incompatible use.



transportation use would not be incompatible with the current use." This statement implies that turning a road into a railroad is an acceptable form of land use for the Town. That is incorrect. The transition from a one-way road with adjacent sidewalk to a railroad track with adjacent sidewalk in downtown Ashland is not a compatible use. Some roadways are built in such a way that transitioning to a railroad track may work, but in downtown Ashland the roadways are in a pedestrian and community setting which would not be compatible with additional railroad track. 170

9. Section 4.11.5.2 states "In Alternative Area 5 (Ashland), the Build Alternatives, other than the Ashland Bypass (build Alternative 5C and Alternative 5C-Ashcake), are compatible with future land use." The Town of Ashland would like further analysis, or at least some analysis of the statement. As stated in the prior bullets, adding an additional set of tracks through the Town is not compatible with our comprehensive plan, existing land use, or future land use plans of the Town. 171
10. Section 4.15.2.4 – DC2RVA Crossing Improvement Effects on the Total Daily Vehicle Delay refers to the Transportation Technical Report (Appendix S) for the details on the daily delay data. The referenced Appendix S Table 5-42 shows that the delay for England Street/Thompson Street is 23.67 hours in 2015 and 37.37 hours in 2025 (No Build). For Alternates 5A and 5B Build, the total delay at this crossing is 41.85 hours, which exceeds the 40-hour FHWA threshold. These dramatic increases under both Build and No Build conditions are due primarily to increased freight traffic, and will cause significant traffic backups for westbound vehicular traffic on England Street (which is State Route 54). The traffic backups will frequently be significant enough to interfere with traffic on US Route 1, which is 2750 feet east of the crossing. This is a significant safety concern and is not acceptable. 172
11. In the Summary of All Proposed Public Roadway Closures and Grade Separations it notes that "The Build Alternatives that include the addition of a track through town (Build Alternatives 5B, 5B-Aschake, and 5D-Aschake) require the closure of the eastern section of Center Street/Railroad Avenue between England/Thompson Street and Maiden Lane." The Town of Ashland finds this closure unacceptable due to the negative impacts to traffic safety, access associated with business, civic, and residential properties, and the negative economic impact of a reduction in parking and access to downtown properties. We would also incorporate this analysis to Table 4.15-11 which says this closing would have a "minimal effect". The impact of this closing would be fair greater than "minimal". 173

Chapter 5: Section 4(f) Evaluation

1. Section 5.5.1 Summary of Preliminary Section 4(f) Use Determinations states, "Two resources along Build Alternatives 5B, 5B-Aschake, and 5D-Ashcake have a potential Section 4(f) use. Build Alternatives 5A, 5A-Aschake, 5C, 5C-Ashcake would not result in a Section 4(f) use and, as such, would be the avoidance alternatives within this area." The Town of Ashland would like additional consideration given to contributing structures as identified by the Ashland Museum and Town of Ashland's Section 106 response. In addition, the Town would like to concur with support of alternative 5C as the best avoidance alternative within Alternative Area 5. 174

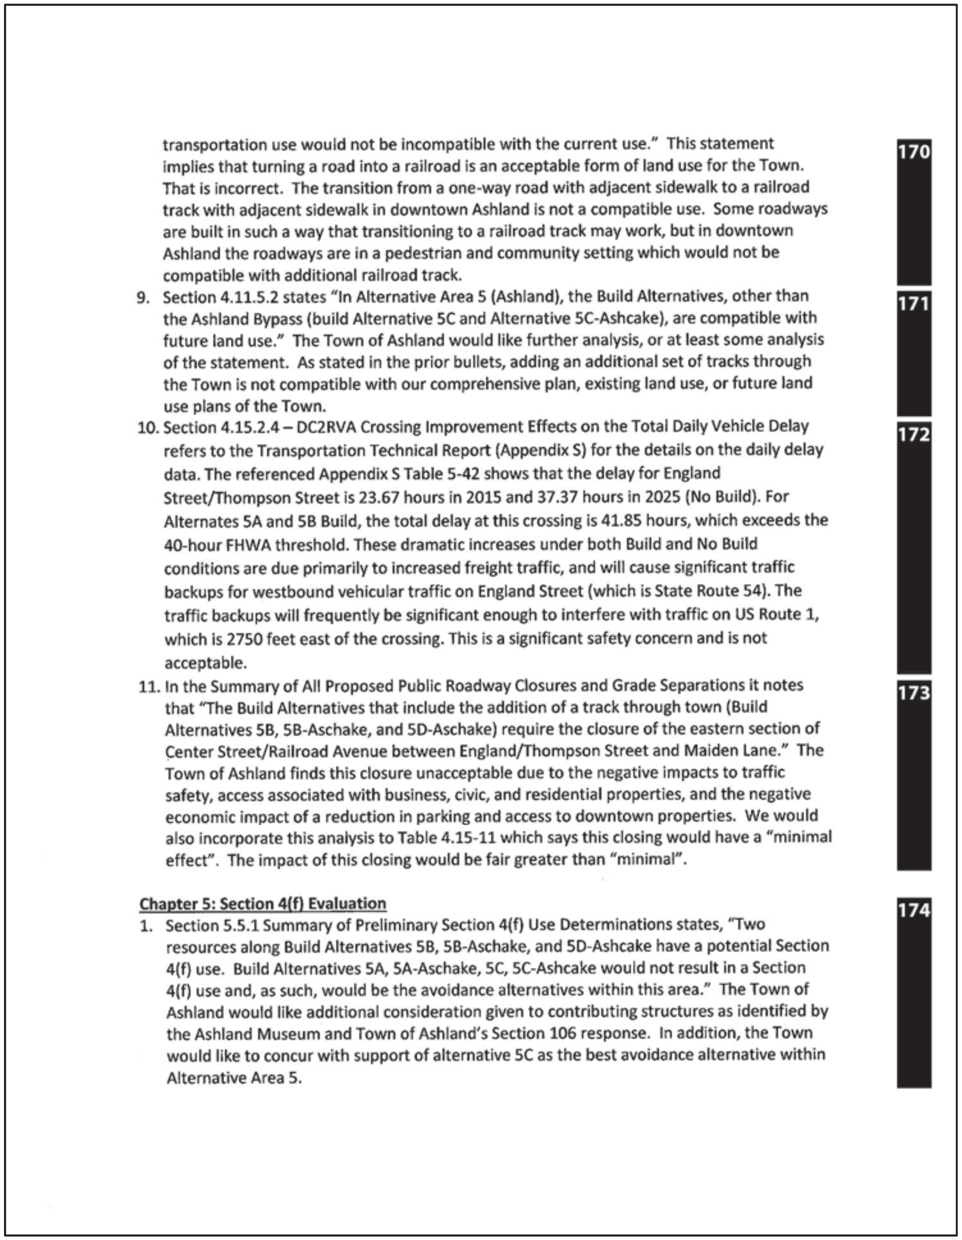
VIRGINIA DEQ (continued)

(Response to comments 170 and 171 on previous page)

172. The comment cites the calculated estimates of daily motor vehicle delay at the England Street/Thompson Street intersection for 2015 and 2025 No-Build, and for Alternatives 5A/5B Year 2025 Build conditions (from Tables 5-41 and 5-42 of Appendix S: Transportation Technical Report of the Draft EIS). As noted in the Draft EIS and reiterated in the comment, there are increases in delays between 2015 and 2025 for both No-Build and Build conditions; it is important to note that the delay impacts of the Project are represented by the difference between the 2025 No-Build and the Alternative 5A/5B Year 2025 Build conditions. Three-quarters of the increased delay occurs based on anticipated changes between 2015 and 2025 No-Build (i.e., unrelated to the DC2RVA Project), with the remaining 25 percent attributable to Alternative 5A/5B. Additionally, these tables summarize vehicle-hours of delay on a daily basis (i.e., an average across an entire day) and are not reflective of delay experienced by a single vehicle. The majority of delay in the corridor is the result of freight trains. CSXT growth is independent of the DC2RVA Project and will occur regardless of whether or not the DC2RVA Project is implemented. An updated analysis of Total Daily Vehicle Delay for the Preferred Alternative is presented in Final EIS Section 5.15.2.4.

    The comment cites the "40-hour FHWA threshold"; this "threshold" is identified as one of 11 conditions for which public at-grade crossings "should be considered for grade separation or otherwise eliminated" in FHWA's Railroad-Highway Grade Crossing Handbook. While one of 11 conditions identified by FHWA for consideration, this 40-hour value is not a hard requirement for implementing any particular improvement or action at a grade-crossing. Additional clarification on this topic has been added to Final EIS Section 5.15.2.4.

(Responses are continued on next page)



170 transportation use would not be incompatible with the current use." This statement implies that turning a road into a railroad is an acceptable form of land use for the Town. That is incorrect. The transition from a one-way road with adjacent sidewalk to a railroad track with adjacent sidewalk in downtown Ashland is not a compatible use. Some roadways are built in such a way that transitioning to a railroad track may work, but in downtown Ashland the roadways are in a pedestrian and community setting which would not be compatible with additional railroad track.

171

9. Section 4.11.5.2 states "In Alternative Area 5 (Ashland), the Build Alternatives, other than the Ashland Bypass (build Alternative 5C and Alternative 5C-Ashcake), are compatible with future land use." The Town of Ashland would like further analysis, or at least some analysis of the statement. As stated in the prior bullets, adding an additional set of tracks through the Town is not compatible with our comprehensive plan, existing land use, or future land use plans of the Town.

172

10. Section 4.15.2.4 – DC2RVA Crossing Improvement Effects on the Total Daily Vehicle Delay refers to the Transportation Technical Report (Appendix S) for the details on the daily delay data. The referenced Appendix S Table 5-42 shows that the delay for England Street/Thompson Street is 23.67 hours in 2015 and 37.37 hours in 2025 (No Build). For Alternates 5A and 5B Build, the total delay at this crossing is 41.85 hours, which exceeds the 40-hour FHWA threshold. These dramatic increases under both Build and No Build conditions are due primarily to increased freight traffic, and will cause significant traffic backups for westbound vehicular traffic on England Street (which is State Route 54). The traffic backups will frequently be significant enough to interfere with traffic on US Route 1, which is 2750 feet east of the crossing. This is a significant safety concern and is not acceptable.

173

11. In the Summary of All Proposed Public Roadway Closures and Grade Separations it notes that "The Build Alternatives that include the addition of a track through town (Build Alternatives 5B, 5B-Aschake, and 5D-Aschake) require the closure of the eastern section of Center Street/Railroad Avenue between England/Thompson Street and Maiden Lane." The Town of Ashland finds this closure unacceptable due to the negative impacts to traffic safety, access associated with business, civic, and residential properties, and the negative economic impact of a reduction in parking and access to downtown properties. We would also incorporate this analysis to Table 4.15-11 which says this closing would have a "minimal effect". The impact of this closing would be fair greater than "minimal".

174

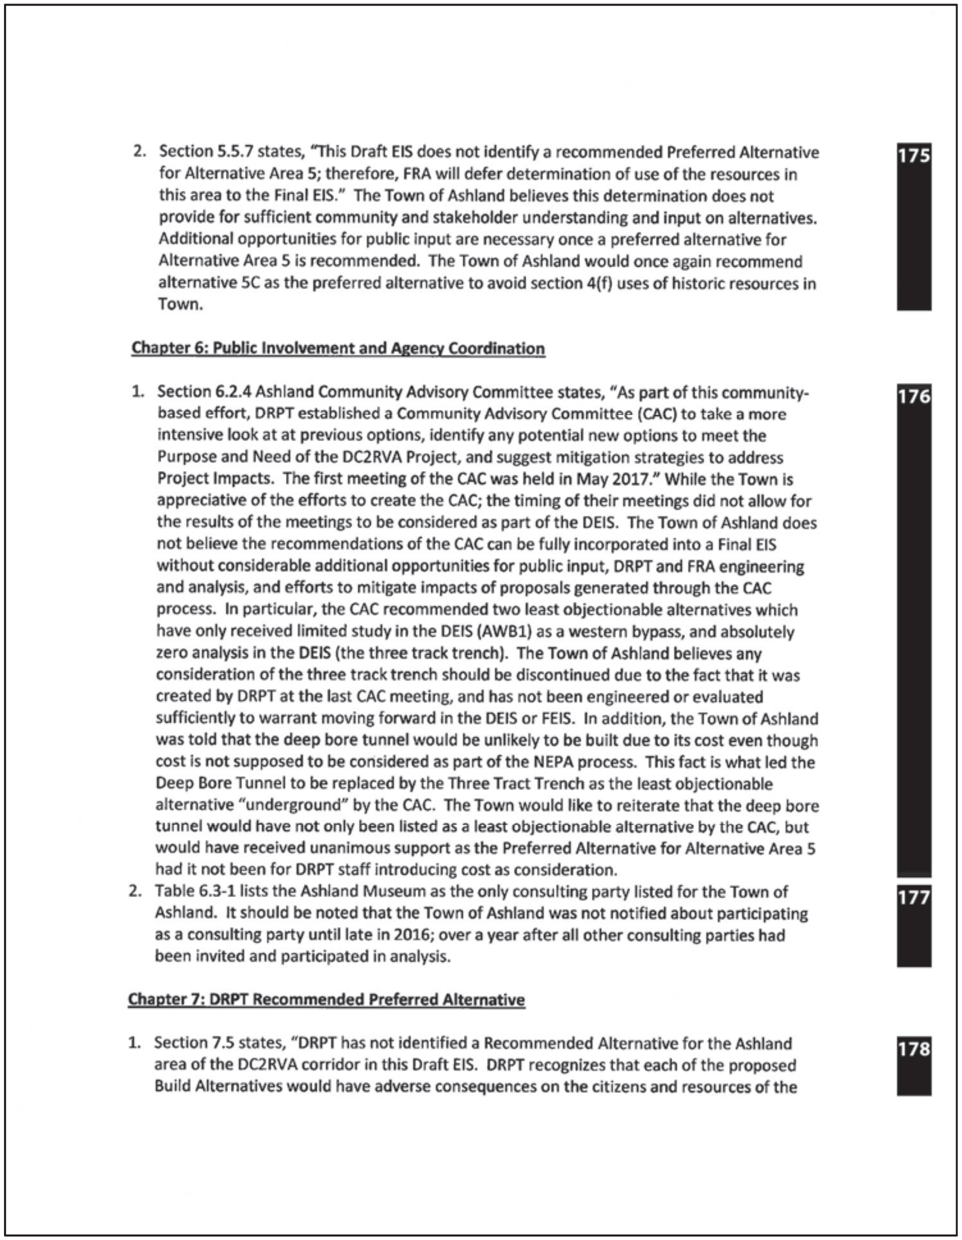
Chapter 5: Section 4(f) Evaluation

1. Section 5.5.1 Summary of Preliminary Section 4(f) Use Determinations states, "Two resources along Build Alternatives 5B, 5B-Aschake, and 5D-Ashcake have a potential Section 4(f) use. Build Alternatives 5A, 5A-Aschake, 5C, 5C-Ashcake would not result in a Section 4(f) use and, as such, would be the avoidance alternatives within this area." The Town of Ashland would like additional consideration given to contributing structures as identified by the Ashland Museum and Town of Ashland's Section 106 response. In addition, the Town would like to concur with support of alternative 5C as the best avoidance alternative within Alternative Area 5.

VIRGINIA DEQ (continued)

173. Refer to DRPT-numbered statement #167. Preferred Alternative 5A will not require any closure of Center Street / Railroad Avenue in the Town of Ashland. All modifications to address necessary changes to traffic flow and operations resulting from the Preferred Alternative will conform to all applicable current AASHTO and VDOT standards.

174. Additional details on this comment are included in the attachment from the Ashland Museum. Refer to DRPT-numbered statements #201-235 for a detailed response.



2. Section 5.5.7 states, "This Draft EIS does not identify a recommended Preferred Alternative for Alternative Area 5; therefore, FRA will defer determination of use of the resources in this area to the Final EIS." The Town of Ashland believes this determination does not provide for sufficient community and stakeholder understanding and input on alternatives. Additional opportunities for public input are necessary once a preferred alternative for Alternative Area 5 is recommended. The Town of Ashland would once again recommend alternative 5C as the preferred alternative to avoid section 4(f) uses of historic resources in Town. 175

Chapter 6: Public Involvement and Agency Coordination

1. Section 6.2.4 Ashland Community Advisory Committee states, "As part of this community-based effort, DRPT established a Community Advisory Committee (CAC) to take a more intensive look at at previous options, identify any potential new options to meet the Purpose and Need of the DC2RVA Project, and suggest mitigation strategies to address Project Impacts. The first meeting of the CAC was held in May 2017." While the Town is appreciative of the efforts to create the CAC; the timing of their meetings did not allow for the results of the meetings to be considered as part of the DEIS. The Town of Ashland does not believe the recommendations of the CAC can be fully incorporated into a Final EIS without considerable additional opportunities for public input, DRPT and FRA engineering and analysis, and efforts to mitigate impacts of proposals generated through the CAC process. In particular, the CAC recommended two least objectionable alternatives which have only received limited study in the DEIS (AWB1) as a western bypass, and absolutely zero analysis in the DEIS (the three track trench). The Town of Ashland believes any consideration of the three track trench should be discontinued due to the fact that it was created by DRPT at the last CAC meeting, and has not been engineered or evaluated sufficiently to warrant moving forward in the DEIS or FEIS. In addition, the Town of Ashland was told that the deep bore tunnel would be unlikely to be built due to its cost even though cost is not supposed to be considered as part of the NEPA process. This fact is what led the Deep Bore Tunnel to be replaced by the Three Tract Trench as the least objectionable alternative "underground" by the CAC. The Town would like to reiterate that the deep bore tunnel would have not only been listed as a least objectionable alternative by the CAC, but would have received unanimous support as the Preferred Alternative for Alternative Area 5 had it not been for DRPT staff introducing cost as consideration. 176
2. Table 6.3-1 lists the Ashland Museum as the only consulting party listed for the Town of Ashland. It should be noted that the Town of Ashland was not notified about participating as a consulting party until late in 2016; over a year after all other consulting parties had been invited and participated in analysis. 177

Chapter 7: DRPT Recommended Preferred Alternative

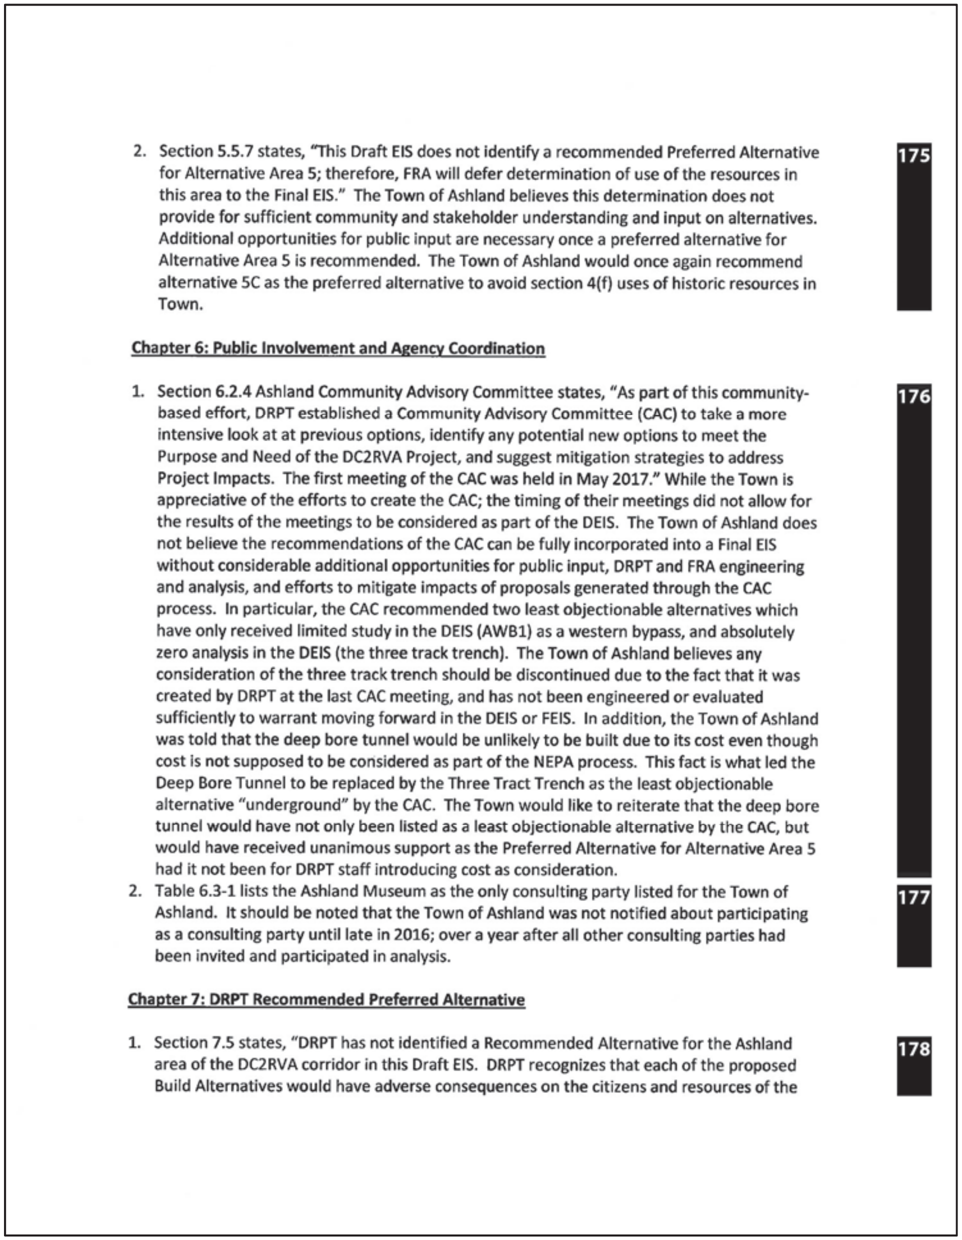
1. Section 7.5 states, "DRPT has not identified a Recommended Alternative for the Ashland area of the DC2RVA corridor in this Draft EIS. DRPT recognizes that each of the proposed Build Alternatives would have adverse consequences on the citizens and resources of the 178

VIRGINIA DEQ (continued)

175. The Draft EIS, prepared by FRA and DRPT in accordance with the National Environmental Policy Act (NEPA) and its implementing regulations, describes the alternatives development process and for Area 5 (Ashland) evaluates in detail seven alternatives, including Alternative 5A, Maintain two Tracks through Town. While there is no requirement within NEPA to identify a preferred alternative as part of Draft EIS documentation, the Draft EIS for the Project identified DRPT's recommended preferred alternative for the corridor, but did not recommend a specific preferred alternative for Area 5 (Ashland). Instead, DRPT established a CAC to further review and inform the evaluation of alternatives for Area 5, which is summarized in Section 3.3 of the Final EIS. The CAC met five times in open public meetings to review Project alternatives and identified, from a community perspective, the least objectionable through Town, western bypass, and below-ground alternatives. After reviewing all the comments received on the Draft EIS and considering the input from the CAC process, on December 6, 2017, DRPT provided the CTB with a final recommendation for a Preferred Alternative. The CTB formally identified Alternative 5A - Maintain Two Tracks Through Town as the Commonwealth of Virginia's Preferred Alternative for Area 5. FRA has agreed with and confirmed DRPT's recommendation that Alternative 5A meets the Purpose and Need of the DC2RVA Project.

176. DRPT has conducted the public outreach for the Project in accordance with FRA's requirements under NEPA and its implementing regulations. Beginning in 2014, DRPT held 4 public scoping meetings (including one in Ashland), 3 public meetings to present alternatives development and screening criteria, 3 public meetings to review preliminary alternatives screening results, and 1 public meeting in Hanover County to review the Project, proposed bypass routes, and access to private property. DRPT also held multiple meetings with representatives of the Town and County since the Project inception.

(Responses are continued on next page)



2. Section 5.5.7 states, "This Draft EIS does not identify a recommended Preferred Alternative for Alternative Area 5; therefore, FRA will defer determination of use of the resources in this area to the Final EIS." The Town of Ashland believes this determination does not provide for sufficient community and stakeholder understanding and input on alternatives. Additional opportunities for public input are necessary once a preferred alternative for Alternative Area 5 is recommended. The Town of Ashland would once again recommend alternative 5C as the preferred alternative to avoid section 4(f) uses of historic resources in Town. 175

Chapter 6: Public Involvement and Agency Coordination

1. Section 6.2.4 Ashland Community Advisory Committee states, "As part of this community-based effort, DRPT established a Community Advisory Committee (CAC) to take a more intensive look at at previous options, identify any potential new options to meet the Purpose and Need of the DC2RVA Project, and suggest mitigation strategies to address Project Impacts. The first meeting of the CAC was held in May 2017." While the Town is appreciative of the efforts to create the CAC; the timing of their meetings did not allow for the results of the meetings to be considered as part of the DEIS. The Town of Ashland does not believe the recommendations of the CAC can be fully incorporated into a Final EIS without considerable additional opportunities for public input, DRPT and FRA engineering and analysis, and efforts to mitigate impacts of proposals generated through the CAC process. In particular, the CAC recommended two least objectionable alternatives which have only received limited study in the DEIS (AWB1) as a western bypass, and absolutely zero analysis in the DEIS (the three track trench). The Town of Ashland believes any consideration of the three track trench should be discontinued due to the fact that it was created by DRPT at the last CAC meeting, and has not been engineered or evaluated sufficiently to warrant moving forward in the DEIS or FEIS. In addition, the Town of Ashland was told that the deep bore tunnel would be unlikely to be built due to its cost even though cost is not supposed to be considered as part of the NEPA process. This fact is what led the Deep Bore Tunnel to be replaced by the Three Tract Trench as the least objectionable alternative "underground" by the CAC. The Town would like to reiterate that the deep bore tunnel would have not only been listed as a least objectionable alternative by the CAC, but would have received unanimous support as the Preferred Alternative for Alternative Area 5 had it not been for DRPT staff introducing cost as consideration. 176
2. Table 6.3-1 lists the Ashland Museum as the only consulting party listed for the Town of Ashland. It should be noted that the Town of Ashland was not notified about participating as a consulting party until late in 2016; over a year after all other consulting parties had been invited and participated in analysis. 177

Chapter 7: DRPT Recommended Preferred Alternative

1. Section 7.5 states, "DRPT has not identified a Recommended Alternative for the Ashland area of the DC2RVA corridor in this Draft EIS. DRPT recognizes that each of the proposed Build Alternatives would have adverse consequences on the citizens and resources of the 178

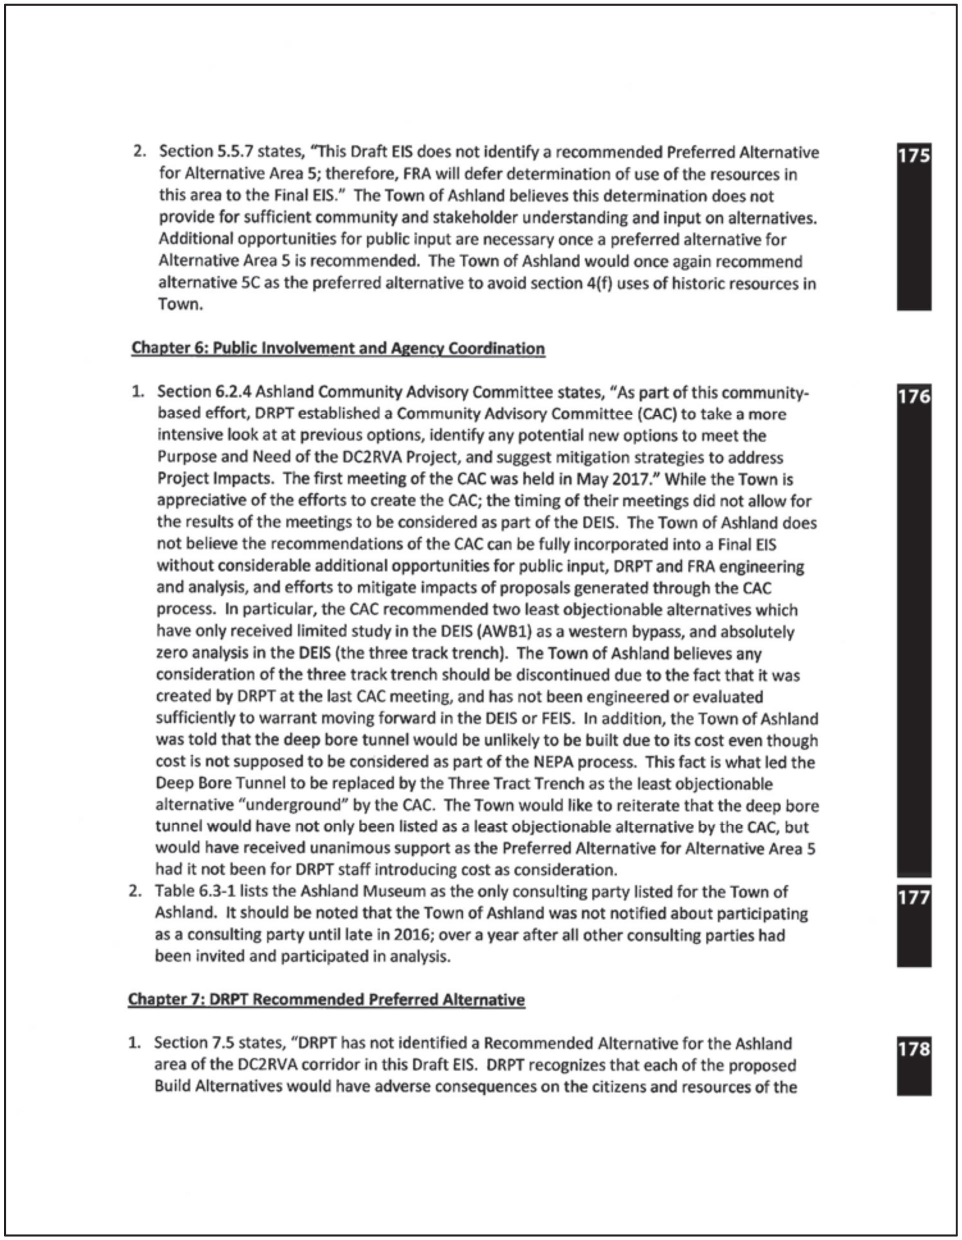
VIRGINIA DEQ (continued)

The Ashland/Hanover CAC held five public meetings during the period May – September 2017, plus multiple community-led meetings to publicly evaluate Project alternatives in the Ashland/Hanover area. The Draft EIS described the CAC process, and all CAC presentations, questions/answers, and technical briefing materials were made public via the DC2RVA Project website.

DRPT held 5 public hearings, including one in the Ashland/Hanover area, in conjunction with the public release of the Draft EIS in September of 2017. FRA's Preferred Alternative, 5A, was evaluated in detail in the Draft EIS, and was identified by the CAC as the "least objectionable" through-town alternative. The deep bore tunnel alternative was considered and eliminated by FRA and DRPT during the initial alternatives screening process, and was considered and eliminated again by the CAC during the CAC process. The three-track trench alternative was considered by the CAC and identified as the "least objectionable" below-ground option.

177. The Ashland Museum elected to be a consulting party in January 2015. The Town of Ashland was invited to be a consulting party, and elected to participate, in February 2017. All consulting party materials (letters, emails, reports, etc.) were disseminated to the Town upon becoming a consulting party. Since February 2017, DRPT held two in-person meetings and two conference calls with the Town and the Ashland Museum specifically focused on cultural resources. DRPT is committed to continuing this dialogue through completion of the Tier II process, final design, and implementation (once funding becomes available) and will disseminate data as available, including any ensuing reports, eligibility determinations, Project effect, and Section 106 Memorandum of Agreement (MOA) production (the Section 106 Draft MOA is Appendix K of the Final EIS). Information and updates will be sent through several media outlets to ensure communication is open and informative.

(Responses are continued on next page)



2. Section 5.5.7 states, "This Draft EIS does not identify a recommended Preferred Alternative for Alternative Area 5; therefore, FRA will defer determination of use of the resources in this area to the Final EIS." The Town of Ashland believes this determination does not provide for sufficient community and stakeholder understanding and input on alternatives. Additional opportunities for public input are necessary once a preferred alternative for Alternative Area 5 is recommended. The Town of Ashland would once again recommend alternative 5C as the preferred alternative to avoid section 4(f) uses of historic resources in Town. **175**

Chapter 6: Public Involvement and Agency Coordination

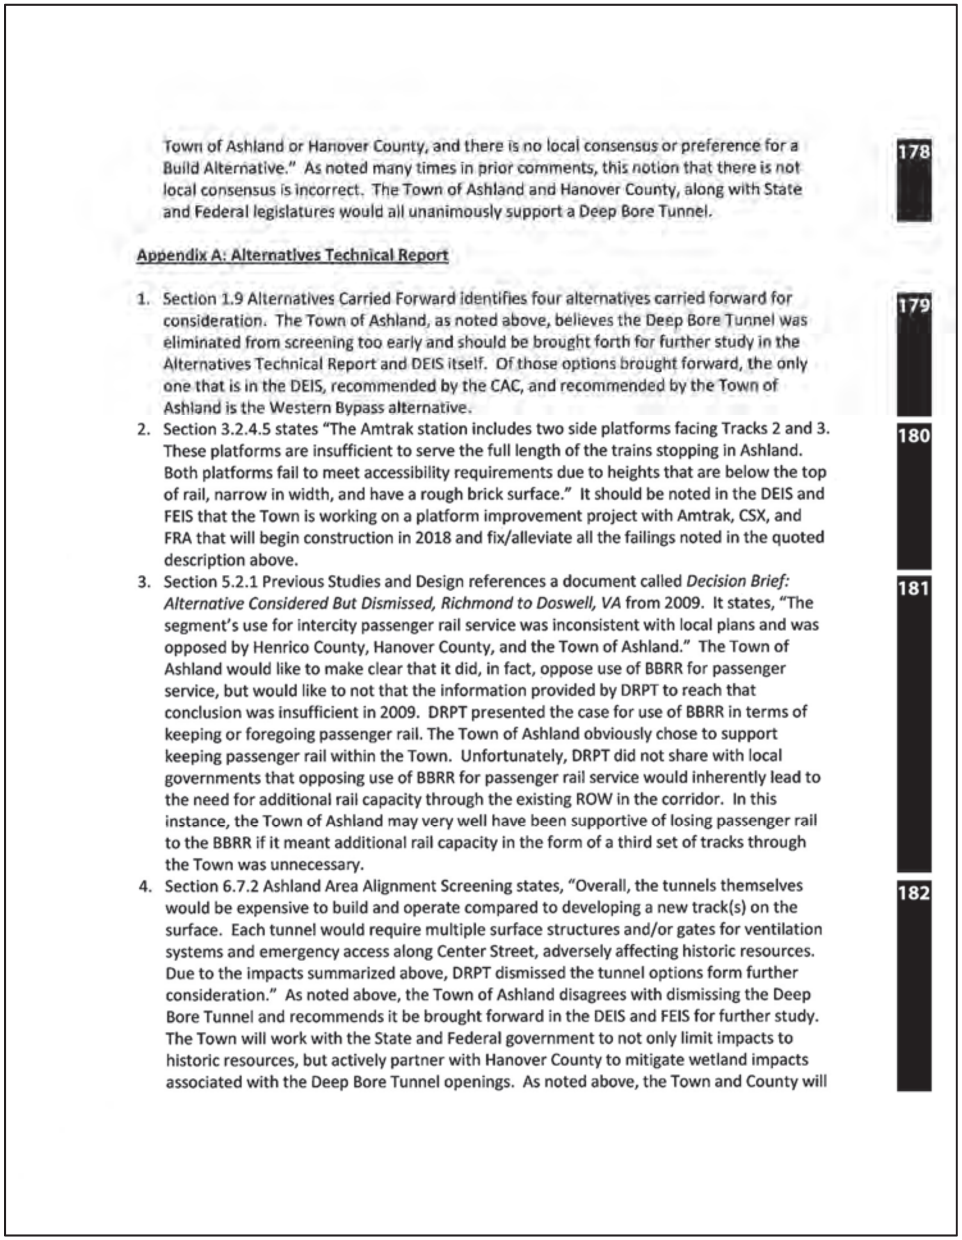
1. Section 6.2.4 Ashland Community Advisory Committee states, "As part of this community-based effort, DRPT established a Community Advisory Committee (CAC) to take a more intensive look at at previous options, identify any potential new options to meet the Purpose and Need of the DC2RVA Project, and suggest mitigation strategies to address Project Impacts. The first meeting of the CAC was held in May 2017." While the Town is appreciative of the efforts to create the CAC; the timing of their meetings did not allow for the results of the meetings to be considered as part of the DEIS. The Town of Ashland does not believe the recommendations of the CAC can be fully incorporated into a Final EIS without considerable additional opportunities for public input, DRPT and FRA engineering and analysis, and efforts to mitigate impacts of proposals generated through the CAC process. In particular, the CAC recommended two least objectionable alternatives which have only received limited study in the DEIS (AWB1) as a western bypass, and absolutely zero analysis in the DEIS (the three track trench). The Town of Ashland believes any consideration of the three track trench should be discontinued due to the fact that it was created by DRPT at the last CAC meeting, and has not been engineered or evaluated sufficiently to warrant moving forward in the DEIS or FEIS. In addition, the Town of Ashland was told that the deep bore tunnel would be unlikely to be built due to its cost even though cost is not supposed to be considered as part of the NEPA process. This fact is what led the Deep Bore Tunnel to be replaced by the Three Tract Trench as the least objectionable alternative "underground" by the CAC. The Town would like to reiterate that the deep bore tunnel would have not only been listed as a least objectionable alternative by the CAC, but would have received unanimous support as the Preferred Alternative for Alternative Area 5 had it not been for DRPT staff introducing cost as consideration. **176**
2. Table 6.3-1 lists the Ashland Museum as the only consulting party listed for the Town of Ashland. It should be noted that the Town of Ashland was not notified about participating as a consulting party until late in 2016; over a year after all other consulting parties had been invited and participated in analysis. **177**

Chapter 7: DRPT Recommended Preferred Alternative

1. Section 7.5 states, "DRPT has not identified a Recommended Alternative for the Ashland area of the DC2RVA corridor in this Draft EIS. DRPT recognizes that each of the proposed Build Alternatives would have adverse consequences on the citizens and resources of the **178**

VIRGINIA DEQ (continued)

178. As described in Section 2.1.4.3 of the Final EIS, the Ashland/Hanover CAC, composed of representatives of Hanover County, Town of Ashland, Randolph-Macon College, and CSXT, was asked to review all Project alternatives for the area and develop a local consensus that met the DC2RVA Purpose and Need. After holding 5 meetings reviewing alternatives for the Ashland/Hanover area, including the deep bore tunnel, the CAC was unable to reach consensus for a single alternative and instead identified a "least objectionable" alternative for a western bypass, a through town option (Alternative 5A, DRPT's Preferred Alternative), and a three-track trench (below grade option). During a CTB meeting in October 2017 to present the results of the CAC process, Town representatives spoke in favor of a western bypass and County representatives spoke in favor of a trench or other through Town option. The rationale for selecting 5A: Maintain Two Tracks Through Town is presented in Section 4.3.5 of the Final EIS.



Town of Ashland or Hanover County, and there is no local consensus or preference for a Build Alternative." As noted many times in prior comments, this notion that there is not local consensus is incorrect. The Town of Ashland and Hanover County, along with State and Federal legislatures would all unanimously support a Deep Bore Tunnel. 178

Appendix A: Alternatives Technical Report

1. Section 1.9 Alternatives Carried Forward identifies four alternatives carried forward for consideration. The Town of Ashland, as noted above, believes the Deep Bore Tunnel was eliminated from screening too early and should be brought forth for further study in the Alternatives Technical Report and DEIS itself. Of those options brought forward, the only one that is in the DEIS, recommended by the CAC, and recommended by the Town of Ashland is the Western Bypass alternative. 179
2. Section 3.2.4.5 states "The Amtrak station includes two side platforms facing Tracks 2 and 3. These platforms are insufficient to serve the full length of the trains stopping in Ashland. Both platforms fail to meet accessibility requirements due to heights that are below the top of rail, narrow in width, and have a rough brick surface." It should be noted in the DEIS and FEIS that the Town is working on a platform improvement project with Amtrak, CSX, and FRA that will begin construction in 2018 and fix/alleviate all the failings noted in the quoted description above. 180
3. Section 5.2.1 Previous Studies and Design references a document called *Decision Brief: Alternative Considered But Dismissed, Richmond to Doswell, VA* from 2009. It states, "The segment's use for intercity passenger rail service was inconsistent with local plans and was opposed by Henrico County, Hanover County, and the Town of Ashland." The Town of Ashland would like to make clear that it did, in fact, oppose use of BBRR for passenger service, but would like to not that the information provided by DRPT to reach that conclusion was insufficient in 2009. DRPT presented the case for use of BBRR in terms of keeping or foregoing passenger rail. The Town of Ashland obviously chose to support keeping passenger rail within the Town. Unfortunately, DRPT did not share with local governments that opposing use of BBRR for passenger rail service would inherently lead to the need for additional rail capacity through the existing ROW in the corridor. In this instance, the Town of Ashland may very well have been supportive of losing passenger rail to the BBRR if it meant additional rail capacity in the form of a third set of tracks through the Town was unnecessary. 181
4. Section 6.7.2 Ashland Area Alignment Screening states, "Overall, the tunnels themselves would be expensive to build and operate compared to developing a new track(s) on the surface. Each tunnel would require multiple surface structures and/or gates for ventilation systems and emergency access along Center Street, adversely affecting historic resources. Due to the impacts summarized above, DRPT dismissed the tunnel options form further consideration." As noted above, the Town of Ashland disagrees with dismissing the Deep Bore Tunnel and recommends it be brought forward in the DEIS and FEIS for further study. The Town will work with the State and Federal government to not only limit impacts to historic resources, but actively partner with Hanover County to mitigate wetland impacts associated with the Deep Bore Tunnel openings. As noted above, the Town and County will 182

VIRGINIA DEQ (continued)

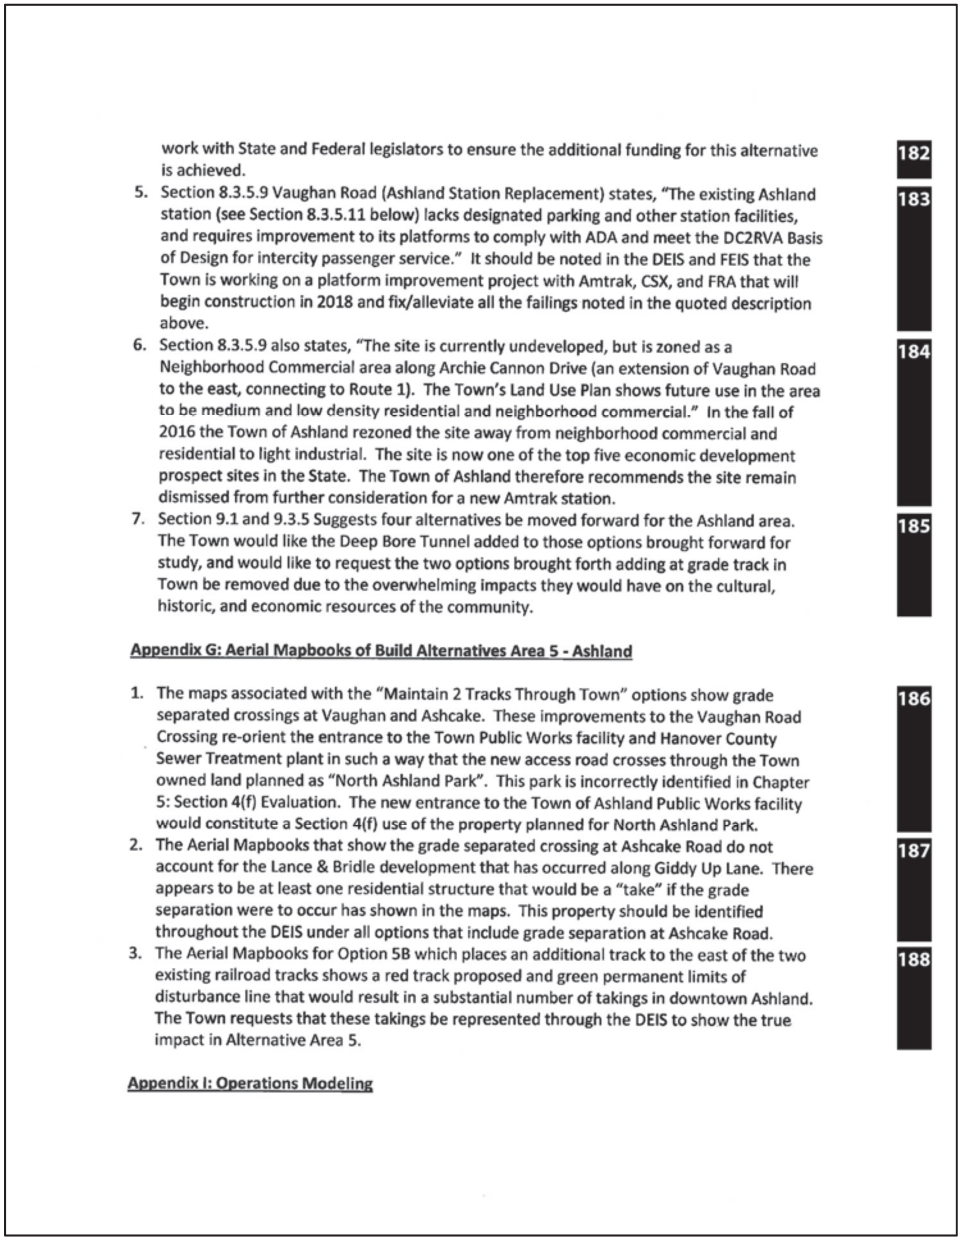
(Response to comment 178 on previous page)

179. Subsequent to the Draft EIS alternatives development process, the concept of a deep bore tunnel – both a deep hard-rock version and a shallower soft-earth version – was further evaluated and considered by the Ashland/Hanover CAC process. The CAC members dismissed the deep bore tunnel as an unlikely Project alternative due to its anticipated cost, impacts to the Town from ventilation towers and other structures, and potential operation concerns; refer to Appendix G of the Final EIS for details.

180. Refer to DRPT-numbered statement #167 for response.

181. As noted by the Town of Ashland, the 2009 Decision Brief: Alternatives Considered but Dismissed, Richmond to Doswell, VA, was developed by DRPT and approved by FRA to evaluate using the Buckingham Branch Railroad for the proposed high speed passenger service, bypassing both Ashland and Staples Mill Road Stations. In 2009, Hanover County, Henrico County, the Town of Ashland, and Randolph-Macon College all opposed moving passenger service to the Buckingham Branch Railroad. In preparing the Draft EIS, FRA and DRPT reevaluated use of the Buckingham Branch Railroad, both as a potential passenger route and as a freight diversion route. FRA and DRPT dismissed alternatives using the Buckingham Branch Railroad from further consideration in the DC2RVA Draft EIS due to substantial impacts to wetlands, cultural resources, property, infrastructure, and rail operations. The Ashland/Hanover CAC also evaluated the Buckingham Branch Railroad for both passenger and/or freight diversion, and eliminated the use of the Buckingham Branch Railroad from their further consideration.

182. Refer to DRPT-numbered statement #179 for response.



182 work with State and Federal legislators to ensure the additional funding for this alternative is achieved.

5. 183 Section 8.3.5.9 Vaughan Road (Ashland Station Replacement) states, "The existing Ashland station (see Section 8.3.5.11 below) lacks designated parking and other station facilities, and requires improvement to its platforms to comply with ADA and meet the DC2RVA Basis of Design for intercity passenger service." It should be noted in the DEIS and FEIS that the Town is working on a platform improvement project with Amtrak, CSX, and FRA that will begin construction in 2018 and fix/alleviate all the failings noted in the quoted description above.
6. 184 Section 8.3.5.9 also states, "The site is currently undeveloped, but is zoned as a Neighborhood Commercial area along Archie Cannon Drive (an extension of Vaughan Road to the east, connecting to Route 1). The Town's Land Use Plan shows future use in the area to be medium and low density residential and neighborhood commercial." In the fall of 2016 the Town of Ashland rezoned the site away from neighborhood commercial and residential to light industrial. The site is now one of the top five economic development prospect sites in the State. The Town of Ashland therefore recommends the site remain dismissed from further consideration for a new Amtrak station.
7. 185 Section 9.1 and 9.3.5 Suggests four alternatives be moved forward for the Ashland area. The Town would like the Deep Bore Tunnel added to those options brought forward for study, and would like to request the two options brought forth adding at grade track in Town be removed due to the overwhelming impacts they would have on the cultural, historic, and economic resources of the community.

__Appendix G: Aerial Mapbooks of Build Alternatives Area 5 - Ashland__

1. 186 The maps associated with the "Maintain 2 Tracks Through Town" options show grade separated crossings at Vaughan and Ashcake. These improvements to the Vaughan Road Crossing re-orient the entrance to the Town Public Works facility and Hanover County Sewer Treatment plant in such a way that the new access road crosses through the Town owned land planned as "North Ashland Park". This park is incorrectly identified in Chapter 5: Section 4(f) Evaluation. The new entrance to the Town of Ashland Public Works facility would constitute a Section 4(f) use of the property planned for North Ashland Park.
2. 187 The Aerial Mapbooks that show the grade separated crossing at Ashcake Road do not account for the Lance & Bridle development that has occurred along Giddy Up Lane. There appears to be at least one residential structure that would be a "take" if the grade separation were to occur has shown in the maps. This property should be identified throughout the DEIS under all options that include grade separation at Ashcake Road.
3. 188 The Aerial Mapbooks for Option 5B which places an additional track to the east of the two existing railroad tracks shows a red track proposed and green permanent limits of disturbance line that would result in a substantial number of takings in downtown Ashland. The Town requests that these takings be represented through the DEIS to show the true impact in Alternative Area 5.

__Appendix I: Operations Modeling__

VIRGINIA DEQ (continued)

(Response to comment 182 on previous page)

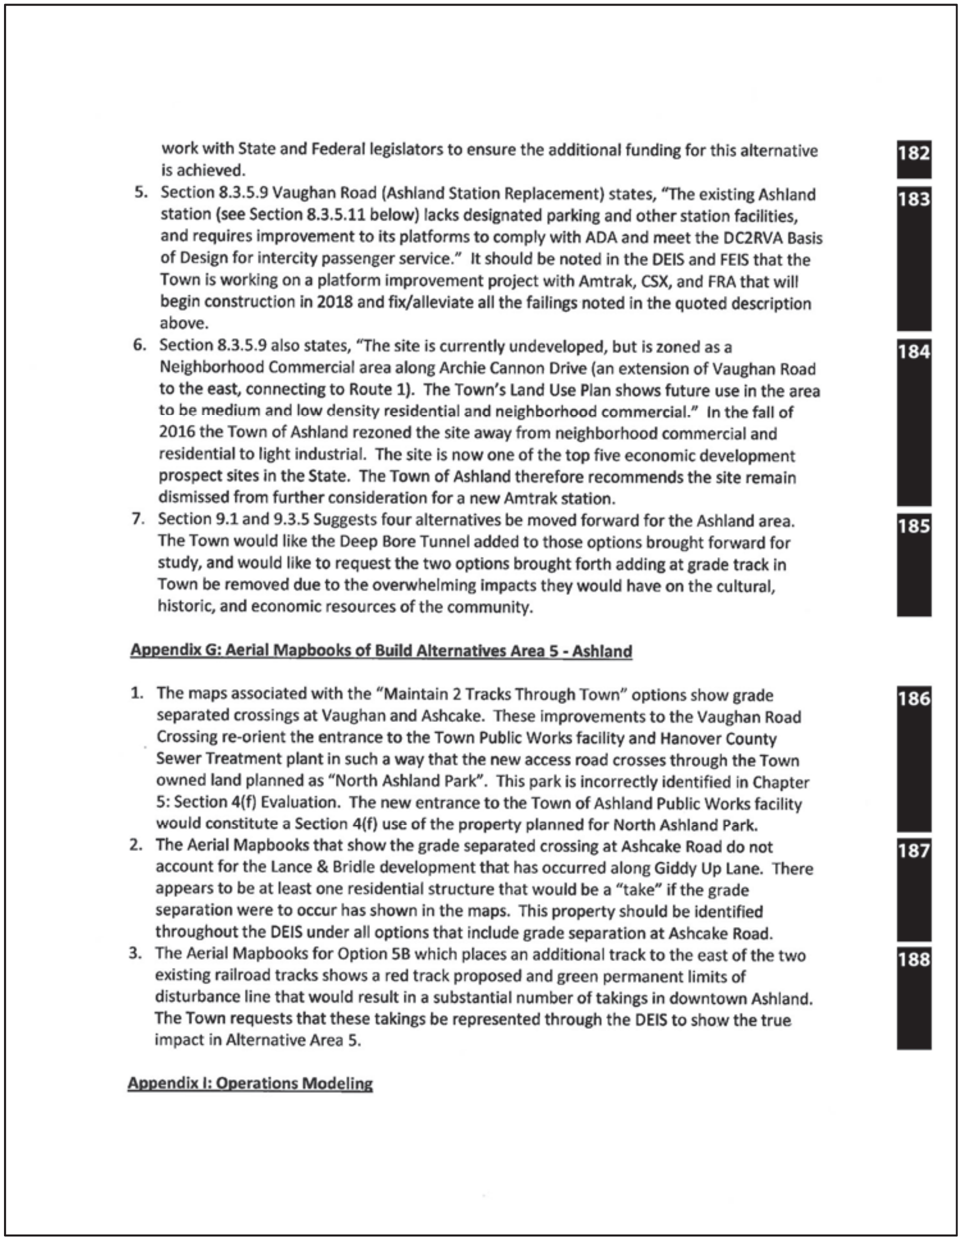
183. Refer to DRPT-numbered statement #180 for response.

184. DRPT eliminated the area north of Vaughan Road for a new Ashland station as part of the alternatives analysis process and it was not considered as part of any of the Build Alternatives analyzed in the Draft EIS (refer to DRPT-numbered statement #150 for additional response). The Preferred Alternative for the Ashland Area is Build Alternative 5A: Maintain Two Tracks Through Town and, per the CTB resolution of December 6, 2017, will not include any modifications to the existing station location.

185. Refer to DRPT-numbered statement #179 for response. Build Alternatives 5B and 5D, each adding a track at grade through Ashland, have been evaluated in detail in the Draft EIS, and were not selected by FRA as the Preferred Alternative.

186. The North Ashland park polygon shown on Figure 3.14-1 in the Draft EIS was obtained from the VDOT CEDAR database – VA DCR "conservation land" dataset (July 2017). Section 4(f) applies when the land is one of the enumerated types of publicly owned lands and the public agency that owns the property has formally designated and determined it to be significant for park, recreation area, or wildlife and waterfowl refuge purposes. Evidence of formal designation would be the inclusion of the publicly owned land, and its function as a Section 4(f) property into a city or county Master Plan; an expression of interest or desire is not sufficient. While the North Ashland Park is included the Town of Ashland's Comprehensive Plan and Parks and Recreation Master Plan, the park location and boundaries are not clearly identified. Additional conversations in January 2018 with Mr. Joseph Collins, Town of Ashland Parks and Recreation Coordinator, indicate the development of North Ashland Park stalled several years ago due to the recession and the location for the development of the future park was never established. The future land use in this area is identified as a mix of government and open space. Given this information, this area would not be considered a Section 4(f) resource at this time. North Ashland Park has been removed as a Section 4(f) resource as indicated in the errata table for the Draft EIS, which is Appendix A of the Final EIS.

(Responses are continued on next page)



work with State and Federal legislators to ensure the additional funding for this alternative is achieved. 182

5. Section 8.3.5.9 Vaughan Road (Ashland Station Replacement) states, "The existing Ashland station (see Section 8.3.5.11 below) lacks designated parking and other station facilities, and requires improvement to its platforms to comply with ADA and meet the DC2RVA Basis of Design for intercity passenger service." It should be noted in the DEIS and FEIS that the Town is working on a platform improvement project with Amtrak, CSX, and FRA that will begin construction in 2018 and fix/alleviate all the failings noted in the quoted description above. 183
6. Section 8.3.5.9 also states, "The site is currently undeveloped, but is zoned as a Neighborhood Commercial area along Archie Cannon Drive (an extension of Vaughan Road to the east, connecting to Route 1). The Town's Land Use Plan shows future use in the area to be medium and low density residential and neighborhood commercial." In the fall of 2016 the Town of Ashland rezoned the site away from neighborhood commercial and residential to light industrial. The site is now one of the top five economic development prospect sites in the State. The Town of Ashland therefore recommends the site remain dismissed from further consideration for a new Amtrak station. 184
7. Section 9.1 and 9.3.5 Suggests four alternatives be moved forward for the Ashland area. The Town would like the Deep Bore Tunnel added to those options brought forward for study, and would like to request the two options brought forth adding at grade track in Town be removed due to the overwhelming impacts they would have on the cultural, historic, and economic resources of the community. 185

Appendix G: Aerial Mapbooks of Build Alternatives Area 5 - Ashland

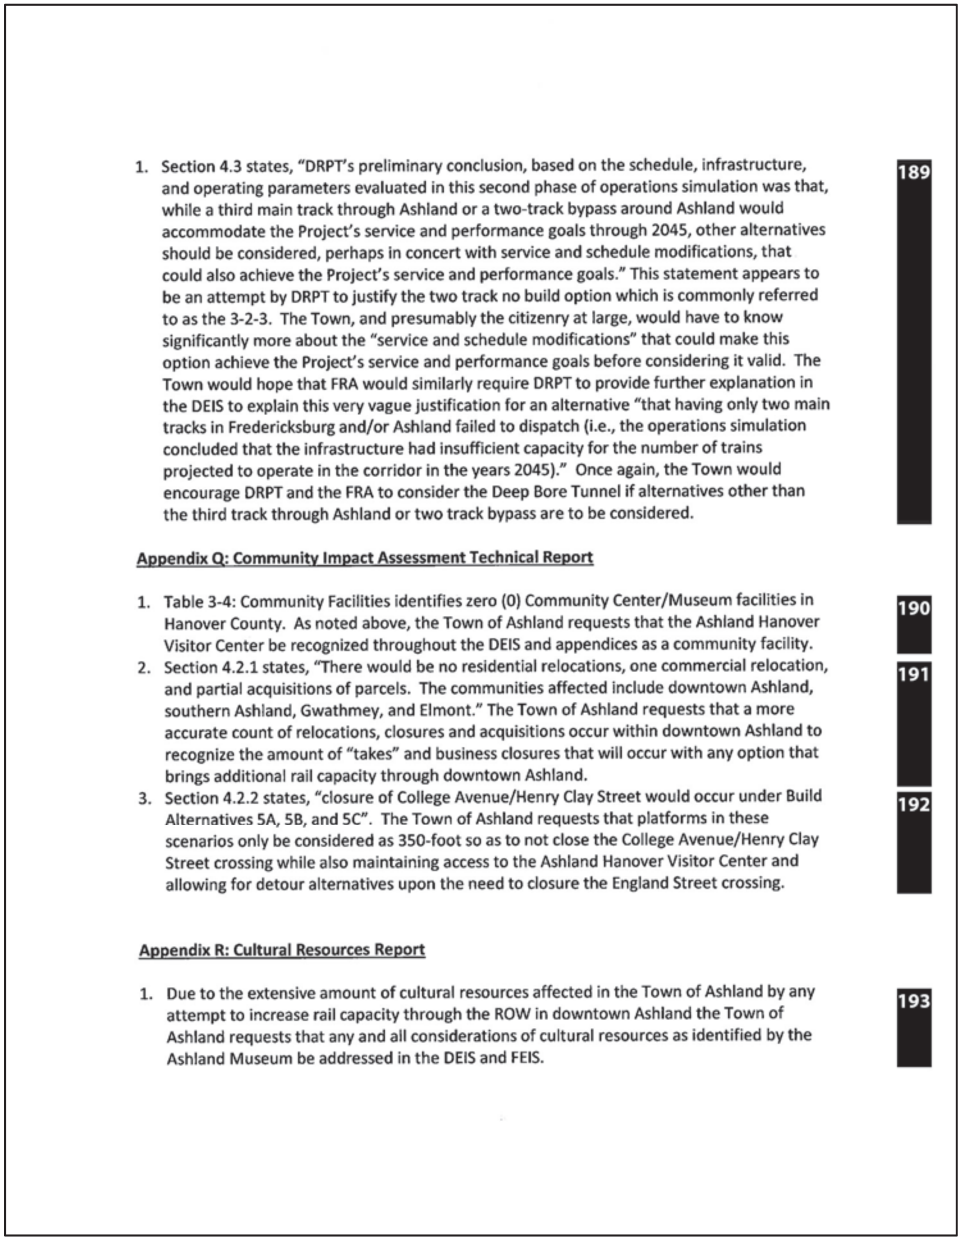
1. The maps associated with the "Maintain 2 Tracks Through Town" options show grade separated crossings at Vaughan and Ashcake. These improvements to the Vaughan Road Crossing re-orient the entrance to the Town Public Works facility and Hanover County Sewer Treatment plant in such a way that the new access road crosses through the Town owned land planned as "North Ashland Park". This park is incorrectly identified in Chapter 5: Section 4(f) Evaluation. The new entrance to the Town of Ashland Public Works facility would constitute a Section 4(f) use of the property planned for North Ashland Park. 186
2. The Aerial Mapbooks that show the grade separated crossing at Ashcake Road do not account for the Lance & Bridle development that has occurred along Giddy Up Lane. There appears to be at least one residential structure that would be a "take" if the grade separation were to occur has shown in the maps. This property should be identified throughout the DEIS under all options that include grade separation at Ashcake Road. 187
3. The Aerial Mapbooks for Option 5B which places an additional track to the east of the two existing railroad tracks shows a red track proposed and green permanent limits of disturbance line that would result in a substantial number of takings in downtown Ashland. The Town requests that these takings be represented through the DEIS to show the true impact in Alternative Area 5. 188

Appendix I: Operations Modeling

VIRGINIA DEQ (continued)

187. The parcel affected in the vicinity of Giddy Up Lane is Parcel ID 7779-76-4998. It is the common area of the Lance and Bridle subdivision. There are no residential relocations in this area.

188. Partial parcel acquisition and one commercial relocation on Ashcake Road would occur under Build Alternative 5B as evaluated in the Draft EIS. However, Alternative 5A was selected as the Preferred Alternative for Area 5; refer to Final EIS Section 5.11 for impacts of the Preferred Alternative on Community Resources, including relocations.



1. Section 4.3 states, "DRPT's preliminary conclusion, based on the schedule, infrastructure, and operating parameters evaluated in this second phase of operations simulation was that, while a third main track through Ashland or a two-track bypass around Ashland would accommodate the Project's service and performance goals through 2045, other alternatives should be considered, perhaps in concert with service and schedule modifications, that could also achieve the Project's service and performance goals." This statement appears to be an attempt by DRPT to justify the two track no build option which is commonly referred to as the 3-2-3. The Town, and presumably the citizenry at large, would have to know significantly more about the "service and schedule modifications" that could make this option achieve the Project's service and performance goals before considering it valid. The Town would hope that FRA would similarly require DRPT to provide further explanation in the DEIS to explain this very vague justification for an alternative "that having only two main tracks in Fredericksburg and/or Ashland failed to dispatch (i.e., the operations simulation concluded that the infrastructure had insufficient capacity for the number of trains projected to operate in the corridor in the years 2045)." Once again, the Town would encourage DRPT and the FRA to consider the Deep Bore Tunnel if alternatives other than the third track through Ashland or two track bypass are to be considered. **189**

Appendix Q: Community Impact Assessment Technical Report

1. Table 3-4: Community Facilities identifies zero (0) Community Center/Museum facilities in Hanover County. As noted above, the Town of Ashland requests that the Ashland Hanover Visitor Center be recognized throughout the DEIS and appendices as a community facility. **190**
2. Section 4.2.1 states, "There would be no residential relocations, one commercial relocation, and partial acquisitions of parcels. The communities affected include downtown Ashland, southern Ashland, Gwathmey, and Elmont." The Town of Ashland requests that a more accurate count of relocations, closures and acquisitions occur within downtown Ashland to recognize the amount of "takes" and business closures that will occur with any option that brings additional rail capacity through downtown Ashland. **191**
3. Section 4.2.2 states, "closure of College Avenue/Henry Clay Street would occur under Build Alternatives 5A, 5B, and 5C". The Town of Ashland requests that platforms in these scenarios only be considered as 350-foot so as to not close the College Avenue/Henry Clay Street crossing while also maintaining access to the Ashland Hanover Visitor Center and allowing for detour alternatives upon the need to closure the England Street crossing. **192**

Appendix R: Cultural Resources Report

1. Due to the extensive amount of cultural resources affected in the Town of Ashland by any attempt to increase rail capacity through the ROW in downtown Ashland the Town of Ashland requests that any and all considerations of cultural resources as identified by the Ashland Museum be addressed in the DEIS and FEIS. **193**

VIRGINIA DEQ (continued)

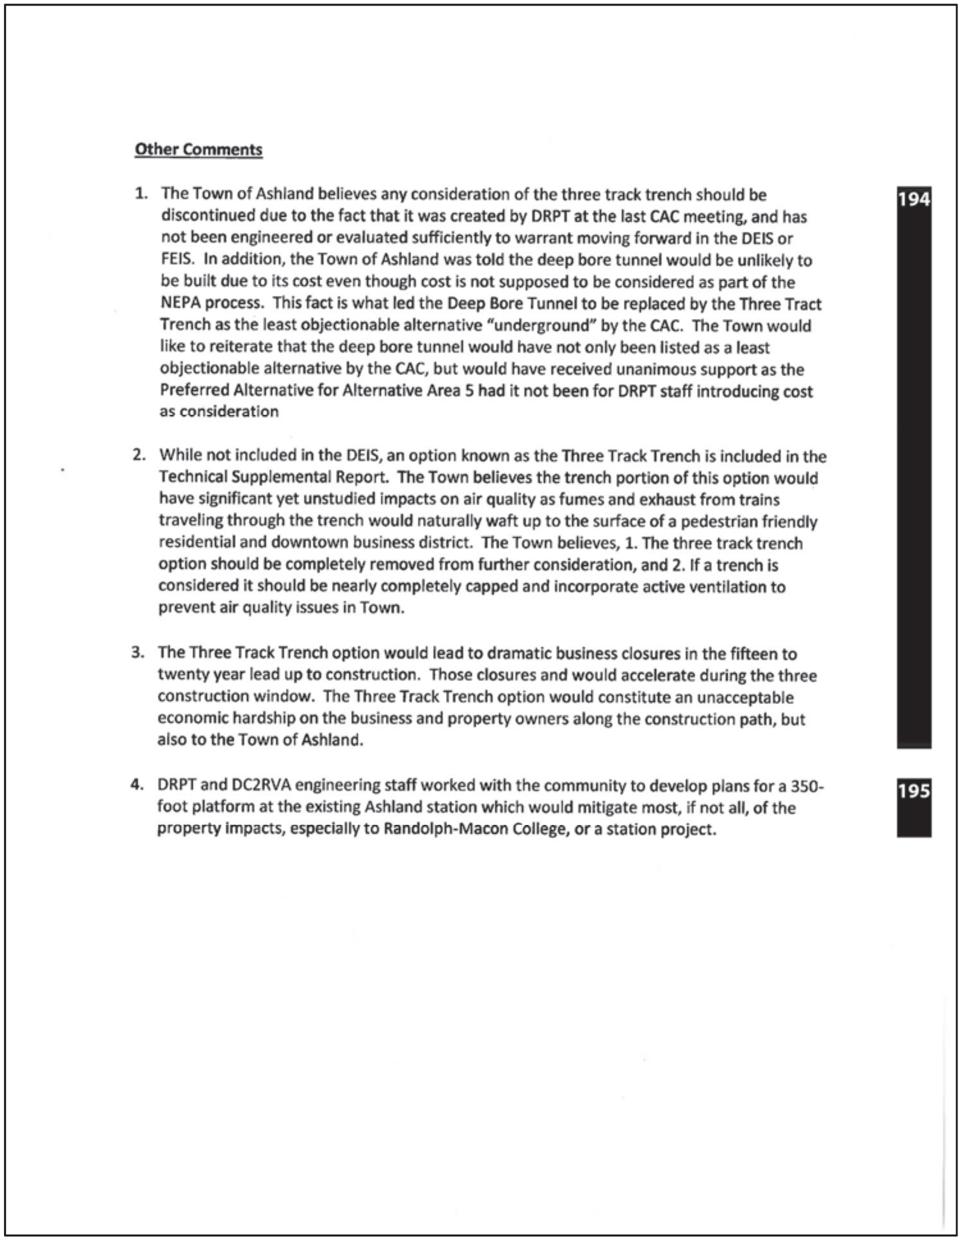
189. The comment was provided verbatim previously; refer to DRPT-numbered statement #156 for response.

190. and 191. The Ashland/Hanover Visitor Center would be relocated under one option evaluated in the Draft EIS, Build Alternative 5D. However, Alternative 5A is the Preferred Alternative for Area 5, which does not affect the existing Ashland/Hanover Visitor Center. The designation of the Ashland/Hanover Visitor Center to a community facility has been corrected; refer to the errata table for the Draft EIS, which is Appendix A to the Final EIS.

The discussion of relocations, closures, and acquisitions in Appendix Q of the Draft EIS are accurate, other than as noted above.

192. Refer to DRPT-numbered statement #167 for response.

193. DRPT acknowledges the economic impact analysis that was conducted by a third party at the request of the Town, which DEQ has provided as an attachment to this letter. Refer to DRPT-numbered statement #236 for response.



Other Comments

1. The Town of Ashland believes any consideration of the three track trench should be discontinued due to the fact that it was created by DRPT at the last CAC meeting, and has not been engineered or evaluated sufficiently to warrant moving forward in the DEIS or FEIS. In addition, the Town of Ashland was told the deep bore tunnel would be unlikely to be built due to its cost even though cost is not supposed to be considered as part of the NEPA process. This fact is what led the Deep Bore Tunnel to be replaced by the Three Tract Trench as the least objectionable alternative "underground" by the CAC. The Town would like to reiterate that the deep bore tunnel would have not only been listed as a least objectionable alternative by the CAC, but would have received unanimous support as the Preferred Alternative for Alternative Area 5 had it not been for DRPT staff introducing cost as consideration 194

2. While not included in the DEIS, an option known as the Three Track Trench is included in the Technical Supplemental Report. The Town believes the trench portion of this option would have significant yet unstudied impacts on air quality as fumes and exhaust from trains traveling through the trench would naturally waft up to the surface of a pedestrian friendly residential and downtown business district. The Town believes, 1. The three track trench option should be completely removed from further consideration, and 2. If a trench is considered it should be nearly completely capped and incorporate active ventilation to prevent air quality issues in Town.

3. The Three Track Trench option would lead to dramatic business closures in the fifteen to twenty year lead up to construction. Those closures and would accelerate during the three construction window. The Three Track Trench option would constitute an unacceptable economic hardship on the business and property owners along the construction path, but also to the Town of Ashland.

4. DRPT and DC2RVA engineering staff worked with the community to develop plans for a 350-foot platform at the existing Ashland station which would mitigate most, if not all, of the property impacts, especially to Randolph-Macon College, or a station project. 195

Re: Comments on Cultural Resource Identification – Level Reports
Southeastern High Speed Rail Tier II Environmental Impact Statement
Washington, DC to Richmond Segment

Dear Dr. Barile,

196

Thank you for allowing us, as a consulting party for the National Historic Preservation Act (NHPA) Section 106 effort for the Washington, DC to Richmond, VA segment of the Southeastern High Speed Rail corridor (DC2RVA), additional time to review the Cultural Resource Identification reports. This allowed us time to coordinate a response with the Ashland Museum and provide additional documentation of our historic resources. As you know, the Town of Ashland nor the Ashland Museum were part of any previous communications as a consulting party, therefore we appreciate your patience.

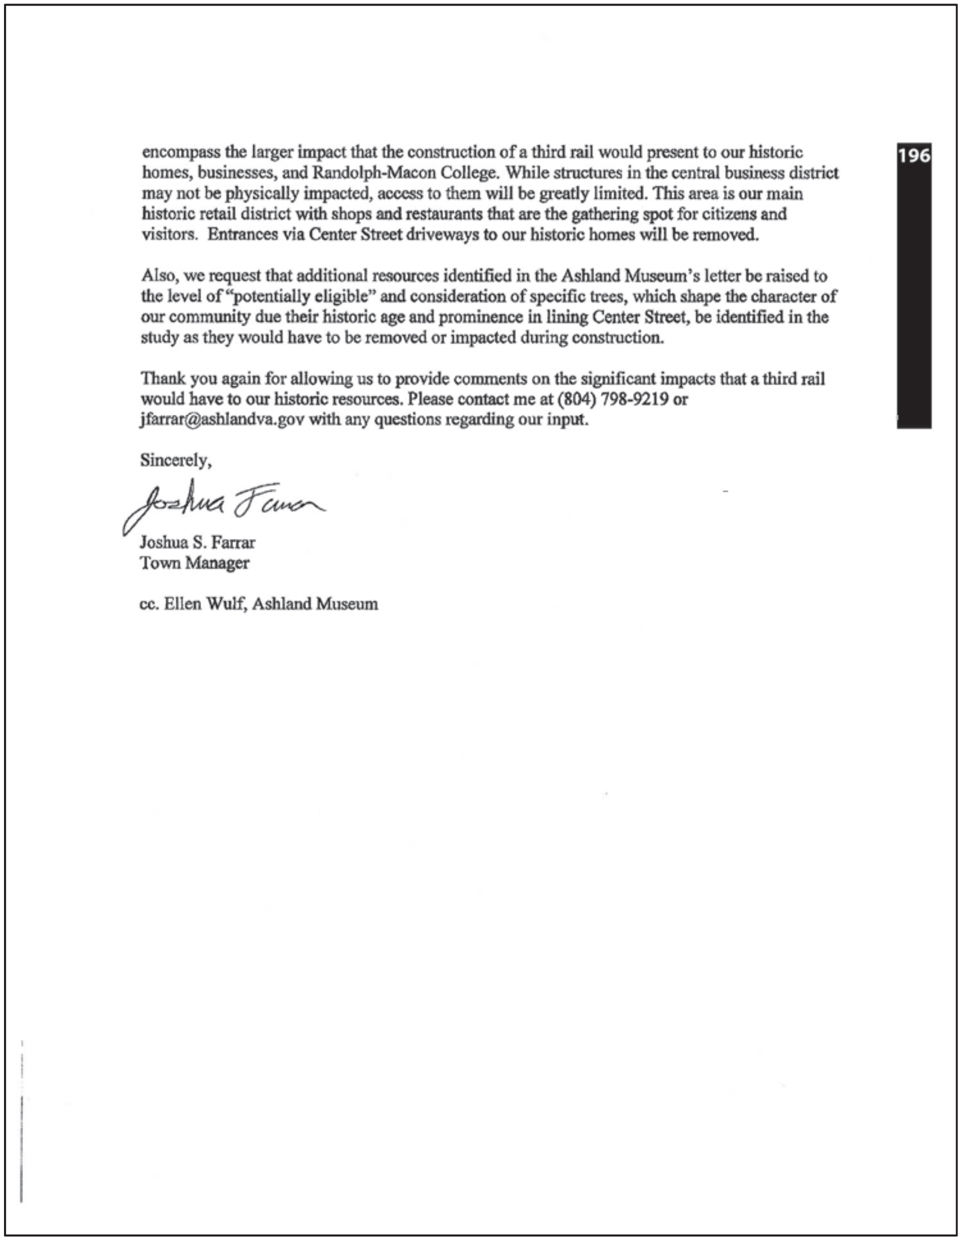
We fully support the attached recommendations and observations documented in the Ashland Museum comment letter dated May 30, 2017. They, and their membership, are the main stakeholders responsible for maintaining, preserving and updating the historic resources within the Town of Ashland.

In particular, take note of the current and proposed historic district updates that are underway in coordination with the Virginia Department of Historic Resources. We look to potentially expand our existing boundaries and/or create new districts. One specific location for consideration is the historically African American community of Berkleytown, which is adjacent to the rail line and proposed third rail. We would anticipate that these updates and additions to the district would require additional study prior to project funding.

We request that the Area of Potential Effects (APE) for portion of the project within Ashland town limits be expanded beyond what was initially studied to

VIRGINIA DEQ (continued)

196. This letter was provided to DRPT prior to the publication of the Draft EIS (on September 8, 2017), and are not specific comments on the content of the Draft EIS. Between receiving this letter and publishing the Draft EIS, DRPT coordinated with the Town of Ashland to address the comments contained within this letter. The comments in this letter are addressed in analyses and documentation that represents the Draft EIS. Notwithstanding, additional details on this comment are included in the attachment from the Ashland Museum; refer to DRPT-numbered statements #201–235 for a detailed response.



encompass the larger impact that the construction of a third rail would present to our historic homes, businesses, and Randolph-Macon College. While structures in the central business district may not be physically impacted, access to them will be greatly limited. This area is our main historic retail district with shops and restaurants that are the gathering spot for citizens and visitors. Entrances via Center Street driveways to our historic homes will be removed.

Also, we request that additional resources identified in the Ashland Museum's letter be raised to the level of "potentially eligible" and consideration of specific trees, which shape the character of our community due their historic age and prominence in lining Center Street, be identified in the study as they would have to be removed or impacted during construction.

Thank you again for allowing us to provide comments on the significant impacts that a third rail would have to our historic resources. Please contact me at (804) 798-9219 or jfarrar@ashlandva.gov with any questions regarding our input.

196

Sincerely,

Joshua Farrar

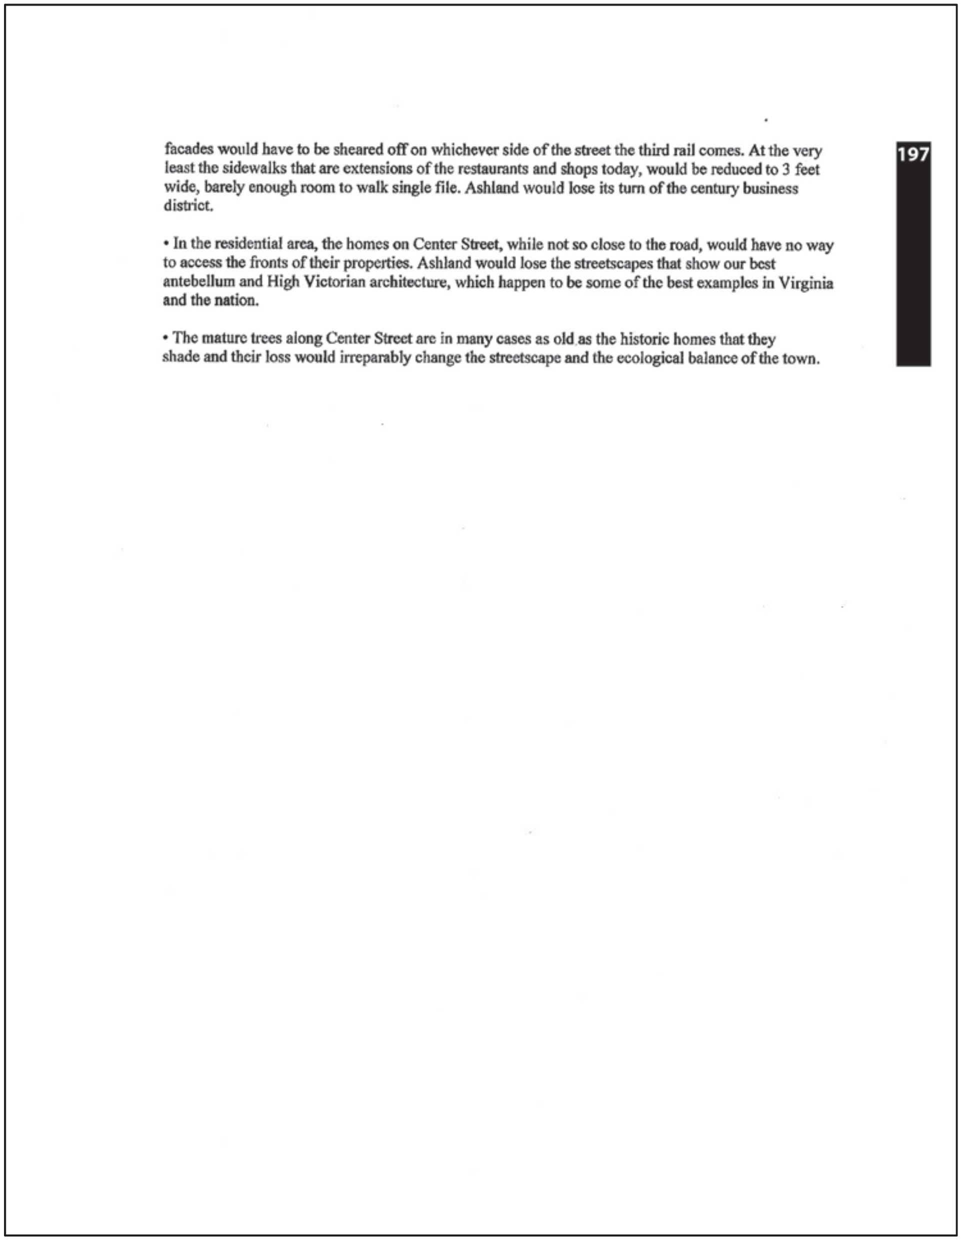
Phase IB Survey of Remaining Ashland Alternatives noted as Segment 13
We understand the studies of the project Area of Potential Effects (APE) are determined by project Limits of Disturbance (through August 2016 Plans). These surveys included "standard recordation of buildings, districts, structures, objects and sites within the APE per DHR (Department of Historic Resources) standards." We would like to comment as follows:

- The 1982 DHR Survey of Ashland for the nomination of the Ashland Historic District was flawed and incomplete in its identification of historic resources.
  - There were addresses that did not exist (110 S. Railroad Ave. is perhaps 210 S. Railroad Ave.), some misspelled street names (St. James Street is really James Street), and some mistakes in the dates of some of the buildings. And, in the architectural history world at that time, there was almost no interest in garages, barns, and other secondary buildings. Since then, the members of the Ashland Museum have researched some of the houses, found interesting facts about the owners, and corrected the dates. Some of those buildings might even be eligible for individual listing under criteria A or B of the DHR's standards when DHR can evaluate our research.
  - In the spring of 2017, we are going to have an updated survey of the original district, which will allow us to include more buildings in the district for three reasons. First, the dates of the contributing members in the original survey were mid-19th century to 1932—50 years from 1982. Now the dates are going to be up to 1967. Second, while we will not necessarily accept any building that is 50 years old, we will look at the best examples of unmodified Craftsman bungalows and other Craftsman style buildings, ranch or rambler style homes, and Art Deco architecture. Ashland Theatre (1948) and McArdle Insurance Building (1940s) are two that might be included. Third, there are a number of barns, garages or carriage houses, and other service buildings that will be considered for inclusion in the updated survey, where we can verify age and if the construction has not been substantially modified.
  - In 2018, the Town in cooperation with the Ashland Museum will be expanding the district boundaries to include some structures on Thompson, Henry Clay, Howard, Racecourse, Berkley, Henry and other areas of town that contain significant buildings relating to the town history or that have interesting architecture. That would allow us to include Craftsmen commercial buildings such as Bryant's grocery, Jake Speer's gas station, and the Craftsmen bungalows on Thompson Street, for example. It might also include the Sears House on Berkeley Street and the Colman Hotel, now called the Elks Home on Henry Street and the Gandy School, a fine example of Prairie Style architecture. They tell part of our African-American story.
- The Area of Potential Effects (APE) does not fully reflect the devastating impacts the acquisition of expanded right of way and the construction of a third rail would have on the Ashland Historic District which is intended by the Virginia Department of Historic Resources and the National Department of Historic Places to be protected.
  - The Town of Ashland community and the Randolph-Macon College campus would be irreparably split up the middle by the construction of a third rail destroying the integrity of both as viable entities.
  - In the business district, a substantial number of historic and architecturally significant buildings along Railroad Avenue/Center Street would be significantly damaged. The business buildings are only about 30 or 40 feet from the center line of the railroad right of way. If a third rail is put through Ashland, the

VIRGINIA DEQ (continued)

197. Similar comments from the Ashland Museum were provided under separate cover from the Ashland Town Manager; refer to DRPT-numbered statement #197. Additional details on this comment are included in the attachment from the Ashland Museum; refer to DRPT-numbered statements #201 through #235 for detailed responses on these topics.

VIRGINIA DEQ (continued)



facades would have to be sheared off on whichever side of the street the third rail comes. At the very least the sidewalks that are extensions of the restaurants and shops today, would be reduced to 3 feet wide, barely enough room to walk single file. Ashland would lose its turn of the century business district.

- In the residential area, the homes on Center Street, while not so close to the road, would have no way to access the fronts of their properties. Ashland would lose the streetscapes that show our best antebellum and High Victorian architecture, which happen to be some of the best examples in Virginia and the nation.

- The mature trees along Center Street are in many cases as old as the historic homes that they shade and their loss would irreparably change the streetscape and the ecological balance of the town.

Re: Comments on Cultural Resource Identification – Level Reports
Southeastern High Speed Rail Tier II Environmental Impact Statement
Washington, DC to Richmond Segment

Dear Kerri,

On behalf of the Ashland Museum, as consulting party for the National Historic Preservation Act (NHPA) Section 106 effort for the Washington, DC to Richmond segment of the Southeastern High Speed Rail corridor (DC2RVA), we would like to submit the following comments in response to your letter of April 14, 2017.

We have reviewed the package of information you provided containing a synthesis of identification-level (Phase I) cultural resource studies for above and below ground resources conducted to date.

Phase IA Studies of the Bypass Alternative around Ashland

198

We understand that the Phase IA technical studies were based on preliminary engineering and reconnaissance fieldwork rather than a full identification level study of the potential bypass to contain historic properties. While we have not studied this alignment to the level of our review of the developed area of the Town, there are significant historic and architectural features which may be overlooked given the time constraints of this part of your study.

Phase IB Survey of Remaining Ashland Alternatives noted as Segment 13

199

We understand the studies of the project Area of Potential Effects (APE) are determined by project Limits of Disturbance (through August 2016 Plans). These surveys included "standard recordation of buildings, districts, structures, objects and sites within the APE per DHR (Department of Historic Resources) standards." We would like to comment as follows:

- **The 1982 DHR Survey of Ashland for the nomination of the Ashland Historic District was flawed and incomplete in its identification of historic resources.**
    - There were addresses that did not exist (110 S. Railroad Ave. is perhaps 210 S. Railroad Ave.), some misspelled street names (St. James Street is really James Street), and some mistakes in the dates of some of the buildings. And, in the

VIRGINIA DEQ (continued)

198. The bypass was the subject of a Phase IA reconnaissance study rather than a full identification-level study as part of the Draft EIS process for numerous reasons, primarily due to the width of the bypass corridor and the archaeological best practice to avoid excavations where possible. It is fully understood that the Phase IA reconnaissance study is a planning document only and does not replace the need for full survey. Rather, this work identified areas that would require archaeological survey and above-ground resources needing study should this alternative be considered. Alternative 5A: Maintain Two Tracks Through Town (without station or roadway modifications between Vaughan Road and Ashcake Road) was selected as the Preferred Alternative for the Ashland Area (refer to Section 4.3.5 of the Final EIS for details on the selection process).

    Because the bypass was not selected as the Preferred Alternative, no additional cultural resource studies beyond the Phase IA study were necessary.

199. These comments were provided verbatim under separate cover; refer to DRPT-numbered statement #197.

801 East Main Street, Suite 1000
Richmond, Virginia 23219

Re: Phase 1 A Cultural Resources Survey for SEHSR, Washington D. C. to Richmond, Virginia,
Ashland Bypass (Segment 22)
VDHR File No. 2014-0666

Dear Dr. Barile:

As an early (1982) member of Ashland, Virginia's streetscape committee, a resident of the Ashland community for over 40 years, and an advocate for trees in my professional and personal life, I would like to add information to what you may have already gathered regarding the impact of a third railway line along Center Street through the town of Ashland. I feel sure you have already collected, or will collect, information about our historic homes, thriving businesses, and college campus, which would all be negatively affected by such a project, but you may not have received information about the mature trees that line Center Street and of their value to our town.

Our entire town is rich in mature trees, but those along Center Street are particularly important in shading the sidewalks that run along our central thoroughfare and in anchoring the plantings that define our streetscape. Many of them—mature white oaks, red oaks, and willow oaks—are as old as the historic homes they shade (some are probably older), and their loss would irreparably change not only the way visitors and residents experience our town but the ecological balance of our town. As I am sure you know, towns and cities all over Virginia are striving to achieve the kind of tree canopy Ashland already has, and it would be a tragedy to deliberately destroy something Ashland has worked so hard to achieve. Please take a ride through Ashland to see not only these old trees, but new ones coming on in promise (evidence of our community's continuing commitment to trees). Please note, too, that in some areas Ashland has used expensive paving materials for sidewalks and parking areas in an effort to protect tree roots and better distribute water. We have spent tax dollars to protect these resources. A third rail through Ashland would destroy a significant percentage of these living landmarks. Please don't let that happen.

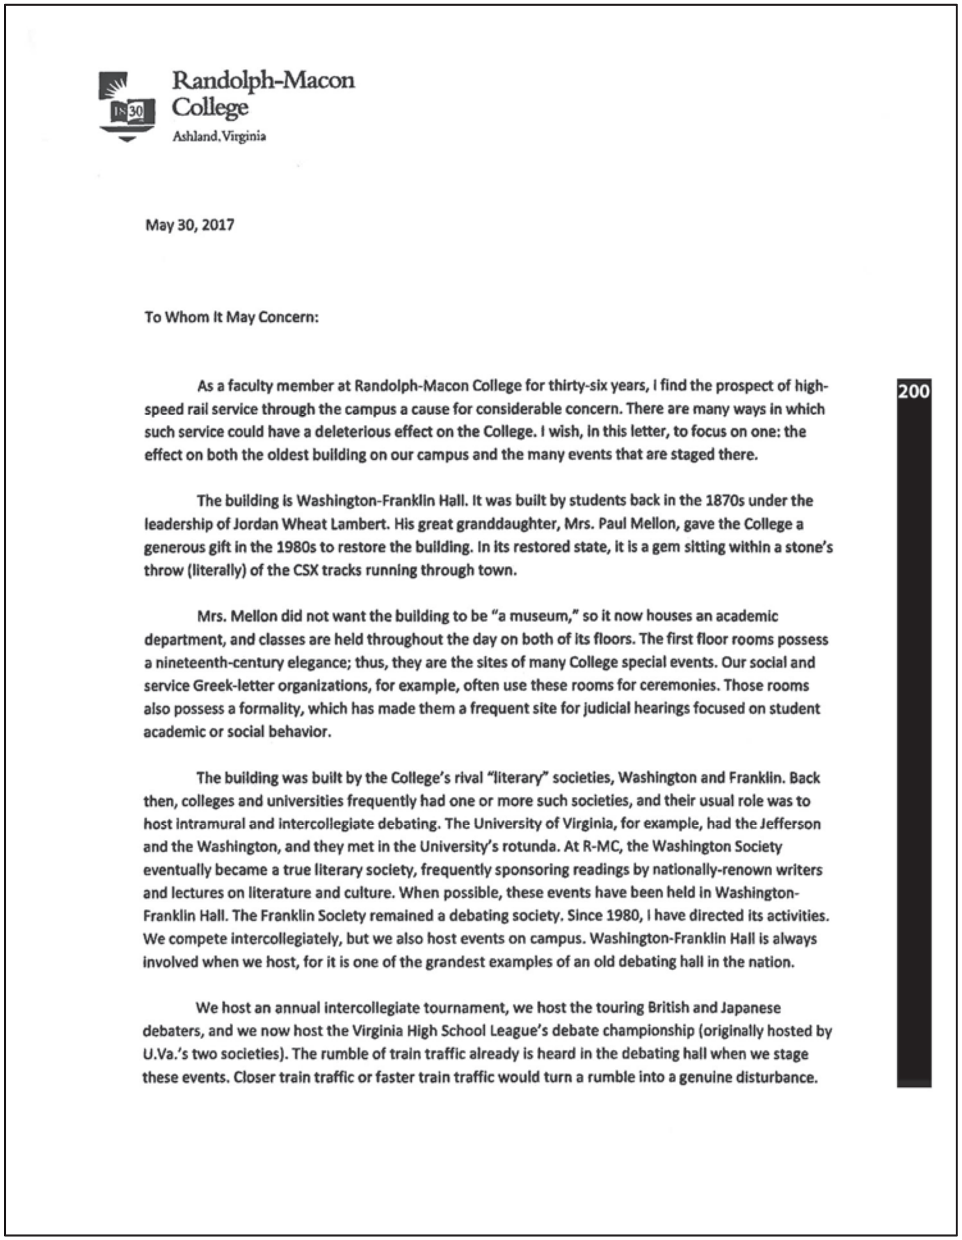
Sincerely,

Nancy Ross Hugo

Nancy Ross Hugo

VIRGINIA DEQ (continued)

(For response to comment 199, refer to page B-172)



Randolph-Macon
College
Ashland, Virginia

May 30, 2017

To Whom It May Concern:

200

As a faculty member at Randolph-Macon College for thirty-six years, I find the prospect of high-speed rail service through the campus a cause for considerable concern. There are many ways in which such service could have a deleterious effect on the College. I wish, in this letter, to focus on one: the effect on both the oldest building on our campus and the many events that are staged there.

The building is Washington-Franklin Hall. It was built by students back in the 1870s under the leadership of Jordan Wheat Lambert. His great granddaughter, Mrs. Paul Mellon, gave the College a generous gift in the 1980s to restore the building. In its restored state, it is a gem sitting within a stone's throw (literally) of the CSX tracks running through town.

Mrs. Mellon did not want the building to be "a museum," so it now houses an academic department, and classes are held throughout the day on both of its floors. The first floor rooms possess a nineteenth-century elegance; thus, they are the sites of many College special events. Our social and service Greek-letter organizations, for example, often use these rooms for ceremonies. Those rooms also possess a formality, which has made them a frequent site for judicial hearings focused on student academic or social behavior.

The building was built by the College's rival "literary" societies, Washington and Franklin. Back then, colleges and universities frequently had one or more such societies, and their usual role was to host intramural and intercollegiate debating. The University of Virginia, for example, had the Jefferson and the Washington, and they met in the University's rotunda. At R-MC, the Washington Society eventually became a true literary society, frequently sponsoring readings by nationally-renown writers and lectures on literature and culture. When possible, these events have been held in Washington-Franklin Hall. The Franklin Society remained a debating society. Since 1980, I have directed its activities. We compete intercollegiately, but we also host events on campus. Washington-Franklin Hall is always involved when we host, for it is one of the grandest examples of an old debating hall in the nation.

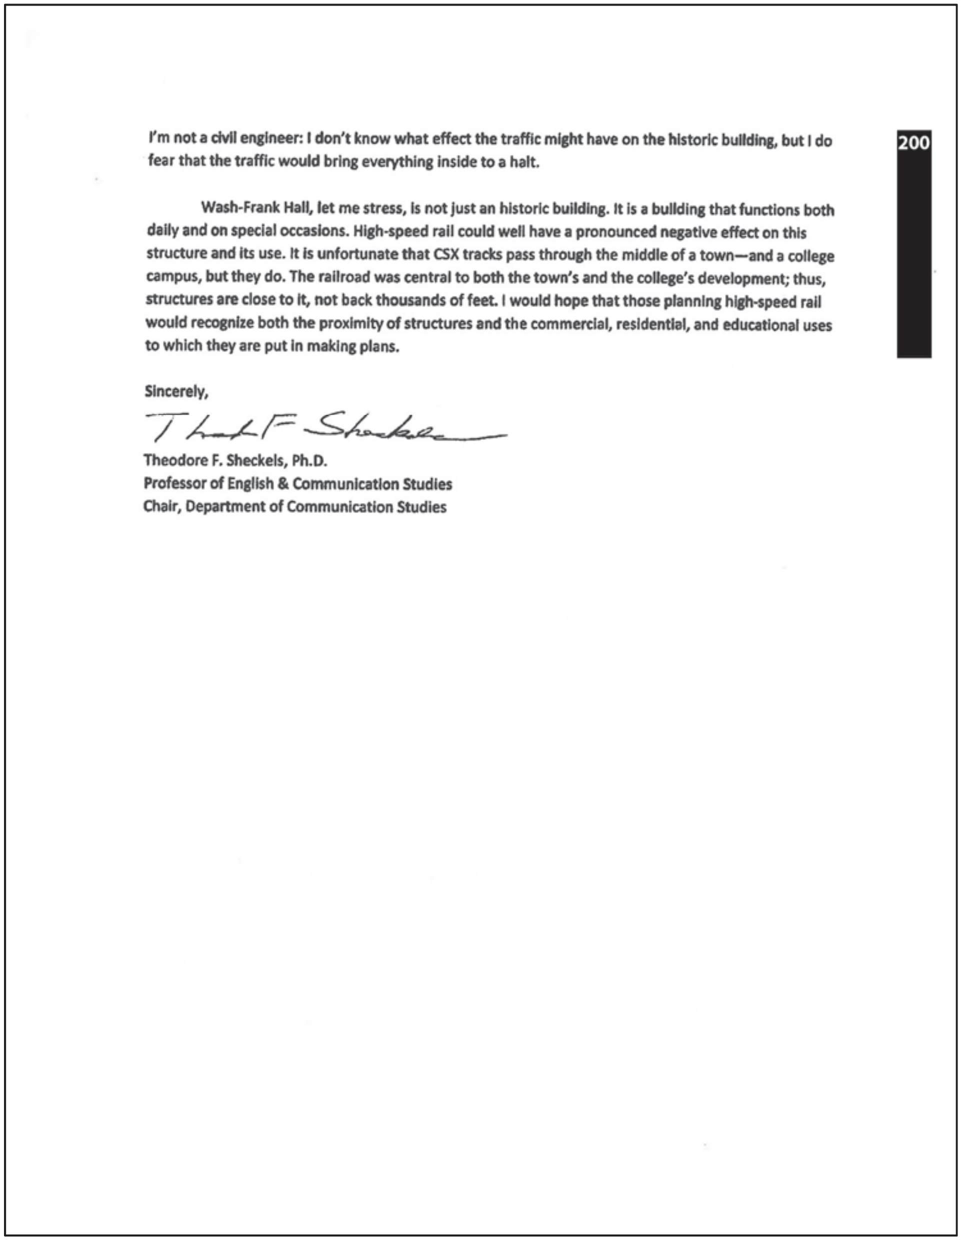
We host an annual intercollegiate tournament, we host the touring British and Japanese debaters, and we now host the Virginia High School League's debate championship (originally hosted by U.Va.'s two societies). The rumble of train traffic already is heard in the debating hall when we stage these events. Closer train traffic or faster train traffic would turn a rumble into a genuine disturbance.

VIRGINIA DEQ (continued)

200. There are no physical impacts to this building under any of the Area 5 Build Alternatives, including the Preferred Alternative 5A: Maintain Two Tracks Through Town. University properties would be covered under relocations as an institutional entity (not business or community entities), but this is not applicable as the building is not being relocated as part of the Project.

The Project requires compliance with the National Historic Preservation Act of 1966. Since 2014, FRA and DRPT have been complying with this legislation, including Project initiation, determination of an area of potential effects (APE), archaeological studies with predictive model, and architectural identification- and evaluation-level surveys of the APE. All studies have been coordinated with DHR and details on these studies and the ensuing coordination can be found in Draft EIS Appendices R and U and Final EIS Appendices D, E, and K.

Randolph-Macon College and the Randolph-Macon extension are both historic properties within the Project APE. As such, DRPT evaluated impacts to these historic resources, both direct and indirect. FRA evaluated the potential impacts of the Project on these resources and determined that the Project will have no effect. DHR concurred with these determinations.



I'm not a civil engineer: I don't know what effect the traffic might have on the historic building, but I do fear that the traffic would bring everything inside to a halt.

Wash-Frank Hall, let me stress, is not just an historic building. It is a building that functions both daily and on special occasions. High-speed rail could well have a pronounced negative effect on this structure and its use. It is unfortunate that CSX tracks pass through the middle of a town—and a college campus, but they do. The railroad was central to both the town's and the college's development; thus, structures are close to it, not back thousands of feet. I would hope that those planning high-speed rail would recognize both the proximity of structures and the commercial, residential, and educational uses to which they are put in making plans.

200

Sincerely,

Theodore F. Sheckels, Ph.D.
Professor of English & Communication Studies
Chair, Department of Communication Studies

Ashland Museum Updates, Corrections, Additions and Comments to DC2RVA Table 6-1

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
166-0001-0007	Hanover Bank Building, 104 N. Railroad Avenue	Ashland	c. 1919	Not Eligible, Contributes to Ashland Historic District

201

GIS # 7870-71-2693

DC2RVA: Not eligible, but it does contribute to the district.

Ashland Museum Comments: The former Hanover Bank Building was built in 1919 to replace the Bank's small frame structure at the same location. The style is the only Beaux Arts Structure in the town. The National Register nomination form states: "Its two-story temple front has paired columns, frieze, and pediment, while brick pilasters with cast-concrete capitals define the ends of the structure." *Because it is an example of a small town version of Beaux Arts in Virginia, we ask that you evaluate it as potentially eligible under Criteria A & C.*

166-0001-0008	Ashland Station Depot, 112 N. Railroad Avenue	Ashland	c. 1923	Potentially Eligible Under A & C; Contributes to Ashland Historic District

202

GIS # 7870-71-4742

DC2RVA: Potentially Eligible Under C; Contributes to Ashland Historic District

Ashland Museum Comments: This information is to bolster criterion A and C. Built by W. Duncan Lee, Ashland native son and Richmond architect, *the Ashland Station is significant nationally under Criterion A because it is an example of segregated and "separate but equal" architecture.* It was featured in the Smithsonian 1980s exhibit "Field to Factory: the Black Migration North from 1915 to 1940," so *it should be considered as potentially eligible under Criterion A.* Ashland Station is also an exceptional example regionally of Dutch Colonial Revival public architecture, so it should be considered potentially eligible under Criterion C.

166-0001-0011	House, 206 N. Center Street	Ashland	c. 1870	Not Eligible; Contributes to Ashland Historic District

203

GIS # 7870-73-2227

DC2RVA: Not Eligible; Contributes to Ashland Historic District.

Ashland Museum Comments: 206 N. Center Street was built during or shortly after the Civil War. William James was a "Strong Republican"—a Southern Union Sympathizer—lived there beginning about 1867. After the Civil War, James was appointed Collector of the Revenue for the Richmond area. In 1867, James and former slave and African-American church leader Burwell Toler were elected delegates for District 5, which included Hanover County, to the 1867 Virginia Constitutional Convention that eventually extended the vote to all males citizens. It also established a state school system. James' daughter Jennie James and her new husband Ira Ayers Jr. moved to Ashland to join her parents when Ayers was appointed to head the Ashland office of the Freedmen's Bureau during Reconstruction about 1867. Ayers proved to be a sympathetic administrator for the poor black and white families in the area, helping to feed and clothe many and also encouraging blacks to register for election and to establish schools, which they did. The school at Ashland's Shiloh Baptist Church was the first. *This house should be considered potentially eligible under Criterion A.* We believe the house was renovated, or updated around the turn of the century to include Colonial Revival columns. The interior grand center staircase has statuettes holding lights. The interior is largely original. *It may be eligible under Criterion C.*

VIRGINIA DEQ (continued)

201. through 235. DRPT commenced coordination with the Ashland Museum in January 2015 and has continued a dialogue with the Museum and the Town of Ashland since that time. Beyond documents sent to all consulting parties, DRPT held one-on-one calls and meetings due to the sensitive nature of cultural resources in this area. On May 12, 2017, DRPT held a call between the team and the Town planning department to discuss the Section 106 process. On May 15, 2017, DRPT held a follow-up call with representatives from the Town and Ashland Museum. During these calls, DRPT presented information on the legal parameters of the studies as well as information on the Project findings. In turn, the Town and Museum presented data on the history of their community and their concerns regarding cultural resources. One item that was discussed was a concurrent investigation (as of the summer of 2017) of architectural properties in the historic district. The Town and DHR had teamed to host a cost-share project to resurvey the Ashland Historic District, evaluate the resources within the district, and make recommendations on boundary changes for the district, if appropriate. Commonwealth Heritage Group was selected to do this work. Because of the nature of the projects, the cost share resurvey project area and the DC2RVA Project area overlapped. DRPT reviewed the results of the cost share resurvey project upon completion and compared the results to the DC2RVA work. The results were discussed with the Town of Ashland, Ashland Museum, and DHR extensively.

166-0001-0015	Business Office, Randolph-Macon (Blackwell House), 310 N. Center Street	Ashland	c. 1895	Potentially Eligible Under C; Contributes to Ashland Historic District

204

GIS # ***DC2RVA:*** Potentially Eligible Under A & C; Contributes to Ashland Historic District.

Ashland Museum Comments: This was built in the 1880s, and it was the home of Robert Emory Blackwell, when he was president of Randolph-Macon College (R-MC). Blackwell was an R-MC student, an R-MC Professor, and finally president of R-MC from 1902 to 1938. During that time he was an early advocate of racial integration in the schools of the South. In 1919 he founded the Virginia Commission on Interracial Cooperation. In one address, he publicly predicted, "There are people in this audience who will live to see the day when Southern state universities will admit colored students for graduate work."[1] *The house is a good example of Queen Anne style architecture. It should be marked potentially eligible under Criteria A & C.*

[1] Russa Moton, "Evaluations of President Blackwell," Randolph-Macon College *Bulletin*, vol 10 (April 1939): p. 27.

166-0001-0027 to 166-0001-0042	Historic Downtown Business District Overall Significance

205

DC2RVA: All but one of the buildings in the downtown business district are contributing but none are potentially eligible for individual listing.

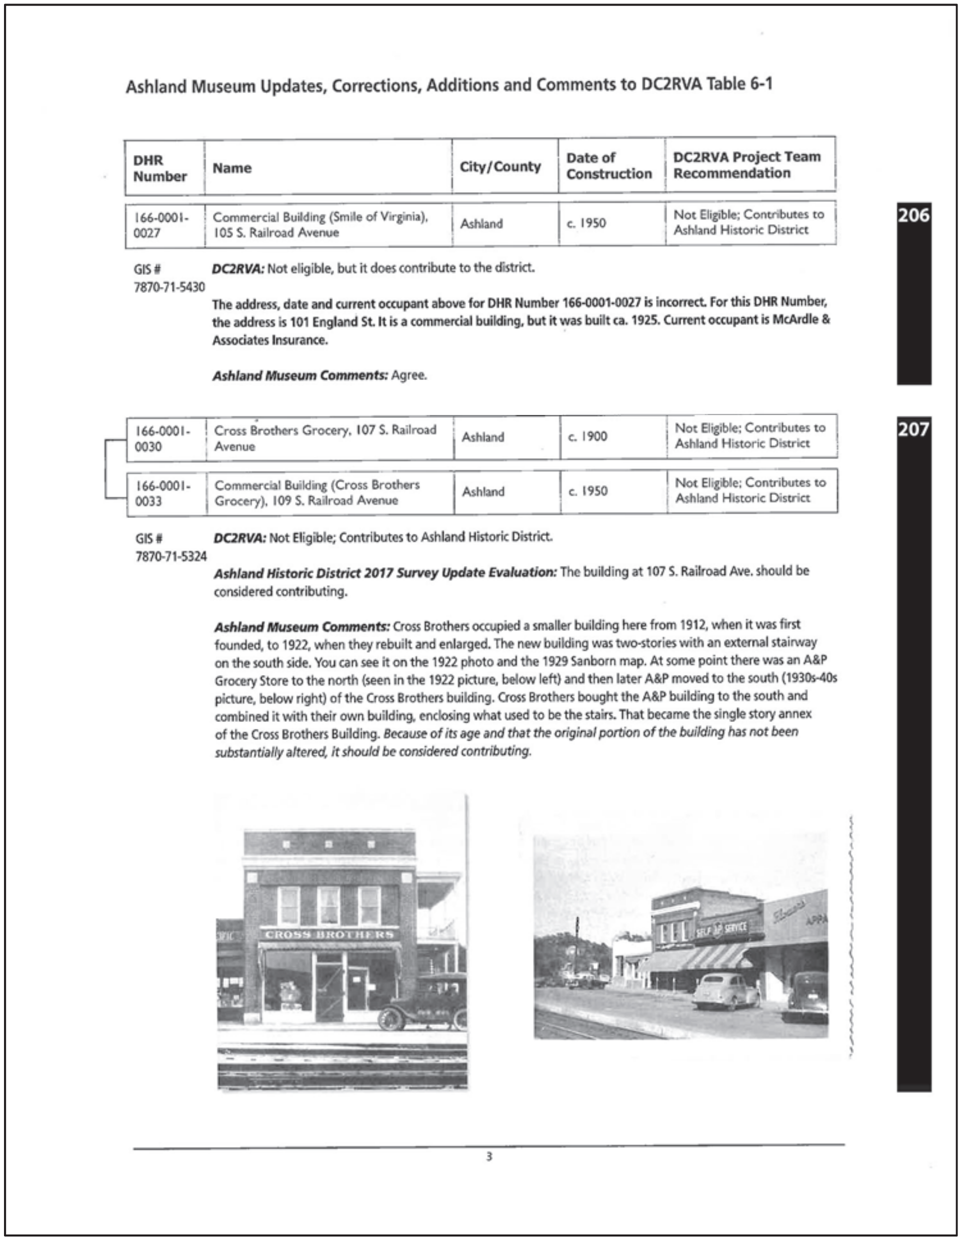
Ashland Museum Comments: We will address the individual stores, but in addition, the entire group on both sides of the track in the 100 block of S. Railroad Avenue is essential to the integrity of the historic district as a whole. Depending upon which side of the tracks the proposed third rail would go, the fronts of the buildings may be sheared off, or at the very least the right-of-way (ROW) will come within three feet of the building facades and will give pedestrians a three-foot sidewalk to sidle down in order to enter a store. That would effectively kill commerce on that side of the street. It would also destroy the integrity of the business district's historical 1870s to 1920s streetscape. Most of the west side of the street was reconstructed after the Great Fire of 1893. It had developed in the decade after the Civil War as a business district with primarily frame buildings. The buildings after 1893 were all brick. The facades have not changed since 1900, except the last building constructed on the block. D.B. Cox Department Store (now the Iron Horse Restaurant)at 100 Railroad Ave. was built 1913. The sole survivor of the fire was the 1870 Puryear Grocery Store (now Caboose Wine and Cheese). The east side of Railroad Avenue contains a mix of styles of buildings, including the mid-20th century McArdle Art Deco building at 101 England St., the 1922 Cross Brothers building, and the late 1860s-70s building (now Shear Power Salon and Jezebel's). All of those buildings should be considered as contributing to the district, but *all of them together constitute an early-20th century example of a small-town business district that has changed little and should be considered potentially eligible under Criterion A.*

VIRGINIA DEQ (continued)

DRPT received written comments on the technical reports from the Town of Ashland on May 31, 2017 and from the Ashland Museum on May 30 and June 19, 2017. DRPT evaluated all comments in light of the Commonwealth study and the DHR determinations on NRHP eligibility. On October 11, 2017, DRPT held a consulting party meeting in Ashland with representatives of the Town, Ashland Museum, and Hanover County present. During this meeting, DRPT presented the results of their investigations on the data presented by the Town and Ashland Museum in their May 30, May 31, and June 19 letters. In sum, the cost-share resurvey project, presented the same NRHP eligibility recommendations in their documents as DRPT on all resources within the DC2RVA area of potential effects (APE). In addition, DRPT met with the DHR to discuss the letters on July 26, 2017 and go over the Town and Museum's concerns. The DHR elected to not expand the APE and said that the matching NRHP determinations presented by DRPT and the cost-share resurvey project appeared accurate. No changes in eligibility were made by the DHR at this time. Upon hearing these results at the October 11 meeting, the Town stated that the results of this subsequent study appeared valid and satiated their concerns. The Museum did not concur but stated that they appreciated the follow up. Given the results of these investigations, the APE was only expanded in those few cases where DRPT adjusted the limits of disturbance (LOD). In general, the APE in Ashland was not expanded beyond the Draft EIS limits and the previous NRHP eligibility results for resources studied for the Draft EIS were not changed. However, additional studies in areas where the LOD has been modified since the Draft EIS were completed, and the results were sent to all consulting parties for comment. These results are also presented in the Final EIS. The results of the additional LOD studies were coordinated with the Ashland Museum and Town of Ashland through emails, telephone calls, and in – person meetings. See Chapter 5 and Appendix E of the Final EIS for additional details.

VIRGINIA DEQ (continued)

(For response to comments 201 through 235, refer to pages B-178 and B-179)



Ashland Museum Updates, Corrections, Additions and Comments to DC2RVA Table 6-1

206

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
166-0001-0027	Commercial Building (Smile of Virginia), 105 S. Railroad Avenue	Ashland	c. 1950	Not Eligible; Contributes to Ashland Historic District

GIS # 7870-71-5430

DC2RVA: Not eligible, but it does contribute to the district.

The address, date and current occupant above for DHR Number 166-0001-0027 is incorrect. For this DHR Number, the address is 101 England St. It is a commercial building, but it was built ca. 1925. Current occupant is McArdle & Associates Insurance.

Ashland Museum Comments: Agree.

207

166-0001-0030	Cross Brothers Grocery, 107 S. Railroad Avenue	Ashland	c. 1900	Not Eligible; Contributes to Ashland Historic District
166-0001-0033	Commercial Building (Cross Brothers Grocery), 109 S. Railroad Avenue	Ashland	c. 1950	Not Eligible; Contributes to Ashland Historic District

GIS # 7870-71-5324

DC2RVA: Not Eligible; Contributes to Ashland Historic District.

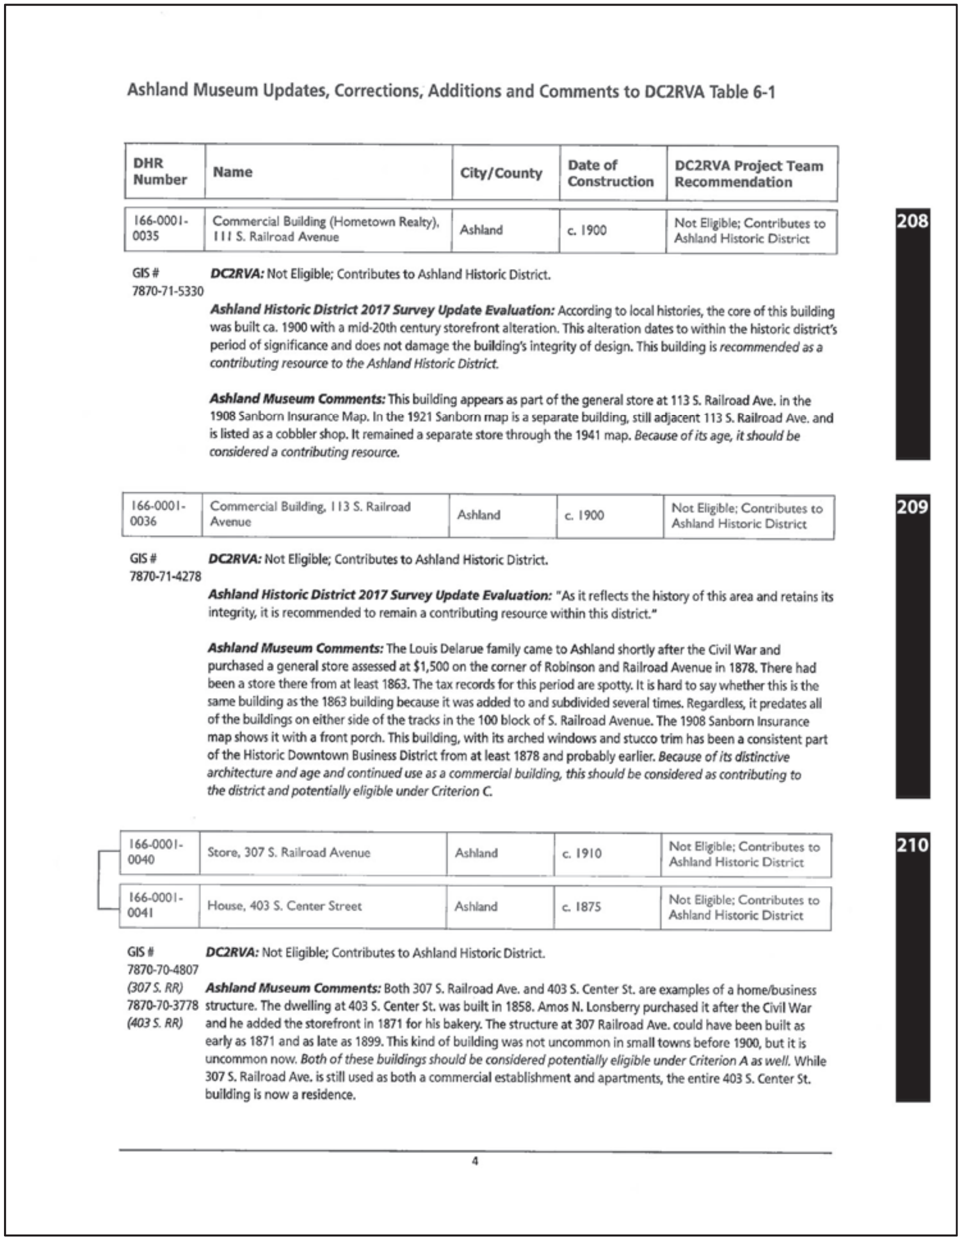
Ashland Historic District 2017 Survey Update Evaluation: The building at 107 S. Railroad Ave. should be considered contributing.

Ashland Museum Comments: Cross Brothers occupied a smaller building here from 1912, when it was first founded, to 1922, when they rebuilt and enlarged. The new building was two-stories with an external stairway on the south side. You can see it on the 1922 photo and the 1929 Sanborn map. At some point there was an A&P Grocery Store to the north (seen in the 1922 picture, below left) and then later A&P moved to the south (1930s-40s picture, below right) of the Cross Brothers building. Cross Brothers bought the A&P building to the south and combined it with their own building, enclosing what used to be the stairs. That became the single story annex of the Cross Brothers Building. *Because of its age and that the original portion of the building has not been substantially altered, it should be considered contributing.*

3

VIRGINIA DEQ (continued)

(For response to comments 201 through 235, refer to pages B-178 and B-179)



Ashland Museum Updates, Corrections, Additions and Comments to DC2RVA Table 6-1

208

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
166-0001-0035	Commercial Building (Hometown Realty), 111 S. Railroad Avenue	Ashland	c. 1900	Not Eligible; Contributes to Ashland Historic District

GIS #
7870-71-5330

DC2RVA: Not Eligible; Contributes to Ashland Historic District.

Ashland Historic District 2017 Survey Update Evaluation: According to local histories, the core of this building was built ca. 1900 with a mid-20th century storefront alteration. This alteration dates to within the historic district's period of significance and does not damage the building's integrity of design. This building is *recommended as a contributing resource to the Ashland Historic District.*

Ashland Museum Comments: This building appears as part of the general store at 113 S. Railroad Ave. in the 1908 Sanborn Insurance Map. In the 1921 Sanborn map is a separate building, still adjacent 113 S. Railroad Ave. and is listed as a cobbler shop. It remained a separate store through the 1941 map. *Because of its age, it should be considered a contributing resource.*

209

166-0001-0036	Commercial Building, 113 S. Railroad Avenue	Ashland	c. 1900	Not Eligible; Contributes to Ashland Historic District

GIS #
7870-71-4278

DC2RVA: Not Eligible; Contributes to Ashland Historic District.

Ashland Historic District 2017 Survey Update Evaluation: "As it reflects the history of this area and retains its integrity, it is recommended to remain a contributing resource within this district."

Ashland Museum Comments: The Louis Delarue family came to Ashland shortly after the Civil War and purchased a general store assessed at $1,500 on the corner of Robinson and Railroad Avenue in 1878. There had been a store there from at least 1863. The tax records for this period are spotty. It is hard to say whether this is the same building as the 1863 building because it was added to and subdivided several times. Regardless, it predates all of the buildings on either side of the tracks in the 100 block of S. Railroad Avenue. The 1908 Sanborn Insurance map shows it with a front porch. This building, with its arched windows and stucco trim has been a consistent part of the Historic Downtown Business District from at least 1878 and probably earlier. *Because of its distinctive architecture and age and continued use as a commercial building, this should be considered as contributing to the district and potentially eligible under Criterion C.*

210

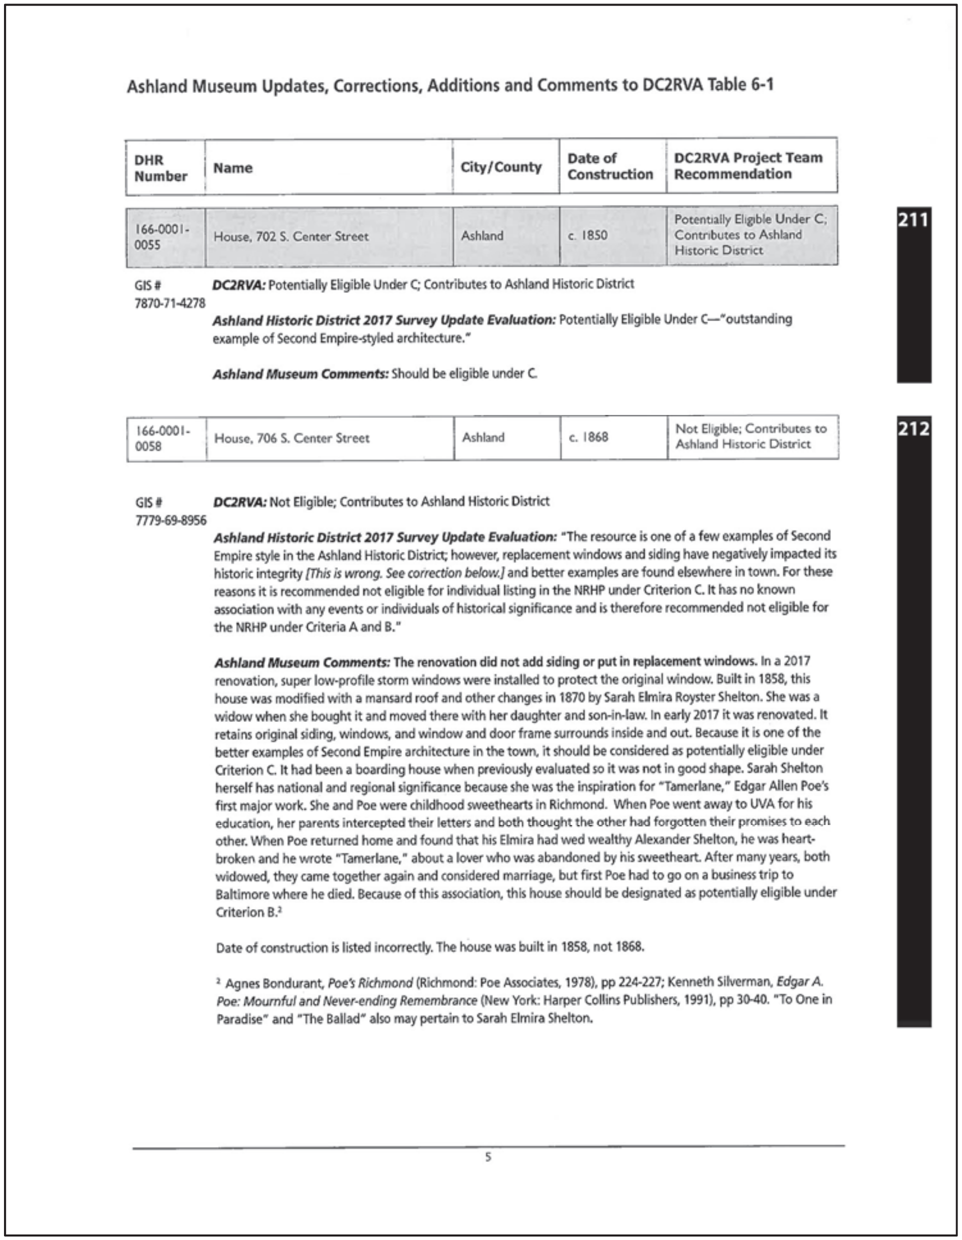
166-0001-0040	Store, 307 S. Railroad Avenue	Ashland	c. 1910	Not Eligible; Contributes to Ashland Historic District
166-0001-0041	House, 403 S. Center Street	Ashland	c. 1875	Not Eligible; Contributes to Ashland Historic District

GIS #
7870-70-4807
(307 S. RR)
7870-70-3778
(403 S. RR)

DC2RVA: Not Eligible; Contributes to Ashland Historic District.

Ashland Museum Comments: Both 307 S. Railroad Ave. and 403 S. Center St. are examples of a home/business structure. The dwelling at 403 S. Center St. was built in 1858. Amos N. Lonsberry purchased it after the Civil War and he added the storefront in 1871 for his bakery. The structure at 307 Railroad Ave. could have been built as early as 1871 and as late as 1899. This kind of building was not uncommon in small towns before 1900, but it is uncommon now. *Both of these buildings should be considered potentially eligible under Criterion A as well.* While 307 S. Railroad Ave. is still used as both a commercial establishment and apartments, the entire 403 S. Center St. building is now a residence.

4



Ashland Museum Updates, Corrections, Additions and Comments to DC2RVA Table 6-1

211

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
166-0001-0055	House, 702 S. Center Street	Ashland	c. 1850	Potentially Eligible Under C; Contributes to Ashland Historic District

GIS # 7870-71-4278

DC2RVA: Potentially Eligible Under C; Contributes to Ashland Historic District

Ashland Historic District 2017 Survey Update Evaluation: Potentially Eligible Under C—"outstanding example of Second Empire-styled architecture."

Ashland Museum Comments: Should be eligible under C.

212

166-0001-0058	House, 706 S. Center Street	Ashland	c. 1868	Not Eligible; Contributes to Ashland Historic District

GIS # 7779-69-8956

DC2RVA: Not Eligible; Contributes to Ashland Historic District

Ashland Historic District 2017 Survey Update Evaluation: "The resource is one of a few examples of Second Empire style in the Ashland Historic District; however, replacement windows and siding have negatively impacted its historic integrity *[This is wrong. See correction below.]* and better examples are found elsewhere in town. For these reasons it is recommended not eligible for individual listing in the NRHP under Criterion C. It has no known association with any events or individuals of historical significance and is therefore recommended not eligible for the NRHP under Criteria A and B."

Ashland Museum Comments: **The renovation did not add siding or put in replacement windows.** In a 2017 renovation, super low-profile storm windows were installed to protect the original window. Built in 1858, this house was modified with a mansard roof and other changes in 1870 by Sarah Elmira Royster Shelton. She was a widow when she bought it and moved there with her daughter and son-in-law. In early 2017 it was renovated. It retains original siding, windows, and window and door frame surrounds inside and out. Because it is one of the better examples of Second Empire architecture in the town, it should be considered as potentially eligible under Criterion C. It had been a boarding house when previously evaluated so it was not in good shape. Sarah Shelton herself has national and regional significance because she was the inspiration for "Tamerlane," Edgar Allen Poe's first major work. She and Poe were childhood sweethearts in Richmond. When Poe went away to UVA for his education, her parents intercepted their letters and both thought the other had forgotten their promises to each other. When Poe returned home and found that his Elmira had wed wealthy Alexander Shelton, he was heart-broken and he wrote "Tamerlane," about a lover who was abandoned by his sweetheart. After many years, both widowed, they came together again and considered marriage, but first Poe had to go on a business trip to Baltimore where he died. Because of this association, this house should be designated as potentially eligible under Criterion B.[2]

Date of construction is listed incorrectly. The house was built in 1858, not 1868.

---

[2] Agnes Bondurant, *Poe's Richmond* (Richmond: Poe Associates, 1978), pp 224-227; Kenneth Silverman, *Edgar A. Poe: Mournful and Never-ending Remembrance* (New York: Harper Collins Publishers, 1991), pp 30-40. "To One in Paradise" and "The Ballad" also may pertain to Sarah Elmira Shelton.

213

GIS # 7779-69-8842

DC2RVA: Potentially Eligible Under C; Contributes to Ashland Historic District

Ashland Historic District 2017 Survey Update Evaluation: "outstanding example of a Colonial Revival-styled dwelling with Free Classic elements in this historic community (VHLC 1982). Minor modifications appear to have been made to this resource since it was constructed, including a few small rear additions, but these alterations do not appear to have negatively impacted its historic integrity. As the best example of this style within the Ashland Historic District, this property is recommended potentially eligible for individually listing on the NRHP under Criterion C.

Ashland Museum Comments: Architect was Julian Powers Fox, a respected Richmond architect. He built this house for his brother Flemming Fox. *As an example of Dutch Colonial Revival architecture and one designed by Julian Powers Fox, it should be listed as potentially eligible under Criterion C.*

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
166-0001-0077	House, 1005 S. Center Street	Ashland	c. 1890	Potentially Eligible Under C; Contributes to Ashland Historic District

214

GIS # 7779-68-9418

DC2RVA: Potentially Eligible Under C; Contributes to Ashland Historic District

Ashland Historic District 2017 Survey Update Evaluation: "It is not known if this house was designed by an architect, but it possesses characteristics of the Queen Anne style while its form suggests an earlier construction date. Further, the property's spatial organization reflects more of a rural setting like that attributed to the town during its time as a mid- to late-19th-century resort community. Therefore, this property is recommended for further study and is potentially eligible for listing on the NRHP under Criterion C at the local level."

Ashland Museum Comments: Assessor says this house was built just after the Civil War in 1867. *Should be potentially eligible under Criterion C.*

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
166-0001-0232	Commercial Building, 103–109 England Street	Ashland	c. 1950	Not Eligible, Contributes to Ashland Historic District

216

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
166-0002	Randolph-Macon College Historic District	Ashland	late 19th c. - early 20th c.	Listed VLR & NRHP; Contributes to Ashland Historic District

GIS #

DC2RVA: Listed VLR & NRHP; Contributes to Ashland Historic District

Dates are listed above are incorrect. Correct dates are 1872-1879. The Randolph-Macon College Historic District continues to be a separate historic district.

Ashland Historic District 2017 Survey Update Evaluation: Potentially Eligible Under A & C; Contributes to R-MC Historic District

Ashland Museum Comments: This is additional information to bolster the criteria A&C. First, the lawn of the R-MC Historic District with very old oak and maple trees, reflects the ambiance of a mid-19th century college campus. Today it is used for college gatherings because it is shaded and can hold a large number of people. To cut into that lawn would damage the ambiance and curtail the use. As for the individual buildings, they are all contributing to their district, but because of their history and the people associated with them, they should be considered individually under Criteria A, B, and C to be potentially eligible.

Washington Franklin Literary Societies Hall, 1872, Italianate with Bonnet Roof. B.F. Price, Alexandria Architect. Significant under Criterion B because Jordan Wheat Lambert, who was president of the Franklin Literary Society, and leader in the construction of the building, went on to found Lambert Pharmaceuticals and along with Lister he created Listerine. Lambert's parents had employed Price to build their home in Alexandria. Significant under Criterion A to larger education history because it is an example of early to mid-19th century college literary society activity on many US college campuses. Most have dissolved, but Washington Franklin Literary Societies Hall is still used by the two societies for lectures and debates. In addition, it is also offices and lecture halls of the history department.

Duncan Memorial Chapel. William West, Richmond Architect. 1879. Ecclesiastic Gothic style.

Pace Lecture Hall. 1876. Italianate style. Originally one first floor room was dedicated to chemistry labs, unusual for small colleges at the time.

These properties should be considered potentially eligible under criterion A, B, and C.

217

166-0036; 166-0001-0063	MacMurdo House, 713 S. Center Street	Ashland	c. 1858	Potentially Eligible Under B and C; Contributes to Ashland Historic District

GIS #
7779-79-1601

DC2RVA: Potentially Eligible Under B and C; Contributes to Ashland Historic District

Ashland Historic District 2017 Survey Update Evaluation: Recommended under B & C "constructed for RF&P Treasurer, Waldrop Macmurdo, who also had his office built across the railroad for his convenience (Lancaster 1953). This house has been identified as one of very few Greek Revival-styled dwellings in the historic district (VHLC 1982). Therefore, this property is recommended for further study and is considered potentially eligible for listing on the NRHP under B&C."

Ashland Museum Comments: As the home of C. Waldrop Macmurdo, an early Treasurer of the RF&P, it should be potentially eligible under Criterion B. As a fine example of an un-modified Greek Revival-styled dwelling, it should be potentially eligible under Criterion C.

7

VIRGINIA DEQ (continued)

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
166-0037; 166-0001-0073	Hugo House , 904 S. Center Street	Ashland	c. 1886	Potentially Eligible Under C; Contributes to Ashland Historic District

218

GIS # 7779-68-6848

DC2RVA: Potentially Eligible Under A, B, and C; Contributes to Ashland Historic District

Ashland Museum Comments: Lila Vance Lefebvre, headmistress of Edgeworth French Finishing School in Baltimore, bought newly constructed 904 S. Center St. for her stepdaughter Mary's husband, William Isaacs, and his daughters after Mary had died. Her granddaughter, Lila Lefebvre Isaacs, was soon courted by John Skelton Williams, the creator and president of Seaboard Air Line Railway and later an undersecretary of the Treasury and Comptroller of the Currency under the Wilson administration. Their wedding took place in the S. Center Street house and in the midst of the festivities the couple walked across the lawn and boarded a train to Washington for their honeymoon.[3] *As the home of the wife of John Skelton Williams, this property should be eligible under Criterion A.* The tin house in the back yard is where acetylene gas was made and then piped into the house for lighting. A tank of calcium carbide was kept in the tin house along with a tank of water. The water was allowed to drip on the carbide to create the gas. Holes for the pipes are still visable.[4] The dwelling, as an extraordinary example of Queen Anne style architecture, and the gas house in the yard, as an example of an early domestic acetylene gas apparatus, should be potentially eligible under Criterion A and C.

[3] Interview with John Skelton Williams Jr. by Rosanne Groat Shalf.

166-0039; 166-0001-0082	Blair House, 1014 S. Center Street	Ashland	c. 1888	Not Eligible; Contributes to Ashland Historic District

219

GIS # 7779-68-3016

DC2RVA: Not Eligible; Contributes to Ashland Historic District

Ashland Museum Comments: Built in 1890 in the Queen Anne or Eastlake style, this house has undergone changes and subsequent renovations that restored the changes. When the Hendrixsons purchased it in 2007, the previous owners had removed the southern wrap-around portion of the porch because it had rotted. Using a photo of the original house, they restored the wrap-around porch, adding a turret roof. There have been sensitive rear additions, but otherwise the original house is much the same. *Because it is such a fine example of Eastlake, this should be considered potentially eligible under Criterion C.*

166-0040; 166-0001-0044	Hanover Arts Center (Ashland Baptist Church), 500 S. Center Street	Ashland	c. 1858	Not Eligible; Contributes to Ashland Historic District

GIS # 7870-60-9649 & 7870-70-0585

DC2RVA: Not Eligible; Contributes to Ashland Historic District

Ashland Museum Comments: he former Ashland Baptist Church, built in 1859, was the first of the protestant congregations to break free of the shared building called the Free Church or Union Church. It was the only congregation to build before the Civil War. It was a Greek Revival, board and batten church with a large cupola (sold after the war to pay the preacher) and very tall, stately windows. Remarkably, that portion of the church remains largely untouched inside and out. The turn-of-the-century additions include a columned porch to make it look Colonial Revival, two side wings and a room between for offices, and a 1957 Sunday School addition in the rear that does not affect the original building. During the Civil War, it was a major hospital for wounded soldiers. We know this from diaries, the R.T James' Burial Book from the 1860s, and oral histories passed down the generations. For those reasons, *it should be considered potentially eligible under Criterion A and C.* In 1967, the congregation outgrew the church and sold the building to a non-profit group to run as an arts and community center. The Hanover Arts and Activities Center (The Center) has faithfully cared for the building since that time. The long lawn in front of the building and the oaks and maples gracing it are integral to the property. It is used as a community gathering place that holds hundreds of people for the Ashland Railroad Run in April, the annual 4th of July celebration, Ashland Train Day in November, Beer Festival in the fall, and Light Up The Tracks celebration in December. To help keep The Center financially viable, the lawn and the former sanctuary are used on weekends for weddings and reunions. This is the Center's primary source of funds to run its programs in theatre and art. It would be wrong to cut into that landscape and remove a community gathering space and also terminating The Center's ability to finance its programs.

221

166-5041	Priddy House, 107 Stebbins Street	Ashland	c. 1926	Potentially Eligible Under C

GIS # 7870-60-6458

DC2RVA: Potentially Eligible Under C

Ashland Museum Comments: Built in the 1920s by town Mayor Newton Priddy, this is an unusually fine example of Craftsman Bungalow. The brick is rumored to be "silo brick." *Should be potentially eligible by criterion C.*

222

166-5072	Randolph-Macon College Historic District Expansion	Ashland	early 20th c. - mid-20th c.	Potentially Eligible Under Criteria A and C

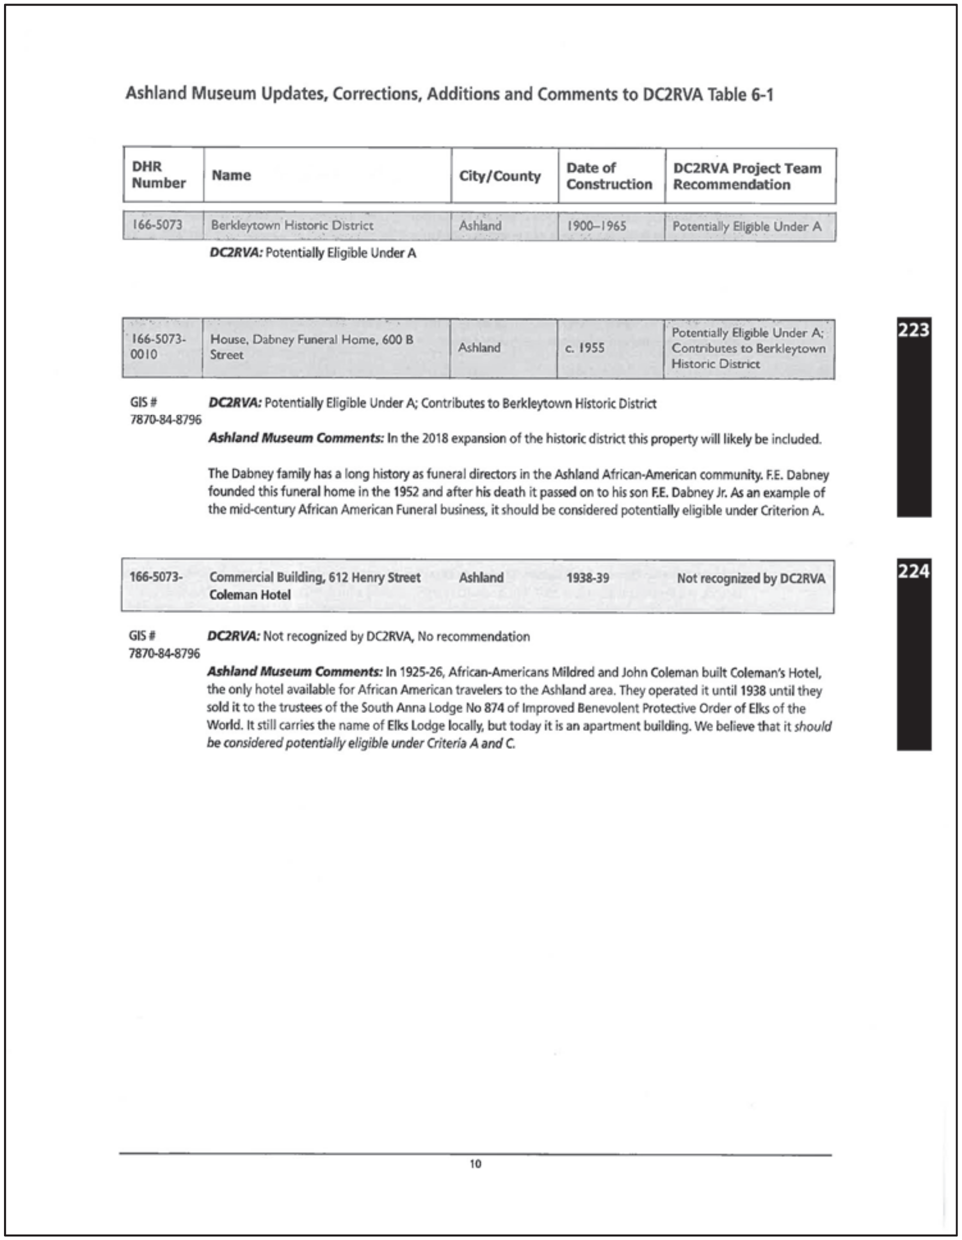
GIS # 7870-60-6458

DC2RVA: Potentially Eligible Under Criteria A and C; [Contributes to Ashland Historic District]

Ashland Historic District 2017 Survey Update Evaluation: The large brick structures at Randolph-Macon College including Thomas Branch Hall, Mary Branch Dormitory, and Peele Hall (not located in the Randolph-Macon College Complex; National Register of Historic Places) are good examples of the institutional interpretation of the Georgian Revival.

Ashland Museum Comments: Agree.

9



Ashland Museum Updates, Corrections, Additions and Comments to DC2RVA Table 6-1

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
166-5073	Berkleytown Historic District	Ashland	1900–1965	Potentially Eligible Under A

DC2RVA: Potentially Eligible Under A

223

166-5073-0010	House, Dabney Funeral Home, 600 B Street	Ashland	c. 1955	Potentially Eligible Under A; Contributes to Berkleytown Historic District

GIS # 7870-84-8796

DC2RVA: Potentially Eligible Under A; Contributes to Berkleytown Historic District

Ashland Museum Comments: In the 2018 expansion of the historic district this property will likely be included.

The Dabney family has a long history as funeral directors in the Ashland African-American community. F.E. Dabney founded this funeral home in the 1952 and after his death it passed on to his son F.E. Dabney Jr. As an example of the mid-century African American Funeral business, it should be considered potentially eligible under Criterion A.

224

166-5073-	Commercial Building, 612 Henry Street Coleman Hotel	Ashland	1938-39	Not recognized by DC2RVA

GIS # 7870-84-8796

DC2RVA: Not recognized by DC2RVA, No recommendation

Ashland Museum Comments: In 1925-26, African-Americans Mildred and John Coleman built Coleman's Hotel, the only hotel available for African American travelers to the Ashland area. They operated it until 1938 until they sold it to the trustees of the South Anna Lodge No 874 of Improved Benevolent Protective Order of Elks of the World. It still carries the name of Elks Lodge locally, but today it is an apartment building. We believe that it *should be considered potentially eligible under Criteria A and C.*

Ashland Museum Updates, Corrections, Additions and Comments to DC2RVA Table 6-1

Race Course Addition

225

Ashland Historic District 2017 Survey Update Evaluation: This neighborhood is known as the Race Course Addition because it was the location of the antebellum Ashland Race Course and was developed after 1870. According to the survey "The area located within the L-shaped area formed by Racecourse and … James Street includes a handsome grouping of late-19th century and early-20th century houses. Among these are some of the best examples of the Eastlake style found in Virginia. Set on large well-shaded yards, 316 St. James **[correct street name is James St., not St. James]**, 402 Duncan, and 207 Howard streets are among the exceptional examples of the Eastlake design. 402 displays decorative shingle siding, match-stick weather- boarding in the gable end, and a single-story porch with decorative brackets and spindle frieze."

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation
166-0001-0111	House, 402 Duncan Street	Ashland	1891	Not recognized by DC2RVA

226

GIS # 7779-69-2300

DC2RVA: Not recognized by DC2RVA, No recommendation

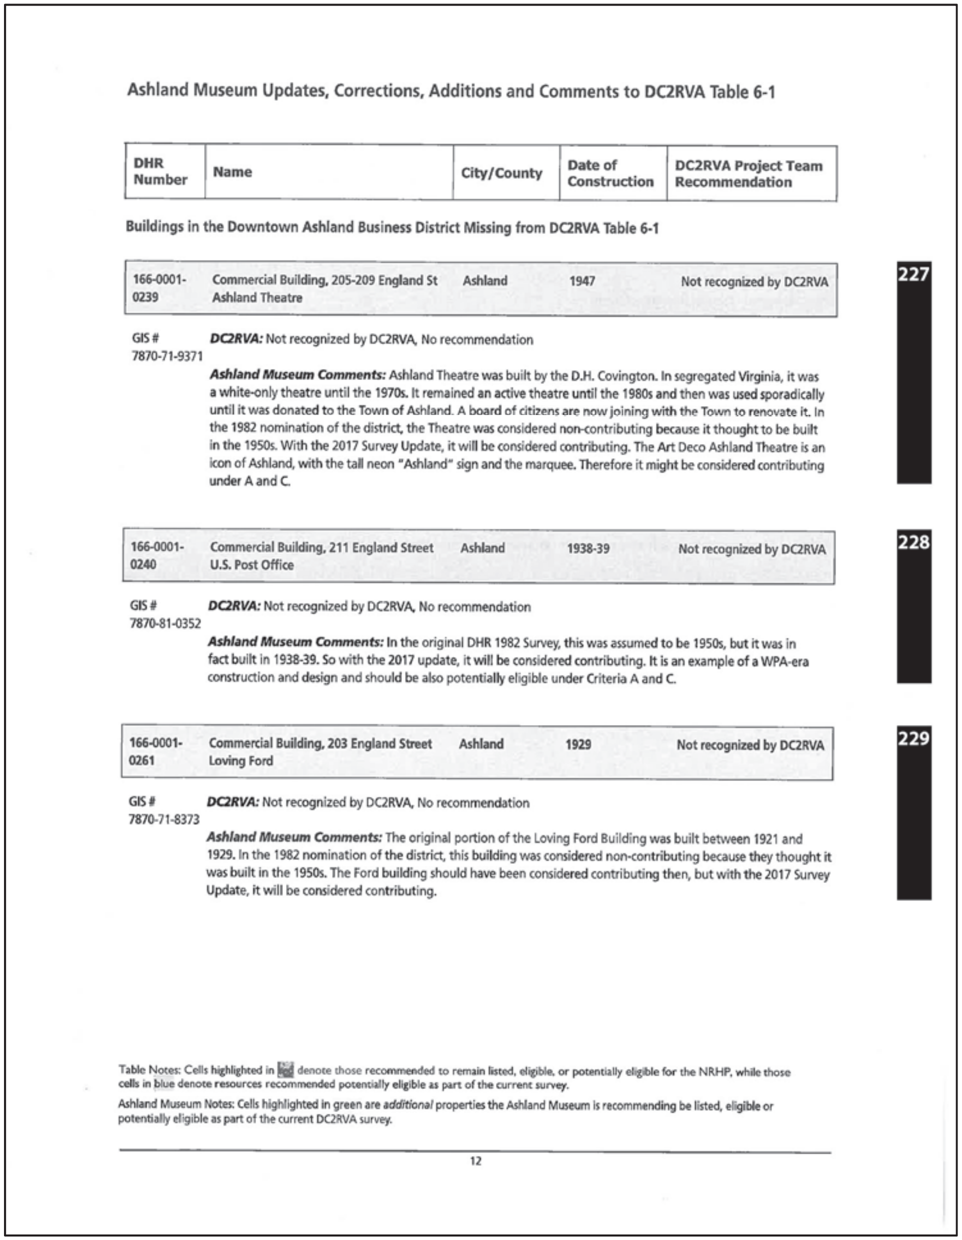
Ashland Historic District 2017 Survey Update Evaluation: "According to Hanover County property assessment records, this dwelling was built in 1891. It is an Eastlake style dwelling with complex plan and roofline, multiple exterior wall surfaces, decorative brackets in the gables, and porch with spindle frieze, and several projecting bays. It maintains its integrity of form, design, materials, location, setting, association, and feeling. This building is recommended as a contributing resource to the Ashland Historic District as an example of a late nineteenth century Eastlake house under Criterion C of the NRHP. It is not known to be associated with significant events or persons, and as an architectural resource is not recommended eligible under Criterion D."

Ashland Museum Comments: While this house is just outside the 500' border of the rail ROW, the high speed rail would certainly be in view. The James Chenery family rented the house and then purchased the house in 1902. They rented part of the house to the Moore family who then bought it when the Chenerys sold in 1925. Christopher and William L. Chenery grew up here. Chris Chenery was the owner of Triple Crown winner Secretariat, and William Chenery was the well-respected author and editor of *Collier's* magazine in New York from 1925-31. Will Chenery wrote *So It Seemed*, an autobiography that in the first chapters describes R-MC and Ashland at the turn of the century, talking about discrimination in the South. *It should be potentially eligible under Criteria A and B. It is a fine example of Eastlake Architecture and should be considered potentially eligible under Criterion C.*

11

VIRGINIA DEQ (continued)

(For response to comments 201 through 235, refer to pages B-178 and B-179)



Ashland Museum Updates, Corrections, Additions and Comments to DC2RVA Table 6-1

DHR Number	Name	City/County	Date of Construction	DC2RVA Project Team Recommendation

Buildings in the Downtown Ashland Business District Missing from DC2RVA Table 6-1

227

166-0001-0239	Commercial Building, 205-209 England St Ashland Theatre	Ashland	1947	Not recognized by DC2RVA

GIS # 7870-71-9371

DC2RVA: Not recognized by DC2RVA, No recommendation

Ashland Museum Comments: Ashland Theatre was built by the D.H. Covington. In segregated Virginia, it was a white-only theatre until the 1970s. It remained an active theatre until the 1980s and then was used sporadically until it was donated to the Town of Ashland. A board of citizens are now joining with the Town to renovate it. In the 1982 nomination of the district, the Theatre was considered non-contributing because it thought to be built in the 1950s. With the 2017 Survey Update, it will be considered contributing. The Art Deco Ashland Theatre is an icon of Ashland, with the tall neon "Ashland" sign and the marquee. Therefore it might be considered contributing under A and C.

228

166-0001-0240	Commercial Building, 211 England Street U.S. Post Office	Ashland	1938-39	Not recognized by DC2RVA

GIS # 7870-81-0352

DC2RVA: Not recognized by DC2RVA, No recommendation

Ashland Museum Comments: In the original DHR 1982 Survey, this was assumed to be 1950s, but it was in fact built in 1938-39. So with the 2017 update, it will be considered contributing. It is an example of a WPA-era construction and design and should be also potentially eligible under Criteria A and C.

229

166-0001-0261	Commercial Building, 203 England Street Loving Ford	Ashland	1929	Not recognized by DC2RVA

GIS # 7870-71-8373

DC2RVA: Not recognized by DC2RVA, No recommendation

Ashland Museum Comments: The original portion of the Loving Ford Building was built between 1921 and 1929. In the 1982 nomination of the district, this building was considered non-contributing because they thought it was built in the 1950s. The Ford building should have been considered contributing then, but with the 2017 Survey Update, it will be considered contributing.

Table Notes: Cells highlighted in red denote those recommended to remain listed, eligible, or potentially eligible for the NRHP, while those cells in blue denote resources recommended potentially eligible as part of the current survey.

Ashland Museum Notes: Cells highlighted in green are *additional* properties the Ashland Museum is recommending be listed, eligible or potentially eligible as part of the current DC2RVA survey.

THE
ASHLAND
MUSEUM

Showcasing the rich historical and cultural heritage of our town of Ashland, Virginia

June 19, 2017

Kerri S. Barile, Ph.D.
President, Dovetail Cultural Resource Group
c/o Virginia Department of Rail and Public Transportation
801 E. Main Street, Suite 1000
Richmond, VA 23219

Re: Comments on Cultural Resource Identification – Level Reports
Southeastern High Speed Rail Tier II Environmental Impact Statement
Washington, DC to Richmond Segment

Dear Kerri:

The Ashland Museum is taking advantage of your extension until June 19 to make additional comments.

The attachment is a summary list of the parcels the Ashland Museum commented on without the detail included in the May 30 letter/email. At this time, we are recommending a few additional properties from your Indentified Resources list be considered as potentially eligible. The list does not include our comments, but those can be forwarded to you in a separate document if you would like.

Please contact us with any questions.

Sincerely,

Rosanne Groat Shalf

Betsy Hodges

June 19, 2017 – Summary of Ashland Museum Comments on Identified Resources and Additional Updates

1. ***The following parcels are ones that DC2RVA has previously recommended for consideration as potentially eligible for individual listing. The Ashland Museum concurred in the letter and email to Dr. Barile on 5/30/17.*** 230

166-0001-0008, Ashland Station Depot, 112 N. Railroad Ave., 1923
166-0001-0015, 310 N. Center St., 1895, Business Office, R-MC (Blackwell House)
166-0001-0055, 702 S. Center St., 1850s
166-0001-0060, 708 S. Center St., 1894
166-0001-0077, 1005 S. Center St., 1890
Randolph-Macon College Historic District/Randolph-Macon College Historic Campus District/ Randolph-Macon College Complex Historic District
    166-0002, Washington Franklin Hall, Duncan Memorial Chapel, Pace Lecture Hall
        correct dates are Washington Franklin Hall – 1872, Pace Lecture Hall – 1876, Duncan Memorial Chapel – 1879
166-0036 and 166-0001-0063, 713 S. Center St., MacMurdo House, 1858
166-0037; 166-0001-0073, 904 S. Center St., 1886
166-5041, 107 Stebbins St., 1926
166-5072, Other R-MC Buildings, early- to mid-20th century, they are within the Ashland Historic District but not in R-MC Historic District,
    166-0001-0084, 114 College Ave., Thomas Branch Building, 1904
    166-0001-0243, Henry St., Peele Hall, 1922
    166-0001-0244, Henry St.. Mary Branch Residence Hall, 1906
166-5073, Berkleytown Historic District 1900-1965
    166-5073-0010, 600 B St., Dabney Funeral Home, 1952

2. ***The following parcels are ones that are on DC2RVA's list of Identified Resources, but are not listed as potentially eligible for individual listing. The Ashland Museum recommends that they are added to the list of potentially eligible. These were included in the letter and email to Dr. Barile on 5/30/17.*** 231

166-0001-0007, 104 N. Railroad Ave., Hanover National Bank Building, 1919
166-0001-0011, 206 N. Center Street, Ayers House, *correct date is 1866-70, columns added c. 1900*

166-0001-0007 to 0042, parcels on both sides of the track in the 100 block of S. Railroad Avenue – Historic Downtown District as a group, 1860s to 1925

166-0001-0036, 113 S. Railroad Ave., *correct date is 1870s or earlier*
166-0001-0040, 307 S. Railroad Ave., *correct date is pre-1900*
166-0001-0041, 403 S. Center St., *correct dates are 1858 (house), 1871 (shop)*
166-0001-0058, 706 S. Center St. *correct date is 1858/mansard roof added c. 1870*
166-0039, 166-0001-0082, 1014 S. Center St., 1888
166-0040; 166-0001-0044, 500 S. Center St., Hanover Arts and Activities Center/ Ashland Baptist Church, 1859

3. ***These parcels were not on DC2RVA's list of identified resources or were not evaluated. The Ashland Museum included them in the letter and email to Dr. Barile on 5/30/17 as potentially eligible. Although they fall just outside of the 500' rail ROW, they were included based on Dr. Barile's criterion that the high speed rail is certainly in view of the property.*** 232
    166-0001-0111, 402 Duncan St., House, 1891
    166-0001-0240, 211 England St., USPO, *correct date is 1938-39*
    166-0001-0261, 203 England Street, Commercial Building (Ford motor), 1921-29,

Berkleytown Historic District additions
    166-5073, 612 Henry St., Coleman Hotel (Elk's Lodges), 1925-26

166-0001-0035, 111 S. Railroad Ave., (Hometown Realty) c. 1900

166-0001-0232, 103-109 England St., *Correction: date is 1925.*

5. ***The following parcel is on DC2RVA's list of Identified Resources and the Ashland Museum concurs with the recommendation, but corrections are noted. This was not listed in the letter and email to Dr. Barile on 5/30/17.*** 234

166-0001-0083, 1017 S. Center St., *Correction: date is 1888-1889.*

6. ***The following parcels are additional ones that were not on DC2RVA's list of potentially eligible and were not previously noted by the Museum, but ones that the Ashland Museum would like to add to those deemed potentially eligible.*** 235

166-0001-0013, 304 N. Center St., 1858 with 1925 renovation, Rhodeen, home of St. George Tucker, clerk of the Virginia Senate, Richard Bierne, editor of State newspaper, Mary Bierne prominent horticulturist.

166-0001-0017, 312 N. Center St., 1850s, owned by George Nolley, prominent Methodist minister, and son Olin, who was a builder/designer of many homes in Ashland, active around 1900-30

166-0001-0049, 600 S. Center St., 1850s with post Civil War Italianate details added, home of the Stebbins family

166-0001-0050, 601 S. Center St., 1850s, W. W. Bennett home and farm, R-MC President

166-0001-0051, 603 S. Center St., 1850s

166-0001-0052, 604 S. Center St., 1850s, Vernacular I-house

166-0001-0069, 804 S. Center St., 1870s, Vernacular I-house

166-0001-0070, 805 S. Center St., 1880s, Eastlake/ Stick Style

166-0001-0071, 807 S. Center St., Vernacular I-house, 1870

166-0001-0072, 901 S. Center St., 1910s, Queen Anne, recently renovated,

166-0001-0074, 905 S. Center St., Colonial Revival, c. 1900

166-0001-0081, 1013 S. Center St., Colonial Revival, c. 1900

166-0001-0110, 400 Duncan St., Architect-designed Craftsman home

166-0001-0186, 203 Race Course St., Transitional Queen Anne/Colonial Revival, c. 1900

166-0001-0211, 203 Virginia St., 1850s, Vernacular antebellum

166-0001-0213, 300 Virginia St., 1850s, Vernacular antebellum, 1870s Italianate decoration added

166-0001-0214, 301 Virginia St., 1850s, Vernacular antebellum, 1870s Italianate decoration added

166-0001-0215, 302 Virginia St., 1850s, Vernacular antebellum, 1870s Italianate decoration added

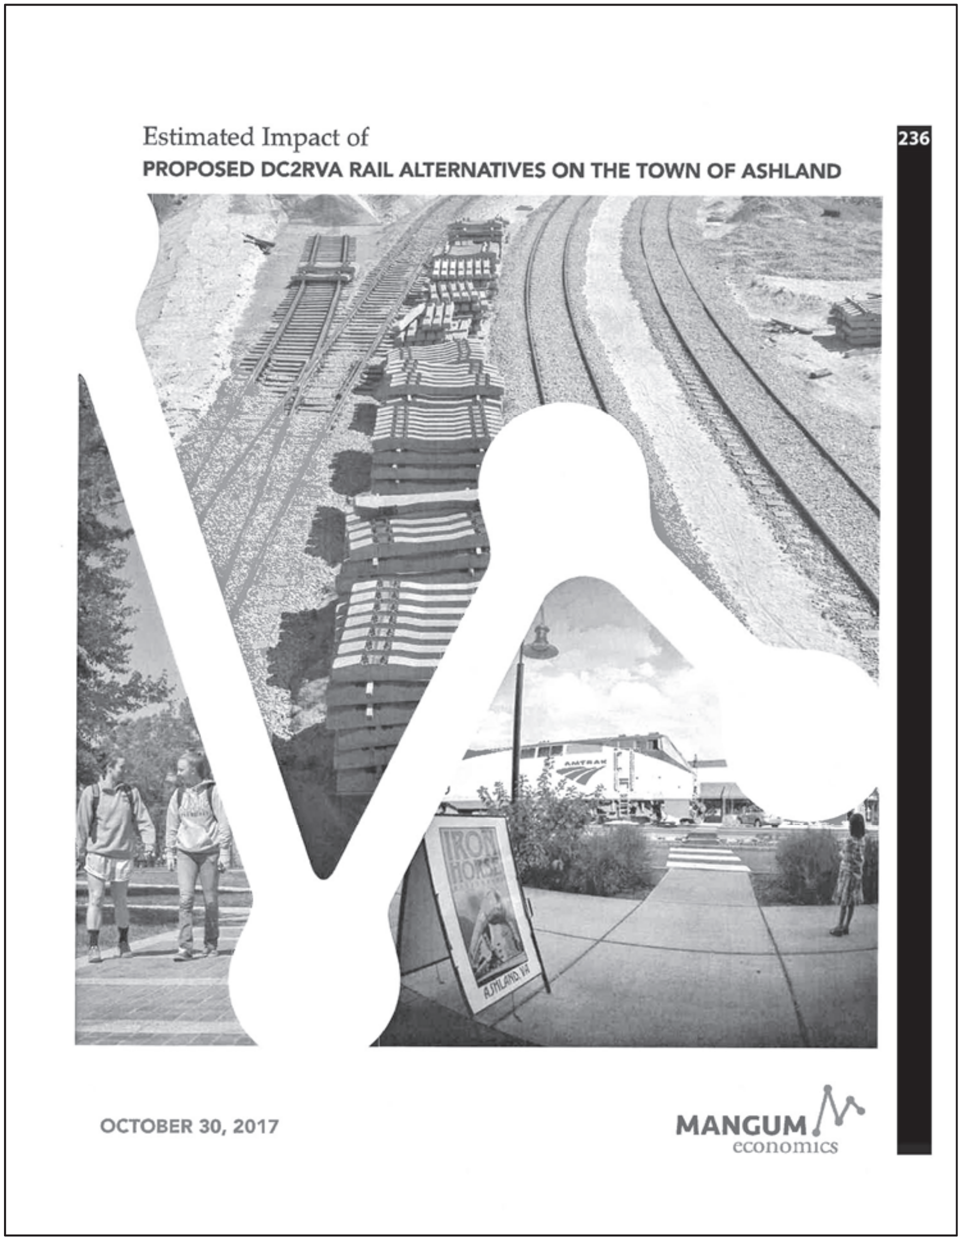
166-0001-0216, 303 Virginia St., 1850s, Vernacular antebellum

166-0001-0218, 401 Virginia St., 1870-80s, Ashland Presbyterian Church

No DHR #, 1009 S. Center St., 1910-20, "Telcourt" built by Luck Family on England Street east of Rt 1, moved to this location in 2010

Berkleytown Historic District additions

  166-5073-, Franklin Jackson home, 1880s
  166-5073-, corner of Berkley and Henry Streets, John M. Gandy School, 1948, mid-century modern, good example of the Prairie School Style or Chicago School Style influenced by Frank Lloyd Wright and the Bauhaus Movement.



236

Estimated Impact of

PROPOSED DC2RVA RAIL ALTERNATIVES ON THE TOWN OF ASHLAND

OCTOBER 30, 2017

MANGUM economics

VIRGINIA DEQ (continued)

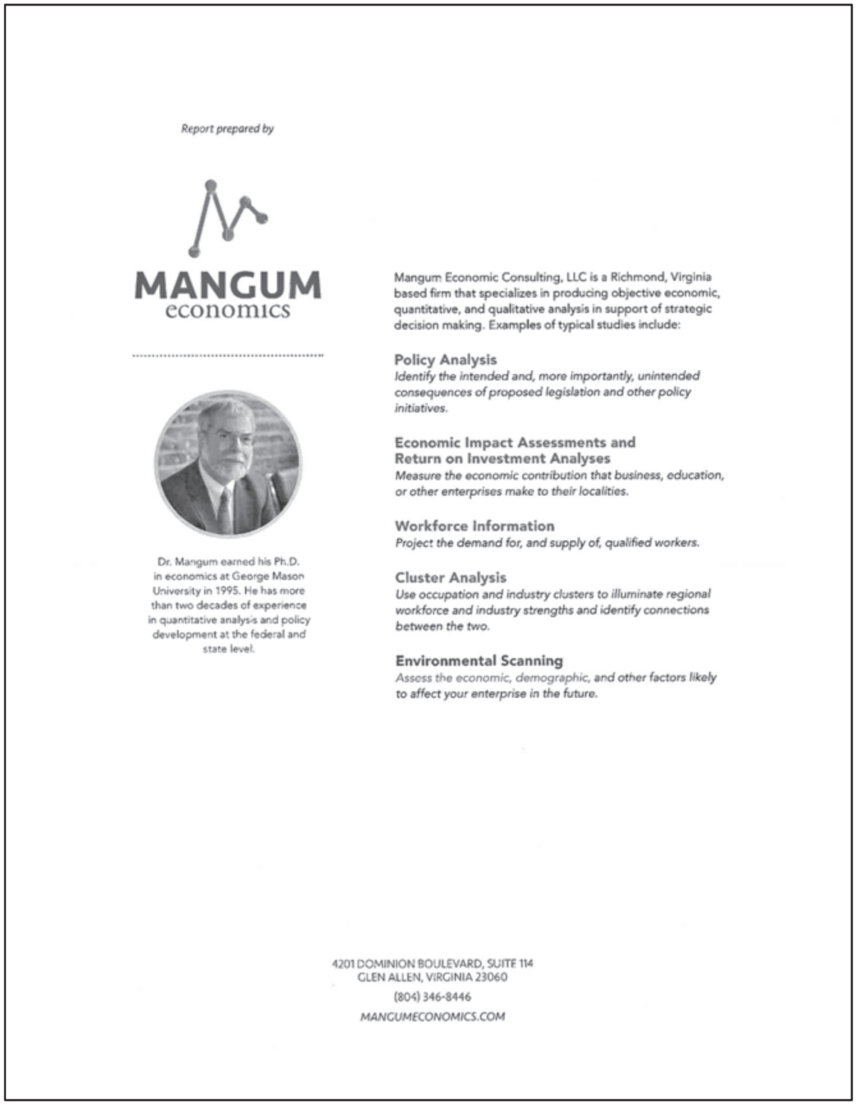
236. DRPT acknowledges that the Town of Ashland commissioned an economic report and has included the report in its formal comments.

NEPA requires FRA to evaluate the physical impacts of construction of no-build and build alternatives. Relocation of businesses is the primary adverse economic effect of a build alternative. Build Alternative 5A, the Preferred Alternative for Area 5, has one business relocation on Ashcake Road due to the grade separation of Ashcake Road and the CSXT tracks for safety and traffic mobility purposes. There are adequate replacement properties available for relocation purposes in the area.

The economic report commissioned by the Town of Ashland focused on "two general categories [of construction alternatives] that are likely to have a significantly disruptive impact": "the proposals that add a third above-ground track" and "constructing the three-track trench" (Mangum, p.15). Alternative 5A, the Preferred Alternative for Area 5, does not fall into either of these categories and was not formally assessed in the report. Nevertheless, the "Disruptive Impact of Construction" is addressed in Section 4.11.1 of the Draft EIS and Section 5.11.1 of the Final EIS and comes to a similar conclusion as the report.

The construction management plan (to be developed once final design is complete and construction is to commence) will include provisions to maintain access during construction to all businesses/buildings not being relocated.

VIRGINIA DEQ (continued)



Report prepared by

MANGUM
economics

Mangum Economic Consulting, LLC is a Richmond, Virginia based firm that specializes in producing objective economic, quantitative, and qualitative analysis in support of strategic decision making. Examples of typical studies include:

Policy Analysis
Identify the intended and, more importantly, unintended consequences of proposed legislation and other policy initiatives.

Economic Impact Assessments and Return on Investment Analyses
Measure the economic contribution that business, education, or other enterprises make to their localities.

Workforce Information
Project the demand for, and supply of, qualified workers.

Cluster Analysis
Use occupation and industry clusters to illuminate regional workforce and industry strengths and identify connections between the two.

Environmental Scanning
Assess the economic, demographic, and other factors likely to affect your enterprise in the future.

Dr. Mangum earned his Ph.D. in economics at George Mason University in 1995. He has more than two decades of experience in quantitative analysis and policy development at the federal and state level.

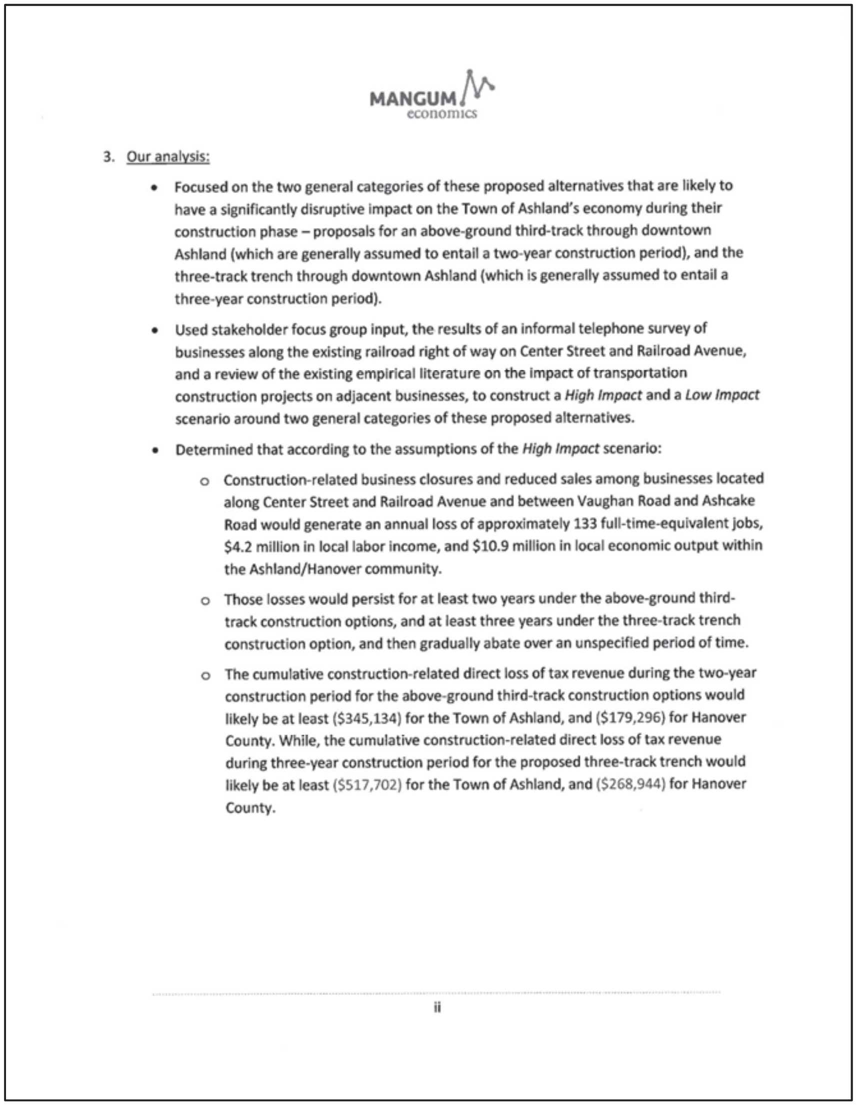
Executive Summary

This report assesses the potential economic and fiscal impact on the Town of Ashland from proposed construction alternatives associated with Alternative Area 5, the ten-mile portion of the 123-mile DC2RVA High-Speed Rail Project that encompasses the Town of Ashland. The principal findings from that assessment are as follows:

1. The DC2RVA High-Speed Rail Project:
    - The purpose of DC2RVA is to increase rail capacity along the Washington, D.C. to Richmond corridor in order to provide reliable, frequent, and high-speed passenger service, and also to better accommodate freight rail movement through the corridor, including freight going to and from Virginia's ports.
    - In addition to proposed improvements to stations, parking, signals, and other safety systems, the primary infrastructure improvement associated with the DC2RVA High-Speed Rail Project would be to add an additional main track to the existing two main tracks within this corridor.
2. Proposed construction alternatives for the Ashland portion of the DC2RVA corridor:
    - In September of this year, Federal Rail Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) proposed five general construction alternatives for the Ashland portion of the DC2RVA High-Speed Rail Project. Those alternatives were: 1) maintain two tracks through Ashland (the 3:2:3 option), 2) add one track east of the existing two tracks running through Ashland, 3) construct three tracks running through Ashland that would be centered within the existing right of way, 4) construct a three-track trench running through Ashland, and 5) add a two-track western bypass.:
        - Maintain two tracks through Ashland (the 3:2:3 option).
        - Add one track east of the existing two tracks running through Ashland.
        - Construct three tracks running through Ashland that would be centered within the existing right of way.
        - Construct a three-track trench running through Ashland.
        - Add a two-track western bypass>
    - Subsequent to the release of the FRA and DRPT proposed construction alternatives:
        - The Hanover County Board of Supervisors passed a resolution endorsing the 3-2-3 construction alternative.
        - The Ashland Town Council passed a resolution endorsing the western bypass.

i

VIRGINIA DEQ (continued)

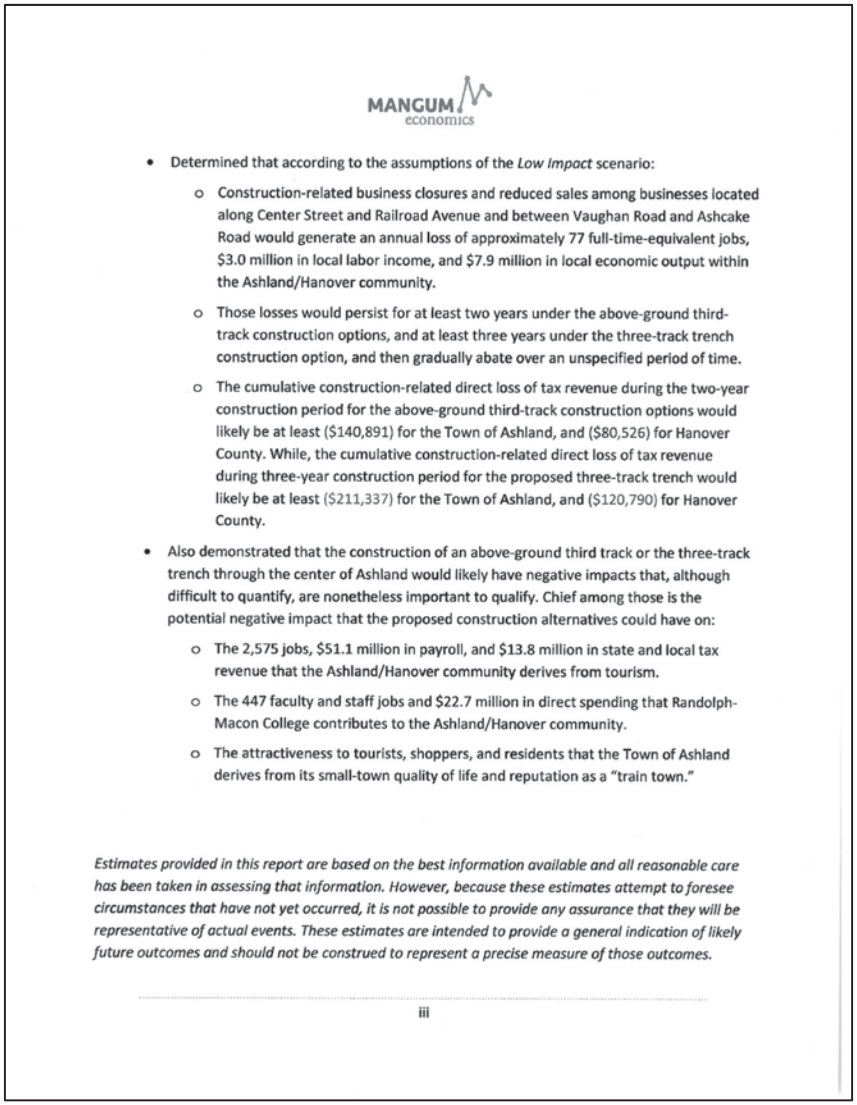


MANGUM economics

3. Our analysis:
   - Focused on the two general categories of these proposed alternatives that are likely to have a significantly disruptive impact on the Town of Ashland's economy during their construction phase – proposals for an above-ground third-track through downtown Ashland (which are generally assumed to entail a two-year construction period), and the three-track trench through downtown Ashland (which is generally assumed to entail a three-year construction period).
   - Used stakeholder focus group input, the results of an informal telephone survey of businesses along the existing railroad right of way on Center Street and Railroad Avenue, and a review of the existing empirical literature on the impact of transportation construction projects on adjacent businesses, to construct a *High Impact* and a *Low Impact* scenario around two general categories of these proposed alternatives.
   - Determined that according to the assumptions of the *High Impact* scenario:
     - Construction-related business closures and reduced sales among businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road would generate an annual loss of approximately 133 full-time-equivalent jobs, $4.2 million in local labor income, and $10.9 million in local economic output within the Ashland/Hanover community.
     - Those losses would persist for at least two years under the above-ground third-track construction options, and at least three years under the three-track trench construction option, and then gradually abate over an unspecified period of time.
     - The cumulative construction-related direct loss of tax revenue during the two-year construction period for the above-ground third-track construction options would likely be at least ($345,134) for the Town of Ashland, and ($179,296) for Hanover County. While, the cumulative construction-related direct loss of tax revenue during three-year construction period for the proposed three-track trench would likely be at least ($517,702) for the Town of Ashland, and ($268,944) for Hanover County.

ii

VIRGINIA DEQ (continued)



MANGUM economics

- Determined that according to the assumptions of the *Low Impact* scenario:
  - Construction-related business closures and reduced sales among businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road would generate an annual loss of approximately 77 full-time-equivalent jobs, $3.0 million in local labor income, and $7.9 million in local economic output within the Ashland/Hanover community.
  - Those losses would persist for at least two years under the above-ground third-track construction options, and at least three years under the three-track trench construction option, and then gradually abate over an unspecified period of time.
  - The cumulative construction-related direct loss of tax revenue during the two-year construction period for the above-ground third-track construction options would likely be at least ($140,891) for the Town of Ashland, and ($80,526) for Hanover County. While, the cumulative construction-related direct loss of tax revenue during three-year construction period for the proposed three-track trench would likely be at least ($211,337) for the Town of Ashland, and ($120,790) for Hanover County.
- Also demonstrated that the construction of an above-ground third track or the three-track trench through the center of Ashland would likely have negative impacts that, although difficult to quantify, are nonetheless important to qualify. Chief among those is the potential negative impact that the proposed construction alternatives could have on:
  - The 2,575 jobs, $51.1 million in payroll, and $13.8 million in state and local tax revenue that the Ashland/Hanover community derives from tourism.
  - The 447 faculty and staff jobs and $22.7 million in direct spending that Randolph-Macon College contributes to the Ashland/Hanover community.
  - The attractiveness to tourists, shoppers, and residents that the Town of Ashland derives from its small-town quality of life and reputation as a "train town."

Estimates provided in this report are based on the best information available and all reasonable care has been taken in assessing that information. However, because these estimates attempt to foresee circumstances that have not yet occurred, it is not possible to provide any assurance that they will be representative of actual events. These estimates are intended to provide a general indication of likely future outcomes and should not be construed to represent a precise measure of those outcomes.

MANGUM economics

Introduction

This report quantifies the potential economic and fiscal impact on the Town of Ashland from proposed construction alternatives associated with Alternative Area 5, the ten-mile portion of the 123-mile DC2RVA High-Speed Rail Project that encompasses the Town of Ashland. The remainder of the report is divided into five sections. *The DC2RVA High-Speed Rail Project* section provides a brief summary of the DC2RVA project and the evolution of the process that generated the currently proposed construction alternatives. The *Background Information* section provides a context for the economic and fiscal impact assessment to follow by providing general background on the Town of Ashland and the economy of the . The *Economic and Fiscal Impact* section provides an estimate of the potential economic and fiscal impact on the Town of Ashland associated with existing proposed Alternative Area 5 construction alternatives. While the *Other Impacts* section identifies and addresses some of the other potential consequences associated with those proposed construction alternatives. Finally, the *Conclusion* section provides a brief summary of our findings and concluding comments.

The DC2RVA High-Speed Rail Project

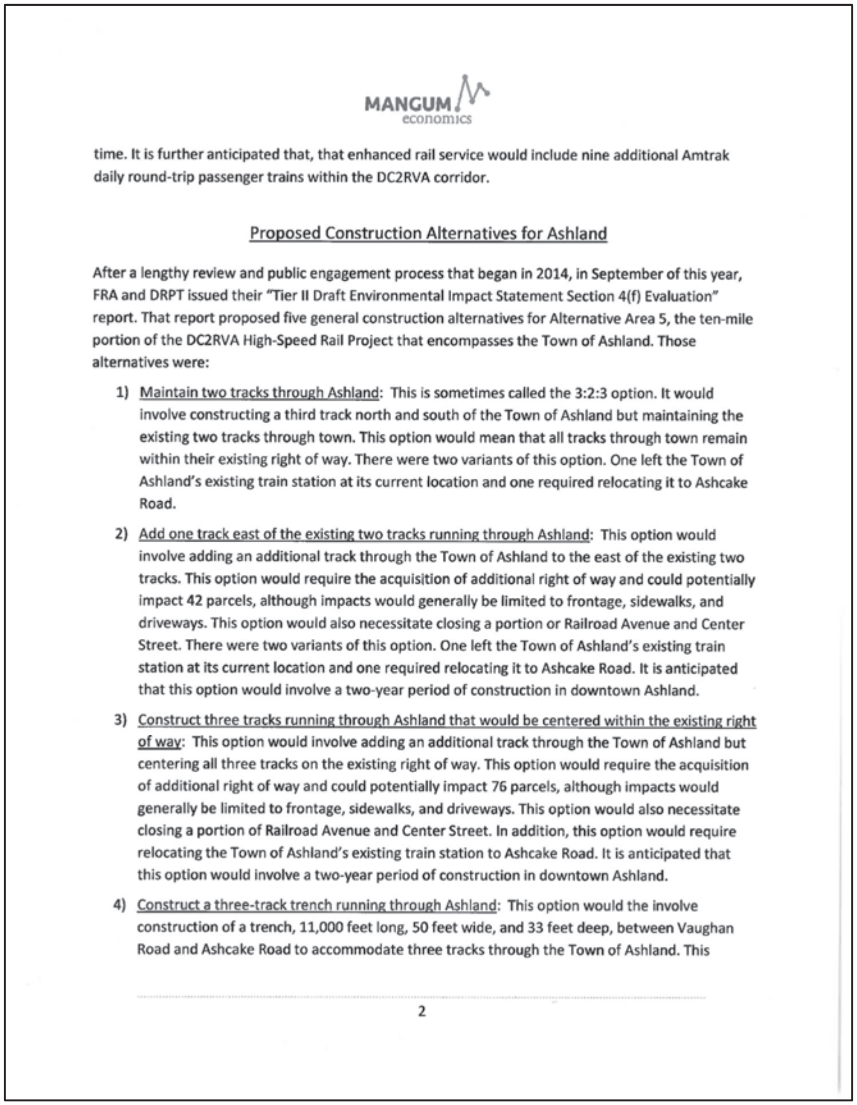
General Description

The DC2RVA High-Speed Rail Project involves service and infrastructure improvements to an existing 123-mile rail corridor owned by CSX Transportation that links Union Station in Washington D.C. to Centralia in Chesterfield County just south of Richmond. The purpose of the project is to increase rail capacity along the Washington, D.C. to Richmond corridor in order to provide reliable, frequent, and high-speed passenger service, and also to better accommodate freight rail movement through the corridor, including freight going to and from Virginia's ports. The need for these improvements is being driven primarily by population growth along the eastern seaboard, which is causing significant and ever-worsening congestion in the I-95 interstate highway corridor, and that is increasing the demand for efficient and reliable passenger rail service and freight rail service within the DC2RVA rail corridor.

In addition to proposed improvements to stations, parking, signals, and other safety systems, the primary infrastructure improvement associated with the DC2RVA High-Speed Rail Project would be to add an additional main track, either to the left or right, of the existing two main tracks within this corridor. According to the Federal Rail Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT), it is anticipated that the proposed improvements to the DC2RVA corridor would be completed by 2025 and enhanced passenger and rail service could be made available at that

1

VIRGINIA DEQ (continued)



MANGUM economics

time. It is further anticipated that, that enhanced rail service would include nine additional Amtrak daily round-trip passenger trains within the DC2RVA corridor.

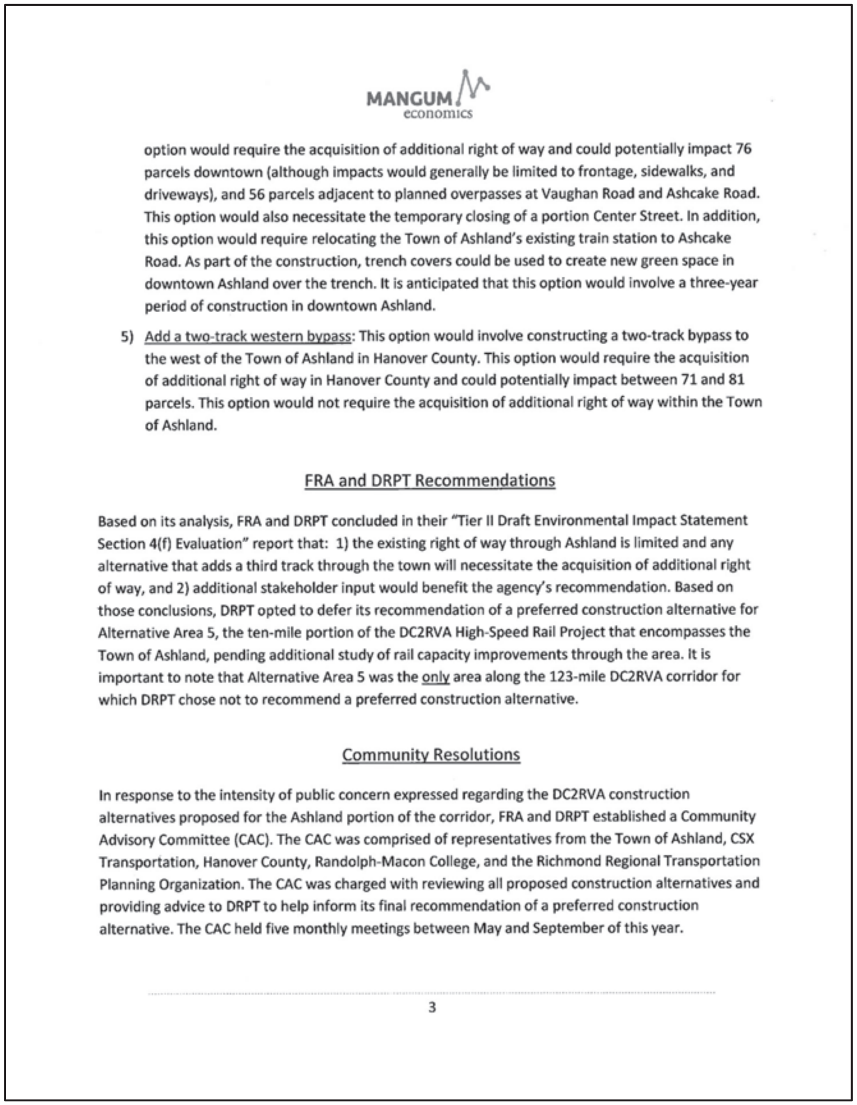
Proposed Construction Alternatives for Ashland

After a lengthy review and public engagement process that began in 2014, in September of this year, FRA and DRPT issued their "Tier II Draft Environmental Impact Statement Section 4(f) Evaluation" report. That report proposed five general construction alternatives for Alternative Area 5, the ten-mile portion of the DC2RVA High-Speed Rail Project that encompasses the Town of Ashland. Those alternatives were:

1) Maintain two tracks through Ashland: This is sometimes called the 3:2:3 option. It would involve constructing a third track north and south of the Town of Ashland but maintaining the existing two tracks through town. This option would mean that all tracks through town remain within their existing right of way. There were two variants of this option. One left the Town of Ashland's existing train station at its current location and one required relocating it to Ashcake Road.
2) Add one track east of the existing two tracks running through Ashland: This option would involve adding an additional track through the Town of Ashland to the east of the existing two tracks. This option would require the acquisition of additional right of way and could potentially impact 42 parcels, although impacts would generally be limited to frontage, sidewalks, and driveways. This option would also necessitate closing a portion or Railroad Avenue and Center Street. There were two variants of this option. One left the Town of Ashland's existing train station at its current location and one required relocating it to Ashcake Road. It is anticipated that this option would involve a two-year period of construction in downtown Ashland.
3) Construct three tracks running through Ashland that would be centered within the existing right of way: This option would involve adding an additional track through the Town of Ashland but centering all three tracks on the existing right of way. This option would require the acquisition of additional right of way and could potentially impact 76 parcels, although impacts would generally be limited to frontage, sidewalks, and driveways. This option would also necessitate closing a portion of Railroad Avenue and Center Street. In addition, this option would require relocating the Town of Ashland's existing train station to Ashcake Road. It is anticipated that this option would involve a two-year period of construction in downtown Ashland.
4) Construct a three-track trench running through Ashland: This option would the involve construction of a trench, 11,000 feet long, 50 feet wide, and 33 feet deep, between Vaughan Road and Ashcake Road to accommodate three tracks through the Town of Ashland. This

2

VIRGINIA DEQ (continued)



option would require the acquisition of additional right of way and could potentially impact 76 parcels downtown (although impacts would generally be limited to frontage, sidewalks, and driveways), and 56 parcels adjacent to planned overpasses at Vaughan Road and Ashcake Road. This option would also necessitate the temporary closing of a portion Center Street. In addition, this option would require relocating the Town of Ashland's existing train station to Ashcake Road. As part of the construction, trench covers could be used to create new green space in downtown Ashland over the trench. It is anticipated that this option would involve a three-year period of construction in downtown Ashland.

5) Add a two-track western bypass: This option would involve constructing a two-track bypass to the west of the Town of Ashland in Hanover County. This option would require the acquisition of additional right of way in Hanover County and could potentially impact between 71 and 81 parcels. This option would not require the acquisition of additional right of way within the Town of Ashland.

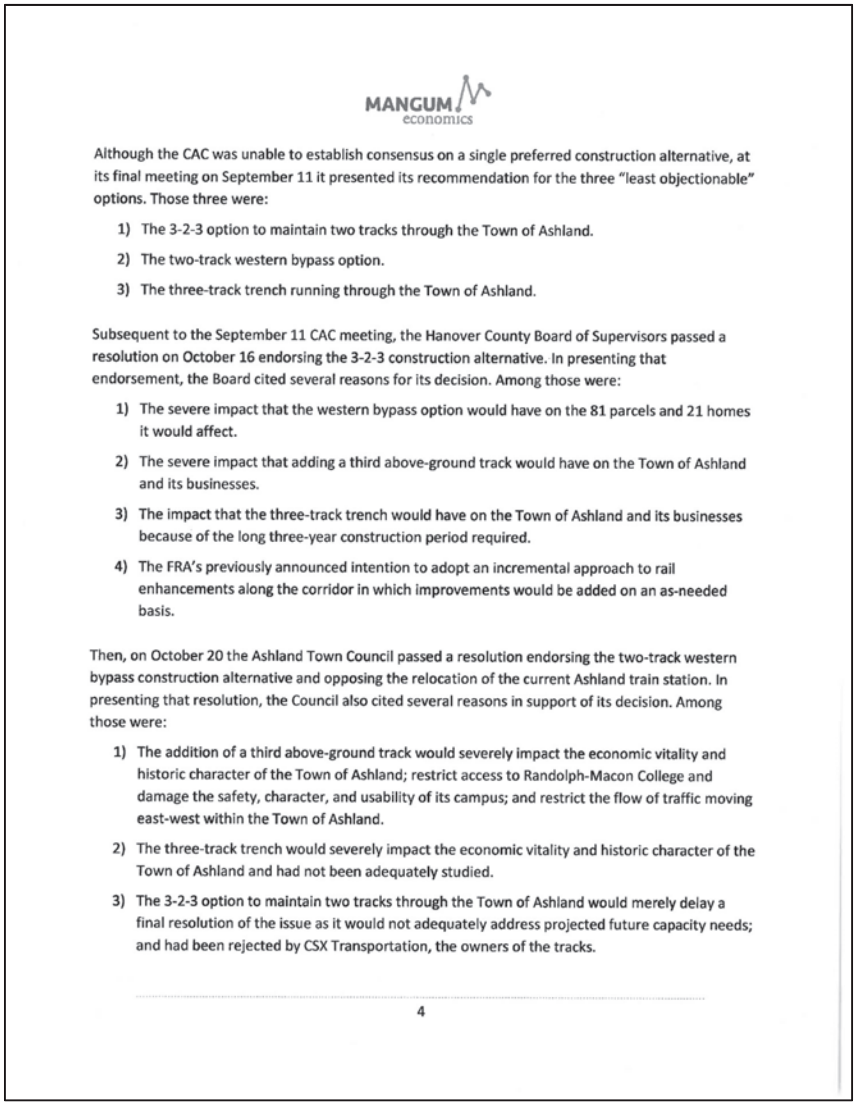
FRA and DRPT Recommendations

Based on its analysis, FRA and DRPT concluded in their "Tier II Draft Environmental Impact Statement Section 4(f) Evaluation" report that: 1) the existing right of way through Ashland is limited and any alternative that adds a third track through the town will necessitate the acquisition of additional right of way, and 2) additional stakeholder input would benefit the agency's recommendation. Based on those conclusions, DRPT opted to defer its recommendation of a preferred construction alternative for Alternative Area 5, the ten-mile portion of the DC2RVA High-Speed Rail Project that encompasses the Town of Ashland, pending additional study of rail capacity improvements through the area. It is important to note that Alternative Area 5 was the only area along the 123-mile DC2RVA corridor for which DRPT chose not to recommend a preferred construction alternative.

Community Resolutions

In response to the intensity of public concern expressed regarding the DC2RVA construction alternatives proposed for the Ashland portion of the corridor, FRA and DRPT established a Community Advisory Committee (CAC). The CAC was comprised of representatives from the Town of Ashland, CSX Transportation, Hanover County, Randolph-Macon College, and the Richmond Regional Transportation Planning Organization. The CAC was charged with reviewing all proposed construction alternatives and providing advice to DRPT to help inform its final recommendation of a preferred construction alternative. The CAC held five monthly meetings between May and September of this year.

VIRGINIA DEQ (continued)



Although the CAC was unable to establish consensus on a single preferred construction alternative, at its final meeting on September 11 it presented its recommendation for the three "least objectionable" options. Those three were:

1) The 3-2-3 option to maintain two tracks through the Town of Ashland.
2) The two-track western bypass option.
3) The three-track trench running through the Town of Ashland.

Subsequent to the September 11 CAC meeting, the Hanover County Board of Supervisors passed a resolution on October 16 endorsing the 3-2-3 construction alternative. In presenting that endorsement, the Board cited several reasons for its decision. Among those were:

1) The severe impact that the western bypass option would have on the 81 parcels and 21 homes it would affect.
2) The severe impact that adding a third above-ground track would have on the Town of Ashland and its businesses.
3) The impact that the three-track trench would have on the Town of Ashland and its businesses because of the long three-year construction period required.
4) The FRA's previously announced intention to adopt an incremental approach to rail enhancements along the corridor in which improvements would be added on an as-needed basis.

Then, on October 20 the Ashland Town Council passed a resolution endorsing the two-track western bypass construction alternative and opposing the relocation of the current Ashland train station. In presenting that resolution, the Council also cited several reasons in support of its decision. Among those were:

1) The addition of a third above-ground track would severely impact the economic vitality and historic character of the Town of Ashland; restrict access to Randolph-Macon College and damage the safety, character, and usability of its campus; and restrict the flow of traffic moving east-west within the Town of Ashland.
2) The three-track trench would severely impact the economic vitality and historic character of the Town of Ashland and had not been adequately studied.
3) The 3-2-3 option to maintain two tracks through the Town of Ashland would merely delay a final resolution of the issue as it would not adequately address projected future capacity needs; and had been rejected by CSX Transportation, the owners of the tracks.

Background Information

In this section, we provide a context for the economic and fiscal impact analyses to follow by providing some general background on the Town of Ashland and the Ashland/Hanover economy.

General Description

The Town of Ashland is a historic and picturesque locality with a population of around 7,200 residents. It was initially developed by the railroad as a mineral springs resort in the late 1840s. In 1868, Randolph-Macon College relocated to the Town of Ashland and that move eventually transitioned the character of Ashland into what it is today – a small college town where Randolph-Macon College not only provides a cultural locus for the Ashland community but is also the town's primary economic driver.

Recent Economic Trends

In this portion of the section, we set the stage for the economic and fiscal impact analyses to follow by providing background information on the Ashland/Hanover community's key economic characteristics. In reviewing these data, it is important to keep in mind that employment and wage data reported for Hanover County are inclusive of the Town of Ashland.[1]

Total Employment

Figure 1 provides data on the trend in total employment in Hanover County over the five-year period from the first quarter of 2012 through the first quarter of 2017. As these data demonstrate, employment growth in the county increased steadily over the period. Overall, between 1st quarter of 2012 and the 1st quarter of 2017 Hanover County experienced an increase of 5,723 jobs, or a 13.1 percent increase in total employment. To put that figure in perspective, over the same period the state of Virginia as a whole experienced a 6.0 percent increase in total employment.

---

[1] Because the Town of Ashland is not an independent city, its employment and wage data are not reported individually by the Virginia Employment Commission. Instead, they are included in data reported for Hanover County.

Figure 1: Hanover County Total Employment – 1st Quarter of 2012 through 1st Quarter of 2017[2]

To provide a point of reference, and to control for seasonality, Figure 2 compares Hanover County's year-over-year change in total employment over this same five-year period to comparable data for the state of Virginia as a whole. Any observation above the zero line in this graph denotes a year-over-year increase in employment, while any observation below the zero line denotes a year-over-year decline in employment. As these data indicate, up until 2016 year-over-year changes in employment in Hanover County generally exceeded the statewide average and typically by a substantial margin. However, in 2016 that changed as employment growth within the county collapsed back to the statewide trend. Moreover, in both cases, employment growth decelerated steadily throughout 2016. As of the first quarter of 2017, the year-over-year change in total employment was 1.4 percent in both Hanover County and the state of Virginia as a whole.

Employment and Wages by Major Industry Sector

Figures 3 and 4 provide additional information on the factors underlying the employment trends displayed in Figures 1 and 2, by providing data on employment and wages by major industry sector in Hanover County in 2016. As these data show, the largest employment sector in the county that year was *Retail Trade* with 7,188 jobs (18th in wages at $585 per week), followed by *Health Care and Social Assistance* with 6,368 jobs (9th in wages at $927 per week), *Wholesale Trade* with 5,212 jobs (5th in wages at $1,110 per week), *Construction* with 5,209 jobs (8th in wages at $954 per week), and *Accommodation and Food Services* with 3,855 jobs (19th in wages at $292 per week). To place these figures in perspective, the average wage across all industry sectors in Hanover County in 2016 was $799 per week.

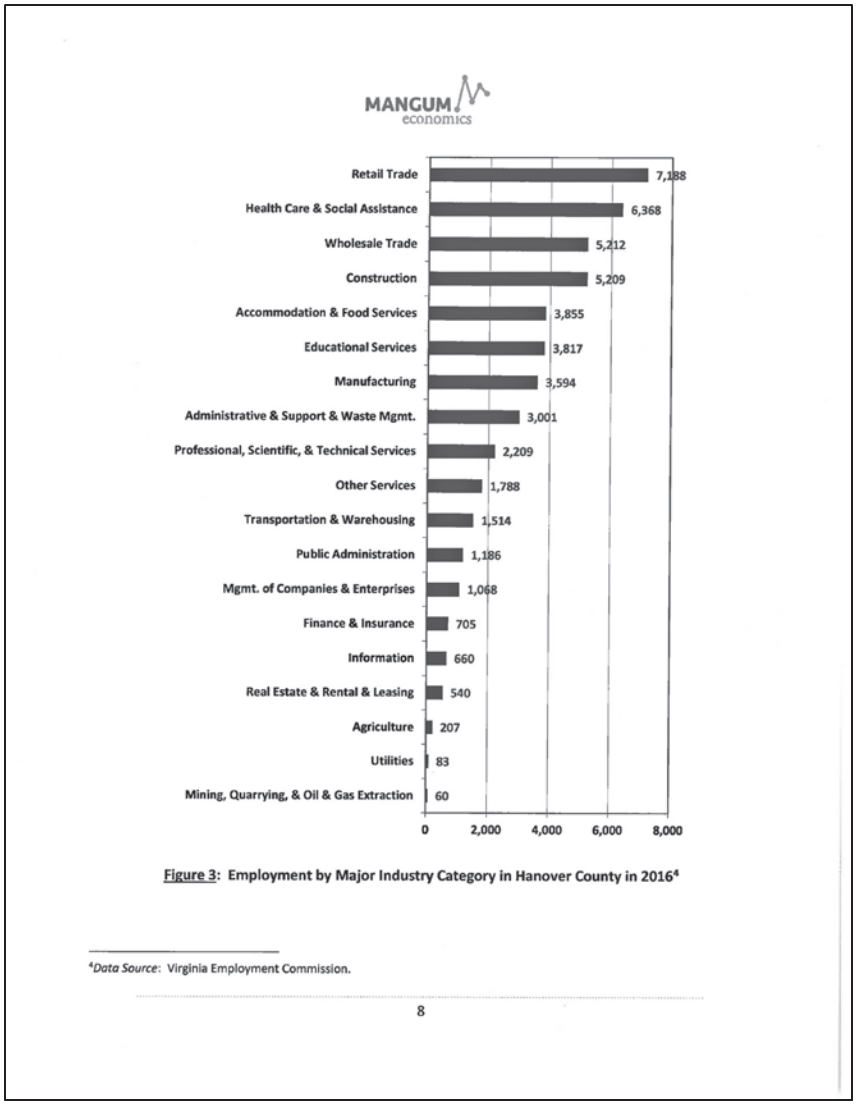
VIRGINIA DEQ (continued)



MANGUM economics

Figure 5 depicts the change in employment in Hanover County by major industry sector between 2015 and 2016. As these data indicate, the largest employment gains in the county over this period occurred in the *Administrative and Support and Waste Management Services* (up 208 jobs), *Health Care and Social Assistance* (up 137 jobs), and *Accommodation and Food Services* (up 105 jobs) sectors. At the other end of the spectrum, the largest employment losses in Hanover County occurred in the *Construction* (down 134 jobs), *Mining* (down 33 jobs), and *Information* (down 31 jobs) sectors.

Unemployment

Figure 6 provides information on unemployment trends in Hanover County over the five-year period from August 2012 to August 2017 and benchmarks those data against the statewide norm. As these data show, throughout this period unemployment rates in the county tracked relatively closely with the statewide average. However, Hanover County's unemployment rate was typically about one half a percentage point below the statewide average. As of August 2017, unemployment stood at 3.4 percent in Hanover County and 3.8 percent statewide in Virginia.

Figure 6: Unemployment Rate – August 2012 to August 2017[7]

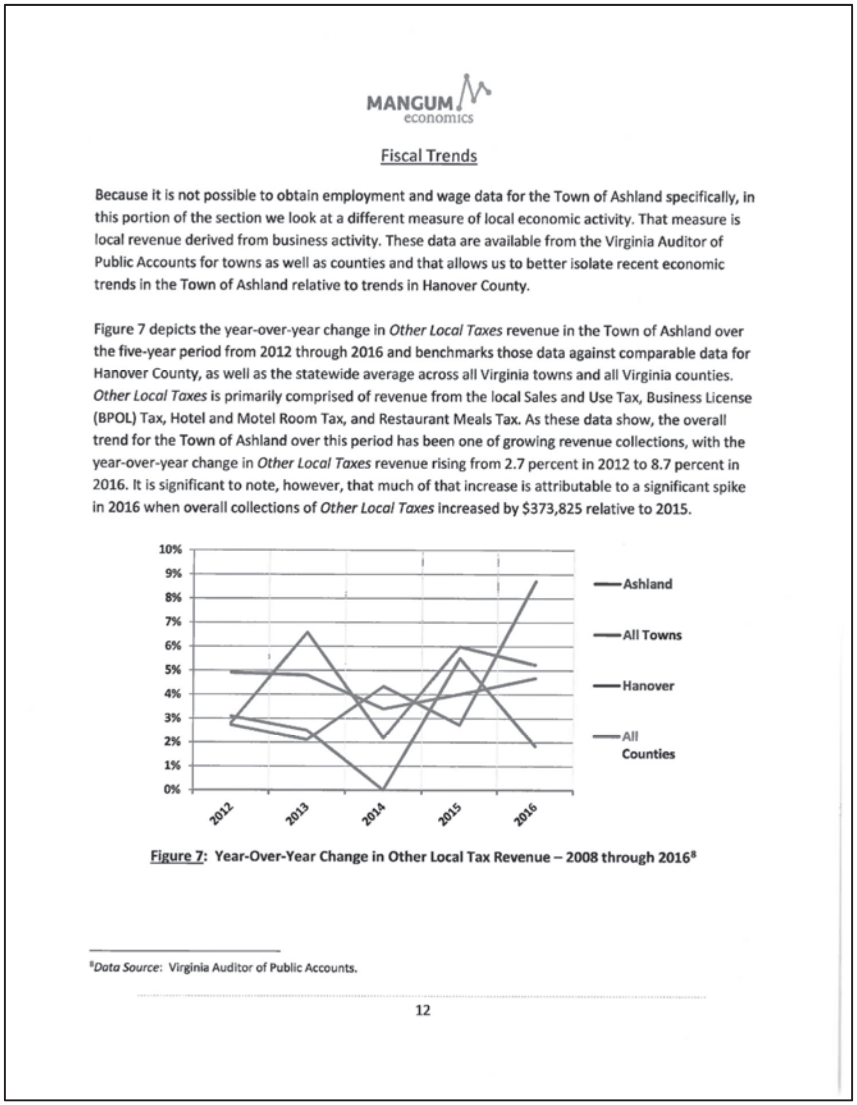
VIRGINIA DEQ (continued)



MANGUM economics

Fiscal Trends

Because it is not possible to obtain employment and wage data for the Town of Ashland specifically, in this portion of the section we look at a different measure of local economic activity. That measure is local revenue derived from business activity. These data are available from the Virginia Auditor of Public Accounts for towns as well as counties and that allows us to better isolate recent economic trends in the Town of Ashland relative to trends in Hanover County.

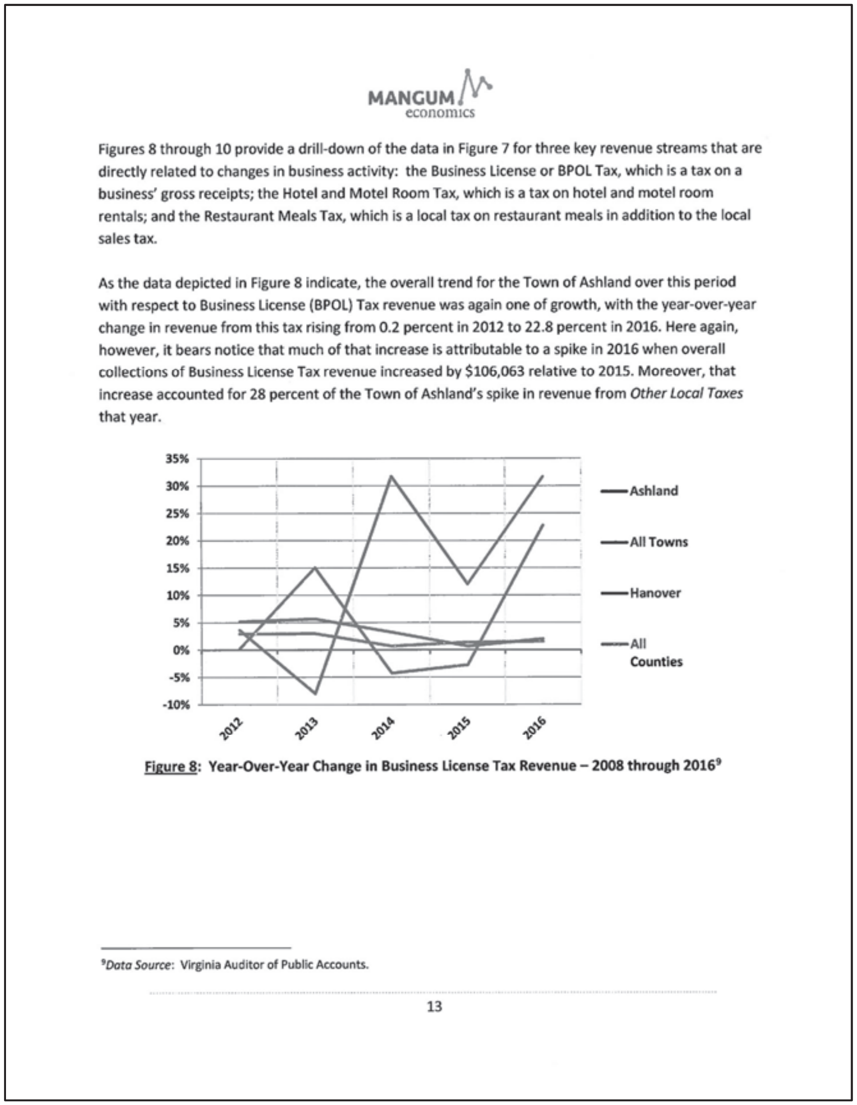
Figure 7 depicts the year-over-year change in *Other Local Taxes* revenue in the Town of Ashland over the five-year period from 2012 through 2016 and benchmarks those data against comparable data for Hanover County, as well as the statewide average across all Virginia towns and all Virginia counties. *Other Local Taxes* is primarily comprised of revenue from the local Sales and Use Tax, Business License (BPOL) Tax, Hotel and Motel Room Tax, and Restaurant Meals Tax. As these data show, the overall trend for the Town of Ashland over this period has been one of growing revenue collections, with the year-over-year change in *Other Local Taxes* revenue rising from 2.7 percent in 2012 to 8.7 percent in 2016. It is significant to note, however, that much of that increase is attributable to a significant spike in 2016 when overall collections of *Other Local Taxes* increased by $373,825 relative to 2015.

Figure 7: Year-Over-Year Change in Other Local Tax Revenue – 2008 through 2016[8]

---

[8] *Data Source*: Virginia Auditor of Public Accounts.

VIRGINIA DEQ (continued)



MANGUM economics

Figures 8 through 10 provide a drill-down of the data in Figure 7 for three key revenue streams that are directly related to changes in business activity: the Business License or BPOL Tax, which is a tax on a business' gross receipts; the Hotel and Motel Room Tax, which is a tax on hotel and motel room rentals; and the Restaurant Meals Tax, which is a local tax on restaurant meals in addition to the local sales tax.

As the data depicted in Figure 8 indicate, the overall trend for the Town of Ashland over this period with respect to Business License (BPOL) Tax revenue was again one of growth, with the year-over-year change in revenue from this tax rising from 0.2 percent in 2012 to 22.8 percent in 2016. Here again, however, it bears notice that much of that increase is attributable to a spike in 2016 when overall collections of Business License Tax revenue increased by $106,063 relative to 2015. Moreover, that increase accounted for 28 percent of the Town of Ashland's spike in revenue from *Other Local Taxes* that year.

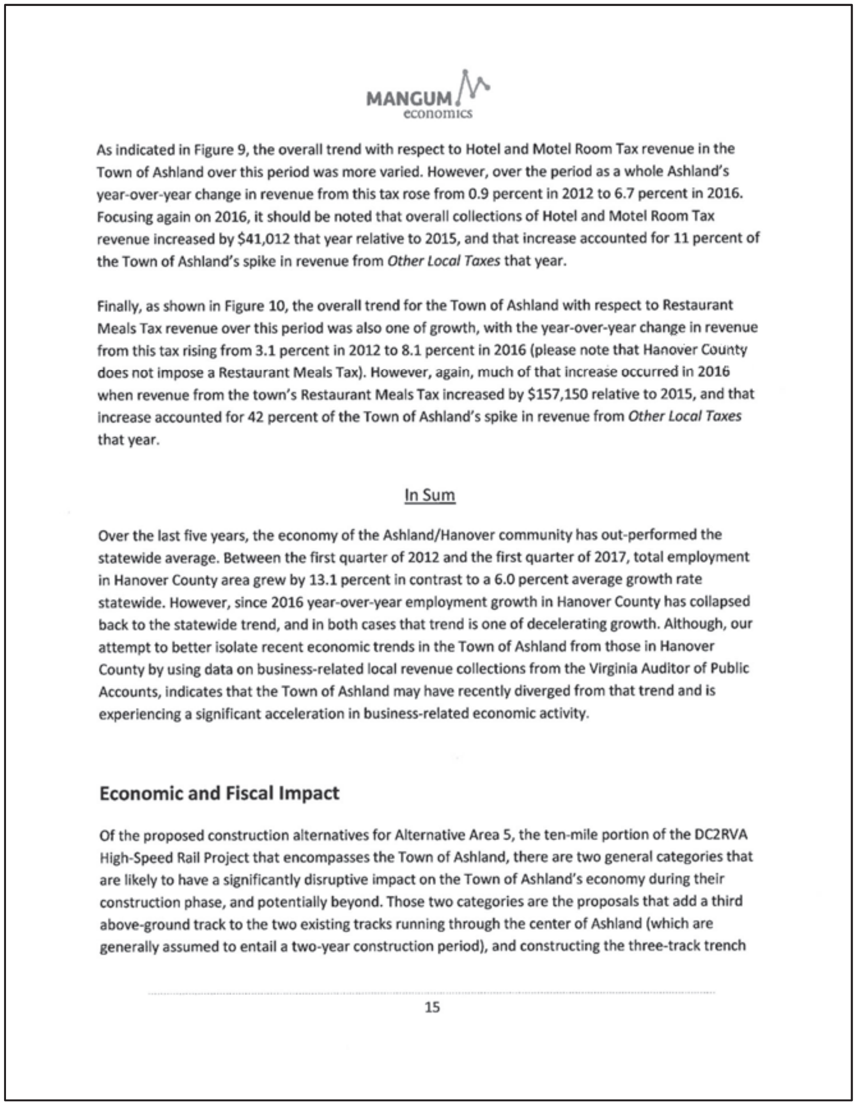
14

VIRGINIA DEQ (continued)



As indicated in Figure 9, the overall trend with respect to Hotel and Motel Room Tax revenue in the Town of Ashland over this period was more varied. However, over the period as a whole Ashland's year-over-year change in revenue from this tax rose from 0.9 percent in 2012 to 6.7 percent in 2016. Focusing again on 2016, it should be noted that overall collections of Hotel and Motel Room Tax revenue increased by $41,012 that year relative to 2015, and that increase accounted for 11 percent of the Town of Ashland's spike in revenue from *Other Local Taxes* that year.

Finally, as shown in Figure 10, the overall trend for the Town of Ashland with respect to Restaurant Meals Tax revenue over this period was also one of growth, with the year-over-year change in revenue from this tax rising from 3.1 percent in 2012 to 8.1 percent in 2016 (please note that Hanover County does not impose a Restaurant Meals Tax). However, again, much of that increase occurred in 2016 when revenue from the town's Restaurant Meals Tax increased by $157,150 relative to 2015, and that increase accounted for 42 percent of the Town of Ashland's spike in revenue from *Other Local Taxes* that year.

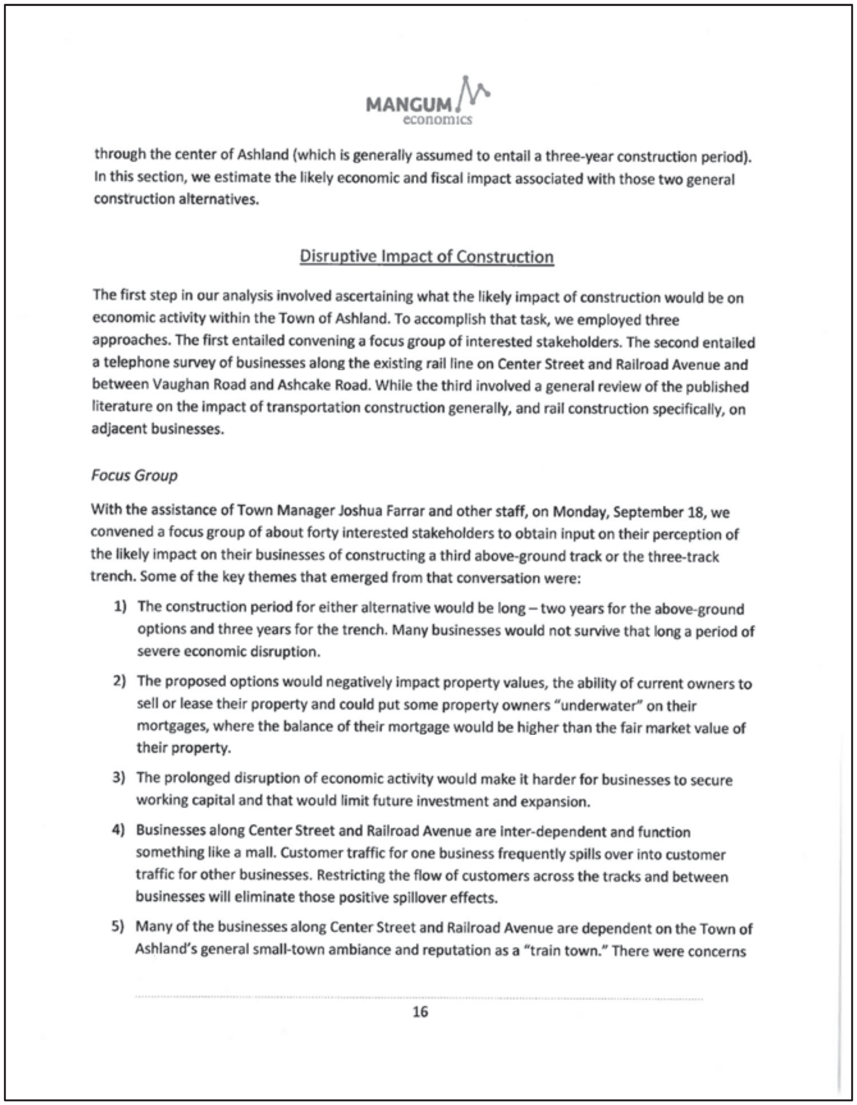
In Sum

Over the last five years, the economy of the Ashland/Hanover community has out-performed the statewide average. Between the first quarter of 2012 and the first quarter of 2017, total employment in Hanover County area grew by 13.1 percent in contrast to a 6.0 percent average growth rate statewide. However, since 2016 year-over-year employment growth in Hanover County has collapsed back to the statewide trend, and in both cases that trend is one of decelerating growth. Although, our attempt to better isolate recent economic trends in the Town of Ashland from those in Hanover County by using data on business-related local revenue collections from the Virginia Auditor of Public Accounts, indicates that the Town of Ashland may have recently diverged from that trend and is experiencing a significant acceleration in business-related economic activity.

Economic and Fiscal Impact

Of the proposed construction alternatives for Alternative Area 5, the ten-mile portion of the DC2RVA High-Speed Rail Project that encompasses the Town of Ashland, there are two general categories that are likely to have a significantly disruptive impact on the Town of Ashland's economy during their construction phase, and potentially beyond. Those two categories are the proposals that add a third above-ground track to the two existing tracks running through the center of Ashland (which are generally assumed to entail a two-year construction period), and constructing the three-track trench

VIRGINIA DEQ (continued)



through the center of Ashland (which is generally assumed to entail a three-year construction period). In this section, we estimate the likely economic and fiscal impact associated with those two general construction alternatives.

Disruptive Impact of Construction

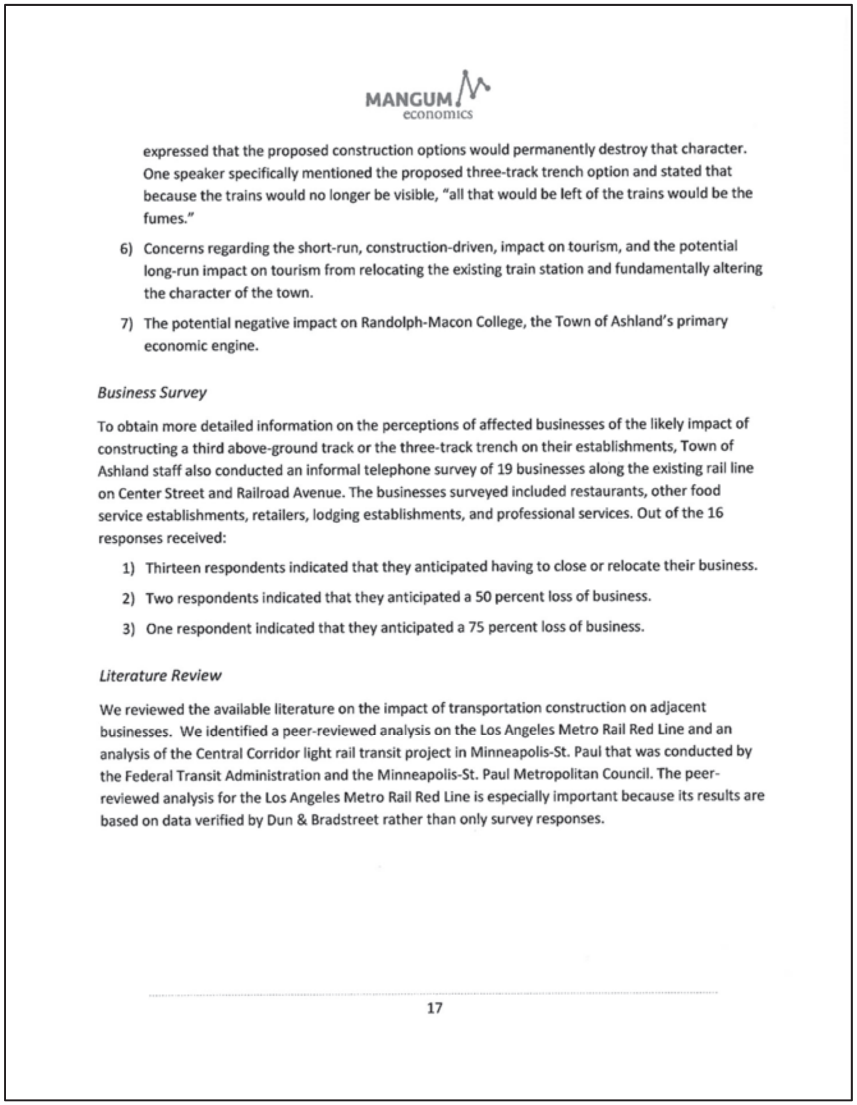
The first step in our analysis involved ascertaining what the likely impact of construction would be on economic activity within the Town of Ashland. To accomplish that task, we employed three approaches. The first entailed convening a focus group of interested stakeholders. The second entailed a telephone survey of businesses along the existing rail line on Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road. While the third involved a general review of the published literature on the impact of transportation construction generally, and rail construction specifically, on adjacent businesses.

Focus Group

With the assistance of Town Manager Joshua Farrar and other staff, on Monday, September 18, we convened a focus group of about forty interested stakeholders to obtain input on their perception of the likely impact on their businesses of constructing a third above-ground track or the three-track trench. Some of the key themes that emerged from that conversation were:

1) The construction period for either alternative would be long – two years for the above-ground options and three years for the trench. Many businesses would not survive that long a period of severe economic disruption.
2) The proposed options would negatively impact property values, the ability of current owners to sell or lease their property and could put some property owners "underwater" on their mortgages, where the balance of their mortgage would be higher than the fair market value of their property.
3) The prolonged disruption of economic activity would make it harder for businesses to secure working capital and that would limit future investment and expansion.
4) Businesses along Center Street and Railroad Avenue are inter-dependent and function something like a mall. Customer traffic for one business frequently spills over into customer traffic for other businesses. Restricting the flow of customers across the tracks and between businesses will eliminate those positive spillover effects.
5) Many of the businesses along Center Street and Railroad Avenue are dependent on the Town of Ashland's general small-town ambiance and reputation as a "train town." There were concerns

VIRGINIA DEQ (continued)



expressed that the proposed construction options would permanently destroy that character. One speaker specifically mentioned the proposed three-track trench option and stated that because the trains would no longer be visible, "all that would be left of the trains would be the fumes."

6) Concerns regarding the short-run, construction-driven, impact on tourism, and the potential long-run impact on tourism from relocating the existing train station and fundamentally altering the character of the town.
7) The potential negative impact on Randolph-Macon College, the Town of Ashland's primary economic engine.

Business Survey

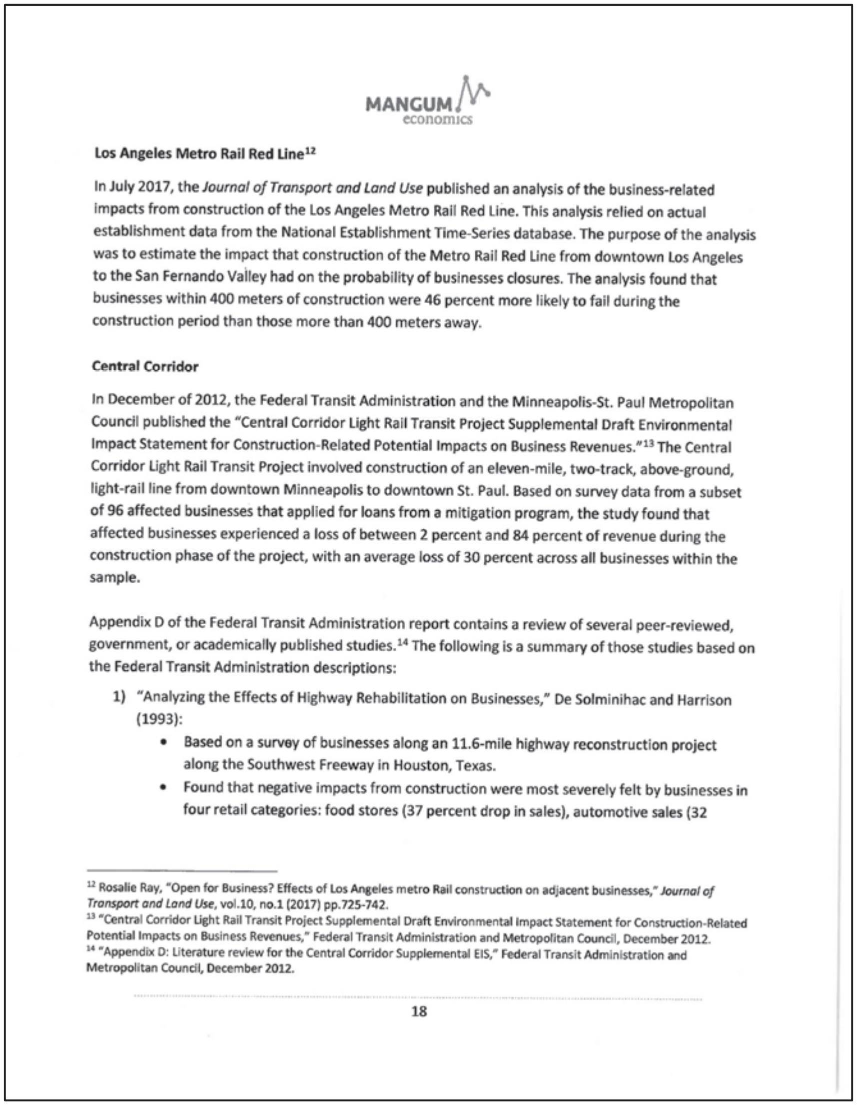
To obtain more detailed information on the perceptions of affected businesses of the likely impact of constructing a third above-ground track or the three-track trench on their establishments, Town of Ashland staff also conducted an informal telephone survey of 19 businesses along the existing rail line on Center Street and Railroad Avenue. The businesses surveyed included restaurants, other food service establishments, retailers, lodging establishments, and professional services. Out of the 16 responses received:

1) Thirteen respondents indicated that they anticipated having to close or relocate their business.
2) Two respondents indicated that they anticipated a 50 percent loss of business.
3) One respondent indicated that they anticipated a 75 percent loss of business.

Literature Review

We reviewed the available literature on the impact of transportation construction on adjacent businesses. We identified a peer-reviewed analysis on the Los Angeles Metro Rail Red Line and an analysis of the Central Corridor light rail transit project in Minneapolis-St. Paul that was conducted by the Federal Transit Administration and the Minneapolis-St. Paul Metropolitan Council. The peer-reviewed analysis for the Los Angeles Metro Rail Red Line is especially important because its results are based on data verified by Dun & Bradstreet rather than only survey responses.

VIRGINIA DEQ (continued)



Los Angeles Metro Rail Red Line[12]

In July 2017, the *Journal of Transport and Land Use* published an analysis of the business-related impacts from construction of the Los Angeles Metro Rail Red Line. This analysis relied on actual establishment data from the National Establishment Time-Series database. The purpose of the analysis was to estimate the impact that construction of the Metro Rail Red Line from downtown Los Angeles to the San Fernando Valley had on the probability of businesses closures. The analysis found that businesses within 400 meters of construction were 46 percent more likely to fail during the construction period than those more than 400 meters away.

Central Corridor

In December of 2012, the Federal Transit Administration and the Minneapolis-St. Paul Metropolitan Council published the "Central Corridor Light Rail Transit Project Supplemental Draft Environmental Impact Statement for Construction-Related Potential Impacts on Business Revenues."[13] The Central Corridor Light Rail Transit Project involved construction of an eleven-mile, two-track, above-ground, light-rail line from downtown Minneapolis to downtown St. Paul. Based on survey data from a subset of 96 affected businesses that applied for loans from a mitigation program, the study found that affected businesses experienced a loss of between 2 percent and 84 percent of revenue during the construction phase of the project, with an average loss of 30 percent across all businesses within the sample.

Appendix D of the Federal Transit Administration report contains a review of several peer-reviewed, government, or academically published studies.[14] The following is a summary of those studies based on the Federal Transit Administration descriptions:

1) "Analyzing the Effects of Highway Rehabilitation on Businesses," De Solminihac and Harrison (1993):
    - Based on a survey of businesses along an 11.6-mile highway reconstruction project along the Southwest Freeway in Houston, Texas.
    - Found that negative impacts from construction were most severely felt by businesses in four retail categories: food stores (37 percent drop in sales), automotive sales (32

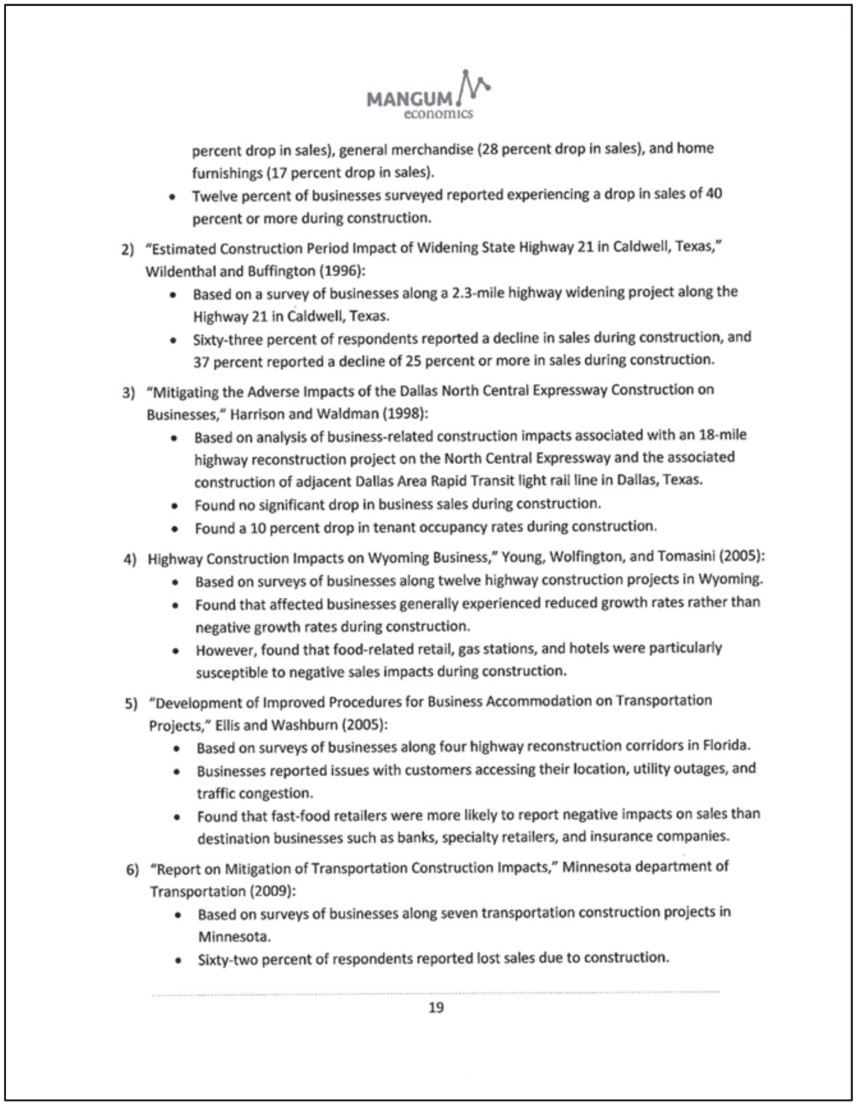
VIRGINIA DEQ (continued)

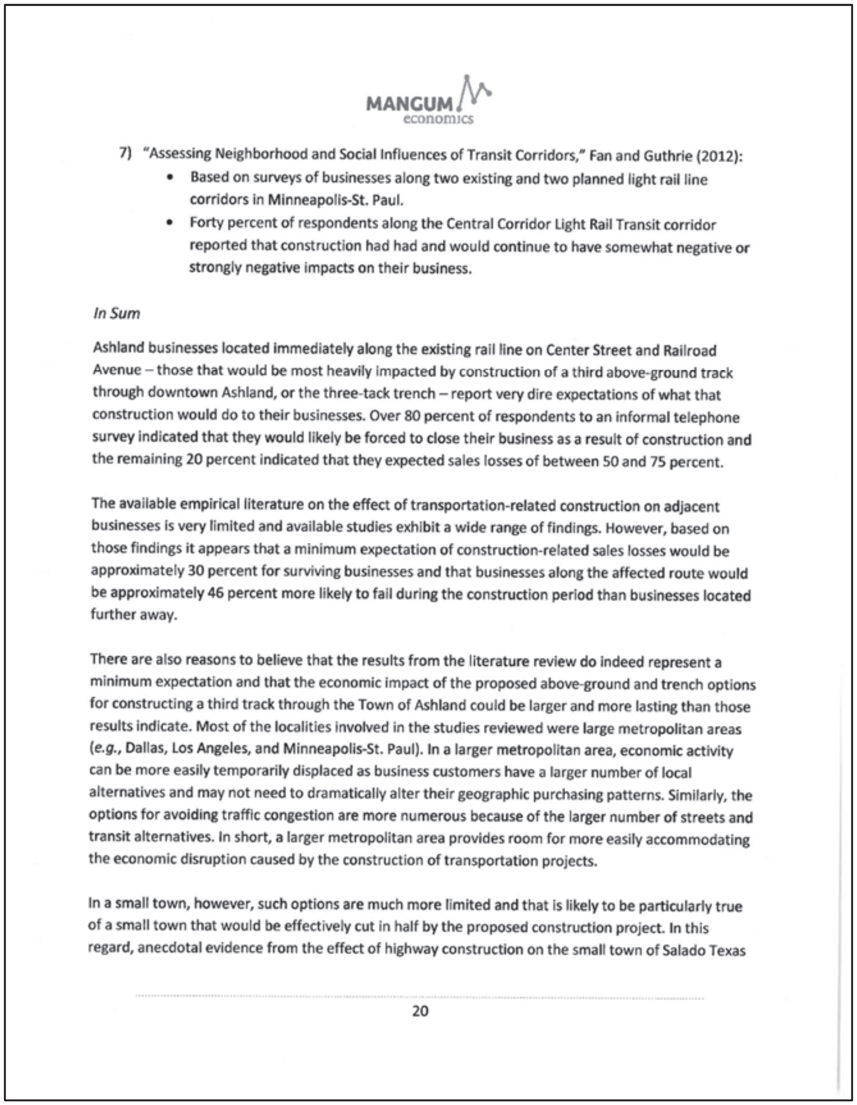


percent drop in sales), general merchandise (28 percent drop in sales), and home furnishings (17 percent drop in sales).

- Twelve percent of businesses surveyed reported experiencing a drop in sales of 40 percent or more during construction.

2) "Estimated Construction Period Impact of Widening State Highway 21 in Caldwell, Texas," Wildenthal and Buffington (1996):
    - Based on a survey of businesses along a 2.3-mile highway widening project along the Highway 21 in Caldwell, Texas.
    - Sixty-three percent of respondents reported a decline in sales during construction, and 37 percent reported a decline of 25 percent or more in sales during construction.
3) "Mitigating the Adverse Impacts of the Dallas North Central Expressway Construction on Businesses," Harrison and Waldman (1998):
    - Based on analysis of business-related construction impacts associated with an 18-mile highway reconstruction project on the North Central Expressway and the associated construction of adjacent Dallas Area Rapid Transit light rail line in Dallas, Texas.
    - Found no significant drop in business sales during construction.
    - Found a 10 percent drop in tenant occupancy rates during construction.
4) Highway Construction Impacts on Wyoming Business," Young, Wolfington, and Tomasini (2005):
    - Based on surveys of businesses along twelve highway construction projects in Wyoming.
    - Found that affected businesses generally experienced reduced growth rates rather than negative growth rates during construction.
    - However, found that food-related retail, gas stations, and hotels were particularly susceptible to negative sales impacts during construction.
5) "Development of Improved Procedures for Business Accommodation on Transportation Projects," Ellis and Washburn (2005):
    - Based on surveys of businesses along four highway reconstruction corridors in Florida.
    - Businesses reported issues with customers accessing their location, utility outages, and traffic congestion.
    - Found that fast-food retailers were more likely to report negative impacts on sales than destination businesses such as banks, specialty retailers, and insurance companies.
6) "Report on Mitigation of Transportation Construction Impacts," Minnesota department of Transportation (2009):
    - Based on surveys of businesses along seven transportation construction projects in Minnesota.
    - Sixty-two percent of respondents reported lost sales due to construction.

VIRGINIA DEQ (continued)



7) "Assessing Neighborhood and Social Influences of Transit Corridors," Fan and Guthrie (2012):
    - Based on surveys of businesses along two existing and two planned light rail line corridors in Minneapolis-St. Paul.
    - Forty percent of respondents along the Central Corridor Light Rail Transit corridor reported that construction had had and would continue to have somewhat negative or strongly negative impacts on their business.

In Sum

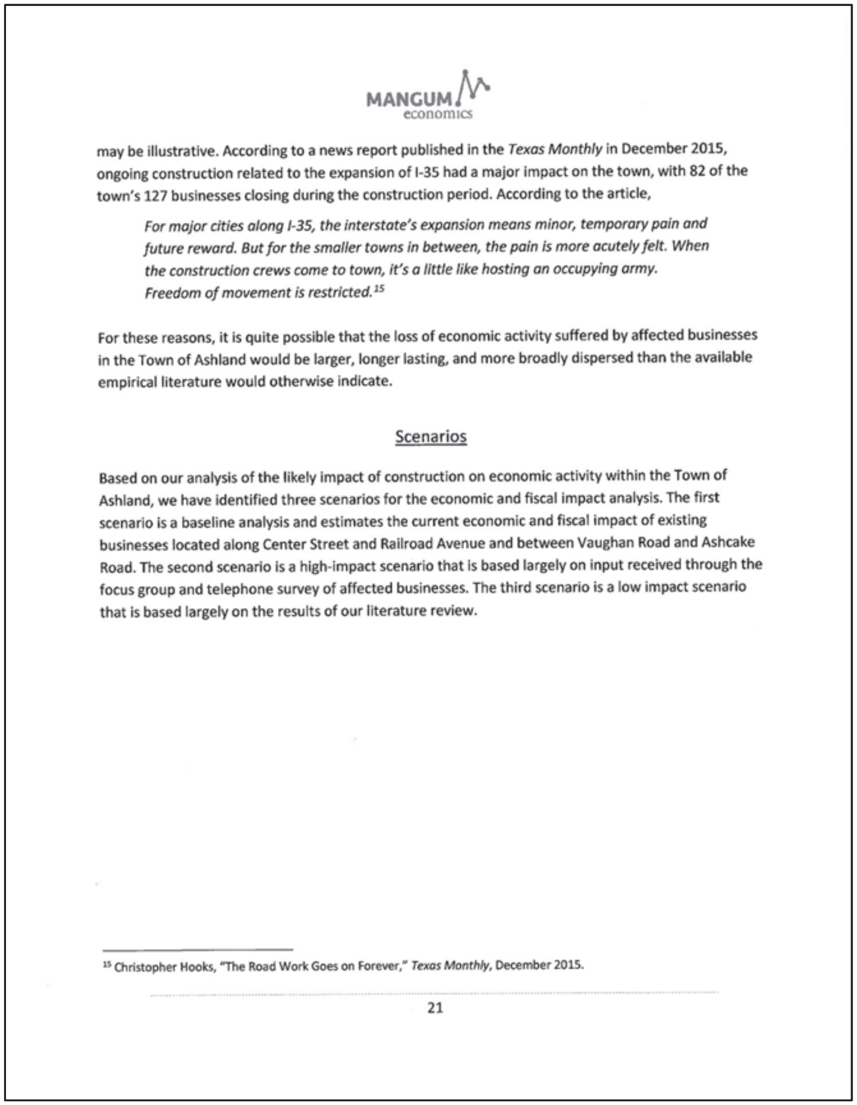
Ashland businesses located immediately along the existing rail line on Center Street and Railroad Avenue – those that would be most heavily impacted by construction of a third above-ground track through downtown Ashland, or the three-tack trench – report very dire expectations of what that construction would do to their businesses. Over 80 percent of respondents to an informal telephone survey indicated that they would likely be forced to close their business as a result of construction and the remaining 20 percent indicated that they expected sales losses of between 50 and 75 percent.

The available empirical literature on the effect of transportation-related construction on adjacent businesses is very limited and available studies exhibit a wide range of findings. However, based on those findings it appears that a minimum expectation of construction-related sales losses would be approximately 30 percent for surviving businesses and that businesses along the affected route would be approximately 46 percent more likely to fail during the construction period than businesses located further away.

There are also reasons to believe that the results from the literature review do indeed represent a minimum expectation and that the economic impact of the proposed above-ground and trench options for constructing a third track through the Town of Ashland could be larger and more lasting than those results indicate. Most of the localities involved in the studies reviewed were large metropolitan areas (*e.g.*, Dallas, Los Angeles, and Minneapolis-St. Paul). In a larger metropolitan area, economic activity can be more easily temporarily displaced as business customers have a larger number of local alternatives and may not need to dramatically alter their geographic purchasing patterns. Similarly, the options for avoiding traffic congestion are more numerous because of the larger number of streets and transit alternatives. In short, a larger metropolitan area provides room for more easily accommodating the economic disruption caused by the construction of transportation projects.

In a small town, however, such options are much more limited and that is likely to be particularly true of a small town that would be effectively cut in half by the proposed construction project. In this regard, anecdotal evidence from the effect of highway construction on the small town of Salado Texas

VIRGINIA DEQ (continued)



may be illustrative. According to a news report published in the *Texas Monthly* in December 2015, ongoing construction related to the expansion of I-35 had a major impact on the town, with 82 of the town's 127 businesses closing during the construction period. According to the article,

> *For major cities along I-35, the interstate's expansion means minor, temporary pain and future reward. But for the smaller towns in between, the pain is more acutely felt. When the construction crews come to town, it's a little like hosting an occupying army. Freedom of movement is restricted.*[15]

For these reasons, it is quite possible that the loss of economic activity suffered by affected businesses in the Town of Ashland would be larger, longer lasting, and more broadly dispersed than the available empirical literature would otherwise indicate.

Scenarios

Based on our analysis of the likely impact of construction on economic activity within the Town of Ashland, we have identified three scenarios for the economic and fiscal impact analysis. The first scenario is a baseline analysis and estimates the current economic and fiscal impact of existing businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road. The second scenario is a high-impact scenario that is based largely on input received through the focus group and telephone survey of affected businesses. The third scenario is a low impact scenario that is based largely on the results of our literature review.

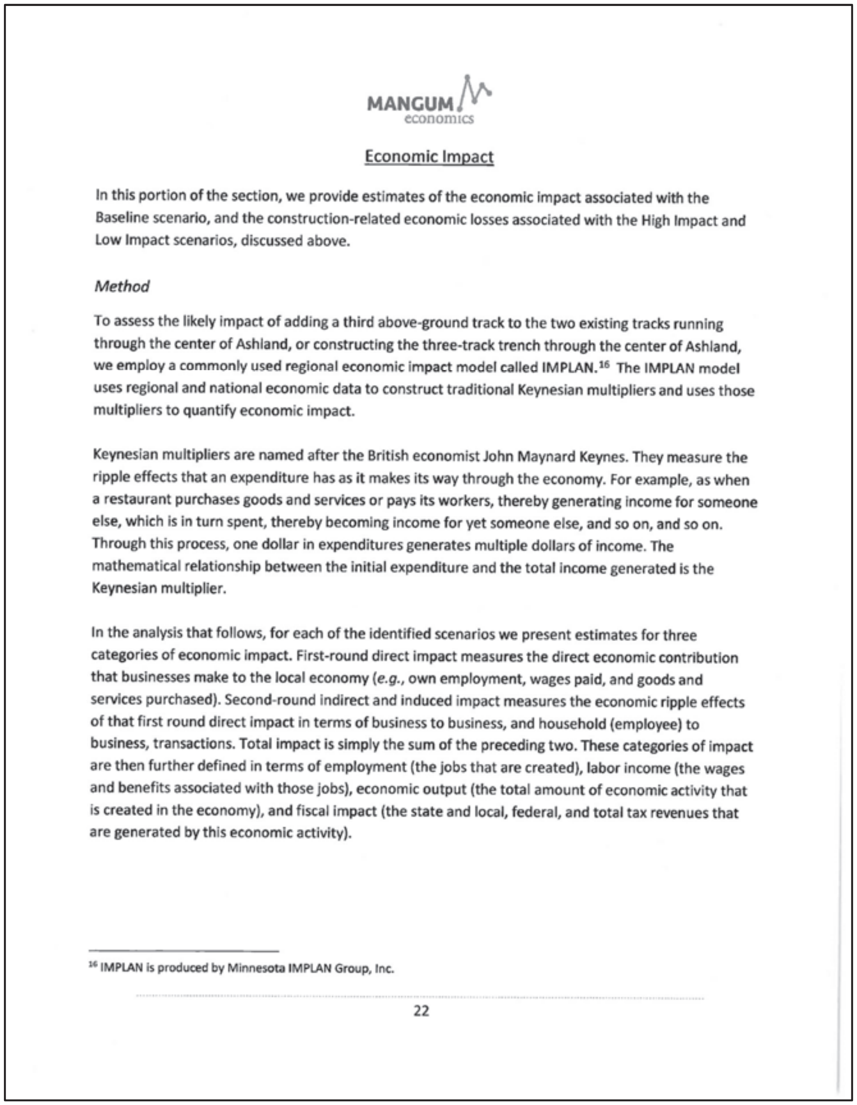
VIRGINIA DEQ (continued)



Economic Impact

In this portion of the section, we provide estimates of the economic impact associated with the Baseline scenario, and the construction-related economic losses associated with the High Impact and Low Impact scenarios, discussed above.

Method

To assess the likely impact of adding a third above-ground track to the two existing tracks running through the center of Ashland, or constructing the three-track trench through the center of Ashland, we employ a commonly used regional economic impact model called IMPLAN.[16] The IMPLAN model uses regional and national economic data to construct traditional Keynesian multipliers and uses those multipliers to quantify economic impact.

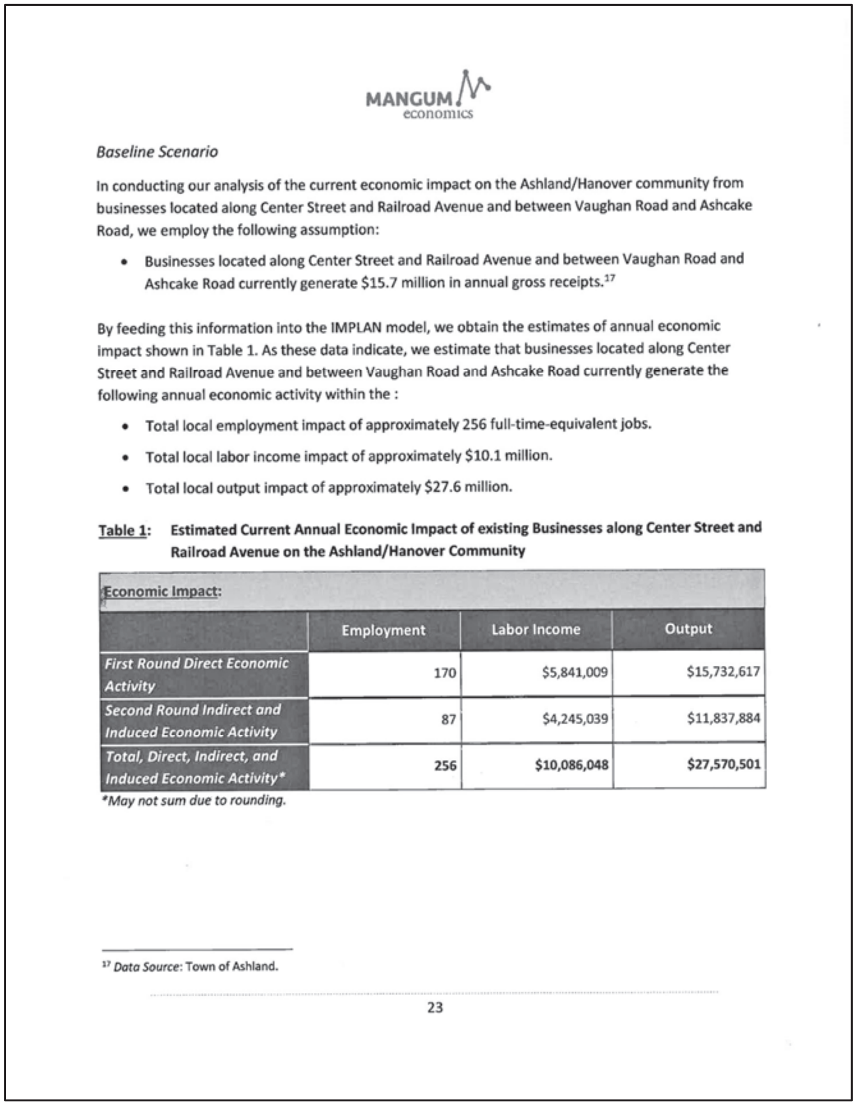
Keynesian multipliers are named after the British economist John Maynard Keynes. They measure the ripple effects that an expenditure has as it makes its way through the economy. For example, as when a restaurant purchases goods and services or pays its workers, thereby generating income for someone else, which is in turn spent, thereby becoming income for yet someone else, and so on, and so on. Through this process, one dollar in expenditures generates multiple dollars of income. The mathematical relationship between the initial expenditure and the total income generated is the Keynesian multiplier.

In the analysis that follows, for each of the identified scenarios we present estimates for three categories of economic impact. First-round direct impact measures the direct economic contribution that businesses make to the local economy (*e.g.*, own employment, wages paid, and goods and services purchased). Second-round indirect and induced impact measures the economic ripple effects of that first round direct impact in terms of business to business, and household (employee) to business, transactions. Total impact is simply the sum of the preceding two. These categories of impact are then further defined in terms of employment (the jobs that are created), labor income (the wages and benefits associated with those jobs), economic output (the total amount of economic activity that is created in the economy), and fiscal impact (the state and local, federal, and total tax revenues that are generated by this economic activity).

---

[16] IMPLAN is produced by Minnesota IMPLAN Group, Inc.

VIRGINIA DEQ (continued)



Baseline Scenario

In conducting our analysis of the current economic impact on the Ashland/Hanover community from businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road, we employ the following assumption:

- Businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road currently generate $15.7 million in annual gross receipts.[17]

By feeding this information into the IMPLAN model, we obtain the estimates of annual economic impact shown in Table 1. As these data indicate, we estimate that businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road currently generate the following annual economic activity within the :

- Total local employment impact of approximately 256 full-time-equivalent jobs.
- Total local labor income impact of approximately $10.1 million.
- Total local output impact of approximately $27.6 million.

Table 1: Estimated Current Annual Economic Impact of existing Businesses along Center Street and Railroad Avenue on the Ashland/Hanover Community

Economic Impact:

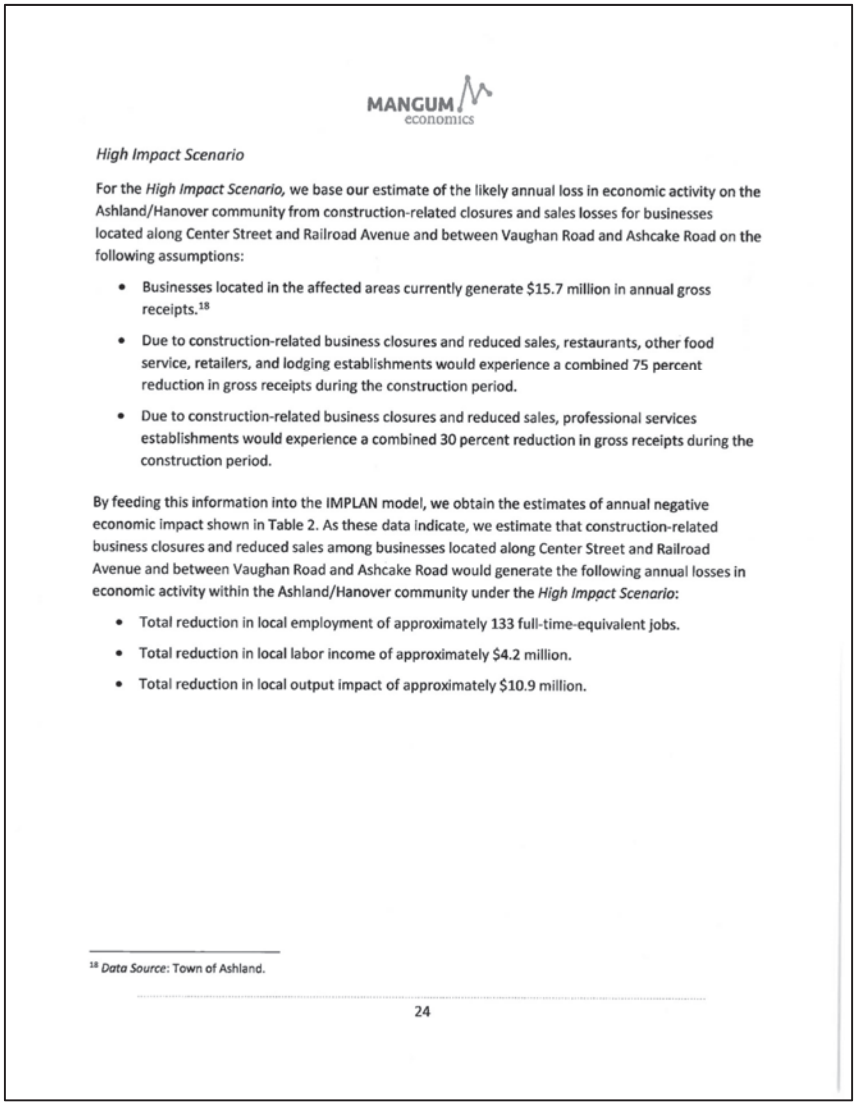
	Employment	Labor Income	Output
First Round Direct Economic Activity	170	$5,841,009	$15,732,617
Second Round Indirect and Induced Economic Activity	87	$4,245,039	$11,837,884
*Total, Direct, Indirect, and Induced Economic Activity**	**256**	**$10,086,048**	**$27,570,501**

**May not sum due to rounding.*

---

[17] *Data Source*: Town of Ashland.

VIRGINIA DEQ (continued)



High Impact Scenario

For the *High Impact Scenario*, we base our estimate of the likely annual loss in economic activity on the Ashland/Hanover community from construction-related closures and sales losses for businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road on the following assumptions:

- Businesses located in the affected areas currently generate $15.7 million in annual gross receipts.[18]
- Due to construction-related business closures and reduced sales, restaurants, other food service, retailers, and lodging establishments would experience a combined 75 percent reduction in gross receipts during the construction period.
- Due to construction-related business closures and reduced sales, professional services establishments would experience a combined 30 percent reduction in gross receipts during the construction period.

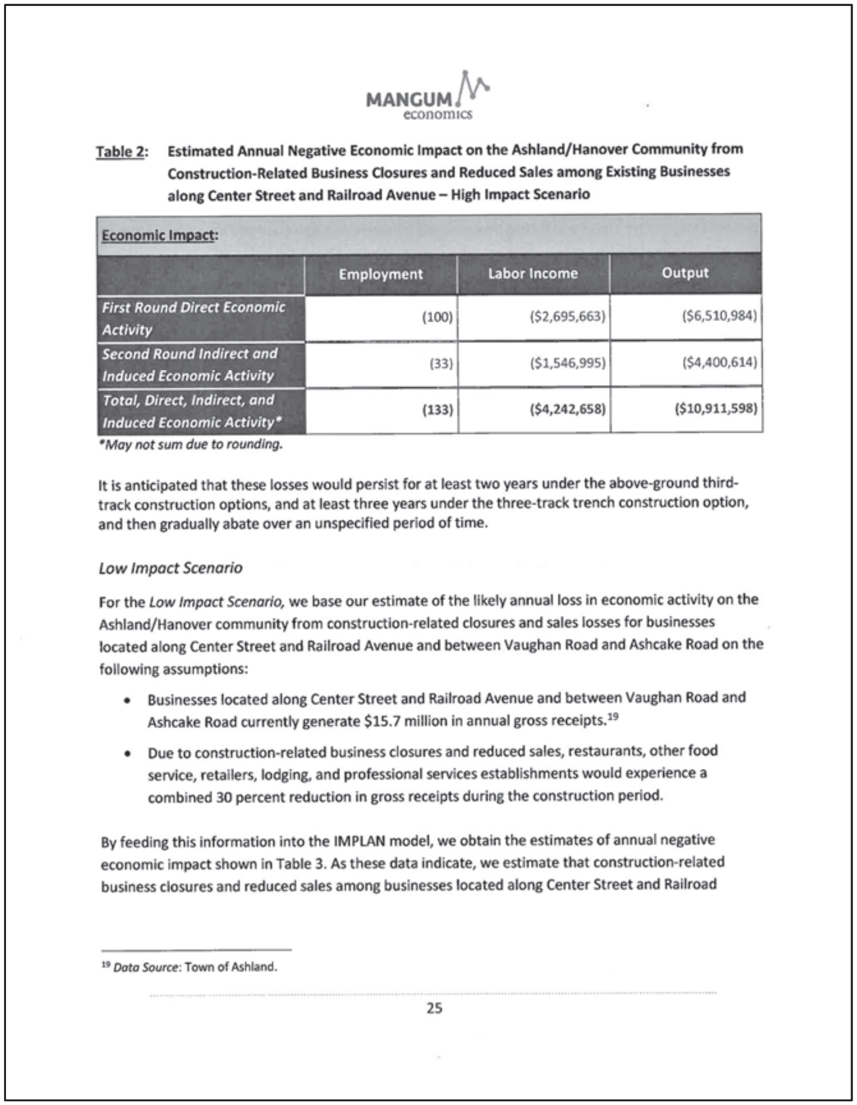
By feeding this information into the IMPLAN model, we obtain the estimates of annual negative economic impact shown in Table 2. As these data indicate, we estimate that construction-related business closures and reduced sales among businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road would generate the following annual losses in economic activity within the Ashland/Hanover community under the *High Impact Scenario*:

- Total reduction in local employment of approximately 133 full-time-equivalent jobs.
- Total reduction in local labor income of approximately $4.2 million.
- Total reduction in local output impact of approximately $10.9 million.

---

[18] *Data Source*: Town of Ashland.

VIRGINIA DEQ (continued)



MANGUM economics

Table 2: Estimated Annual Negative Economic Impact on the Ashland/Hanover Community from Construction-Related Business Closures and Reduced Sales among Existing Businesses along Center Street and Railroad Avenue – High Impact Scenario

Economic Impact:	Employment	Labor Income	Output
First Round Direct Economic Activity	(100)	($2,695,663)	($6,510,984)
Second Round Indirect and Induced Economic Activity	(33)	($1,546,995)	($4,400,614)
*Total, Direct, Indirect, and Induced Economic Activity**	**(133)**	**($4,242,658)**	**($10,911,598)**

**May not sum due to rounding.*

It is anticipated that these losses would persist for at least two years under the above-ground third-track construction options, and at least three years under the three-track trench construction option, and then gradually abate over an unspecified period of time.

Low Impact Scenario

For the *Low Impact Scenario,* we base our estimate of the likely annual loss in economic activity on the Ashland/Hanover community from construction-related closures and sales losses for businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road on the following assumptions:

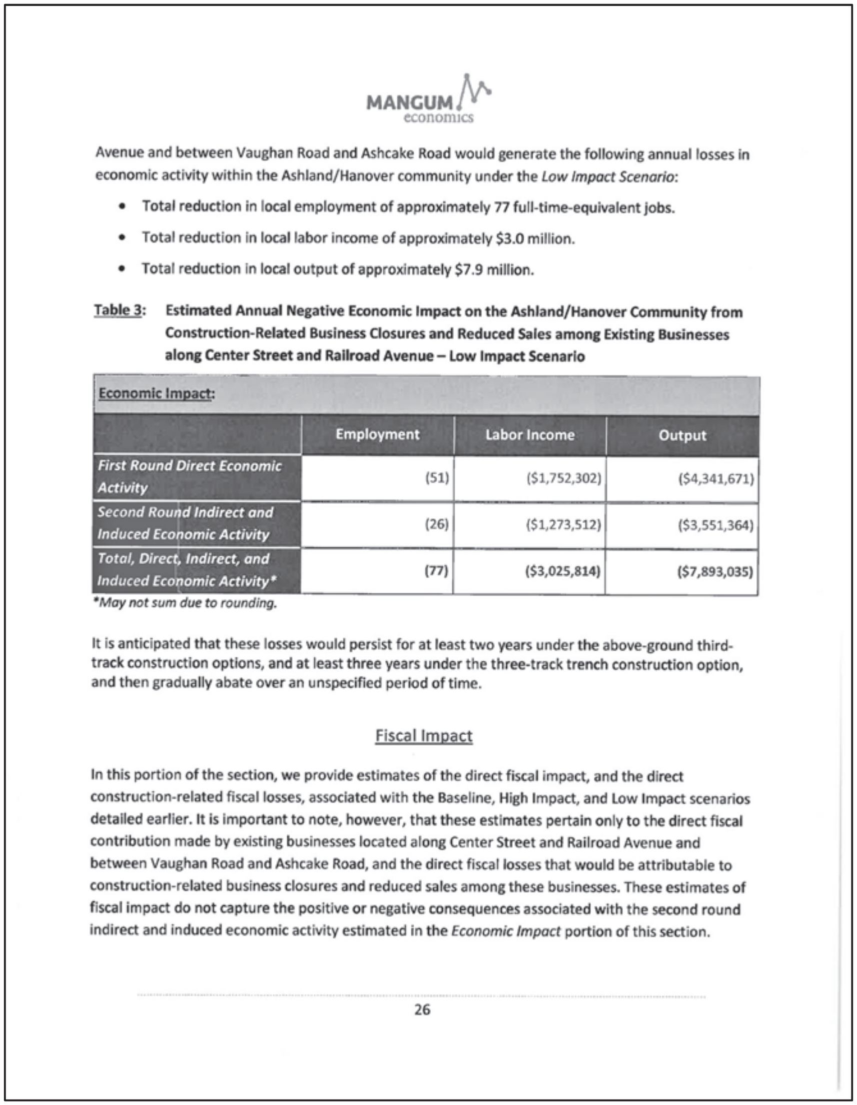
- Businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road currently generate $15.7 million in annual gross receipts.[19]
- Due to construction-related business closures and reduced sales, restaurants, other food service, retailers, lodging, and professional services establishments would experience a combined 30 percent reduction in gross receipts during the construction period.

By feeding this information into the IMPLAN model, we obtain the estimates of annual negative economic impact shown in Table 3. As these data indicate, we estimate that construction-related business closures and reduced sales among businesses located along Center Street and Railroad

---

[19] *Data Source*: Town of Ashland.

VIRGINIA DEQ (continued)



MANGUM economics

Avenue and between Vaughan Road and Ashcake Road would generate the following annual losses in economic activity within the Ashland/Hanover community under the *Low Impact Scenario*:

- Total reduction in local employment of approximately 77 full-time-equivalent jobs.
- Total reduction in local labor income of approximately $3.0 million.
- Total reduction in local output of approximately $7.9 million.

Table 3: Estimated Annual Negative Economic Impact on the Ashland/Hanover Community from Construction-Related Business Closures and Reduced Sales among Existing Businesses along Center Street and Railroad Avenue – Low Impact Scenario

Economic Impact:	Employment	Labor Income	Output
First Round Direct Economic Activity	(51)	($1,752,302)	($4,341,671)
Second Round Indirect and Induced Economic Activity	(26)	($1,273,512)	($3,551,364)
*Total, Direct, Indirect, and Induced Economic Activity**	**(77)**	**($3,025,814)**	**($7,893,035)**

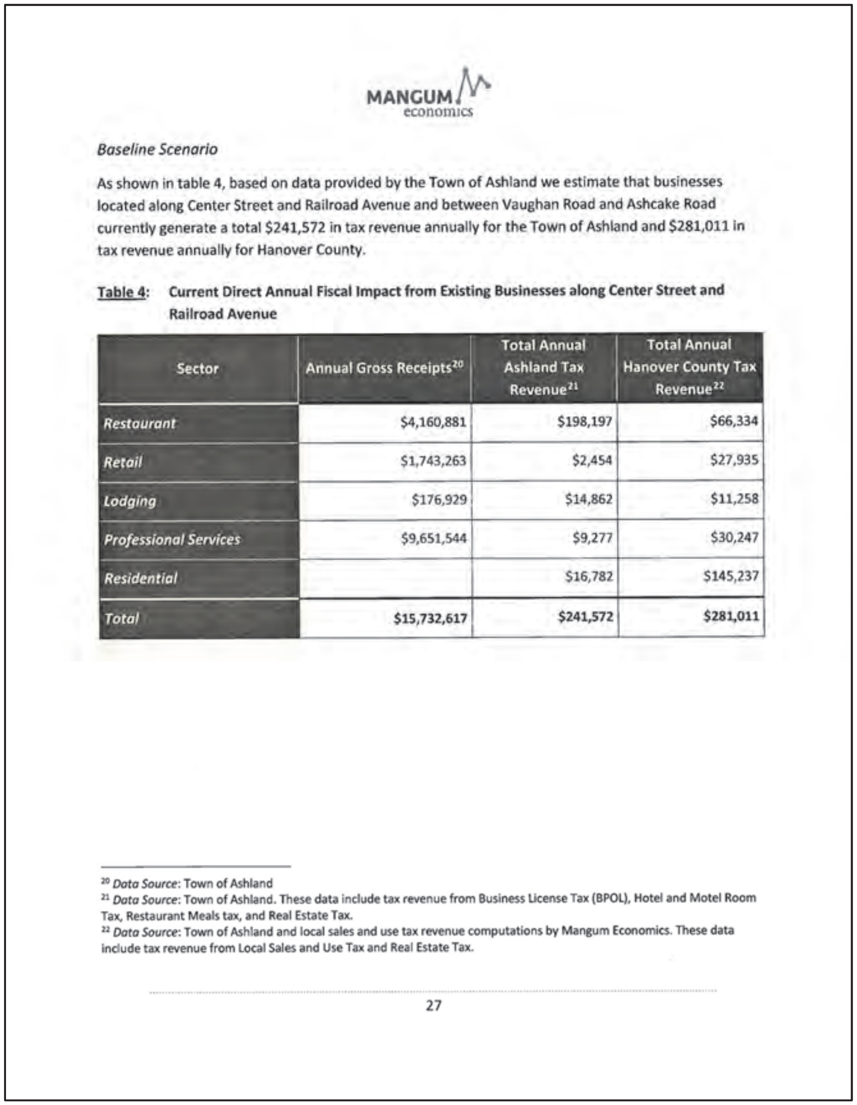
**May not sum due to rounding.*

It is anticipated that these losses would persist for at least two years under the above-ground third-track construction options, and at least three years under the three-track trench construction option, and then gradually abate over an unspecified period of time.

Fiscal Impact

In this portion of the section, we provide estimates of the direct fiscal impact, and the direct construction-related fiscal losses, associated with the Baseline, High Impact, and Low Impact scenarios detailed earlier. It is important to note, however, that these estimates pertain only to the direct fiscal contribution made by existing businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road, and the direct fiscal losses that would be attributable to construction-related business closures and reduced sales among these businesses. These estimates of fiscal impact do not capture the positive or negative consequences associated with the second round indirect and induced economic activity estimated in the *Economic Impact* portion of this section.

VIRGINIA DEQ (continued)



Baseline Scenario

As shown in table 4, based on data provided by the Town of Ashland we estimate that businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road currently generate a total $241,572 in tax revenue annually for the Town of Ashland and $281,011 in tax revenue annually for Hanover County.

Table 4: Current Direct Annual Fiscal Impact from Existing Businesses along Center Street and Railroad Avenue

Sector	Annual Gross Receipts[20]	Total Annual Ashland Tax Revenue[21]	Total Annual Hanover County Tax Revenue[22]
Restaurant	$4,160,881	$198,197	$66,334
Retail	$1,743,263	$2,454	$27,935
Lodging	$176,929	$14,862	$11,258
Professional Services	$9,651,544	$9,277	$30,247
Residential		$16,782	$145,237
Total	$15,732,617	$241,572	$281,011

---

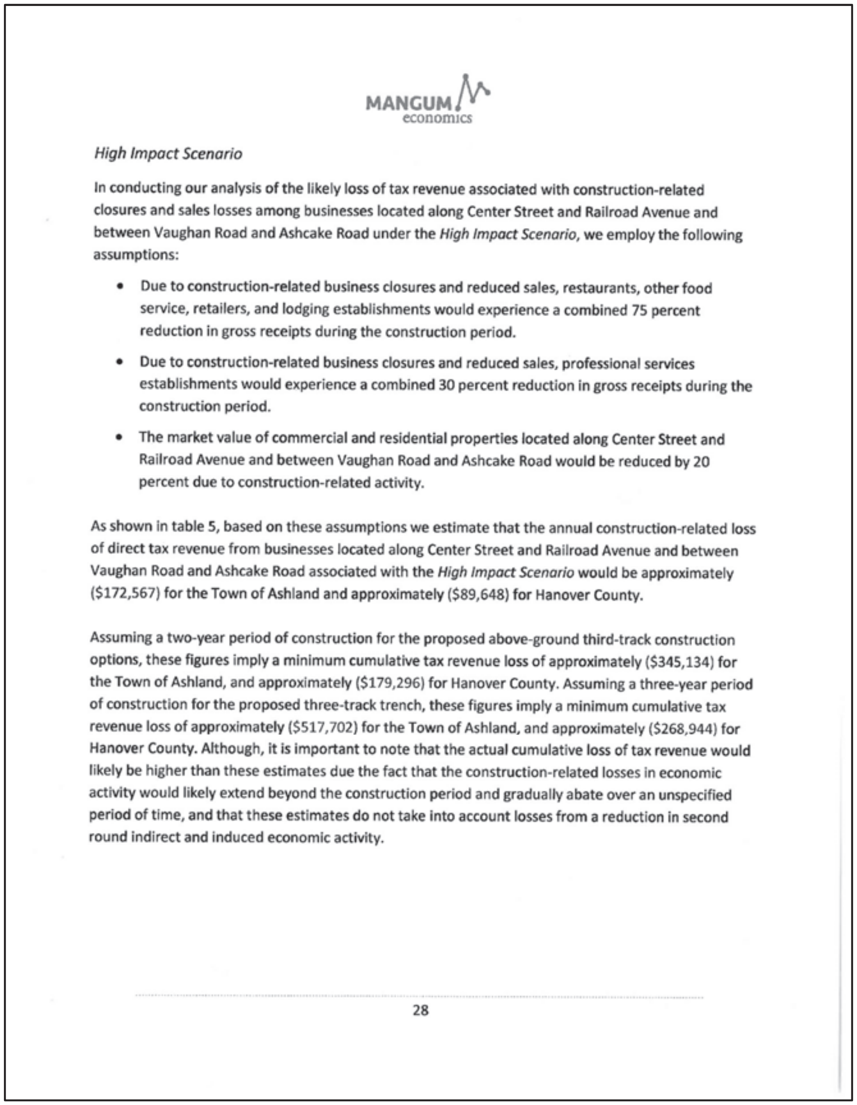
[21] *Data Source*: Town of Ashland. These data include tax revenue from Business License Tax (BPOL), Hotel and Motel Room Tax, Restaurant Meals tax, and Real Estate Tax.

[22] *Data Source*: Town of Ashland and local sales and use tax revenue computations by Mangum Economics. These data include tax revenue from Local Sales and Use Tax and Real Estate Tax.

VIRGINIA DEQ (continued)



High Impact Scenario

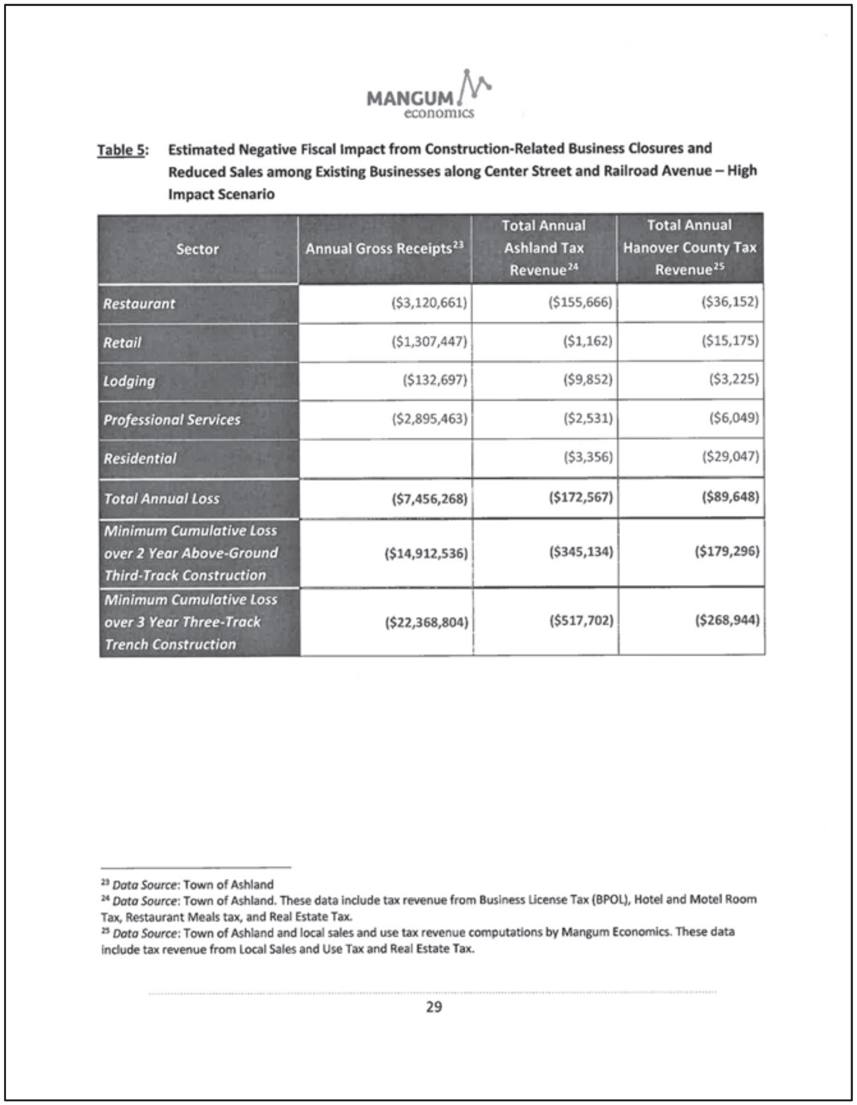
In conducting our analysis of the likely loss of tax revenue associated with construction-related closures and sales losses among businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road under the *High Impact Scenario*, we employ the following assumptions:

- Due to construction-related business closures and reduced sales, restaurants, other food service, retailers, and lodging establishments would experience a combined 75 percent reduction in gross receipts during the construction period.
- Due to construction-related business closures and reduced sales, professional services establishments would experience a combined 30 percent reduction in gross receipts during the construction period.
- The market value of commercial and residential properties located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road would be reduced by 20 percent due to construction-related activity.

As shown in table 5, based on these assumptions we estimate that the annual construction-related loss of direct tax revenue from businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road associated with the *High Impact Scenario* would be approximately ($172,567) for the Town of Ashland and approximately ($89,648) for Hanover County.

Assuming a two-year period of construction for the proposed above-ground third-track construction options, these figures imply a minimum cumulative tax revenue loss of approximately ($345,134) for the Town of Ashland, and approximately ($179,296) for Hanover County. Assuming a three-year period of construction for the proposed three-track trench, these figures imply a minimum cumulative tax revenue loss of approximately ($517,702) for the Town of Ashland, and approximately ($268,944) for Hanover County. Although, it is important to note that the actual cumulative loss of tax revenue would likely be higher than these estimates due the fact that the construction-related losses in economic activity would likely extend beyond the construction period and gradually abate over an unspecified period of time, and that these estimates do not take into account losses from a reduction in second round indirect and induced economic activity.

VIRGINIA DEQ (continued)



MANGUM economics

Table 5: Estimated Negative Fiscal Impact from Construction-Related Business Closures and Reduced Sales among Existing Businesses along Center Street and Railroad Avenue – High Impact Scenario

Sector	Annual Gross Receipts[23]	Total Annual Ashland Tax Revenue[24]	Total Annual Hanover County Tax Revenue[25]
Restaurant	($3,120,661)	($155,666)	($36,152)
Retail	($1,307,447)	($1,162)	($15,175)
Lodging	($132,697)	($9,852)	($3,225)
Professional Services	($2,895,463)	($2,531)	($6,049)
Residential		($3,356)	($29,047)
Total Annual Loss	($7,456,268)	($172,567)	($89,648)
Minimum Cumulative Loss over 2 Year Above-Ground Third-Track Construction	($14,912,536)	($345,134)	($179,296)

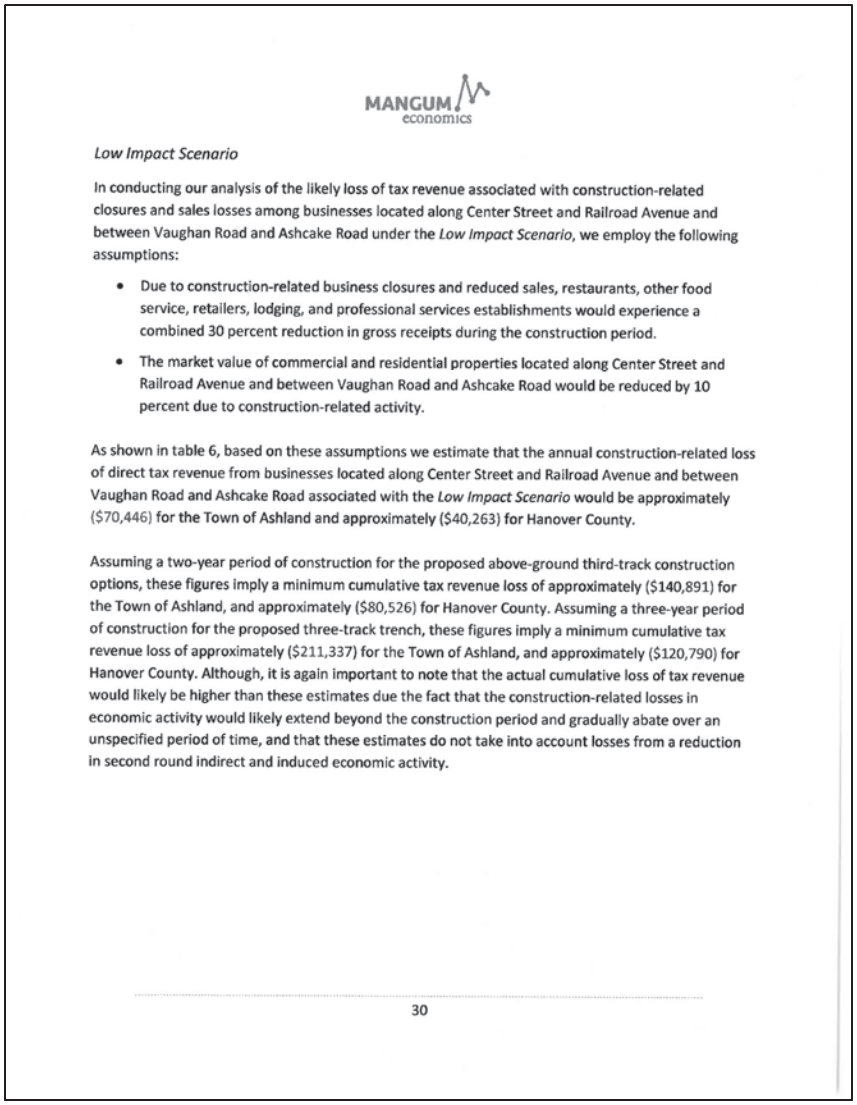
VIRGINIA DEQ (continued)



MANGUM economics

Low Impact Scenario

In conducting our analysis of the likely loss of tax revenue associated with construction-related closures and sales losses among businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road under the *Low Impact Scenario*, we employ the following assumptions:

- Due to construction-related business closures and reduced sales, restaurants, other food service, retailers, lodging, and professional services establishments would experience a combined 30 percent reduction in gross receipts during the construction period.
- The market value of commercial and residential properties located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road would be reduced by 10 percent due to construction-related activity.

As shown in table 6, based on these assumptions we estimate that the annual construction-related loss of direct tax revenue from businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road associated with the *Low Impact Scenario* would be approximately ($70,446) for the Town of Ashland and approximately ($40,263) for Hanover County.

Assuming a two-year period of construction for the proposed above-ground third-track construction options, these figures imply a minimum cumulative tax revenue loss of approximately ($140,891) for the Town of Ashland, and approximately ($80,526) for Hanover County. Assuming a three-year period of construction for the proposed three-track trench, these figures imply a minimum cumulative tax revenue loss of approximately ($211,337) for the Town of Ashland, and approximately ($120,790) for Hanover County. Although, it is again important to note that the actual cumulative loss of tax revenue would likely be higher than these estimates due the fact that the construction-related losses in economic activity would likely extend beyond the construction period and gradually abate over an unspecified period of time, and that these estimates do not take into account losses from a reduction in second round indirect and induced economic activity.

VIRGINIA DEQ (continued)

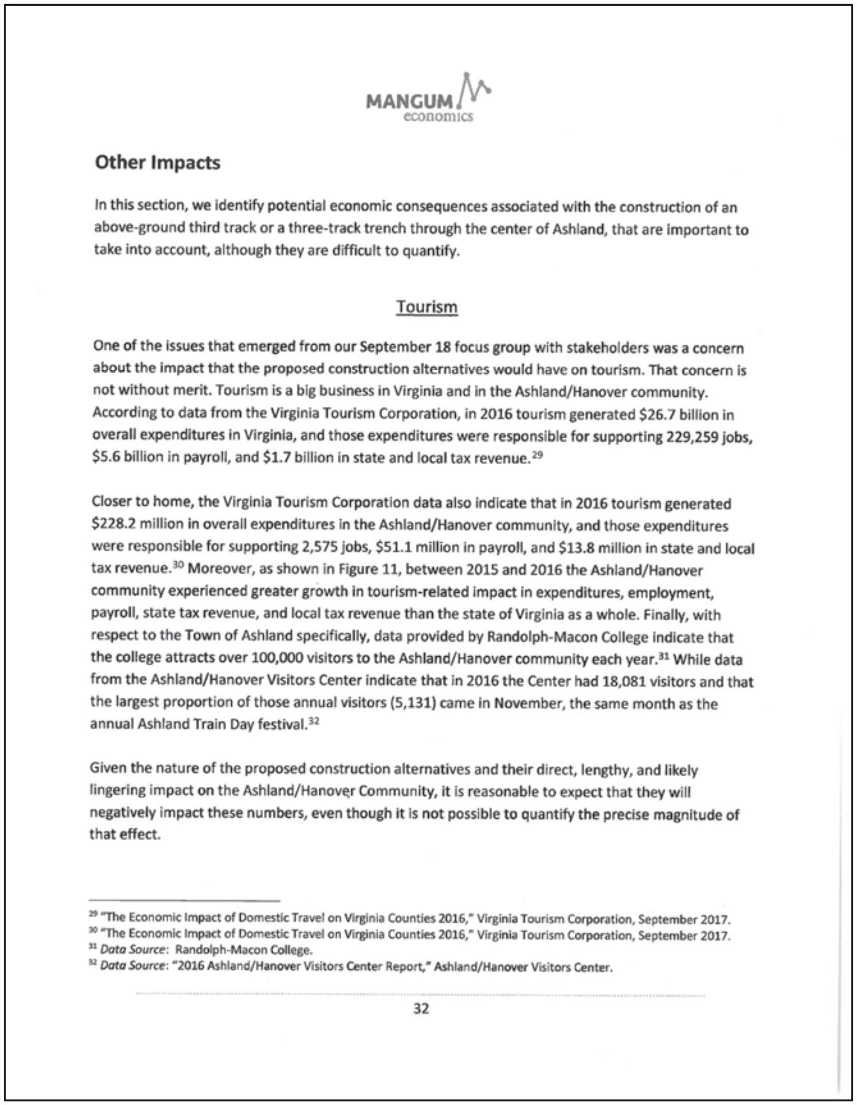
VIRGINIA DEQ (continued)



Other Impacts

In this section, we identify potential economic consequences associated with the construction of an above-ground third track or a three-track trench through the center of Ashland, that are important to take into account, although they are difficult to quantify.

Tourism

One of the issues that emerged from our September 18 focus group with stakeholders was a concern about the impact that the proposed construction alternatives would have on tourism. That concern is not without merit. Tourism is a big business in Virginia and in the Ashland/Hanover community. According to data from the Virginia Tourism Corporation, in 2016 tourism generated $26.7 billion in overall expenditures in Virginia, and those expenditures were responsible for supporting 229,259 jobs, $5.6 billion in payroll, and $1.7 billion in state and local tax revenue.[29]

Closer to home, the Virginia Tourism Corporation data also indicate that in 2016 tourism generated $228.2 million in overall expenditures in the Ashland/Hanover community, and those expenditures were responsible for supporting 2,575 jobs, $51.1 million in payroll, and $13.8 million in state and local tax revenue.[30] Moreover, as shown in Figure 11, between 2015 and 2016 the Ashland/Hanover community experienced greater growth in tourism-related impact in expenditures, employment, payroll, state tax revenue, and local tax revenue than the state of Virginia as a whole. Finally, with respect to the Town of Ashland specifically, data provided by Randolph-Macon College indicate that the college attracts over 100,000 visitors to the Ashland/Hanover community each year.[31] While data from the Ashland/Hanover Visitors Center indicate that in 2016 the Center had 18,081 visitors and that the largest proportion of those annual visitors (5,131) came in November, the same month as the annual Ashland Train Day festival.[32]

Given the nature of the proposed construction alternatives and their direct, lengthy, and likely lingering impact on the Ashland/Hanover Community, it is reasonable to expect that they will negatively impact these numbers, even though it is not possible to quantify the precise magnitude of that effect.

VIRGINIA DEQ (continued)

MANGUM economics

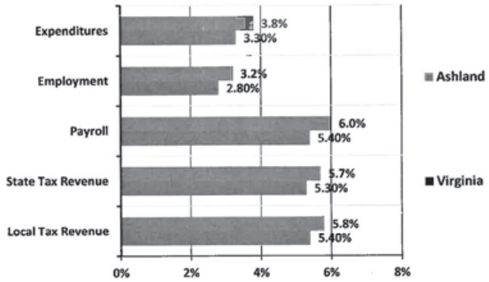

Figure 11: Year-Over-Year Change in Tourism Impact between 2015 and 2016[33]

Randolph-Macon College

Another issue that emerged from our September 18 focus group with stakeholders was a concern about the impact that the proposed construction alternatives would have on Randolph-Macon College. Randolph-Macon College is the primary driver of the Town of Ashland's economy. In the 2014-2015 academic year, Randolph-Macon College had a fall headcount enrollment of 1,394 students, employed 447 faculty and staff, and was directly responsible for contributing $22.7 million in spending to the Ashland/Hanover community.[34] In addition, in recent years the college has undertaken an ambitious capital expansion program that has resulted in $67.5 million in current and ongoing construction on campus. The most recent milestone in that expansion is the new 30,000 square foot science building that had its groundbreaking ceremony in May of 2016.

Because the current railroad right of way cuts right through the middle of Randolph-Macon College's campus, it is certain that either the construction of an above-ground third-track or the three-track trench would significantly disrupt the college's activities, and potentially impact its ability to attract students and continue to grow, expand, and invest. Moreover, that disruption would only further add to the list of significant challenges currently faced by Virginia's private, non-profit, four-year colleges and universities.

---

[33] "The Economic Impact of Domestic Travel on Virginia Counties 2016," Virginia Tourism Corporation, September 2017.
[34] *Data Source*: State Council of Higher Education for Virginia and Randolph-Macon College.

VIRGINIA DEQ (continued)

MANGUM economics

About three-quarters of Randolph-Macon College's students are Virginia residents. According to recent data from the Weldon Cooper Center, the number of college-age (20-24) individuals in Virginia is projected to decline by 4.3% between 2016 and 2020.[35] That decline will shrink the available pool of potential new students for Randolph-Macon College and other private and public Virginia colleges and universities. Moreover, it will likely place smaller private, non-profit, institutions such as Randolph-Macon College at a disadvantage, as they are forced to compete against larger, and heavily subsidized, public colleges and universities for a declining pool of potential new students.

Figure 12 depicts the year-over-year change in fall headcount enrollment in Virginia's public, four-year colleges and universities; private, non-profit, four-year colleges and universities; and Randolph-Macon College over the ten-year period from 2008 through 2016. As these data indicate, consistent with the demographic trends cited above, enrollment growth in Virginia's private, non-profit, four-year colleges and universities has generally been decelerating since 2009 and drifted into negative territory in 2015 and 2016.

To date, however, Randolph-Macon College has been able to out-perform that general trend. In 2016, Randolph-Macon College posted a 2.0 percent year-over-year increase in fall headcount enrollment, as compared to a 2.2 percent decline in enrollment across all Virginia private, non-profit, four-year colleges and universities, and a 0.6 percent increase in enrollment in the state's public, four-year colleges and universities. However, because of the significant, direct, and proximate impact that the proposed construction alternatives would have on the college, it is likely that they would negatively influence Randolph-Macon College's ability to continue to out-perform those statewide enrollment trends.

VIRGINIA DEQ (continued)

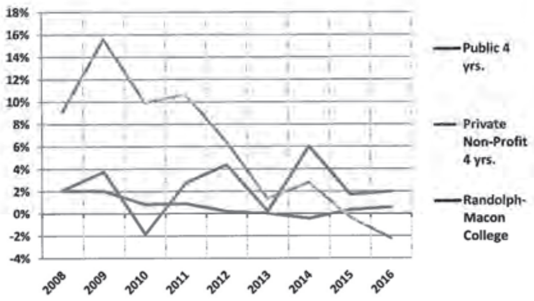

Figure 12: Year-Over-Year Change in Fall Headcount Enrollment[36]

Ashland as a "Train Town"

The last issue that emerged from our September 18 focus group with stakeholders that we address in this section is the impact that the proposed construction alternatives would have on Ashland's image as a "Train Town." As discussed earlier, many of the businesses along Center Street and Railroad Avenue indicated that much of their appeal to customers is linked directly to the Town of Ashland's general small-town ambiance and its reputation as a "train town." Moreover, that perspective is further supported by visitor data from the Ashland/Hanover Visitors Center that confirms that train-related activities such as the annual Ashland Train Day festival are responsible for a significant portion of the Center's visitor traffic. To the extent that the proposed construction alternatives negatively impacted that perceived image, they could have a significant and lasting negative impact on the character and economic vitality of the Town of Ashland that, although difficult to prospectively quantify, is nonetheless likely to be significant.

---

VIRGINIA DEQ (continued)

Conclusion

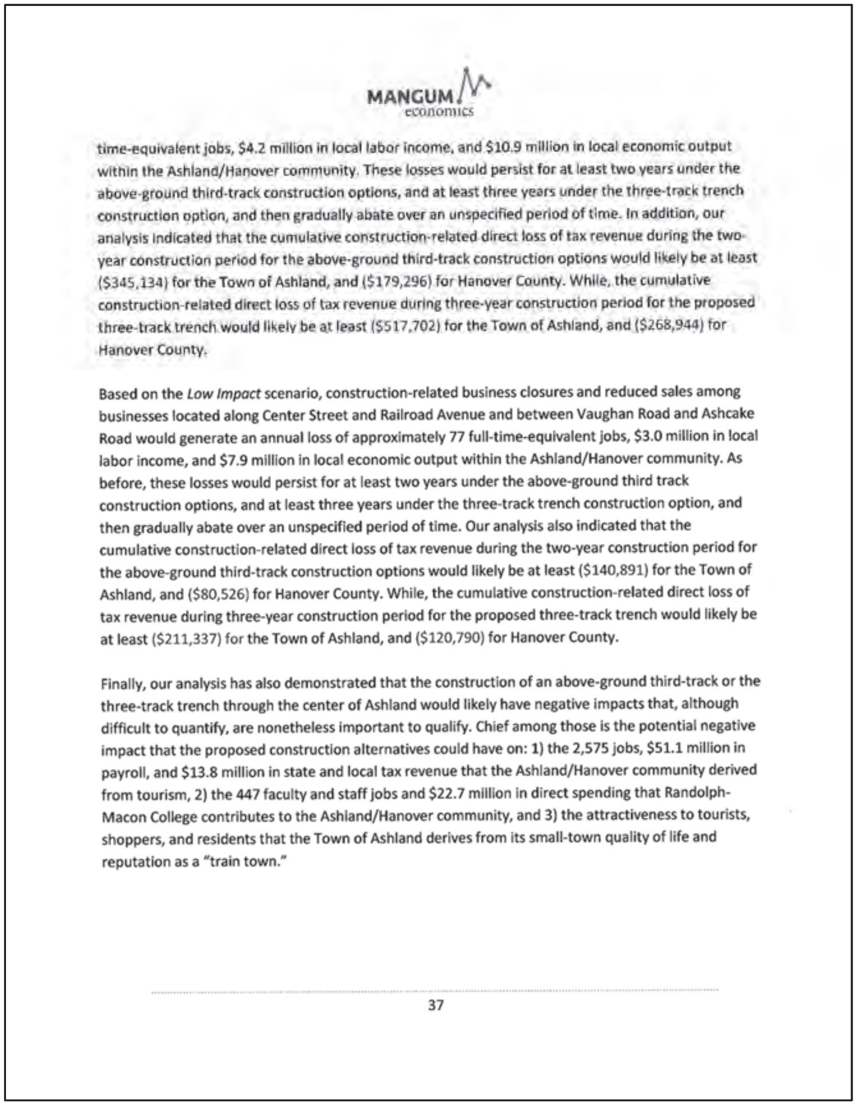
This report has quantified the potential economic and fiscal impact on the Town of Ashland from proposed construction alternatives associated with Alternative Area 5, the ten-mile portion of the 123-mile DC2RVA High-Speed Rail Project that encompasses the Town of Ashland. The purpose of the DC2RVA High-Speed Rail Project is to increase rail capacity along the DC to Richmond corridor in order to provide reliable, frequent, and high-speed passenger service between D.C. and Richmond, and also to better accommodate freight rail movement through the corridor, including freight going to and from Virginia's ports. In addition to proposed improvements to stations, parking, signals, and other safety systems, the primary infrastructure improvement associated with the DC2RVA High-Speed Rail Project would be to add an additional main track to the existing two main tracks within this corridor.

After a lengthy review and public engagement process that began in 2014, in September of this year, the Federal Rail Administration (FRA) and the Virginia Department of Rail and Public Transportation (DRPT) issued their "Tier II Draft Environmental Impact Statement Section 4(f) Evaluation" report. That report proposed five general construction alternatives for the Ashland portion of the DC2RVA High-Speed Rail Project. Those alternatives were: 1) maintain two tracks through Ashland (the 3:2:3 option), 2) add one track east of the existing two tracks running through Ashland, 3) construct three tracks running through Ashland that would be centered within the existing right of way, 4) construct a three-track trench running through Ashland, and 5) add a two-track western bypass. Subsequent to the release of the draft EIS, the Hanover County Board of Supervisors passed a resolution endorsing the 3-2-3 construction alternative, while the Ashland Town Council passed a resolution endorsing the western bypass.

Our analysis focused on the two general categories of these proposed alternatives that are likely to have a significantly disruptive impact on the Town of Ashland's economy during their construction phase – proposals for an above-ground third-track through downtown Ashland (which are generally assumed to entail a two-year construction period), and construction of the three-track trench through downtown Ashland (which is generally assumed to entail a three-year construction period). Based on stakeholder focus group input, the results of an informal telephone survey of businesses along the existing railroad right of way on Center Street and Railroad Avenue, and a review of the existing empirical literature on the impact of transportation construction projects on adjacent businesses, we also constructed a *High Impact* and a *Low Impact* scenario around those proposed alternatives.

What that analysis showed was that, based on the *High Impact* scenario, construction-related business closures and reduced sales among businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road would generate an annual loss of approximately 133 full-

VIRGINIA DEQ (continued)

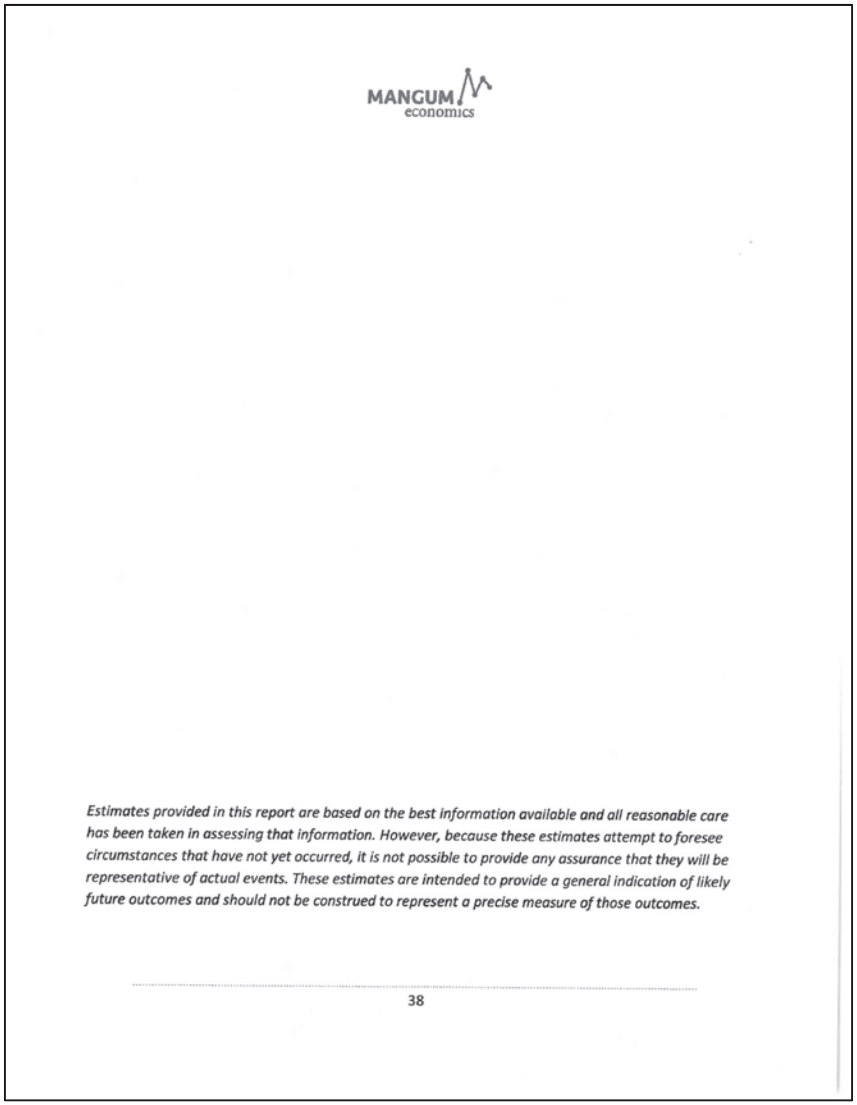


time-equivalent jobs, $4.2 million in local labor income, and $10.9 million in local economic output within the Ashland/Hanover community. These losses would persist for at least two years under the above-ground third-track construction options, and at least three years under the three-track trench construction option, and then gradually abate over an unspecified period of time. In addition, our analysis indicated that the cumulative construction-related direct loss of tax revenue during the two-year construction period for the above-ground third-track construction options would likely be at least ($345,134) for the Town of Ashland, and ($179,296) for Hanover County. While, the cumulative construction-related direct loss of tax revenue during three-year construction period for the proposed three-track trench would likely be at least ($517,702) for the Town of Ashland, and ($268,944) for Hanover County.

Based on the *Low Impact* scenario, construction-related business closures and reduced sales among businesses located along Center Street and Railroad Avenue and between Vaughan Road and Ashcake Road would generate an annual loss of approximately 77 full-time-equivalent jobs, $3.0 million in local labor income, and $7.9 million in local economic output within the Ashland/Hanover community. As before, these losses would persist for at least two years under the above-ground third track construction options, and at least three years under the three-track trench construction option, and then gradually abate over an unspecified period of time. Our analysis also indicated that the cumulative construction-related direct loss of tax revenue during the two-year construction period for the above-ground third-track construction options would likely be at least ($140,891) for the Town of Ashland, and ($80,526) for Hanover County. While, the cumulative construction-related direct loss of tax revenue during three-year construction period for the proposed three-track trench would likely be at least ($211,337) for the Town of Ashland, and ($120,790) for Hanover County.

Finally, our analysis has also demonstrated that the construction of an above-ground third-track or the three-track trench through the center of Ashland would likely have negative impacts that, although difficult to quantify, are nonetheless important to qualify. Chief among those is the potential negative impact that the proposed construction alternatives could have on: 1) the 2,575 jobs, $51.1 million in payroll, and $13.8 million in state and local tax revenue that the Ashland/Hanover community derived from tourism, 2) the 447 faculty and staff jobs and $22.7 million in direct spending that Randolph-Macon College contributes to the Ashland/Hanover community, and 3) the attractiveness to tourists, shoppers, and residents that the Town of Ashland derives from its small-town quality of life and reputation as a "train town."

VIRGINIA DEQ (continued)



Estimates provided in this report are based on the best information available and all reasonable care has been taken in assessing that information. However, because these estimates attempt to foresee circumstances that have not yet occurred, it is not possible to provide any assurance that they will be representative of actual events. These estimates are intended to provide a general indication of likely future outcomes and should not be construed to represent a precise measure of those outcomes.

November 7, 2017

Emily Stock
Manager of Rail Planning
Virginia Department of Rail & Public Transportation
600 E Main St, Suite 2102
Richmond, VA 23219

Dear Ms. Stock,

On September 8, 2017, the Virginia Department of Rail and Public Transportation (DRPT) opened a 60-day public comment period for the Washington, D.C. to Richmond Southeast High Speed Rail Project (DC2RVA) Draft Environmental Impact Statement (EIS). Please accept this letter outlining the County's partial comments on the Draft EIS, conveyed with the understanding that we will continue to work with DRPT and the Federal Railroad Administration (FRA) on concerns that we have related to the alignment options approaching Long Bridge.

We are thrilled that the Commonwealth has initiated a corridor-wide project to identify improvements that will benefit commuter, regional, and high-speed rail. The proposed work will expand track capacity in Northern Virginia, alleviating a Virginia-side bottleneck to the northeast corridor. While this will benefit high-speed rail throughout the Mid-Atlantic, it is also critical for enhancing opportunities for commuter service. We support this initiative from the standpoint of transportation connectivity and look forward to working with all partners towards that goal.

Related to the impacts of the project on Arlington County, we also look forward to working with DRPT and FRA to ensure that the project, when implemented, imposes the least amount of harm on critical environmental assets and County park infrastructure. Please find below our concerns related to impacts on natural resources, as well as a description of County park infrastructure at Long Bridge Park.

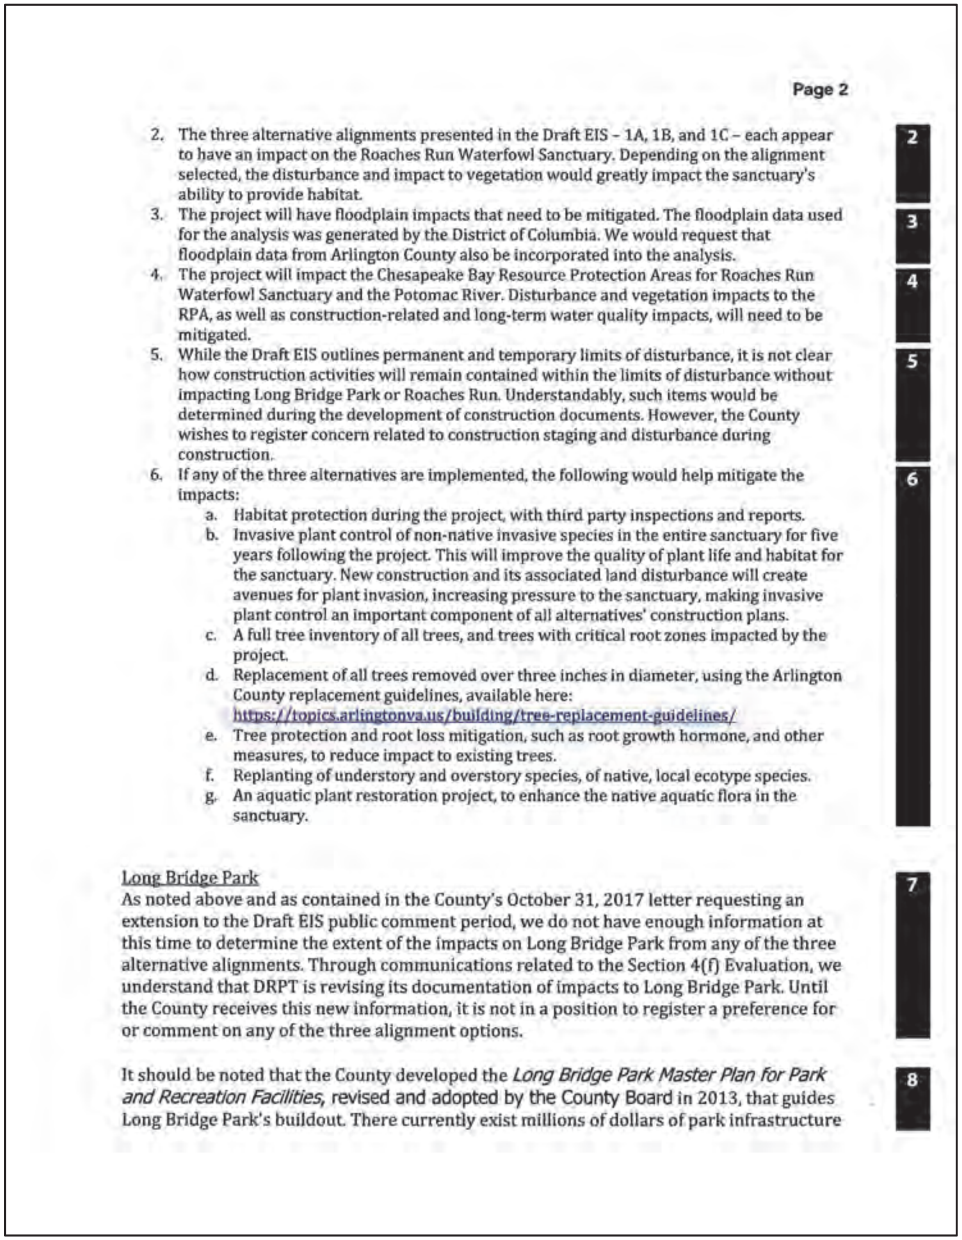
Natural Resources

1. The following natural resources are present in this area:
    a. The Roaches Run Waterfowl Sanctuary
    b. Several state-rare species of plants
    c. State and county champion trees, specifically:
        i. The 3rd and 4th largest buttonbush (Cephalanthus occidentalis) in the state
        ii. The largest Pawpaw (Asimina triloba) in the county
        iii. The largest known colony of Pumpkin ash (Fraxinus profunda) in Northern Virginia

1

ARLINGTON COUNTY (continued)

1. As stated in the Final Section 4(f) Evaluation for the Project (Chapter 6 of the Final EIS), the Preferred Alternative will not encroach upon the Roaches Run Waterfowl Sanctuary. Conceptual designs include retaining walls that will prevent encroachment (temporary or permanent) into the waters or riparian fringe of Roaches Run. Based on the CEDAR and Information for Planning and Consultation (IPaC) databases, no federally or state-listed threatened or endangered plant or animal species were identified as potentially occurring within the vicinity of the study area for the portion of the Project in Arlington County, as indicated in Final EIS Section 5.10.3. Discussions and review between DRPT and the County Department of Parks and Recreation, subsequent to the County's submission of these comments on the Draft EIS, indicate that the noted champion trees are not within the proposed Limits of Disturbance (LOD) for the Project.



Page 2

2. The three alternative alignments presented in the Draft EIS – 1A, 1B, and 1C – each appear to have an impact on the Roaches Run Waterfowl Sanctuary. Depending on the alignment selected, the disturbance and impact to vegetation would greatly impact the sanctuary's ability to provide habitat.
3. The project will have floodplain impacts that need to be mitigated. The floodplain data used for the analysis was generated by the District of Columbia. We would request that floodplain data from Arlington County also be incorporated into the analysis.
4. The project will impact the Chesapeake Bay Resource Protection Areas for Roaches Run Waterfowl Sanctuary and the Potomac River. Disturbance and vegetation impacts to the RPA, as well as construction-related and long-term water quality impacts, will need to be mitigated.
5. While the Draft EIS outlines permanent and temporary limits of disturbance, it is not clear how construction activities will remain contained within the limits of disturbance without impacting Long Bridge Park or Roaches Run. Understandably, such items would be determined during the development of construction documents. However, the County wishes to register concern related to construction staging and disturbance during construction.
6. If any of the three alternatives are implemented, the following would help mitigate the impacts:
   a. Habitat protection during the project, with third party inspections and reports.
   b. Invasive plant control of non-native invasive species in the entire sanctuary for five years following the project. This will improve the quality of plant life and habitat for the sanctuary. New construction and its associated land disturbance will create avenues for plant invasion, increasing pressure to the sanctuary, making invasive plant control an important component of all alternatives' construction plans.
   c. A full tree inventory of all trees, and trees with critical root zones impacted by the project.
   d. Replacement of all trees removed over three inches in diameter, using the Arlington County replacement guidelines, available here: https://topics.arlingtonva.us/building/tree-replacement-guidelines/
   e. Tree protection and root loss mitigation, such as root growth hormone, and other measures, to reduce impact to existing trees.
   f. Replanting of understory and overstory species, of native, local ecotype species.
   g. An aquatic plant restoration project, to enhance the native aquatic flora in the sanctuary.

Long Bridge Park

As noted above and as contained in the County's October 31, 2017 letter requesting an extension to the Draft EIS public comment period, we do not have enough information at this time to determine the extent of the impacts on Long Bridge Park from any of the three alternative alignments. Through communications related to the Section 4(f) Evaluation, we understand that DRPT is revising its documentation of impacts to Long Bridge Park. Until the County receives this new information, it is not in a position to register a preference for or comment on any of the three alignment options.

It should be noted that the County developed the *Long Bridge Park Master Plan for Park and Recreation Facilities*, revised and adopted by the County Board in 2013, that guides Long Bridge Park's buildout. There currently exist millions of dollars of park infrastructure

ARLINGTON COUNTY (continued)

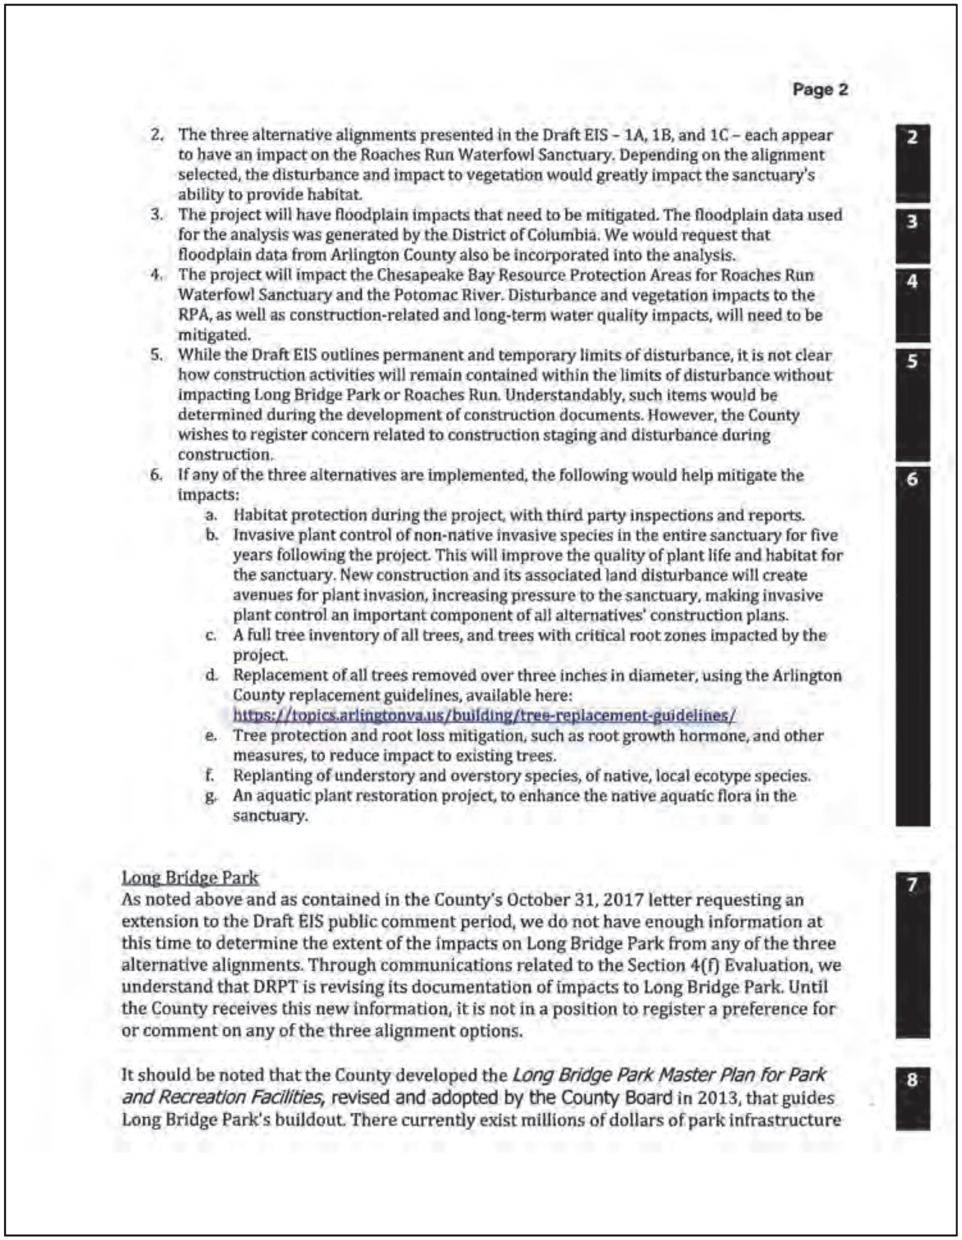
2. No lands will need to be acquired from the Roaches Run Waterfowl Sanctuary. As stated in the Final Section 4(f) Evaluation for the Project (Chapter 6 of the Final EIS), the Preferred Alternative will not encroach upon the Roaches Run Waterfowl Sanctuary and therefore will not disturb vegetation within the Sanctuary. Alternative 1B: Add Two Tracks on the West was selected as the Preferred Alternative in Area 1, to align with the two alternatives that were recommended in the alternatives report for the Long Bridge project (separate from the DC2RVA Project). Preferred Alternative 1B includes the least amount of disturbance on the east side of the existing CSXT right-of-way adjacent to the Roaches Run Waterfowl Sanctuary, with all proposed improvements contained within the railroad right-of-way.

3. Final EIS Section 5.1.6.2 addresses mitigation of floodplain impacts for the Preferred Alternative. As stated in Draft EIS Section 3.1.5, DRPT used floodplain mapping produced by the Federal Emergency Management Agency (FEMA) for the assessment of potential impacts to floodplains as required by US Department of Transportation Policy and FRA's Procedures for Considering Environmental Impacts. Additional floodplain mapping from local jurisdictions, including Arlington County, will be incorporated into the final design of the Project, as appropriate.

4. Final EIS Section 5.1.1.1 addresses Chesapeake Bay Preservation Act applicability and compliance of the Preferred Alternative.

5. DRPT will continue to coordinate with the County through final design and preparation of construction documents (both of which will occur after funding becomes available), specifically related to construction activities in the vicinity of parks. Temporary impacts to lands outside the railroad right-of-way will be minimized where practical, during final design and construction management planning, once funding is available and incremental improvements are scheduled.

(Responses are continued on next page)



Page 2

2. The three alternative alignments presented in the Draft EIS – 1A, 1B, and 1C – each appear to have an impact on the Roaches Run Waterfowl Sanctuary. Depending on the alignment selected, the disturbance and impact to vegetation would greatly impact the sanctuary's ability to provide habitat. 2
3. The project will have floodplain impacts that need to be mitigated. The floodplain data used for the analysis was generated by the District of Columbia. We would request that floodplain data from Arlington County also be incorporated into the analysis. 3
4. The project will impact the Chesapeake Bay Resource Protection Areas for Roaches Run Waterfowl Sanctuary and the Potomac River. Disturbance and vegetation impacts to the RPA, as well as construction-related and long-term water quality impacts, will need to be mitigated. 4
5. While the Draft EIS outlines permanent and temporary limits of disturbance, it is not clear how construction activities will remain contained within the limits of disturbance without impacting Long Bridge Park or Roaches Run. Understandably, such items would be determined during the development of construction documents. However, the County wishes to register concern related to construction staging and disturbance during construction. 5
6. If any of the three alternatives are implemented, the following would help mitigate the impacts: 6
   a. Habitat protection during the project, with third party inspections and reports.
   b. Invasive plant control of non-native invasive species in the entire sanctuary for five years following the project. This will improve the quality of plant life and habitat for the sanctuary. New construction and its associated land disturbance will create avenues for plant invasion, increasing pressure to the sanctuary, making invasive plant control an important component of all alternatives' construction plans.
   c. A full tree inventory of all trees, and trees with critical root zones impacted by the project.
   d. Replacement of all trees removed over three inches in diameter, using the Arlington County replacement guidelines, available here: https://topics.arlingtonva.us/building/tree-replacement-guidelines/
   e. Tree protection and root loss mitigation, such as root growth hormone, and other measures, to reduce impact to existing trees.
   f. Replanting of understory and overstory species, of native, local ecotype species.
   g. An aquatic plant restoration project, to enhance the native aquatic flora in the sanctuary.

Long Bridge Park

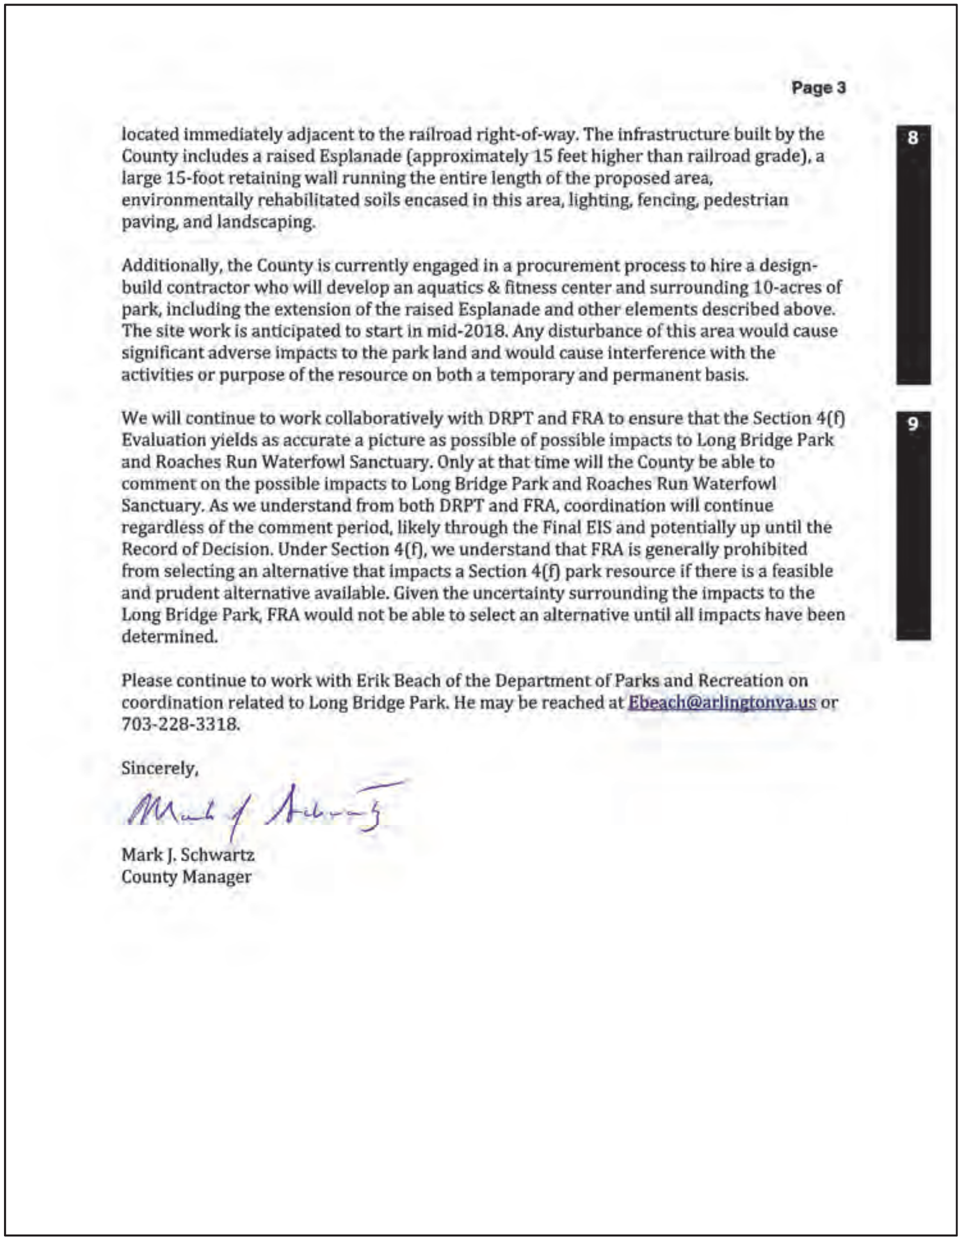
As noted above and as contained in the County's October 31, 2017 letter requesting an extension to the Draft EIS public comment period, we do not have enough information at this time to determine the extent of the impacts on Long Bridge Park from any of the three alternative alignments. Through communications related to the Section 4(f) Evaluation, we understand that DRPT is revising its documentation of impacts to Long Bridge Park. Until the County receives this new information, it is not in a position to register a preference for or comment on any of the three alignment options. 7

It should be noted that the County developed the *Long Bridge Park Master Plan for Park and Recreation Facilities*, revised and adopted by the County Board in 2013, that guides Long Bridge Park's buildout. There currently exist millions of dollars of park infrastructure 8

ARLINGTON COUNTY (continued)

6. Final EIS Section 5.10.3.2 discusses potential avoidance, minimization, and mitigation measures that could potentially be deployed, as required; final determinations on specific mitigation for threatened and endangered species (if required) will be made during final design (after funding becomes available and incremental improvements are scheduled) in coordination with regulatory agencies.

7. and 8. DRPT has reviewed updated information provided by the County and refined the conceptual engineering design to further minimize impacts to Long Bridge Park since the publication of the Draft EIS. Alternative 1B: Add Two Tracks on the West was selected as the Preferred Alternative in Area 1, to align with the two alternatives that were recommended in the alternatives report for the Long Bridge project (separate from the DC2RVA Project). Preferred Alternative 1B includes the installation of two new tracks adjacent to the Long Bridge Park; however, all proposed improvements will be within the existing railroad right-of-way in this area. Accordingly, no land will need to be acquired from Long Bridge Park for Preferred Alternative 1B and no existing park features or proposed plans will be disturbed. Preferred Alternative 1B will require temporary impacts to Long Bridge Park located to the west of the existing CSXT right-of-way, as indicated in the Final Section 4(f) Evaluation (Chapter 6 of the Final EIS); however, these will be temporary construction impacts and existing or proposed park activities will not be impacted. DRPT will continue to coordinate with the County regarding potential impacts to Long Bridge Park during final design and construction, once funding is available and incremental improvements are scheduled.



located immediately adjacent to the railroad right-of-way. The infrastructure built by the County includes a raised Esplanade (approximately 15 feet higher than railroad grade), a large 15-foot retaining wall running the entire length of the proposed area, environmentally rehabilitated soils encased in this area, lighting, fencing, pedestrian paving, and landscaping. 8

Additionally, the County is currently engaged in a procurement process to hire a design-build contractor who will develop an aquatics & fitness center and surrounding 10-acres of park, including the extension of the raised Esplanade and other elements described above. The site work is anticipated to start in mid-2018. Any disturbance of this area would cause significant adverse impacts to the park land and would cause interference with the activities or purpose of the resource on both a temporary and permanent basis.

We will continue to work collaboratively with DRPT and FRA to ensure that the Section 4(f) Evaluation yields as accurate a picture as possible of possible impacts to Long Bridge Park and Roaches Run Waterfowl Sanctuary. Only at that time will the County be able to comment on the possible impacts to Long Bridge Park and Roaches Run Waterfowl Sanctuary. As we understand from both DRPT and FRA, coordination will continue regardless of the comment period, likely through the Final EIS and potentially up until the Record of Decision. Under Section 4(f), we understand that FRA is generally prohibited from selecting an alternative that impacts a Section 4(f) park resource if there is a feasible and prudent alternative available. Given the uncertainty surrounding the impacts to the Long Bridge Park, FRA would not be able to select an alternative until all impacts have been determined. 9

Please continue to work with Erik Beach of the Department of Parks and Recreation on coordination related to Long Bridge Park. He may be reached at Ebeach@arlingtonva.us or 703-228-3318.

Sincerely,

Mark J. Schwartz
County Manager

ARLINGTON COUNTY (continued)

(Response to comment 8 on previous page)

9. FRA and DRPT appreciate the County's collaborative efforts. As stated previously, Preferred Alternative 1B will not permanently impact Long Bridge Park and will therefore not result in a Section 4(f) use for this resource; see Chapter 6 of the Final EIS. DRPT will continue to coordinate with the County regarding the potential temporary impacts associated with the Preferred Alternative 1B, as required.

Re: Long Bridge Park *De Minimis* Impacts and Permanent and Temporary Occupancy

Dear Ms. Stock,

1

Arlington County received your letter dated June 16, 2017 in regard to the use in a temporary and permanent manner land owned by Arlington County included within Arlington County's Long Bridge Park, and DPRT's evaluation that those impacts would be *de minimis*. The County strongly disagrees with this evaluation and asserts that DPRT's use of the properties would have a significant adverse effect on the protected resource in question.

Alternates 1B and 1C would have significant adverse impacts to existing amenities as well as future phases of the park's development. The County adopted a park master plan and design guidelines for the park in 2013 that guide Long Bridge Park's buildout. Although it is not visible in the older satellite imagery you provided in your exhibit, "Long Bride Park Build Alternative 1A, 1B, 1C", a simple site visit would reveal that that there are millions of dollars of existing park infrastructure located in the area outlined by "1B and 1C Permanent Impacts" and "1B and 1C Temporary Impacts" starting almost immediately adjacent to the County property line. This infrastructure includes a raised Esplanade (approximately 15 feet higher than railroad grade), a large 15-foot retaining wall running the entire length of the proposed area, environmentally rehabilitated soils encased in this area, lighting, fencing, pedestrian paving, and landscaping. At the far north end of the area outlined by "1B and 1C Permanent Impacts and 1B and 1C Temporary Impacts", while this infrastructure is not yet in place, the County is currently engaged in a procurement process to hire the design-build contractor who will develop the aquatics and fitness center and surrounding 10-acres of park, including the extension of the raised Esplanade and other elements described above. The site work is anticipated to start as early as mid-2018. Any use of this area would cause significant adverse impacts to the already master-planned park land and would cause interference with the activities or purpose of the resource on both a temporary and permanent basis.

2

Although alternate 1A is located on the east side of the railroad, the proposed work would be located in an area immediately adjacent to the National Park Services' Roaches Run Wildfowl Sanctuary. As you mention in your letter, the County's sports fields would not be impacted, however Roaches Run Wildfowl Sanctuary is home to a variety of sensitive wildlife and plant

ARLINGTON COUNTY, DEPARTMENT OF PARKS AND RECREATION

1. These County comments are primarily in response to FRA's request for the County's concurrence in FRA's preliminary Section 4(f) determination as part of the Section 4(f) process, prior to the publication of the Draft EIS document. Alternative 1B: Add Two Tracks on the West was selected as the Preferred Alternative in Area 1, to align with the two alternatives that were recommended in the alternatives report for the Long Bridge project (separate from the DC2RVA Project). Preferred Alternative 1B includes the least amount of disturbance on the east side of the existing CSXT right-of-way of the evaluated Draft EIS Build Alternatives. Although DRPT's Section 4(f) coordination letter dated June 16, 2017 and the Draft EIS state that Build Alternative 1B would have impacts to Long Bridge Park, since that time DRPT has had further coordination with Arlington County on additional plans for park improvements and elevation changes that have eliminated the need for the permanent impacts to park lands to the west of the existing CSXT right-of-way. There would be no permanent acquisition of Long Bridge Park lands with the Preferred Alternative. The Preferred Alternative would require temporary construction impacts to the west of the existing CSXT right-of-way. These temporary construction impacts do not preclude the Master Plan development and would not impact other existing or proposed park activities. DRPT will continue to coordinate with the County regarding the potential temporary impacts associated with the Preferred Alternative. In a letter dated December 18, 2018, Arlington County Department of Parks and Recreation concurred with the Project impacts to Long Bridge Park (see Appendix E of the Final EIS).

Re: Long Bridge Park *De Minimis* Impacts and Permanent and Temporary Occupancy

Dear Ms. Stock,

1

Arlington County received your letter dated June 16, 2017 in regard to the use in a temporary and permanent manner land owned by Arlington County included within Arlington County's Long Bridge Park, and DPRT's evaluation that those impacts would be *de minimis*. The County strongly disagrees with this evaluation and asserts that DPRT's use of the properties would have a significant adverse effect on the protected resource in question.

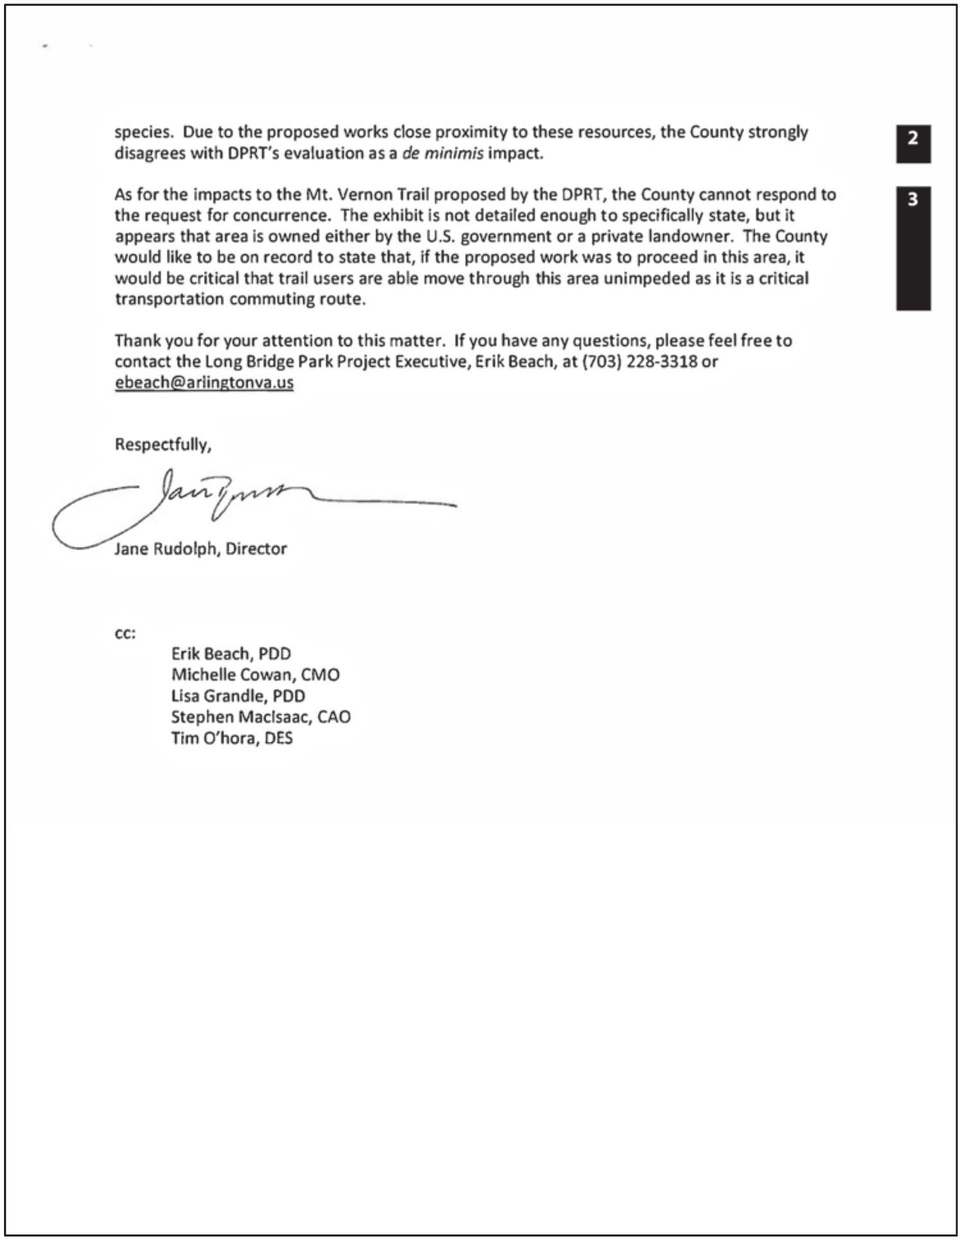
Alternates 1B and 1C would have significant adverse impacts to existing amenities as well as future phases of the park's development. The County adopted a park master plan and design guidelines for the park in 2013 that guide Long Bridge Park's buildout. Although it is not visible in the older satellite imagery you provided in your exhibit, "Long Bride Park Build Alternative 1A, 1B, 1C", a simple site visit would reveal that that there are millions of dollars of existing park infrastructure located in the area outlined by "1B and 1C Permanent Impacts" and "1B and 1C Temporary Impacts" starting almost immediately adjacent to the County property line. This infrastructure includes a raised Esplanade (approximately 15 feet higher than railroad grade), a large 15-foot retaining wall running the entire length of the proposed area, environmentally rehabilitated soils encased in this area, lighting, fencing, pedestrian paving, and landscaping. At the far north end of the area outlined by "1B and 1C Permanent Impacts and 1B and 1C Temporary Impacts", while this infrastructure is not yet in place, the County is currently engaged in a procurement process to hire the design-build contractor who will develop the aquatics and fitness center and surrounding 10-acres of park, including the extension of the raised Esplanade and other elements described above. The site work is anticipated to start as early as mid-2018. Any use of this area would cause significant adverse impacts to the already master-planned park land and would cause interference with the activities or purpose of the resource on both a temporary and permanent basis.

2

Although alternate 1A is located on the east side of the railroad, the proposed work would be located in an area immediately adjacent to the National Park Services' Roaches Run Wildfowl Sanctuary. As you mention in your letter, the County's sports fields would not be impacted, however Roaches Run Wildfowl Sanctuary is home to a variety of sensitive wildlife and plant

ARLINGTON COUNTY, DEPARTMENT OF PARKS AND RECREATION (continued)

2. Alternative 1B: Add Two Tracks on the West was selected as the Preferred Alternative in Area 1, to align with the two alternatives that were recommended in the alternatives report for the Long Bridge project (separate from the DC2RVA Project). Preferred Alternative 1B includes the least amount of disturbance on the east side of the CSXT right-of-way adjacent to the Roaches Run Waterfowl Sanctuary with all improvements contained within the railroad right-of-way. DRPT recognizes that Build Alternative 1A would be in close proximity to Roaches Run Waterfowl Sanctuary; however, DRPT has dismissed this alternative and there are no direct impacts to the sanctuary. Build Alternative 1B will require temporary impacts to Long Bridge Park located on the west side of the existing CSXT right-of-way. These temporary construction impacts will not impact existing or proposed park activities. Removal of trees and other vegetation in the temporary construction area will be limited to the extent feasible. The area will be restored and re-planted with native vegetation similar to prior conditions after completion of construction. DRPT will continue to coordinate with the County regarding the potential temporary impacts associated with Build Alternative 1B, as required.



species. Due to the proposed works close proximity to these resources, the County strongly disagrees with DPRT's evaluation as a *de minimis* impact. 2

As for the impacts to the Mt. Vernon Trail proposed by the DPRT, the County cannot respond to the request for concurrence. The exhibit is not detailed enough to specifically state, but it appears that area is owned either by the U.S. government or a private landowner. The County would like to be on record to state that, if the proposed work was to proceed in this area, it would be critical that trail users are able move through this area unimpeded as it is a critical transportation commuting route. 3

Thank you for your attention to this matter. If you have any questions, please feel free to contact the Long Bridge Park Project Executive, Erik Beach, at (703) 228-3318 or ebeach@arlingtonva.us

Respectfully,

Jane Rudolph, Director

(Response to comment 2 on previous page)

3. DRPT anticipates that approximately 20 feet of the Mount Vernon Trail owned by the National Park Service will be temporarily impacted during construction; however, the Mount Vernon Trail will remain connected and functional, to current levels of service, for all users during and after construction of the Project. The 20 feet of trail that would be temporarily impacted is located on the east side of the existing rail right-of-way on GWMP land opposite Crystal City Water Park and near Ronald Reagan National Airport. Details regarding maintaining access will be determined during final design, after funding becomes available and incremental improvements are scheduled.

Manager of Rail and Planning
Virginia Department of Rail and Public Transit
801 East Main Street, Suite 1000
Richmond, Virginia 23219

Reference: D.C. to Richmond Southeast High Speed Rail - Tier II Draft Environmental Impact Statement

Dear Ms. Stock:

The City of Alexandria appreciates all of the work that the Commonwealth and the Department of Rail and Public Transportation (DRPT) are doing to improve transportation throughout the Commonwealth, including the Northern Virginia region. Thank you for the opportunity to provide comments on the D.C. to Richmond Southeast High Speed Rail - Tier II Draft Environmental Impact Statement (DEIS) and for facilitating a meeting between City and DRPT staff to address some of our preliminary concerns.

City staff have reviewed the DEIS and discussed with our City Council key concerns related to the impact of shifting existing tracks toward residential areas, property acquisition, noise and vibration impacts and mitigation, proposed walls along the corridor, and impacts to Alexandria Union Station parking. The resulting detailed list of questions and comments for you is provided in the attached document.

We look forward to continuing to work with DRPT on this important project. If you have any questions regarding these comments, please feel free to contact me.

Sincerely,

Mark B. Jinks
City Manager

DC2RVA Draft Environmental Impact Statement (DEIS) DRAFT

City of Alexandria Question and Comment Matrix

TOPIC	DEPARTMENT	ID #	QUESTIONS/COMMENTS
Impact on planned future projects	Transportation & Environmental Services	1	Did the analysis consider only existing facilities? Or did it consider pipeline projects or planned development in Alexandria? For example, the North Potomac Yard Phase 1 development between Potomac Avenue and the railroad is anticipated to be completed by approximately 2021, which includes a linear park, mixed use development (including residential). Did the DEIS consider the North Potomac Yard area regarding park impacts, future trails, aesthetics, noise, aesthetics, the proposed school, etc.
		2	In Section 3.11.4.1., the description of the western part of the city is described as "commercial and industrial development". The project team should consult the Eisenhower West Small Area Plan to understand the future planned land uses in those areas.
Private or Business property Acquisition	Transportation & Environmental Services	3	Please clarify that there is no need to permanently acquire private property (residential) or business property in the City of Alexandria
Construction Impacts and Timeframe	Transportation & Environmental Services	4	Has any timeline been established for when construction would need to begin in order for operations to be in effect by 2025?
		5	How would the DC2RVA project construction and operations potentially affect the North Potomac Yard Metro station construction?
		6	Section 4.19 – How will the project construction affect roadway operations, especially where new overpasses are built, such as over King Street, and Commonwealth Avenue.
		7	Would private vehicle traffic be affected during construction? This includes potential traffic affectations related to grade-separated crossing improvements and for bridge stabilization or material removal?
		8	Would any rail spurs within the City of Alexandria be used during construction that could potentially bring affectations to regular traffic (cars, buses, metro rail bike/ped)?
		9	In the technical appendix Figure 2-24 Alexandria Union Station, the VRE pedestrian tunnel under the rail ROW is shown. Can you clarify how the DR2RVA project may impact the construction of this tunnel? How is the DC2RVA project coordinating with "others"?

1

CITY OF ALEXANDRIA (continued)

[Note that the City provided comments on November 7th, 2017 and revised comments on January 26th, 2018. The letter and comments/ responses provided herein reflect the more recent revised comments, as provided by the City.]

1. Future planned developments are taken into consideration throughout the Project process. Section 5.20 of the Final EIS discusses the potential indirect and cumulative effects of planned developments, and has been updated to include the Potomac Yard Metrorail Station and other major projects included in the City of Alexandria's Master Plan.

2. The existing land uses within 500 feet of the CSXT corridor are summarized in Table 3.11-4 of the Draft EIS. The top three existing land uses by acreage are Commercial/Office, Industrial, and Transportation. The existing residential areas within the Eisenhower West Small Area Plan are represented in Table 3.11-4 of the Draft EIS and the plan was consulted during the Project process.

3. DRPT has continued to review its available GIS parcel boundary data and conceptual engineering plans, and has determined there will be no permanent acquisitions of parcels (or portions of parcels) in the City of Alexandria. All Project improvements are designed to occur within existing railroad right-of-way within the City; where possible, retaining walls placed at the boundary of the right-of-way will be used to keep Project grading effects from adjacent lands. Improvements and impact limits at the Alexandria Station, including improvements to the City-owned parking lot, are provided for station planning by the City and do not indicate property acquisition or impacts by the Project. However, there will be temporary impacts to several City-owned park lands during construction as identified in Table 5.14-1 of the Final EIS.

For example, the North Potomac Yard Phase 1 development between Potomac Avenue and the railroad is anticipated to be completed by approximately 2021, which includes a linear park, mixed use development (including residential). Did the DEIS consider the North Potomac Yard area regarding park impacts, future trails, aesthetics, noise, aesthetics, the proposed school, etc.	1
		2	In Section 3.11.4.1., the description of the western part of the city is described as "commercial and industrial development". The project team should consult the Eisenhower West Small Area Plan to understand the future planned land uses in those areas.	2
Private or Business property Acquisition	Transportation & Environmental Services	3	Please clarify that there is no need to permanently acquire private property (residential) or business property in the City of Alexandria	3
Construction Impacts and Timeframe	Transportation & Environmental Services	4	Has any timeline been established for when construction would need to begin in order for operations to be in effect by 2025?	4
		5	How would the DC2RVA project construction and operations potentially affect the North Potomac Yard Metro station construction?	5
		6	Section 4.19 – How will the project construction affect roadway operations, especially where new overpasses are built, such as over King Street, and Commonwealth Avenue.	6
		7	Would private vehicle traffic be affected during construction? This includes potential traffic affectations related to grade-separated crossing improvements and for bridge stabilization or material removal?	7
		8	Would any rail spurs within the City of Alexandria be used during construction that could potentially bring affectations to regular traffic (cars, buses, metro rail bike/ped)?	8
		9	In the technical appendix Figure 2-24 Alexandria Union Station, the VRE pedestrian tunnel under the rail ROW is shown. Can you clarify how the DR2RVA project may impact the construction of this tunnel? How is the DC2RVA project coordinating with "others"?	9

CITY OF ALEXANDRIA (continued)

4. A new chapter (Chapter 7) has been added to the Final EIS since the publication of the Draft EIS, to clarify the next steps of the Project, including funding, final design, and construction. As described more fully in that chapter, the DC2RVA Project is not funded beyond the NEPA Tier II EIS study, with the exception of two segments of new main line track funded through the Atlantic Gateway project. The remainder of the DC2RVA Project will be designed/built in increments as funding becomes available and improvements are scheduled.
5. The DC2RVA Project construction and operations will occur within the CSXT right-of-way/corridor in the vicinity of the North Potomac Yard Metrorail station. With the exception of the Atlantic Gateway suite of projects (see response to DRPT-numbered statement #4), construction scheduling will be performed as part of the final design once funding becomes available and incremental improvements are scheduled. The DC2RVA Project will add a fourth track on the easternmost side of the CSX right-of-way/corridor (i.e., west of all existing tracks and the proposed North Potomac Yard Metrorail station). DRPT does not anticipate that construction of or operations on the new fourth track will impact the North Potomac Yard Metro Station construction or operations. This includes the information provided in the FTA Potomac Yard Metrorail Station EIS and ROD from 2016 (https://www.alexandriava.gov/potomacyard/default.aspx?id=101657), which define the station preferred alternative to be located east of the CSXT right-of-way. The initial plans for Potomac Yard Metro Station called for two entrances, north and south, with each entrance linked to a separate pedestrian bridge over the rail corridor. Due to cost concerns, the south entrance and pedestrian bridge was dropped from station plans in the September 2018 construction plans. Since then, with the announcement in November 2018 of Amazon's new headquarters facility to be located in Arlington, the City of Alexandria has announced the south entrance and pedestrian bridge will again be part of the Potomac Yard Metro Station. There will be two pedestrian bridges crossing the CSXT corridor to a roadway and station access location west of the CSXT right-of-way.

1

CITY OF ALEXANDRIA (continued)

6. There are no new overpasses proposed by the DC2RVA Project within the City of Alexandria. The existing King Street and Commonwealth Avenue underpass bridges are of sufficient width to construct the proposed fourth track on the existing structures. Final design, after funding is secured and incremental improvements are scheduled, will include detailed survey of existing railroad bridge structures, including those spanning King Street and Commonwealth Avenue. Should additional improvements be identified at that time, DRPT will coordinate with the City of Alexandria for the preparation of a traffic management plan.

7. Temporary minor impacts to private vehicle traffic during construction may result from material deliveries to or removal of materials from the construction areas or from structural rehabilitation of underpasses or overpasses; there are no new grade-separations proposed in the City as part of the Project. Detailed traffic control plans to minimize construction impacts will be developed as part of the final design, once funding becomes available and incremental improvements are scheduled; refer to DRPT-numbered statement #4 for construction / funding details.

8. The DC2RVA Project does not plan to construct or make use of any rail spurs within the City of Alexandria. Track designs, including the use of temporary or permanent rail spurs within the City of Alexandria, will be developed as part of the final design, after funding becomes available and incremental improvements are scheduled.

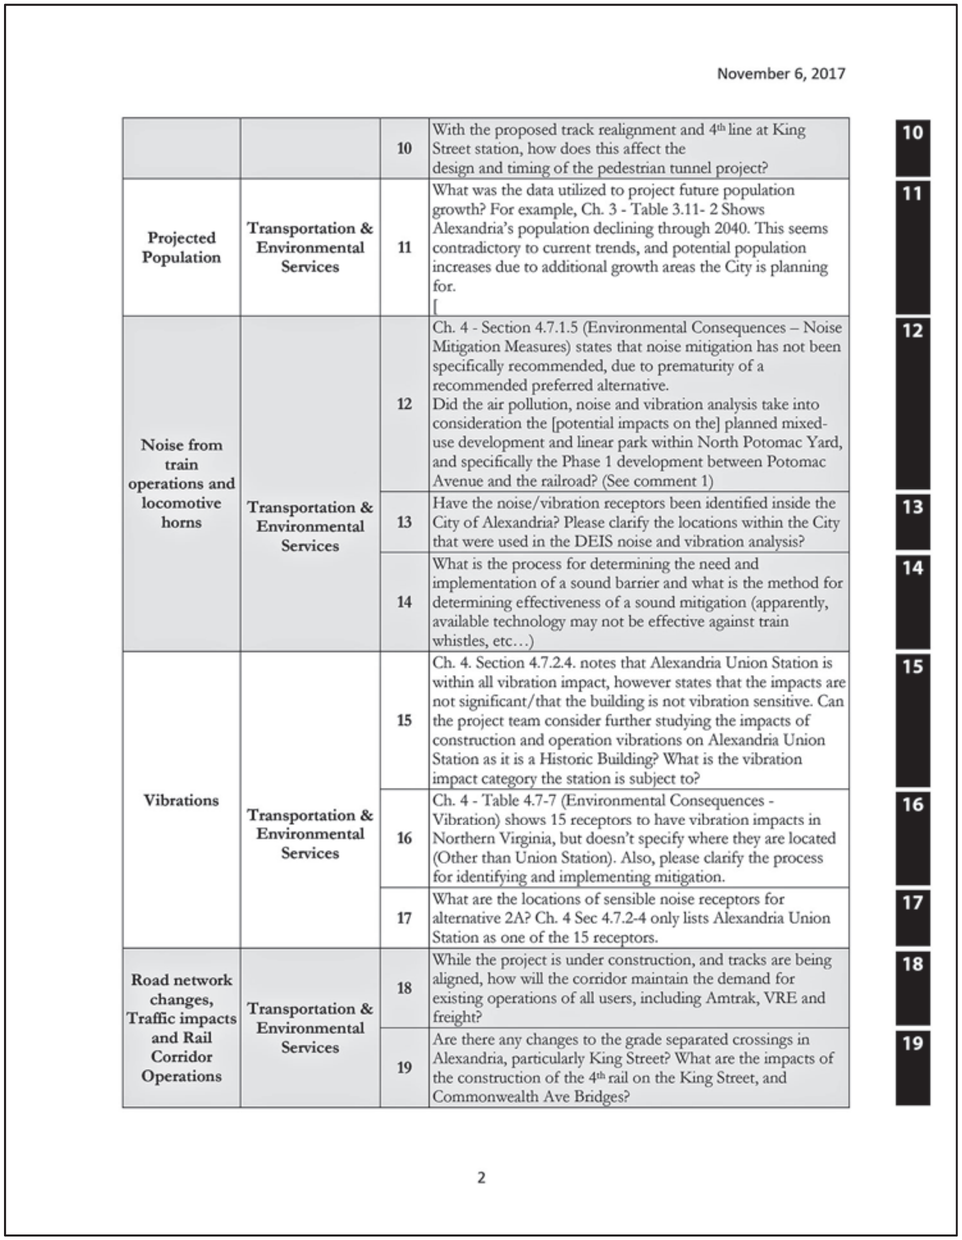
		9	In the technical appendix Figure 2-24 Alexandria Union Station, the VRE pedestrian tunnel under the rail ROW is shown. Can you clarify how the DR2RVA project may impact the construction of this tunnel? How is the DC2RVA project coordinating with "others"?	9

1

CITY OF ALEXANDRIA (continued)

9. and 10. In the vicinity of Alexandria Union Station, the DC2RVA Project proposes to add a fourth track within the existing CSXT right-of-way where a track previously existed. DRPT has coordinated closely with VRE throughout the development of the Draft EIS. The design and timing of the potential pedestrian tunnel project are independent of and separate from the DC2RVA Project, and temporary construction impacts will vary based on which project (DC2RVA or the referenced VRE pedestrian tunnel) is constructed first. Currently, DRPT anticipates that the proposed VRE pedestrian tunnel will be in place before DRPT adds the fourth track as part of the Atlantic Gateway project. Under this scenario, DRPT does not anticipate any impacts to the VRE pedestrian tunnel. However, DRPT recognizes that continued coordination with VRE and the City or Alexandria is critical to minimize the potential for the construction of the fourth track to impact the VRE improvements. Therefore, DRPT remains committed to working with VRE, and the City, during final design and construction of the Project (refer to DRPT-numbered statement #4 for details on Project funding / scheduling).



November 6, 2017

		10	With the proposed track realignment and 4th line at King Street station, how does this affect the design and timing of the pedestrian tunnel project?	10
Projected Population	Transportation & Environmental Services	11	What was the data utilized to project future population growth? For example, Ch. 3 - Table 3.11- 2 Shows Alexandria's population declining through 2040. This seems contradictory to current trends, and potential population increases due to additional growth areas the City is planning for. [	11
Noise from train operations and locomotive horns	Transportation & Environmental Services	12	Ch. 4 - Section 4.7.1.5 (Environmental Consequences – Noise Mitigation Measures) states that noise mitigation has not been specifically recommended, due to prematurity of a recommended preferred alternative. Did the air pollution, noise and vibration analysis take into consideration the [potential impacts on the] planned mixed-use development and linear park within North Potomac Yard, and specifically the Phase 1 development between Potomac Avenue and the railroad? (See comment 1)	12
		13	Have the noise/vibration receptors been identified inside the City of Alexandria? Please clarify the locations within the City that were used in the DEIS noise and vibration analysis?	13
		14	What is the process for determining the need and implementation of a sound barrier and what is the method for determining effectiveness of a sound mitigation (apparently, available technology may not be effective against train whistles, etc…)	14
Vibrations	Transportation & Environmental Services	15	Ch. 4. Section 4.7.2.4. notes that Alexandria Union Station is within all vibration impact, however states that the impacts are not significant/that the building is not vibration sensitive. Can the project team consider further studying the impacts of construction and operation vibrations on Alexandria Union Station as it is a Historic Building? What is the vibration impact category the station is subject to?	15
		16	Ch. 4 - Table 4.7-7 (Environmental Consequences - Vibration) shows 15 receptors to have vibration impacts in Northern Virginia, but doesn't specify where they are located (Other than Union Station). Also, please clarify the process for identifying and implementing mitigation.	16
		17	What are the locations of sensible noise receptors for alternative 2A? Ch. 4 Sec 4.7.2-4 only lists Alexandria Union Station as one of the 15 receptors.	17
Road network changes, Traffic impacts and Rail Corridor Operations	Transportation & Environmental Services	18	While the project is under construction, and tracks are being aligned, how will the corridor maintain the demand for existing operations of all users, including Amtrak, VRE and freight?	18
		19	Are there any changes to the grade separated crossings in Alexandria, particularly King Street? What are the impacts of the construction of the 4th rail on the King Street, and Commonwealth Ave Bridges?	19

2

CITY OF ALEXANDRIA (continued)

(Response to comment 10 on previous page)

11. DRPT used the state-approved Weldon Cooper Center population projection data for the Draft EIS population evaluations, as available at that time of analysis, which were later updated in June 2017. DRPT has reviewed the updated 2017 Weldon Cooper Center projections, which show greater growth in the City of Alexandria between 2015 and 2045 as compared to the values available at the time of the Draft EIS. While the updated data is consistent with the City's assertion, it does not affect any conclusions drawn in the Draft EIS regarding population increases for the overall study area.

12. DRPT evaluated noise and vibration effects from the proposed intercity passenger train using land use data that was publicly available and reasonably obtainable at the time the analyses were performed. This included digital aerial photographs showing the rail corridor and surrounding land uses near the planned North Potomac Yard. The noise and vibration contour figures in Appendix P of the Draft EIS show where Project-related noise and vibration impacts (as defined by FRA) are projected to occur including the area near the North Potomac Yard. Category Severe 1 Noise Impacts, as defined by FRA, may be experienced within 120 to 140 feet of the new main track along the corridor, depending on site specific conditions and land use; refer to the noise and vibration contours in Appendix P of the Draft EIS for additional information. There are no changes to the vibration impact contours or noise impact contours since the publication of the Draft EIS, with the exception of two areas for noise only; these two areas are detailed in Final EIS Section 5.7 and updated maps are provided in Appendix M of the Final EIS. Additionally, Section 5.20 of the Final EIS discusses the potential indirect and cumulative effects of planned developments, including the Potomac Yard Metrorail Station and other major projects included in the City of Alexandria's Master Plan.

    DRPT considered local Project-related air quality effects in the Draft EIS. Any increases in pollutant emissions related to trains operating along the DC2RVA corridor at this and other locations are expected to be minor. Additionally, construction activities can result in short-term increases in fugitive dust and equipment-related particulate emissions.

2

CITY OF ALEXANDRIA (continued)

The potential air quality effects from construction activity will be short-term, occurring only while construction work is in progress and local conditions are appropriate, and appropriate Best Management Practices will be identified during construction to minimize air quality effects.

13. DRPT evaluated noise and vibration effects from the proposed intercity passenger trains using land use data that was publicly available and reasonably obtainable at the time the analyses were performed. This included digital aerial photographs and land use data for City of Alexandria. The noise and vibration contour figures in Appendix P of the Draft EIS show where Project-related noise and vibration impacts (as defined by FRA) are projected to occur, including in the City of Alexandria. Category Severe 1 Noise Impacts, as defined by FRA, may be experienced within 120 to 140 feet of the new main track along the corridor, depending on site specific conditions and land use; refer to the noise and vibration contours in Appendix P of the Draft EIS for additional information. There are no changes to the noise impact contours since the publication of the Draft EIS, with the exception of two areas; these two areas are detailed in Final EIS Section 5.7 and updated maps are provided in Appendix M of the Final EIS.

14. FRA noise impact assessment guidelines include the methodology for determining if the proposed intercity passenger trains are projected to cause moderate or severe noise impacts (as defined by FRA). During the final design phase of the Project, which will occur after funding becomes available and incremental improvements are scheduled, the noise assessment will be revised to determine where severe noise impacts are projected to occur. Noise mitigation measures will be evaluated and selected at that time, as required. While sound barrier walls are a common mitigation measure for major highway projects, they are not typical for intercity passenger rail projects and are not required by FRA or FTA. Further, CSXT policy generally does not allow sound barrier walls within their right-of-way. Therefore, use of sound barrier walls as future mitigation for DC2RVA train noise would require additional property impacts.

2

CITY OF ALEXANDRIA (continued)

It is important to note that freight train noise, which accounts for more noise than passenger trains, will increase independently of the DC2RVA Project.

15. The Alexandria Union Station is an active, functioning train station that was designed and constructed to withstand exposure to train-induced ground-borne vibration on a daily basis. Therefore, it is not considered vibration-sensitive. While the building may have historic characteristics and designation, train-induced ground-borne vibration is a common phenomenon at the station by virtue of its nature as an active train station. It is important to note that train frequency of VRE commuter trains and CSXT freight trains (which account for more noise and vibration than passenger trains) through Alexandria Union Station will increase independently of the DC2RVA Project.

16. Appendix P of the Draft EIS includes noise and vibration contour figures that identify where noise and vibration impacts (as defined by FRA) are projected to occur as a result of the proposed intercity passenger trains. There are no changes to the vibration impact contours or noise impact contours since the publication of the Draft EIS, with the exception of two areas for noise only; these two areas are detailed in Final EIS Section 5.7 and updated maps are provided in Appendix M of the Final EIS.

    Mitigation measures will be evaluated in more detail during the final design phase of the Project, which will occur after funding becomes available and incremental improvements are scheduled. FRA noise and vibration impact assessment guidelines include guidelines for evaluating and implementing mitigation measures. Final mitigation decisions will be determined by FRA, with recommendations for permitting, as required, from Federal, state, and local agencies.

November 6, 2017

		10	With the proposed track realignment and 4th line at King Street station, how does this affect the design and timing of the pedestrian tunnel project?	10
Projected Population	**Transportation & Environmental Services**	11	What was the data utilized to project future population growth? For example, Ch. 3 - Table 3.11- 2 Shows Alexandria's population declining through 2040. This seems contradictory to current trends, and potential population increases due to additional growth areas the City is planning for. [	11
Noise from train operations and locomotive horns	**Transportation & Environmental Services**	12	Ch. 4 - Section 4.7.1.5 (Environmental Consequences – Noise Mitigation Measures) states that noise mitigation has not been specifically recommended, due to prematurity of a recommended preferred alternative. Did the air pollution, noise and vibration analysis take into consideration the [potential impacts on the] planned mixed-use development and linear park within North Potomac Yard, and specifically the Phase 1 development between Potomac Avenue and the railroad? (See comment 1)	12
		13	Have the noise/vibration receptors been identified inside the City of Alexandria? Please clarify the locations within the City that were used in the DEIS noise and vibration analysis?	13
		14	What is the process for determining the need and implementation of a sound barrier and what is the method for determining effectiveness of a sound mitigation (apparently, available technology may not be effective against train whistles, etc…)	14
Vibrations	**Transportation & Environmental Services**	15	Ch. 4. Section 4.7.2.4. notes that Alexandria Union Station is within all vibration impact, however states that the impacts are not significant/that the building is not vibration sensitive. Can the project team consider further studying the impacts of construction and operation vibrations on Alexandria Union Station as it is a Historic Building? What is the vibration impact category the station is subject to?	15
		16	Ch. 4 - Table 4.7-7 (Environmental Consequences - Vibration) shows 15 receptors to have vibration impacts in Northern Virginia, but doesn't specify where they are located (Other than Union Station). Also, please clarify the process for identifying and implementing mitigation.	16
		17	What are the locations of sensible noise receptors for alternative 2A? Ch. 4 Sec 4.7.2-4 only lists Alexandria Union Station as one of the 15 receptors.	17
Road network changes, Traffic impacts and Rail Corridor Operations	**Transportation & Environmental Services**	18	While the project is under construction, and tracks are being aligned, how will the corridor maintain the demand for existing operations of all users, including Amtrak, VRE and freight?	18
		19	Are there any changes to the grade separated crossings in Alexandria, particularly King Street? What are the impacts of the construction of the 4th rail on the King Street, and Commonwealth Ave Bridges?	19

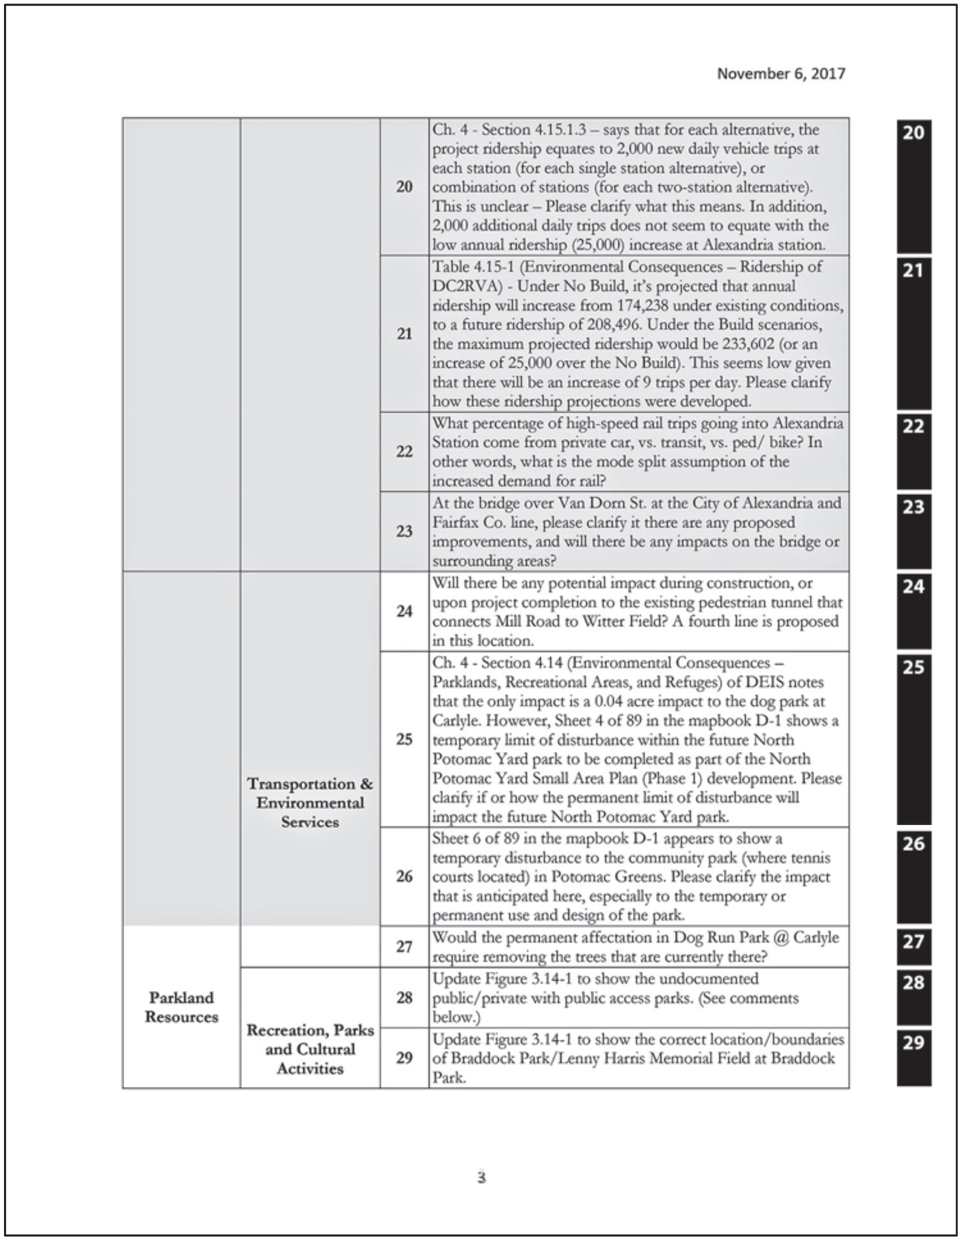
2

CITY OF ALEXANDRIA (continued)

17. Refer to the noise and vibration contour figures in Appendix P of the Draft EIS for the locations where noise and vibration impacts are projected to occur as a result of the build alternative for the proposed intercity passenger trains. There are no changes to the vibration impact contours or noise impact contours since the publication of the Draft EIS, with the exception of two areas for noise only; these two areas are detailed in Final EIS Section 5.7 and updated maps are provided in Appendix M of the Final EIS.

18. Existing operations for Amtrak, VRE, and freight will be maintained during construction to the extent practicable. DRPT anticipates that track outages would be limited, to the maximum extent possible, to periods when CSXT, Amtrak and VRE have a reduced number of trains operating. Coordination prior and during construction with CSXT, Amtrak and VRE will identify day, time of day, and length of time that a track outage may occur.

19. There are no proposed changes to the existing King Street or Commonwealth Avenue rail bridges. Structural assessments and construction impacts will be identified as part of the final design after funding becomes available and incremental improvements are scheduled; refer to DRPT-numbered statement #4 for construction / funding details. Final design, after funding is secured and incremental improvements are scheduled, will include detailed survey of existing railroad bridge structures, including those spanning King Street and Commonwealth Avenue. Should additional improvements be identified at that time, DRPT will coordinate with the City of Alexandria for the preparation of a traffic management plan during final design.



November 6, 2017

		20	Ch. 4 - Section 4.15.1.3 – says that for each alternative, the project ridership equates to 2,000 new daily vehicle trips at each station (for each single station alternative), or combination of stations (for each two-station alternative). This is unclear – Please clarify what this means. In addition, 2,000 additional daily trips does not seem to equate with the low annual ridership (25,000) increase at Alexandria station.	20
		21	Table 4.15-1 (Environmental Consequences – Ridership of DC2RVA) - Under No Build, it's projected that annual ridership will increase from 174,238 under existing conditions, to a future ridership of 208,496. Under the Build scenarios, the maximum projected ridership would be 233,602 (or an increase of 25,000 over the No Build). This seems low given that there will be an increase of 9 trips per day. Please clarify how these ridership projections were developed.	21
		22	What percentage of high-speed rail trips going into Alexandria Station come from private car, vs. transit, vs. ped/ bike? In other words, what is the mode split assumption of the increased demand for rail?	22
		23	At the bridge over Van Dorn St. at the City of Alexandria and Fairfax Co. line, please clarify it there are any proposed improvements, and will there be any impacts on the bridge or surrounding areas?	23
	Transportation & Environmental Services	24	Will there be any potential impact during construction, or upon project completion to the existing pedestrian tunnel that connects Mill Road to Witter Field? A fourth line is proposed in this location.	24
		25	Ch. 4 - Section 4.14 (Environmental Consequences – Parklands, Recreational Areas, and Refuges) of DEIS notes that the only impact is a 0.04 acre impact to the dog park at Carlyle. However, Sheet 4 of 89 in the mapbook D-1 shows a temporary limit of disturbance within the future North Potomac Yard park to be completed as part of the North Potomac Yard Small Area Plan (Phase 1) development. Please clarify if or how the permanent limit of disturbance will impact the future North Potomac Yard park.	25
		26	Sheet 6 of 89 in the mapbook D-1 appears to show a temporary disturbance to the community park (where tennis courts located) in Potomac Greens. Please clarify the impact that is anticipated here, especially to the temporary or permanent use and design of the park.	26
Parkland Resources		27	Would the permanent affectation in Dog Run Park @ Carlyle require removing the trees that are currently there?	27
	Recreation, Parks and Cultural Activities	28	Update Figure 3.14-1 to show the undocumented public/private with public access parks. (See comments below.)	28
		29	Update Figure 3.14-1 to show the correct location/boundaries of Braddock Park/Lenny Harris Memorial Field at Braddock Park.	29

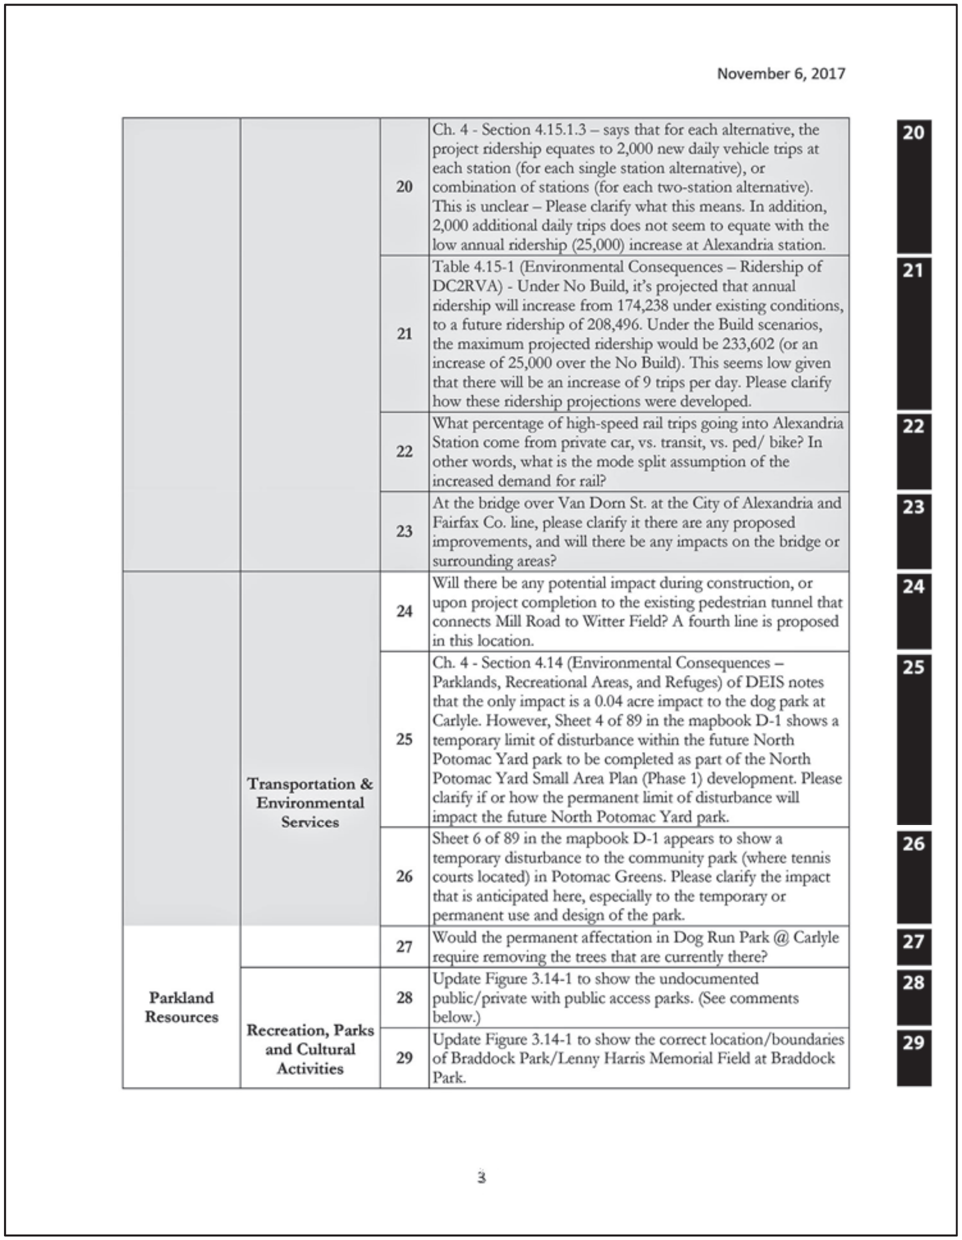
3

CITY OF ALEXANDRIA (continued)

20. The referenced text is in a section of the Draft EIS that is a summary of Table 4.15-3, the first column of which lists the station alternatives in Richmond; these alternatives drive the differences in ridership projections for Build conditions throughout the DC2RVA corridor. The referenced text "for each alternative…" is intended to indicate daily vehicle trips at each of the Richmond station alternatives (not each Build Alternative throughout the corridor), and is not intended to be a reflection of ridership at the Alexandria station; this text is clarified in Section 5.15.1.3 of the Final EIS, as well as in the errata table for the Draft EIS, which is Appendix A of the Final EIS. As shown in Table 4.15-1 of the Draft EIS, the annual ridership at Alexandria Station is anticipated to increase 11% in 2025, as compared to the No Build. Daily vehicle trips are a separate estimate from annual ridership and are not a one-to-one correlation (refer to DRPT-numbered statement #22 for mode-split assumptions at Alexandria Station).

21. Table 4.15-1 of the Draft EIS provides information on the total annual boardings and alightings at Alexandria Station for each of the alternatives. This comment cites the highest increase in boardings/alightings, resulting with the implementation of Alternative 6A in Richmond; the increase in boardings/alightings at Alexandria Station from the 2025 No-Build to 2025 Alternative 6A is anticipated to be 25,106 annually (a 12 percent annual increase). While this averages to be an increase of just under 69 boardings/alightings per day across 365 days per year, it is important to note that the ridership is not consistent across all days. However, Alternative 6F: Full Service (Staples Mill Road Station and Main Street Station) was selected as the Preferred Alternative for the Richmond Area (refer to Final EIS Section 4.3.6 for details); from this same table, the increase in boardings/alightings at Alexandria Station from the 2025 No-Build to 2025 Alternative 6F is anticipated to be 22,400 annually (an 11 percent annual increase).

(Responses are continued on next page)



November 6, 2017

		20	Ch. 4 - Section 4.15.1.3 – says that for each alternative, the project ridership equates to 2,000 new daily vehicle trips at each station (for each single station alternative), or combination of stations (for each two-station alternative). This is unclear – Please clarify what this means. In addition, 2,000 additional daily trips does not seem to equate with the low annual ridership (25,000) increase at Alexandria station.
		21	Table 4.15-1 (Environmental Consequences – Ridership of DC2RVA) - Under No Build, it's projected that annual ridership will increase from 174,238 under existing conditions, to a future ridership of 208,496. Under the Build scenarios, the maximum projected ridership would be 233,602 (or an increase of 25,000 over the No Build). This seems low given that there will be an increase of 9 trips per day. Please clarify how these ridership projections were developed.
		22	What percentage of high-speed rail trips going into Alexandria Station come from private car, vs. transit, vs. ped/ bike? In other words, what is the mode split assumption of the increased demand for rail?
		23	At the bridge over Van Dorn St. at the City of Alexandria and Fairfax Co. line, please clarify it there are any proposed improvements, and will there be any impacts on the bridge or surrounding areas?
	Transportation & Environmental Services	24	Will there be any potential impact during construction, or upon project completion to the existing pedestrian tunnel that connects Mill Road to Witter Field? A fourth line is proposed in this location.
		25	Ch. 4 - Section 4.14 (Environmental Consequences – Parklands, Recreational Areas, and Refuges) of DEIS notes that the only impact is a 0.04 acre impact to the dog park at Carlyle. However, Sheet 4 of 89 in the mapbook D-1 shows a temporary limit of disturbance within the future North Potomac Yard park to be completed as part of the North Potomac Yard Small Area Plan (Phase 1) development. Please clarify if or how the permanent limit of disturbance will impact the future North Potomac Yard park.
		26	Sheet 6 of 89 in the mapbook D-1 appears to show a temporary disturbance to the community park (where tennis courts located) in Potomac Greens. Please clarify the impact that is anticipated here, especially to the temporary or permanent use and design of the park.
Parkland Resources		27	Would the permanent affectation in Dog Run Park @ Carlyle require removing the trees that are currently there?
	Recreation, Parks and Cultural Activities	28	Update Figure 3.14-1 to show the undocumented public/private with public access parks. (See comments below.)
		29	Update Figure 3.14-1 to show the correct location/boundaries of Braddock Park/Lenny Harris Memorial Field at Braddock Park.

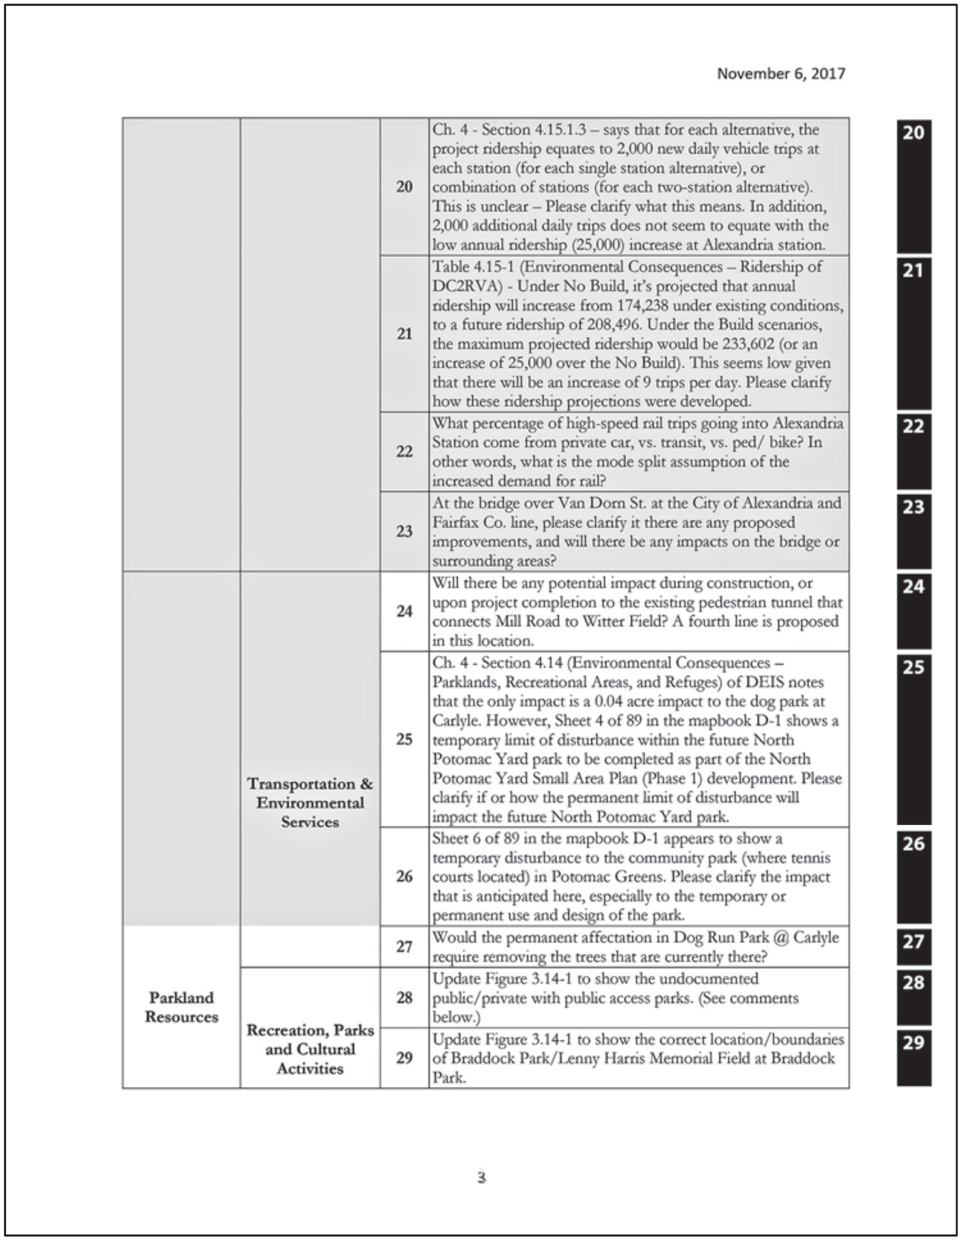
3

CITY OF ALEXANDRIA (continued)

Reported ridership at the Alexandria Station includes customers boarding all trains serving that station; not just those traveling in the DC2RVA corridor. This reporting is consistent with Amtrak's publicly-available ridership statistics and avoids disclosure of proprietary station-to-station information. These total numbers include travelers to destinations not affected by the Project including Florida, Charlottesville, Atlanta, New Orleans, and Chicago. Since service to these other destinations are largely unaffected by the Project and are a significant share of the existing ridership, the change in total ridership is less sensitive than corridor-specific ridership. The Project forecasts were reviewed by Amtrak and model parameters were adjusted to match Amtrak's own experience with the effect of service improvements on changes in ridership.

22. Mode split assumptions are included in Table 4-6 of the Transportation Technical Report (Appendix S) of the Draft EIS. Stations in the DC2RVA corridor were categorized as either suburban or urban based on the adjacent land uses; Alexandria Station was categorized as an urban station. Mode split assumptions for arriving and departing passengers at urban stations are as follows (Mode / Mode Split, as a percentage of total person-trips): Drive and Park (22%); Kiss and Ride (20%); Taxi / Car Service (29%); Public Transit (12%); Walk (15%); and Bicycles / Other (2%).
23. The DC2RVA Project proposes no improvements to the three existing tracks at this location and has no impacts to the bridge or the area immediately surrounding the bridge.
24. Construction and operation of a fourth track over the Telegraph Road Tunnel is not expected to have any potential impacts to the tunnel.
25. Based on updated Potomac Yard Park boundaries that DRPT received from the City of Alexandria, the Preferred Alternative 2A will have temporary impacts to the Potomac Yard Park, as reported in Section 5.14 of the Final EIS. These temporary impacts have been minimized to the extent possible at the conceptual level of design.

(Responses are continued on next page)



November 6, 2017

		20	Ch. 4 - Section 4.15.1.3 – says that for each alternative, the project ridership equates to 2,000 new daily vehicle trips at each station (for each single station alternative), or combination of stations (for each two-station alternative). This is unclear – Please clarify what this means. In addition, 2,000 additional daily trips does not seem to equate with the low annual ridership (25,000) increase at Alexandria station.	20
		21	Table 4.15-1 (Environmental Consequences – Ridership of DC2RVA) - Under No Build, it's projected that annual ridership will increase from 174,238 under existing conditions, to a future ridership of 208,496. Under the Build scenarios, the maximum projected ridership would be 233,602 (or an increase of 25,000 over the No Build). This seems low given that there will be an increase of 9 trips per day. 	Recreation, Parks and Cultural Activities	28	Update Figure 3.14-1 to show the undocumented public/private with public access parks. (See comments below.)	28
		29	Update Figure 3.14-1 to show the correct location/boundaries of Braddock Park/Lenny Harris Memorial Field at Braddock Park.	29

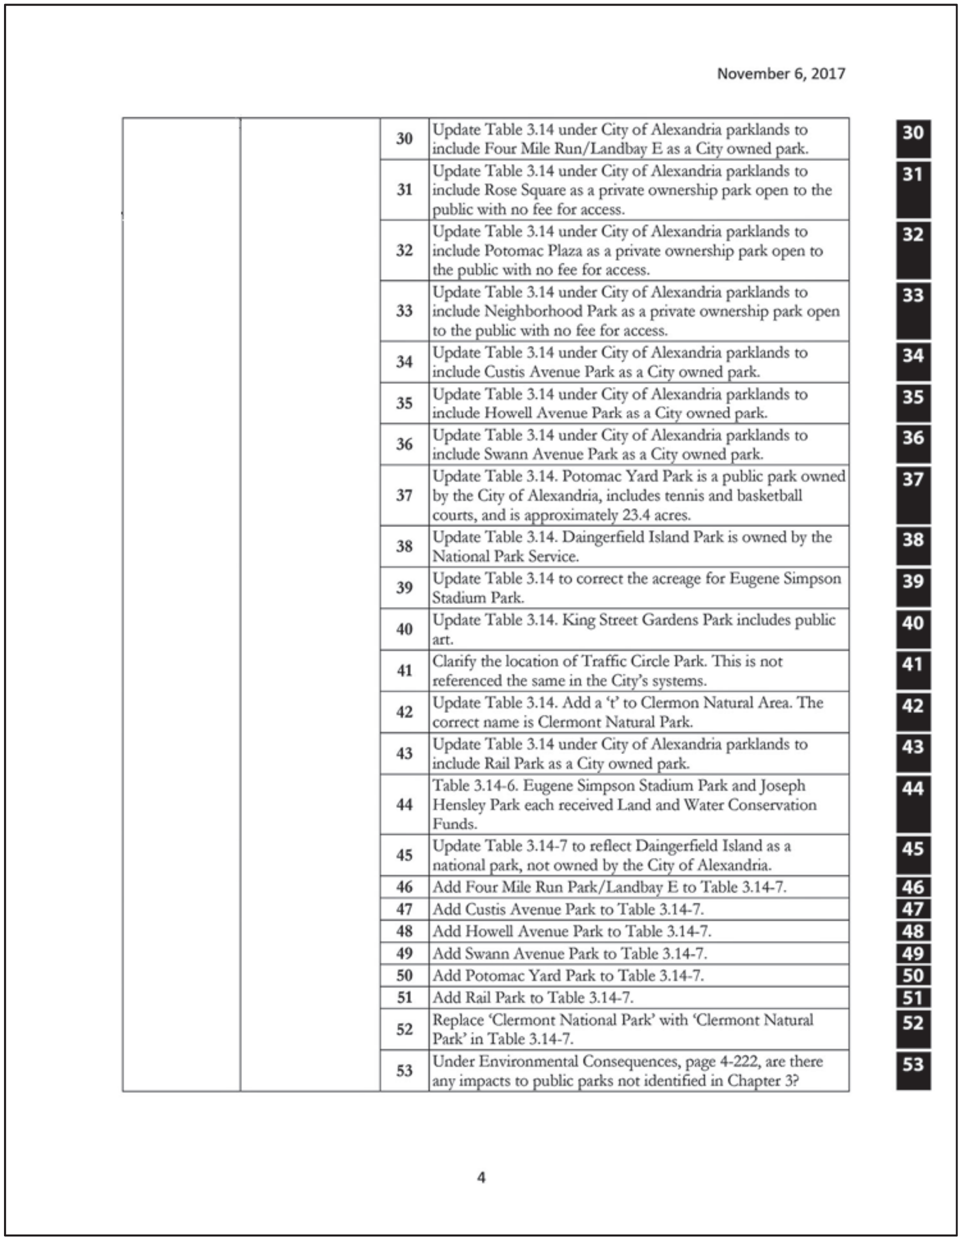
3

CITY OF ALEXANDRIA (continued)

26. The temporary right-of-way easement needed during construction is along the edge of the tennis courts and is associated with access, erosion control, and material placement. The referenced tennis courts are privately owned and not a public park. As such, the temporary use and restoration of the area and tennis courts will be coordinated with the private landowner.

27. Impacts of the Preferred Alternative on parks is presented in Table 5.14-1 of the Final EIS. DRPT does not anticipate a permanent impact to Dog Run Park at Carlyle. Trees and other vegetation will need to be removed within the existing railroad right-of-way adjacent to the Park. A temporary construction easement will be necessary where the Park abuts the railroad right-of-way; however, the adjacent dog run area and tennis courts will not be impacted (see Chapter 6 of the Final EIS for details). Within the temporary construction easement, removal of trees will be avoided to the maximum extent feasible, and the area restored at the end of use.

28. through 40. DRPT received updated GIS information from the City of Alexandria. Draft EIS Table 3.14-3 and Figure 3.14-1, as referenced by the City, have been updated accordingly; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS. DRPT does note that the referenced Four Mile Run / Landbay E was not added to the Final EIS as it is outside the study area (500 feet on either side of the rail corridor).



November 6, 2017

		30	Update Table 3.14 under City of Alexandria parklands to include Four Mile Run/Landbay E as a City owned park.	30
		31	Update Table 3.14 under City of Alexandria parklands to include Rose Square as a private ownership park open to the public with no fee for access.	31
		32	Update Table 3.14 under City of Alexandria parklands to include Potomac Plaza as a private ownership park open to the public with no fee for access.	32
		33	Update Table 3.14 under City of Alexandria parklands to include Neighborhood Park as a private ownership park open to the public with no fee for access.	33
		34	Update Table 3.14 under City of Alexandria parklands to include Custis Avenue Park as a City owned park.	34
		35	Update Table 3.14 under City of Alexandria parklands to include Howell Avenue Park as a City owned park.	35
		36	Update Table 3.14 under City of Alexandria parklands to include Swann Avenue Park as a City owned park.	36
		37	Update Table 3.14. Potomac Yard Park is a public park owned by the City of Alexandria, includes tennis and basketball courts, and is approximately 23.4 acres.	37
		38	Update Table 3.14. Daingerfield Island Park is owned by the National Park Service.	38
		39	Update Table 3.14 to correct the acreage for Eugene Simpson Stadium Park.	39
		40	Update Table 3.14. King Street Gardens Park includes public art.	40
		41	Clarify the location of Traffic Circle Park. This is not referenced the same in the City's systems.	41
		42	Update Table 3.14. Add a 't' to Clermon Natural Area. The correct name is Clermont Natural Park.	42
		43	Update Table 3.14 under City of Alexandria parklands to include Rail Park as a City owned park.	43
		44	Table 3.14-6. Eugene Simpson Stadium Park and Joseph Hensley Park each received Land and Water Conservation Funds.	44
		45	Update Table 3.14-7 to reflect Daingerfield Island as a national park, not owned by the City of Alexandria.	45
		46	Add Four Mile Run Park/Landbay E to Table 3.14-7.	46
		47	Add Custis Avenue Park to Table 3.14-7.	47
		48	Add Howell Avenue Park to Table 3.14-7.	48
		49	Add Swann Avenue Park to Table 3.14-7.	49
		50	Add Potomac Yard Park to Table 3.14-7.	50
		51	Add Rail Park to Table 3.14-7.	51
		52	Replace 'Clermont National Park' with 'Clermont Natural Park' in Table 3.14-7.	52
		53	Under Environmental Consequences, page 4-222, are there any impacts to public parks not identified in Chapter 3?	53

4

CITY OF ALEXANDRIA (continued)

(Response to comments 30 to 40 on previous page)

41. In the Draft EIS, Traffic Circle Park was shown to be located at the southwest corner of East Rosemont Avenue and Mount Vernon Avenue. However, based on updated GIS information and input from the City of Alexandria, Traffic Circle Park is not considered a public park and Project references to it are removed; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

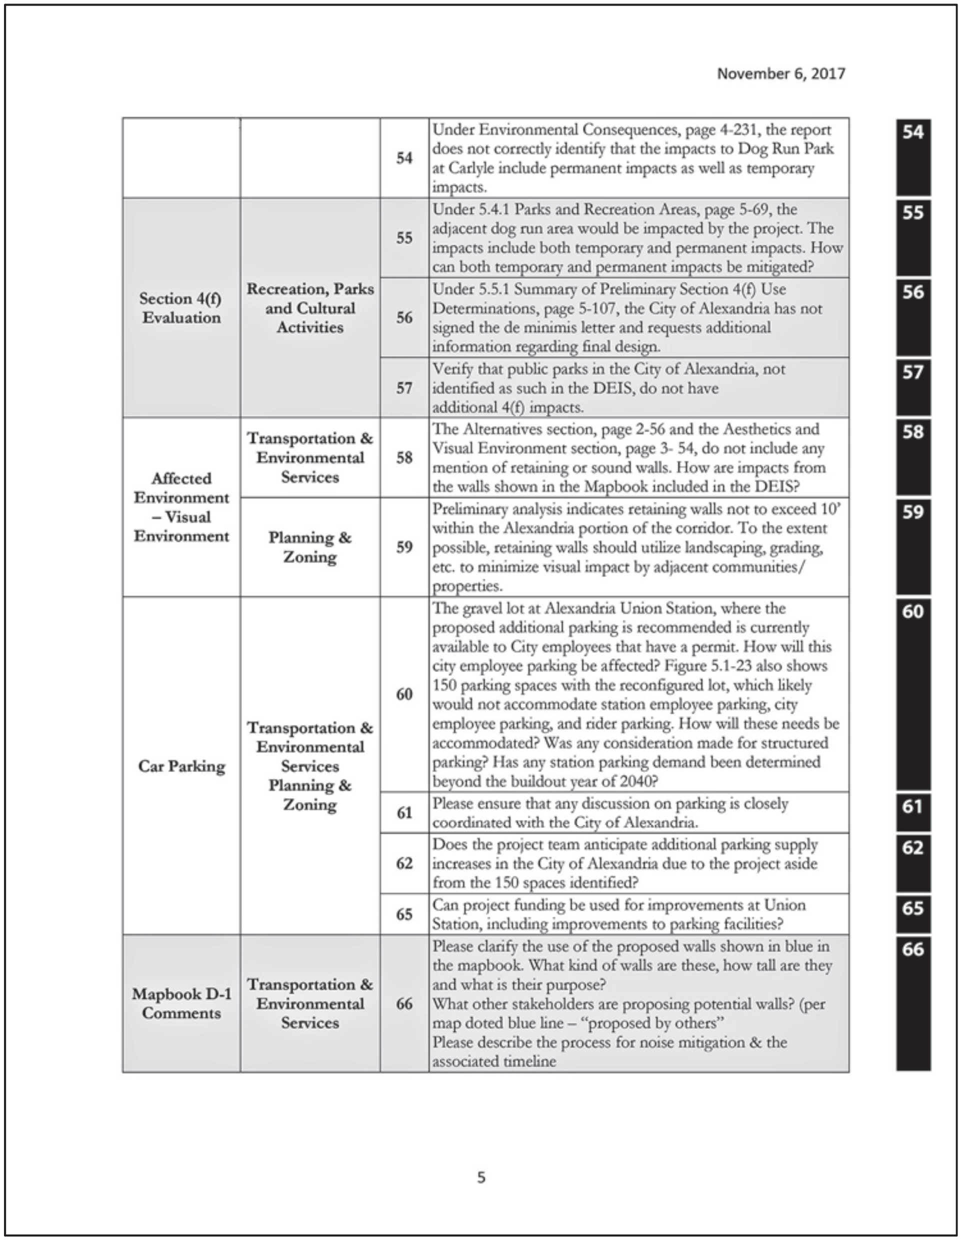
42. and 43. Draft EIS Table 3.14-3 has been updated as requested by the City; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

44. Draft EIS Table 3.14-6 has been updated to include Eugene Simpson Stadium Park and Joseph Hensley Park as Section 6(f) Resources since they received Land and Water Conservation funds; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

45. The left column in Table 3.14-7 of the Draft EIS indicates where the park is located, not ownership; however, it has been clarified to indicate that Daingerfield Island Park is owned by the National Park Service. Refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

46. to 52. Draft EIS Table 3.14-7 has been updated as requested by the City; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS. DRPT does note that the referenced Four Mile Run / Landbay E was not added to the Final EIS as it is outside the study area (500 feet on either side of the rail corridor).

53. Section 5.14.1 and 5.20.2.2 of the Final EIS have been updated to reflect that: the Project will not require any permanent right-of-way from Dog Run Park at Carlyle; impacts have been reduced to Long Bridge Park; and additional temporary impacts have been identified to Potomac Yard Park, Potomac Yard Landbay N, and Rail Park.



November 6, 2017

		54	Under Environmental Consequences, page 4-231, the report does not correctly identify that the impacts to Dog Run Park at Carlyle include permanent impacts as well as temporary impacts.	54
Section 4(f) Evaluation	**Recreation, Parks and Cultural Activities**	55	Under 5.4.1 Parks and Recreation Areas, page 5-69, the adjacent dog run area would be impacted by the project. The impacts include both temporary and permanent impacts. How can both temporary and permanent impacts be mitigated?	55
		56	Under 5.5.1 Summary of Preliminary Section 4(f) Use Determinations, page 5-107, the City of Alexandria has not signed the de minimis letter and requests additional information regarding final design.	56
		57	Verify that public parks in the City of Alexandria, not identified as such in the DEIS, do not have additional 4(f) impacts.	57
Affected Environment – Visual Environment	**Transportation & Environmental Services**	58	The Alternatives section, page 2-56 and the Aesthetics and Visual Environment section, page 3- 54, do not include any mention of retaining or sound walls. How are impacts from the walls shown in the Mapbook included in the DEIS?	58
	Planning & Zoning	59	Preliminary analysis indicates retaining walls not to exceed 10' within the Alexandria portion of the corridor. To the extent possible, retaining walls should utilize landscaping, grading, etc. to minimize visual impact by adjacent communities/ properties.	59
Car Parking	**Transportation & Environmental Services Planning & Zoning**	60	The gravel lot at Alexandria Union Station, where the proposed additional parking is recommended is currently available to City employees that have a permit. How will this city employee parking be affected? Figure 5.1-23 also shows 150 parking spaces with the reconfigured lot, which likely would not accommodate station employee parking, city employee parking, and rider parking. How will these needs be accommodated? Was any consideration made for structured parking? Has any station parking demand been determined beyond the buildout year of 2040?	60
		61	Please ensure that any discussion on parking is closely coordinated with the City of Alexandria.	61
		62	Does the project team anticipate additional parking supply increases in the City of Alexandria due to the project aside from the 150 spaces identified?	62
		65	Can project funding be used for improvements at Union Station, including improvements to parking facilities?	65
Mapbook D-1 Comments	**Transportation & Environmental Services**	66	Please clarify the use of the proposed walls shown in blue in the mapbook. What kind of walls are these, how tall are they and what is their purpose? What other stakeholders are proposing potential walls? (per map doted blue line – "proposed by others" Please describe the process for noise mitigation & the associated timeline	66

CITY OF ALEXANDRIA (continued)

54. and 55. In the referenced section of the Draft EIS, Dog Run Park is included as one of the "six parks" that will be directly used by the Project. However, based on updated data and refined designs/mitigation measures, permanent impacts to the Dog Run Park at Carlyle are avoided as part of the Preferred Alternative, as reported in Section 5.14 of the Final EIS.

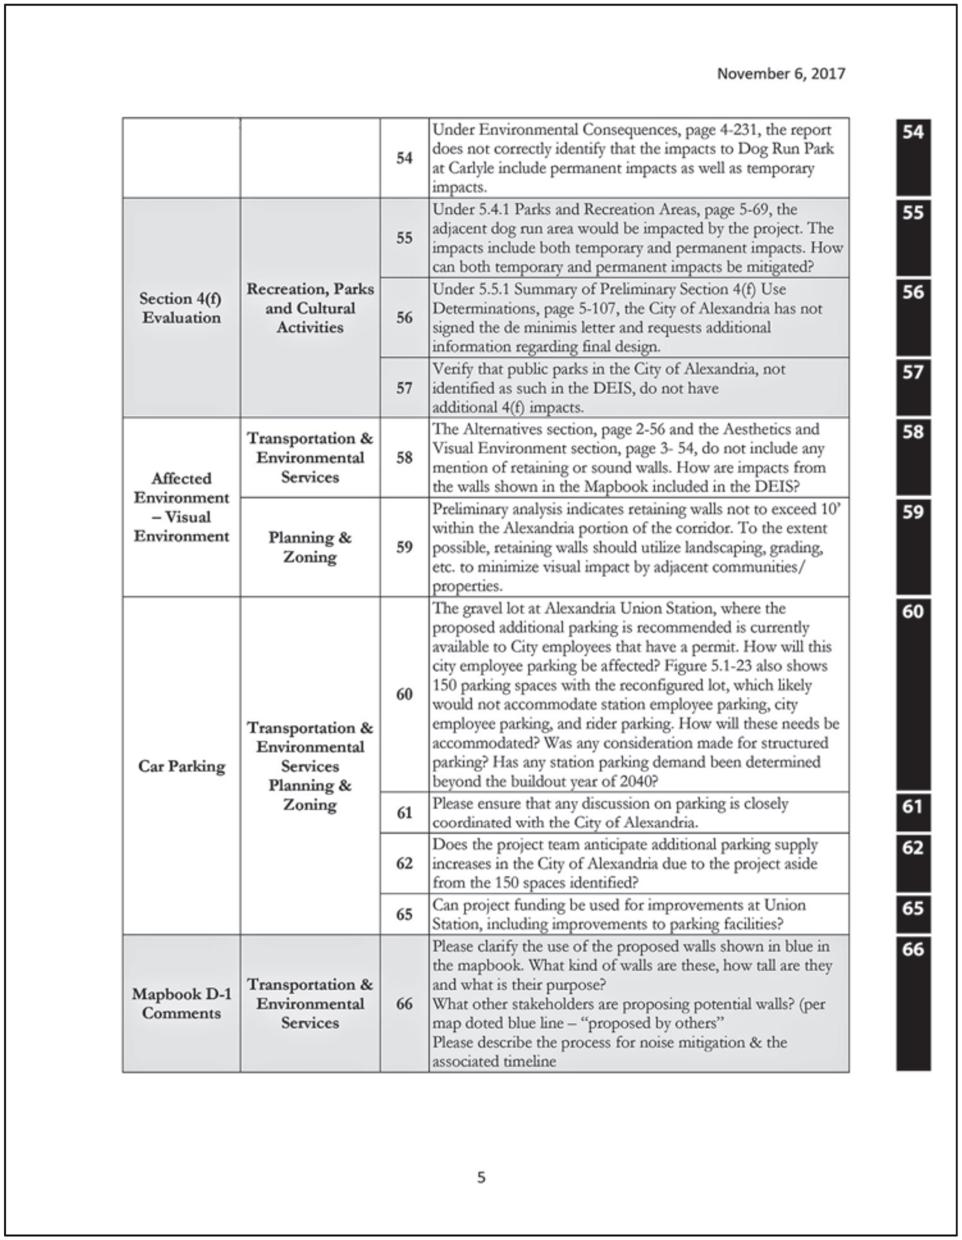
The Project occurs entirely within existing railroad right-of-way through the City of Alexandria, and there will be no permanent acquisition of other right-of-way. It is important to note that the improvements and impact limits at the Alexandria Station, including improvements to the City-owned parking lot, are provided for station planning by the City and do not indicate property acquisition or impacts by the Project. Retaining walls at the boundary of existing railroad right-of-way is one design measure being employed to minimize impacts to property. Construction of the retaining walls may require temporary construction easements on adjacent properties, including park lands. Lands temporarily used for construction easements will be restored upon completion of construction. Details of the construction easements and restoration plans will be developed in coordination with the landowners during final design.

56. DRPT will continue to coordinate with the City of Alexandria through final design of the Project, including on Section 4(f) resources.

57. Based on the updated GIS information obtained (see response to DRPT-numbered statement #28), there are additional temporary construction impacts to parks, including to Potomac Yard Park, Potomac Yard Landbay N, and Rail Park, as reported in Section 5.14 of the Final EIS. These temporary impacts have been minimized to the extent possible at the conceptual level of design.

58. Refer to DRPT-numbered statement #66 for details on how walls are shown in the Draft EIS mapbooks. Retaining walls are generally used in areas to minimize impacts to adjacent developed areas and, in general, are not out of character with the visual environment in these areas.

(Responses are continued on next page)



November 6, 2017

		54	Under Environmental Consequences, page 4-231, the report does not correctly identify that the impacts to Dog Run Park at Carlyle include permanent impacts as well as temporary impacts.	54
Section 4(f) Evaluation	**Recreation, Parks and Cultural Activities**	55	Under 5.4.1 Parks and Recreation Areas, page 5-69, the adjacent dog run area would be impacted by the project. The impacts include both temporary and permanent impacts. How can both temporary and permanent impacts be mitigated?	55
		56	Under 5.5.1 Summary of Preliminary Section 4(f) Use Determinations, page 5-107, the City of Alexandria has not signed the de minimis letter and requests additional information regarding final design.	56
		57	Verify that public parks in the City of Alexandria, not identified as such in the DEIS, do not have additional 4(f) impacts.	57
Affected Environment – Visual Environment	**Transportation & Environmental Services**	58	The Alternatives section, page 2-56 and the Aesthetics and Visual Environment section, page 3- 54, do not include any mention of retaining or sound walls. How are impacts from the walls shown in the Mapbook included in the DEIS?	58
	Planning & Zoning	59	Preliminary analysis indicates retaining walls not to exceed 10' within the Alexandria portion of the corridor. To the extent possible, retaining walls should utilize landscaping, grading, etc. to minimize visual impact by adjacent communities/ properties.	59
Car Parking	**Transportation & Environmental Services Planning & Zoning**	60	The gravel lot at Alexandria Union Station, where the proposed additional parking is recommended is currently available to City employees that have a permit. How will this city employee parking be affected? Figure 5.1-23 also shows 150 parking spaces with the reconfigured lot, which likely would not accommodate station employee parking, city employee parking, and rider parking. How will these needs be accommodated? Was any consideration made for structured parking? Has any station parking demand been determined beyond the buildout year of 2040?	60
		61	Please ensure that any discussion on parking is closely coordinated with the City of Alexandria.	61
		62	Does the project team anticipate additional parking supply increases in the City of Alexandria due to the project aside from the 150 spaces identified?	62
		65	Can project funding be used for improvements at Union Station, including improvements to parking facilities?	65
Mapbook D-1 Comments	**Transportation & Environmental Services**	66	Please clarify the use of the proposed walls shown in blue in the mapbook. What kind of walls are these, how tall are they and what is their purpose? What other stakeholders are proposing potential walls? (per map doted blue line – "proposed by others" Please describe the process for noise mitigation & the associated timeline	66

5

CITY OF ALEXANDRIA (continued)

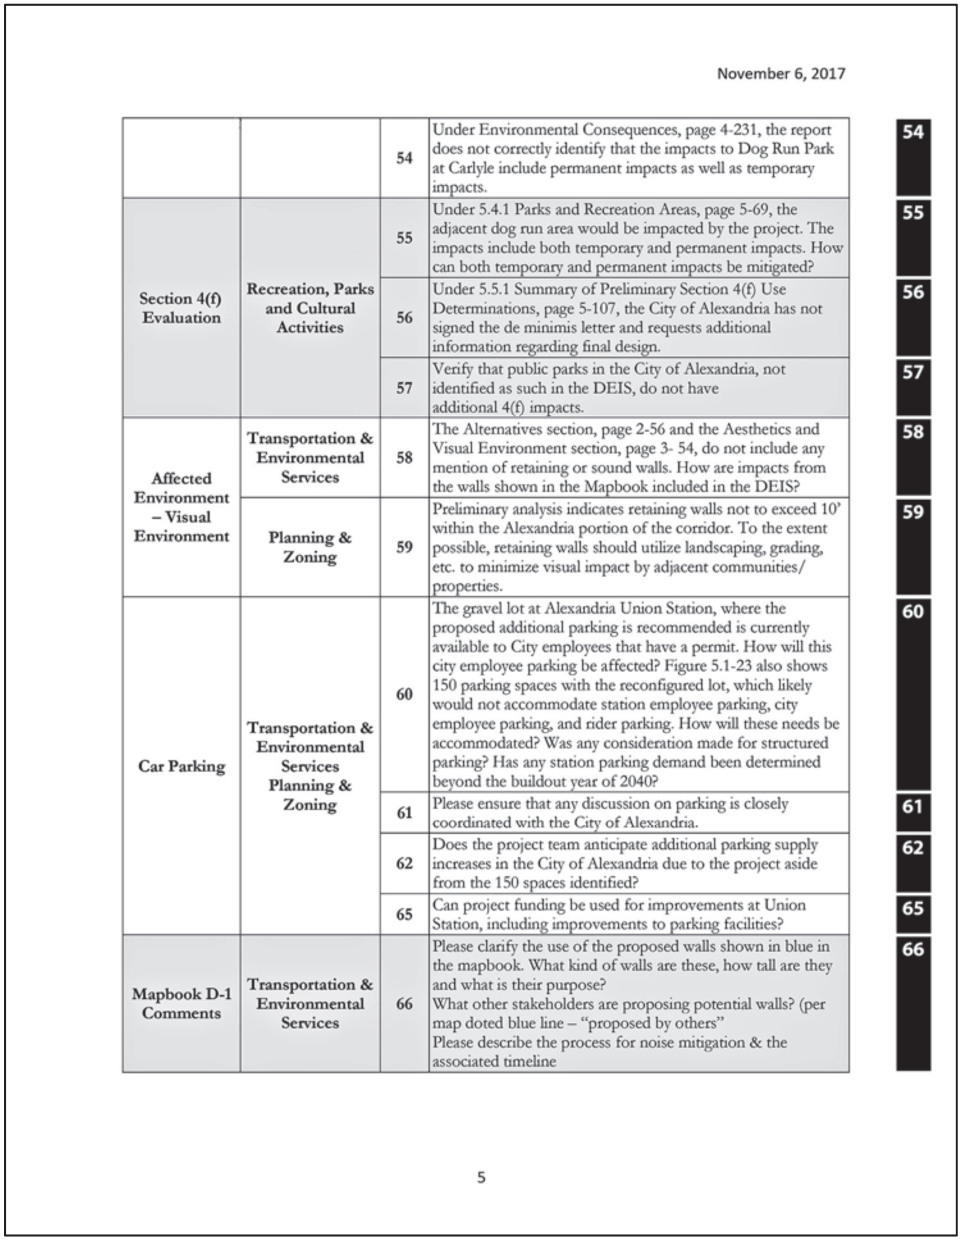
59. The City's comment concerning the visual aesthetics of retaining walls is noted. The height and surface appearance of the retaining walls will be determined during final design, as required at that time.

60. to 62. DRPT developed the conceptual station layout at Alexandria Union Station, including parking area(s) and the number and configuration of parking spaces, based on ridership forecasts projected to the planning horizon year 2045. A surface parking area configuration utilizing the existing unimproved parking area owned by the City of Alexandria was shown to indicate the maximum area of potential impact, and was intended as a concept to show how parking needs could be addressed. Project improvements and impact limits at the Alexandria Union Station, including improvements to the City-owned parking lot, are provided for station planning by the City and do not indicate property acquisition or impacts by the Project. DRPT will work with the City to identify the need and location of parking and to minimize its impacts on existing uses as the layout of the station site progresses from conceptual layout to final design, which will occur after funding becomes available and incremental improvements are scheduled (refer to DRPT-numbered statement #4 for construction / funding details). The DC2RVA Project does not preclude the future development of the station and parking layout by the City, separate from the DC2RVA Project.

[Note that the numbering in the City-provided comments skipped from #62 to #65.]

65. The DC2RVA Project is not funded beyond the NEPA Tier II EIS study, with the exception of one segment of new main track funded through the Atlantic Gateway suite of projects (refer to DRPT-numbered statement #4). The Draft EIS contains conceptual station and parking layouts; however, any actual parking/station improvements will be the responsibility of Amtrak and/or the locality, and could be constructed with a mix of federal, state, local, or other funds. Refer to DRPT-numbered statements #3, #54 and #55, and #60 through #62 for further detail.

(Responses are continued on next page)



November 6, 2017

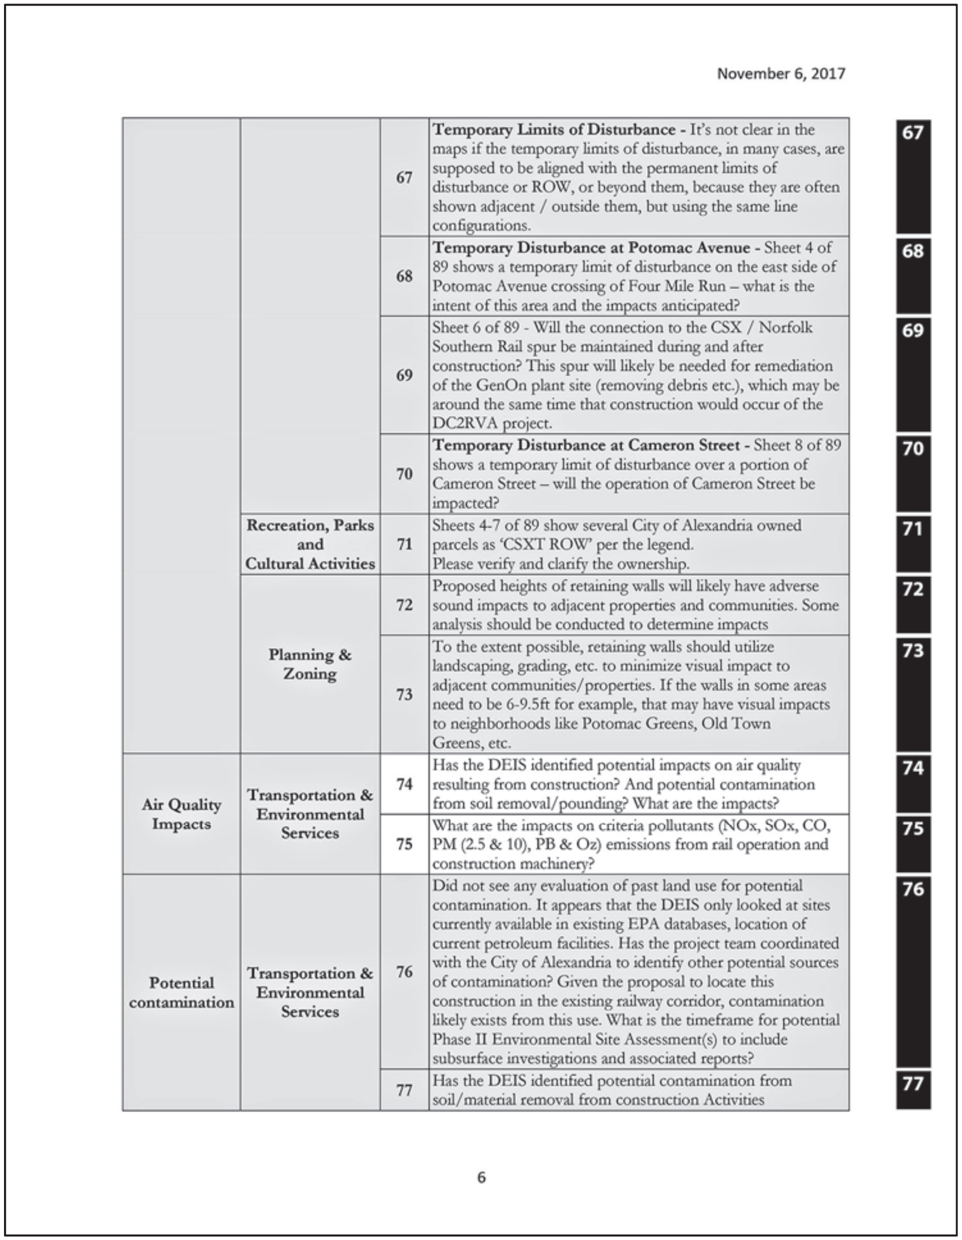
		54	Under Environmental Consequences, page 4-231, the report does not correctly identify that the impacts to Dog Run Park at Carlyle include permanent impacts as well as temporary impacts.	54
Section 4(f) Evaluation	Recreation, Parks and Cultural Activities	55	Under 5.4.1 Parks and Recreation Areas, page 5-69, the adjacent dog run area would be impacted by the project. The impacts include both temporary and permanent impacts. How can both temporary and permanent impacts be mitigated?	55
		56	Under 5.5.1 Summary of Preliminary Section 4(f) Use Determinations, page 5-107, the City of Alexandria has not signed the de minimis letter and requests additional information regarding final design.	56
		57	Verify that public parks in the City of Alexandria, not identified as such in the DEIS, do not have additional 4(f) impacts.	57
Affected Environment – Visual Environment	Transportation & Environmental Services	58	The Alternatives section, page 2-56 and the Aesthetics and Visual Environment section, page 3- 54, do not include any mention of retaining or sound walls. How are impacts from the walls shown in the Mapbook included in the DEIS?	58
	Planning & Zoning	59	Preliminary analysis indicates retaining walls not to exceed 10' within the Alexandria portion of the corridor. To the extent possible, retaining walls should utilize landscaping, grading, etc. to minimize visual impact by adjacent communities/ properties.	59
Car Parking	Transportation & Environmental Services Planning & Zoning	60	The gravel lot at Alexandria Union Station, where the proposed additional parking is recommended is currently available to City employees that have a permit. How will this city employee parking be affected? Figure 5.1-23 also shows 150 parking spaces with the reconfigured lot, which likely would not accommodate station employee parking, city employee parking, and rider parking. How will these needs be accommodated? Was any consideration made for structured parking? Has any station parking demand been determined beyond the buildout year of 2040?	60
		61	Please ensure that any discussion on parking is closely coordinated with the City of Alexandria.	61
		62	Does the project team anticipate additional parking supply increases in the City of Alexandria due to the project aside from the 150 spaces identified?	62
		65	Can project funding be used for improvements at Union Station, including improvements to parking facilities?	65
Mapbook D-1 Comments	Transportation & Environmental Services	66	Please clarify the use of the proposed walls shown in blue in the mapbook. What kind of walls are these, how tall are they and what is their purpose? What other stakeholders are proposing potential walls? (per map doted blue line – "proposed by others" Please describe the process for noise mitigation & the associated timeline	66

5

CITY OF ALEXANDRIA (continued)

66. The walls shown in blue in the referenced Draft EIS mapbooks (and in the updated Preferred Alternative mapbook that is Appendix L of the Final EIS) are retaining walls. Retaining walls are used to limit the extent of impacts where slopes from the additional track or realigned tracks will extend outside of the existing railroad right-of-way. The height of the retaining walls varies depending on the elevation difference between the track and the adjacent ground. "Walls – proposed by others" refers to wall locations provided by DRPT, VRE, or other stakeholders that are within the corridor and will impact or be impacted by the DC2RVA Project. Noise mitigation is a feature that may be added to retaining wall designs during final design, but it is not a conceptual function of the proposed retaining walls.

    Refer to DRPT numbered response #14 for a discussion of the noise and vibration analysis process.



November 6, 2017

		67	**Temporary Limits of Disturbance -** It's not clear in the maps if the temporary limits of disturbance, in many cases, are supposed to be aligned with the permanent limits of disturbance or ROW, or beyond them, because they are often shown adjacent / outside them, but using the same line configurations.	67
		68	**Temporary Disturbance at Potomac Avenue -** Sheet 4 of 89 shows a temporary limit of disturbance on the east side of Potomac Avenue crossing of Four Mile Run – what is the intent of this area and the impacts anticipated?	68
		69	Sheet 6 of 89 - Will the connection to the CSX / Norfolk Southern Rail spur be maintained during and after construction? This spur will likely be needed for remediation of the GenOn plant site (removing debris etc.), which may be around the same time that construction would occur of the DC2RVA project.	69
		70	**Temporary Disturbance at Cameron Street -** Sheet 8 of 89 shows a temporary limit of disturbance over a portion of Cameron Street – will the operation of Cameron Street be impacted?	70
	Recreation, Parks and Cultural Activities	71	Sheets 4-7 of 89 show several City of Alexandria owned parcels as 'CSXT ROW' per the legend. Please verify and clarify the ownership.	71
	Planning & Zoning	72	Proposed heights of retaining walls will likely have adverse sound impacts to adjacent properties and communities. Some analysis should be conducted to determine impacts	72
		73	To the extent possible, retaining walls should utilize landscaping, grading, etc. to minimize visual impact to adjacent communities/properties. If the walls in some areas need to be 6-9.5ft for example, that may have visual impacts to neighborhoods like Potomac Greens, Old Town Greens, etc.	73
Air Quality Impacts	**Transportation & Environmental Services**	74	Has the DEIS identified potential impacts on air quality resulting from construction? And potential contamination from soil removal/pounding? What are the impacts?	74
		75	What are the impacts on criteria pollutants (NOx, SOx, CO, PM (2.5 & 10), PB & Oz) emissions from rail operation and construction machinery?	75
Potential contamination	**Transportation & Environmental Services**	76	Did not see any evaluation of past land use for potential contamination. It appears that the DEIS only looked at sites currently available in existing EPA databases, location of current petroleum facilities. Has the project team coordinated with the City of Alexandria to identify other potential sources of contamination? Given the proposal to locate this construction in the existing railway corridor, contamination likely exists from this use. What is the timeframe for potential Phase II Environmental Site Assessment(s) to include subsurface investigations and associated reports?	76
		77	Has the DEIS identified potential contamination from soil/material removal from construction Activities	77

6

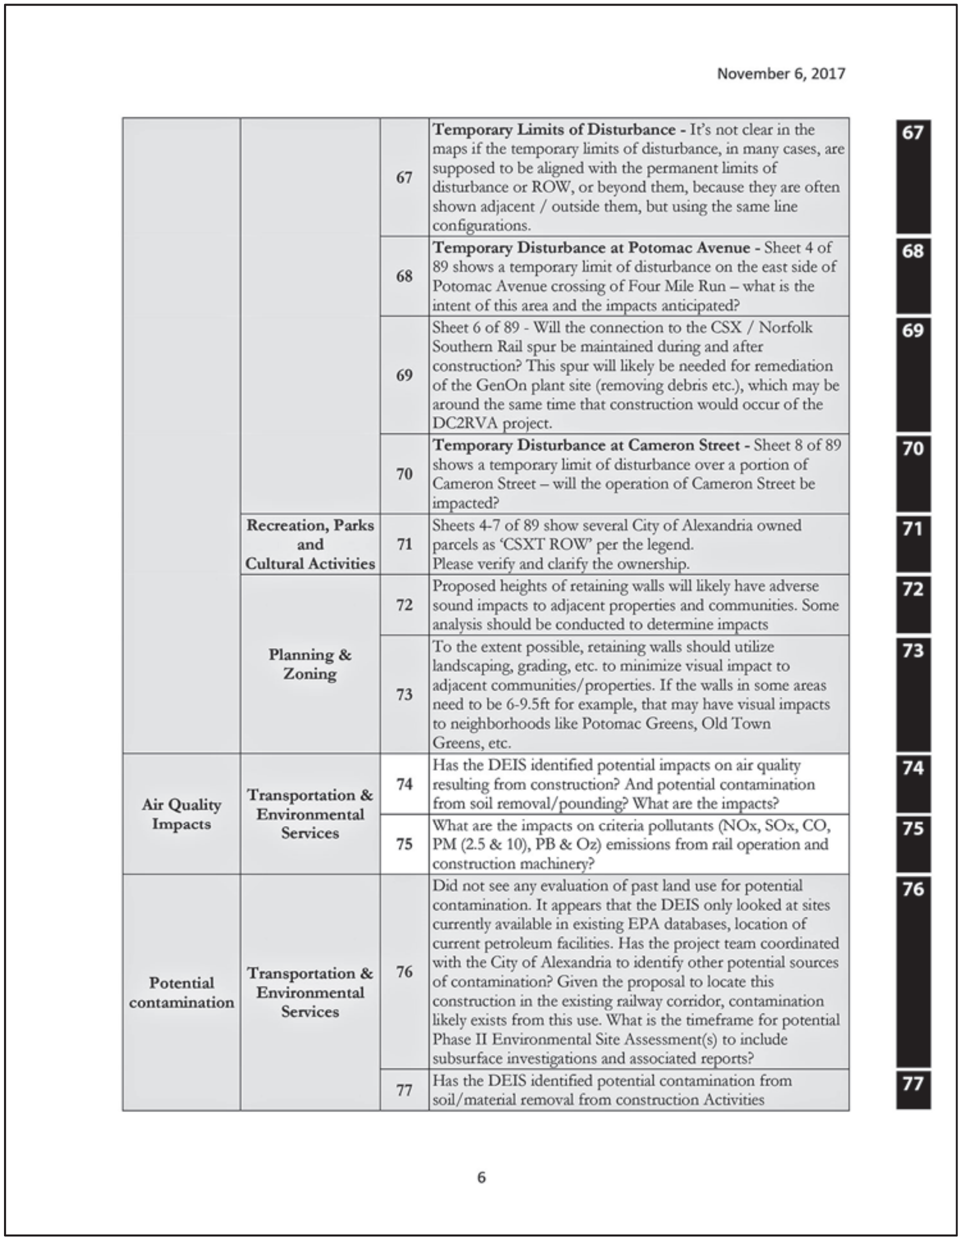
CITY OF ALEXANDRIA (continued)

67. The permanent and temporary limits of disturbance (LOD) presented in the Draft EIS include areas identified during conceptual engineering for construction activities and staging areas to the extent that such areas could be determined at the conceptual level of design. Temporary LOD should be "outside" of the permanent LOD, but may not necessarily align with them where additional area is needed for access or construction staging. Permanent or temporary limits of disturbance may be obscured in the report figures by the right-of-way lines where the right-of-way lines are equivalent to the limits of disturbance. See Appendix L of the Final EIS, which provides detailed mapbooks that show the permanent and temporary LOD for the Preferred Alternative for the Project corridor.

68. Temporary limits of disturbance along the Potomac Avenue crossing of Four Mile Run indicate a potential construction staging area (see Appendix L of the Final EIS for detailed mapbooks that show the permanent and temporary LOD for the Preferred Alternative for the 123-mile Project corridor). The area may be used to stage construction materials and equipment during construction in this area. The intent of the conceptual engineering plans is that the area will be returned to existing conditions, to the extent possible, upon completion of the construction.

69. DRPT anticipates that the connection to the rail spur, known as the PEPCO Lead, north of the Richmond Highway overpass and east of the CSXT main lines will be maintained during construction. A temporary track outage will be scheduled for the PEPCO Lead at a time convenient to CSXT and its customer(s). During this time the PEPCO Lead track will be connected to the fourth track and construction of the fourth track across the existing lead track will be completed.

(Responses are continued on next page)



November 6, 2017

		67	**Temporary Limits of Disturbance -** It's not clear in the maps if the temporary limits of disturbance, in many cases, are supposed to be aligned with the permanent limits of disturbance or ROW, or beyond them, because they are often shown adjacent / outside them, but using the same line configurations.	67
		68	**Temporary Disturbance at Potomac Avenue -** Sheet 4 of 89 shows a temporary limit of disturbance on the east side of Potomac Avenue crossing of Four Mile Run – what is the intent of this area and the impacts anticipated?	68
		69	Sheet 6 of 89 - Will the connection to the CSX / Norfolk Southern Rail spur be maintained during and after construction? This spur will likely be needed for remediation of the GenOn plant site (removing debris etc.), which may be around the same time that construction would occur of the DC2RVA project.	69
		70	**Temporary Disturbance at Cameron Street -** Sheet 8 of 89 shows a temporary limit of disturbance over a portion of Cameron Street – will the operation of Cameron Street be impacted?	70
	Recreation, Parks and Cultural Activities	71	Sheets 4-7 of 89 show several City of Alexandria owned parcels as 'CSXT ROW' per the legend. Please verify and clarify the ownership.	71
	Planning & Zoning	72	Proposed heights of retaining walls will likely have adverse sound impacts to adjacent properties and communities. Some analysis should be conducted to determine impacts	72
		73	To the extent possible, retaining walls should utilize landscaping, grading, etc. to minimize visual impact to adjacent communities/properties. If the walls in some areas need to be 6-9.5ft for example, that may have visual impacts to neighborhoods like Potomac Greens, Old Town Greens, etc.	73
Air Quality Impacts	**Transportation & Environmental Services**	74	Has the DEIS identified potential impacts on air quality resulting from construction? And potential contamination from soil removal/pounding? What are the impacts?	74
		75	What are the impacts on criteria pollutants (NOx, SOx, CO, PM (2.5 & 10), PB & Oz) emissions from rail operation and construction machinery?	75
Potential contamination	**Transportation & Environmental Services**	76	Did not see any evaluation of past land use for potential contamination. It appears that the DEIS only looked at sites currently available in existing EPA databases, location of current petroleum facilities. Has the project team coordinated with the City of Alexandria to identify other potential sources of contamination? Given the proposal to locate this construction in the existing railway corridor, contamination likely exists from this use. What is the timeframe for potential Phase II Environmental Site Assessment(s) to include subsurface investigations and associated reports?	76
		77	Has the DEIS identified potential contamination from soil/material removal from construction Activities	77

6

CITY OF ALEXANDRIA (continued)

70. There is the potential for temporary impacts to the operation of Cameron Street, which may include prescheduled and publicly announced temporary lane closures. The temporary lane closures may result from construction means and methods that will be assessed during final design. DRPT will work with the City through final design, after funding becomes available and incremental improvements are scheduled, to minimize any temporary impact to Cameron Street.

71. Parcel ownership is based on GIS data provided to DRPT by the municipalities. Surveys used to verify and clarify property ownership will be performed as part of the final design, as needed; refer to DRPT-numbered statement #4 for construction / funding details.

72. DRPT does not anticipate that the sound and retaining walls will have an adverse effect on noise levels; inclusion of any sound wall or retaining walls will reduce noise levels in areas behind the wall. DRPT did not include sound walls or retaining walls in the noise analysis; therefore, the results conservatively overestimate the potential noise effects associated with the proposed intercity passenger trains. DRPT will continue to evaluate the potential effects of the retaining walls on noise and coordinate with the City during final design, after funding becomes available and incremental improvements are scheduled.

73. The City's comment about retaining walls minimizing visual impacts is noted. Retaining wall design for the Project is at the conceptual engineering level of design. Minimizing the visual impacts of retaining walls will be performed as part of the final design after funding becomes available and incremental improvements are scheduled; refer to DRPT-numbered statement #4 for construction / funding details.

(Responses are continued on next page)

		77	Has the DEIS identified potential contamination from soil/material removal from construction Activities	77

6

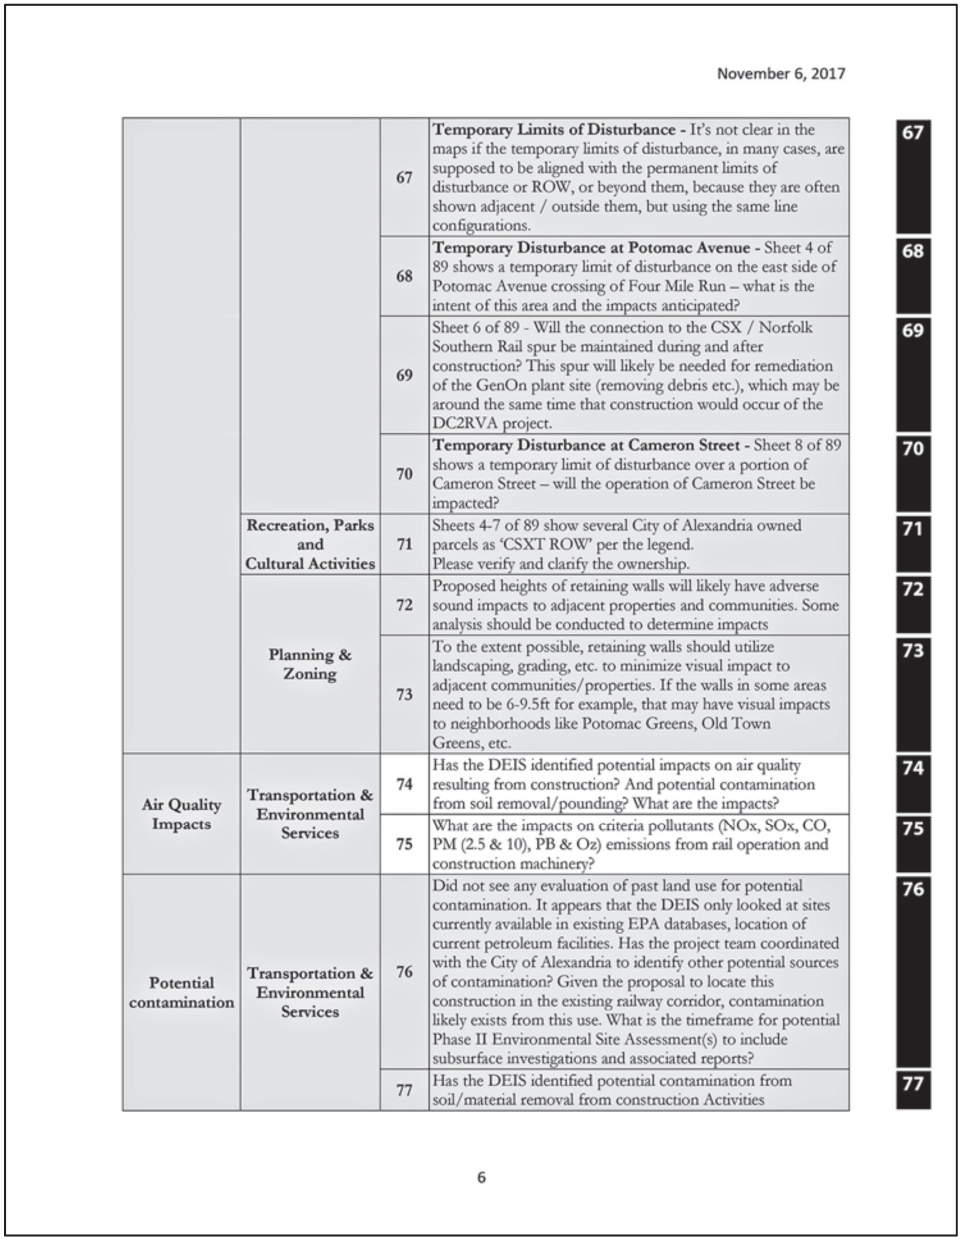
CITY OF ALEXANDRIA (continued)

74. A qualitative assessment of potential impacts to air quality from construction has been updated in Final EIS Section 5.19.2.3 since the Draft EIS. DRPT will follow the Virginia Department of Transportation Road and Bridge Specifications during design and construction. Dust suppression or containment systems will be implemented, as appropriate, to minimize migration of airborne contaminants. Contaminated soils identified during construction will be removed and disposed, in accordance with applicable federal and state protocols.

    With the application of appropriate measures during construction, this Project will not cause any significant, short-term particulate matter air quality impacts.

75. The DC2RVA Project is subject to federal air quality general conformity regulations (40 CFR Part 93, Subpart B). Annual Project-generated pollutant emissions related to operations were calculated for the one marginal nonattainment area in the study area (i.e., the Washington, D.C.-Maryland-Virginia ozone marginal nonattainment area). The Project-generated predicted annual pollutant emissions related to operations for nitrogen oxides (NOx) and volatile organic compounds (VOCs)—precursors to ozone—are below general conformity de minimis threshold values within the Washington, D.C.-Maryland-Virginia ozone marginal nonattainment area. Pursuant to the General Conformity Rule, EPA considers Project-generated emissions below these de minimis values to be minimal. Such projects do not require formal conformity determinations. Similarly, given the amount of construction proposed within the Washington, D.C.-Maryland-Virginia ozone marginal nonattainment area, DRPT does not anticipate that construction-related NOx and VOC emissions will exceed the general conformity de minimis thresholds either. Additionally, since the DC2RVA study area is located within areas that are in attainment for the other criteria pollutants (i.e., sulfur dioxide, carbon monoxide, particulate matter, and lead), emissions were not calculated for these pollutants.

(Responses are continued on next page)



November 6, 2017

		67	**Temporary Limits of Disturbance -** It's not clear in the maps if the temporary limits of disturbance, in many cases, are supposed to be aligned with the permanent limits of disturbance or ROW, or beyond them, because they are often shown adjacent / outside them, but using the same line configurations.	67

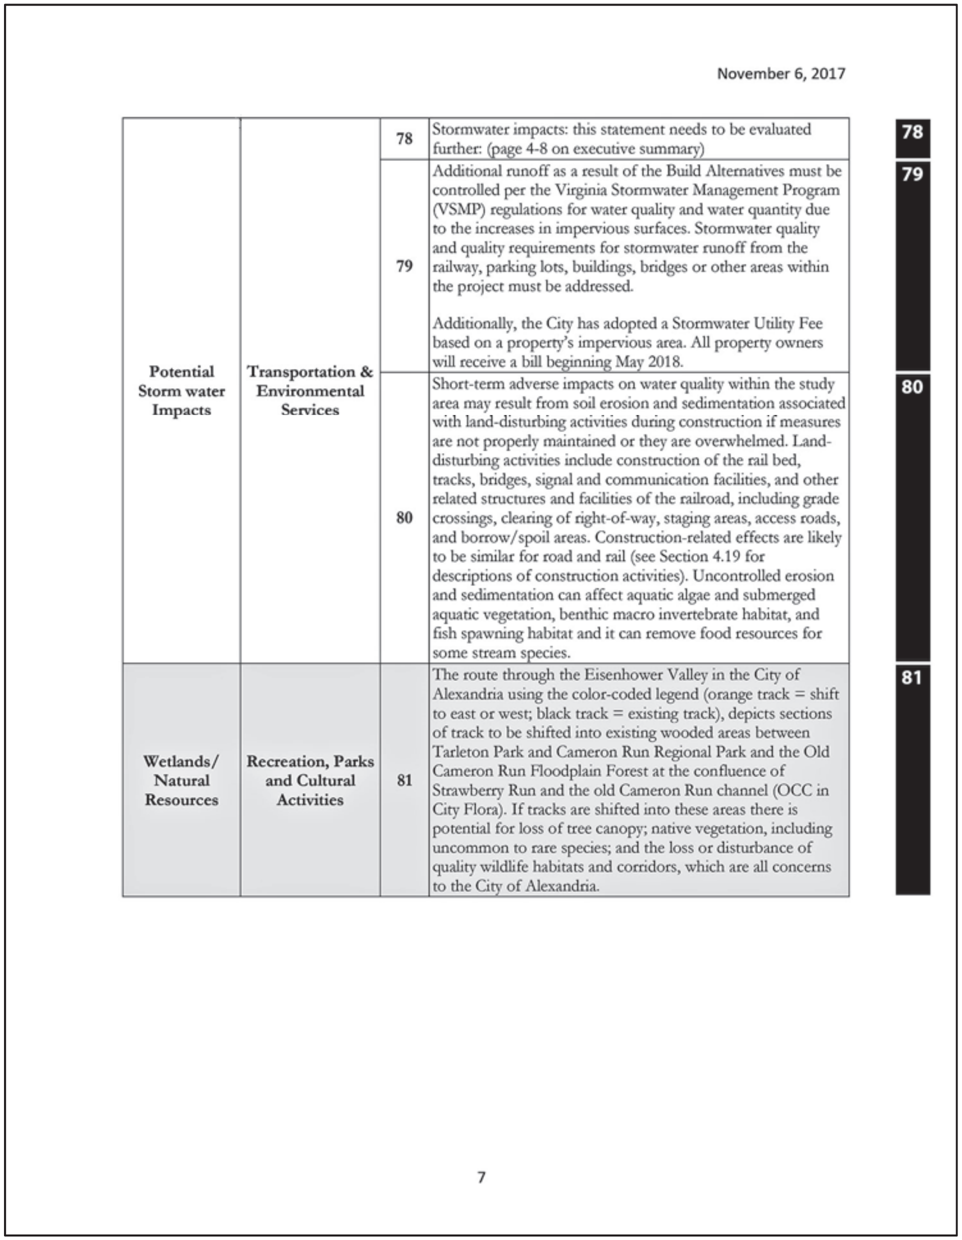
		77	Has the DEIS identified potential contamination from soil/material removal from construction Activities	77

6

CITY OF ALEXANDRIA (continued)

76. As discussed in Section 3.5 of the Draft EIS, DRPT conducted an environmental records review to identify hazardous material (hazmat) database records along the Project corridor from Environmental Risk Information Service (ERIS), a commercial database search and environmental risk information provider. Investigation of hazardous material sites/facilities that could potentially be affected by the Project will be completed in a Phase I Environmental Site Assessment that will occur prior to any property acquisition. Construction plans, to be developed during final design, will contain provisions for responding to potential site contamination issues that may be identified during construction.

77. If contaminated soils or materials are encountered during construction, they will be disposed of in accordance with applicable state and federal regulations, as stated in Section 5.5.2 of the Final EIS.



November 6, 2017

Potential Storm water Impacts	Transportation & Environmental Services	78	Stormwater impacts: this statement needs to be evaluated further: (page 4-8 on executive summary)	78
		79	Additional runoff as a result of the Build Alternatives must be controlled per the Virginia Stormwater Management Program (VSMP) regulations for water quality and water quantity due to the increases in impervious surfaces. Stormwater quality and quality requirements for stormwater runoff from the railway, parking lots, buildings, bridges or other areas within the project must be addressed. Additionally, the City has adopted a Stormwater Utility Fee based on a property's impervious area. All property owners will receive a bill beginning May 2018.	79
		80	Short-term adverse impacts on water quality within the study area may result from soil erosion and sedimentation associated with land-disturbing activities during construction if measures are not properly maintained or they are overwhelmed. Land-disturbing activities include construction of the rail bed, tracks, bridges, signal and communication facilities, and other related structures and facilities of the railroad, including grade crossings, clearing of right-of-way, staging areas, access roads, and borrow/spoil areas. Construction-related effects are likely to be similar for road and rail (see Section 4.19 for descriptions of construction activities). Uncontrolled erosion and sedimentation can affect aquatic algae and submerged aquatic vegetation, benthic macro invertebrate habitat, and fish spawning habitat and it can remove food resources for some stream species.	80
Wetlands/ Natural Resources	Recreation, Parks and Cultural Activities	81	The route through the Eisenhower Valley in the City of Alexandria using the color-coded legend (orange track = shift to east or west; black track = existing track), depicts sections of track to be shifted into existing wooded areas between Tarleton Park and Cameron Run Regional Park and the Old Cameron Run Floodplain Forest at the confluence of Strawberry Run and the old Cameron Run channel (OCC in City Flora). If tracks are shifted into these areas there is potential for loss of tree canopy; native vegetation, including uncommon to rare species; and the loss or disturbance of quality wildlife habitats and corridors, which are all concerns to the City of Alexandria.	81

7

CITY OF ALEXANDRIA (continued)

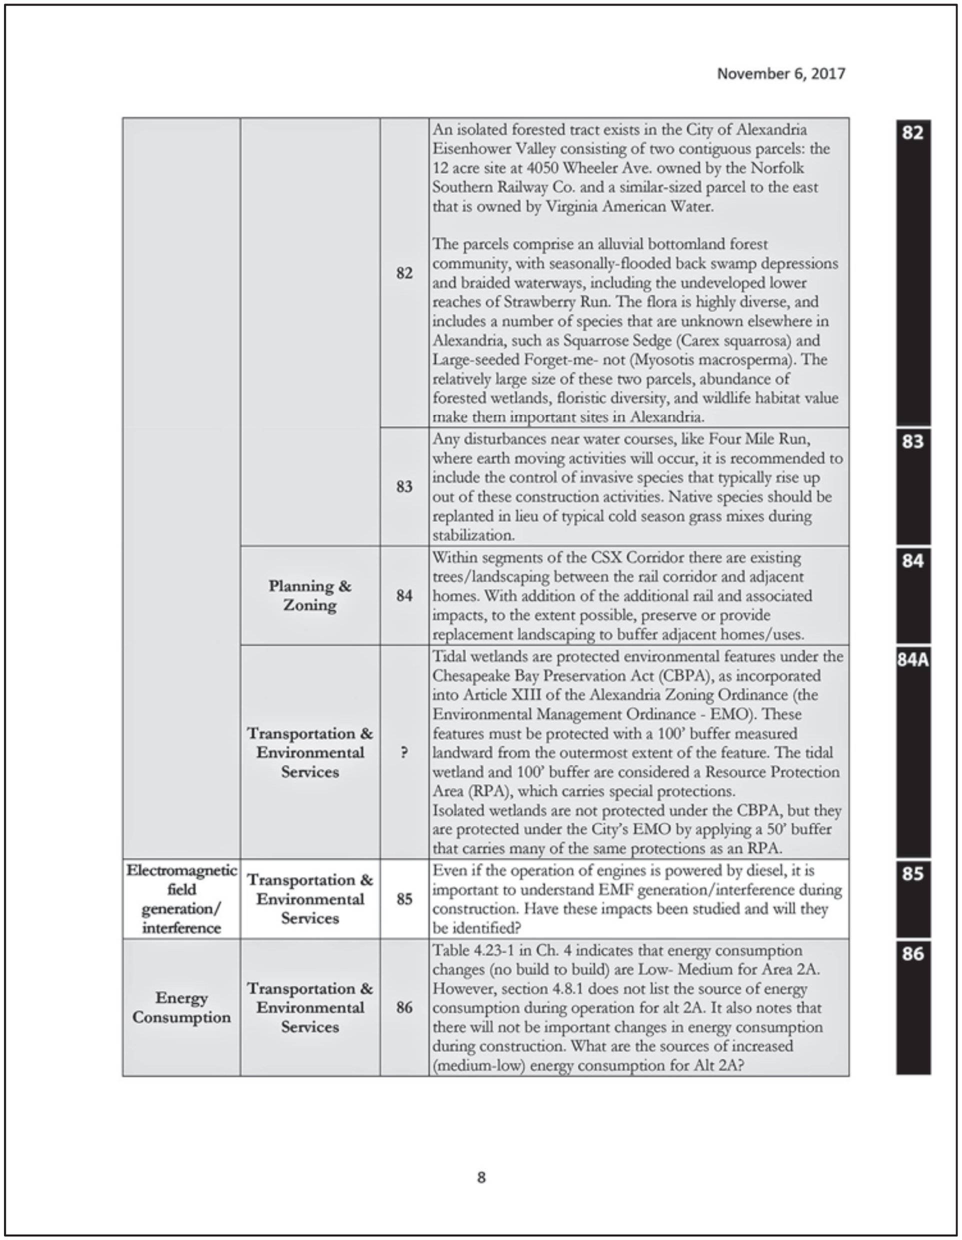
78. Comment noted. The intent of the Executive Summary is to provide a high-level summary of relevant information and the document refers the reader on where to find detailed information in the Draft EIS.

79. DRPT will address all applicable Virginia Stormwater Management Program (VSMP) requirements for water quality and water quantity controls during design and construction of the Project.

80. Comment noted. The City's statements are reflected in Draft EIS Section 4.1.1.3 and Section 4.19.

81. and 82. This comment appears to be referring to a roughly triangular wooded area bounded by two rail lines (see pages D-19 and D-20 in Draft EIS Appendix D, Build Alternatives Area 2 Northern Virginia). According to Simmons (2012),* this area is referred to by Alexandria natural resources staff as "Old Cameron Run channel floodplain forest," which comprises an alluvial bottomland forest community with highly diverse flora and a number of species that are unknown elsewhere in Alexandria, such as squarrose sedge (Carex squarrosa) and Large-seeded forget-me-not (Myosotis macrosperma). Land uses surrounding the site are largely commercial (north of the northern rail line) and recreational and residential (Cameron Run Regional Park and Townes at Cameron Parke) south of the southern rail line. Habitat in the area is highly fragmented and bordered by existing rail lines and dense development. Given the surrounding development, this area represents a wildlife island rather than a wildlife corridor, as suggested by the comment. Further, Project activities will occur within existing railroad right-of-way.

* Simmons, Rod. Remnant Natural Areas in Parks, Waterways, and Undeveloped Sites in the City of Alexandria, Virginia: Eisenhower Valley, Natural Resources Technical Report 12-1. Horticulture and Natural Resources Section, Department of Recreation, Parks & Cultural Activities, City of Alexandria, Virginia. February 2012.



November 6, 2017

		82	An isolated forested tract exists in the City of Alexandria Eisenhower Valley consisting of two contiguous parcels: the 12 acre site at 4050 Wheeler Ave. owned by the Norfolk Southern Railway Co. and a similar-sized parcel to the east that is owned by Virginia American Water. The parcels comprise an alluvial bottomland forest community, with seasonally-flooded back swamp depressions and braided waterways, including the undeveloped lower reaches of Strawberry Run. The flora is highly diverse, and includes a number of species that are unknown elsewhere in Alexandria, such as Squarrose Sedge (Carex squarrosa) and Large-seeded Forget-me- not (Myosotis macrosperma). The relatively large size of these two parcels, abundance of forested wetlands, floristic diversity, and wildlife habitat value make them important sites in Alexandria.	82
		83	Any disturbances near water courses, like Four Mile Run, where earth moving activities will occur, it is recommended to include the control of invasive species that typically rise up out of these construction activities. Native species should be replanted in lieu of typical cold season grass mixes during stabilization.	83
	Planning & Zoning	84	Within segments of the CSX Corridor there are existing trees/landscaping between the rail corridor and adjacent homes. With addition of the additional rail and associated impacts, to the extent possible, preserve or provide replacement landscaping to buffer adjacent homes/uses.	84
	Transportation & Environmental Services	?	Tidal wetlands are protected environmental features under the Chesapeake Bay Preservation Act (CBPA), as incorporated into Article XIII of the Alexandria Zoning Ordinance (the Environmental Management Ordinance - EMO). These features must be protected with a 100' buffer measured landward from the outermost extent of the feature. The tidal wetland and 100' buffer are considered a Resource Protection Area (RPA), which carries special protections. Isolated wetlands are not protected under the CBPA, but they are protected under the City's EMO by applying a 50' buffer that carries many of the same protections as an RPA.	84A
Electromagnetic field generation/ interference	Transportation & Environmental Services	85	Even if the operation of engines is powered by diesel, it is important to understand EMF generation/interference during construction. Have these impacts been studied and will they be identified?	85
Energy Consumption	Transportation & Environmental Services	86	Table 4.23-1 in Ch. 4 indicates that energy consumption changes (no build to build) are Low- Medium for Area 2A. However, section 4.8.1 does not list the source of energy consumption during operation for alt 2A. It also notes that there will not be important changes in energy consumption during construction. What are the sources of increased (medium-low) energy consumption for Alt 2A?	86

8

CITY OF ALEXANDRIA (continued)

(Response to comment 82 on previous page)

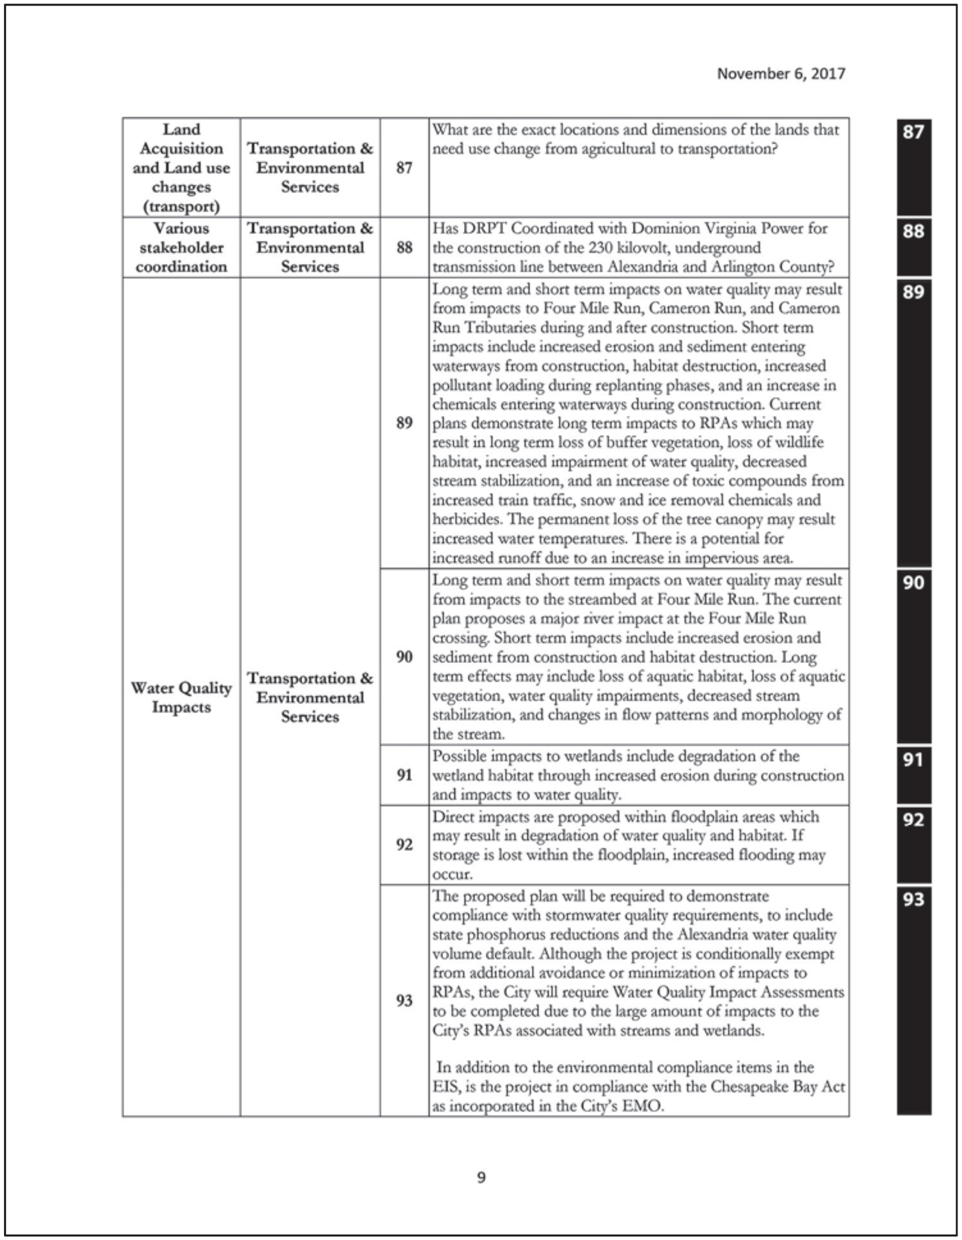
83. Invasive species are addressed in Final EIS Section 5.10.1.2.

84. As indicated in Final EIS Section 5.9.2, mitigation of potential visual impacts associated with landscape impacts to be considered during the final design process will include minimizing tree and shrub removal and incorporating landscaping to screen undesirable features. Final design will occur after funding becomes available and incremental improvements are scheduled.

84a. The Project will comply with applicable provisions of the Chesapeake Bay Preservation Act as indicated in Final EIS Section 5.1.1.1. The City of Alexandria's Environmental Management Ordinance explicitly exempts railroads (Section 13-123(A)(1)) from RPA requirements. Notwithstanding, during final design and construction, impacts to tidal and isolated wetlands will be minimized to the extent practicable; unavoidable impacts will be subject to state and federal permits; and appropriate mitigation will be provided, as applicable.

85. EMF (electromagnetic force) generation was not identified as a potential issue during the public and agency scoping process. Because DRPT is not proposing electrification of the line, and is proposing to use the same basic type of diesel locomotives currently in use on the corridor, DRPT does not anticipate that any possible increase in EMF emissions to be a significant impact. Additionally, emission standards for EMF are not regulated by the federal government or by the Commonwealth of Virginia.

86. The Low-Medium designation for Build Alternative 2A in Table 4.23-1 of the Draft EIS is the Visual Impact Rating and not related to Energy. Energy consumption, as presented in Section 4.8-1 of the Draft EIS, was calculated for the entire DC2RVA corridor. DRPT projects that total energy consumption from intercity passenger travel will be lower under the Build Alternatives than the No Build Alternative.



November 6, 2017

Land Acquisition and Land use changes (transport)	Transportation & Environmental Services	87	What are the exact locations and dimensions of the lands that need use change from agricultural to transportation?	87
Various stakeholder coordination	Transportation & Environmental Services	88	Has DRPT Coordinated with Dominion Virginia Power for the construction of the 230 kilovolt, underground transmission line between Alexandria and Arlington County?	88
Water Quality Impacts	Transportation & Environmental Services	89	Long term and short term impacts on water quality may result from impacts to Four Mile Run, Cameron Run, and Cameron Run Tributaries during and after construction. Short term impacts include increased erosion and sediment entering waterways from construction, habitat destruction, increased pollutant loading during replanting phases, and an increase in chemicals entering waterways during construction. Current plans demonstrate long term impacts to RPAs which may result in long term loss of buffer vegetation, loss of wildlife habitat, increased impairment of water quality, decreased stream stabilization, and an increase of toxic compounds from increased train traffic, snow and ice removal chemicals and herbicides. The permanent loss of the tree canopy may result increased water temperatures. There is a potential for increased runoff due to an increase in impervious area.	89
		90	Long term and short term impacts on water quality may result from impacts to the streambed at Four Mile Run. The current plan proposes a major river impact at the Four Mile Run crossing. Short term impacts include increased erosion and sediment from construction and habitat destruction. Long term effects may include loss of aquatic habitat, loss of aquatic vegetation, water quality impairments, decreased stream stabilization, and changes in flow patterns and morphology of the stream.	90
		91	Possible impacts to wetlands include degradation of the wetland habitat through increased erosion during construction and impacts to water quality.	91
		92	Direct impacts are proposed within floodplain areas which may result in degradation of water quality and habitat. If storage is lost within the floodplain, increased flooding may occur.	92
		93	The proposed plan will be required to demonstrate compliance with stormwater quality requirements, to include state phosphorus reductions and the Alexandria water quality volume default. Although the project is conditionally exempt from additional avoidance or minimization of impacts to RPAs, the City will require Water Quality Impact Assessments to be completed due to the large amount of impacts to the City's RPAs associated with streams and wetlands. In addition to the environmental compliance items in the EIS, is the project in compliance with the Chesapeake Bay Act as incorporated in the City's EMO.	93

9

CITY OF ALEXANDRIA (continued)

87. Chapter 3 of the Draft EIS states that "the highest proportion of land use within 500 feet of the DC2RVA rail line is agricultural". This is for the entire corridor, not just the City of Alexandria. Table 3.11-4 of the Draft EIS lists no Agricultural land use for the City of Alexandria. The Agricultural land use within Table 4.11-3 of the Draft EIS, and Table 5.11-3 of the Final EIS, is for each Alternative Area. Area 2 includes not only the City of Alexandria, but also Fairfax County, Prince William County, and Stafford County.

88. DRPT coordinated with Dominion Virginia Power during the planning phase of their 230-kilovolt transmission line between Alexandria and Arlington County, where the CSXT rail corridor was one of several alternative routes being considered. CSXT negotiates agreements for existing utility infrastructure crossing or within their right-of-way. DRPT will coordinate with CSXT regarding the relocation of existing and planned utility infrastructure during the next phase of design to identify potential conflicts with utilities crossing or on CSXT right-of-way and to coordinate the location of planned utilities to reduce or eliminate potential future conflicts. DRPT will coordinate with utility owners, including Dominion Virginia Power, during the next phase of design to identify potential conflicts with utilities outside of CSXT right-of-way and to coordinate the location of planned utilities outside of CSXT right-of-way to reduce or eliminate potential future conflicts.

89. Final EIS Section 5.1.3 addresses water quality issues and Section 5.1.6.3 identifies avoidance, minimization, and mitigation measures that will be implemented.

90. The additional track across Four Mile Run will be built on the existing railroad bridge. Therefore, no construction in the streambed will be necessary. Final EIS Section 5.1.3 addresses water quality issues and Section 5.1.6.3 identifies avoidance, minimization, and mitigation measures that will be implemented.

91. Draft EIS Section 4.1.2 and Final EIS Section 5.1.2 addresses potential impacts to wetlands.

(Responses are continued on next page)

Land Acquisition and Land use changes (transport)	**Transportation & Environmental Services**	87	What are the exact locations and dimensions of the lands that need use change from agricultural to transportation?	**87**
Various stakeholder coordination	**Transportation & Environmental Services**	88	Has DRPT Coordinated with Dominion Virginia Power for the construction of the 230 kilovolt, underground transmission line between Alexandria and Arlington County?	**88**
Water Quality Impacts	**Transportation & Environmental Services**	89	Long term and short term impacts on water quality may result from impacts to Four Mile Run, Cameron Run, and Cameron Run Tributaries during and after construction. Short term impacts include increased erosion and sediment entering waterways from construction, habitat destruction, increased pollutant loading during replanting phases, and an increase in chemicals entering waterways during construction. Current plans demonstrate long term impacts to RPAs which may result in long term loss of buffer vegetation, loss of wildlife habitat, increased impairment of water quality, decreased stream stabilization, and an increase of toxic compounds from increased train traffic, snow and ice removal chemicals and herbicides. The permanent loss of the tree canopy may result increased water temperatures. There is a potential for increased runoff due to an increase in impervious area.	**89**
		90	Long term and short term impacts on water quality may result from impacts to the streambed at Four Mile Run. The current plan proposes a major river impact at the Four Mile Run crossing. Short term impacts include increased erosion and sediment from construction and habitat destruction. Long term effects may include loss of aquatic habitat, loss of aquatic vegetation, water quality impairments, decreased stream stabilization, and changes in flow patterns and morphology of the stream.	**90**
		91	Possible impacts to wetlands include degradation of the wetland habitat through increased erosion during construction and impacts to water quality.	**91**
		92	Direct impacts are proposed within floodplain areas which may result in degradation of water quality and habitat. If storage is lost within the floodplain, increased flooding may occur.	**92**
		93	The proposed plan will be required to demonstrate compliance with stormwater quality requirements, to include state phosphorus reductions and the Alexandria water quality volume default. Although the project is conditionally exempt from additional avoidance or minimization of impacts to RPAs, the City will require Water Quality Impact Assessments to be completed due to the large amount of impacts to the City's RPAs associated with streams and wetlands. In addition to the environmental compliance items in the EIS, is the project in compliance with the Chesapeake Bay Act as incorporated in the City's EMO.	**93**

County of Fairfax, Virginia

To protect and enrich the quality of life for the people, neighborhoods and diverse communities of Fairfax

November 6, 2017

Emily Stock, Project Manager
Virginia Department of Rail and Public Transportation
600 East Main Street, Suite 2102
Richmond, VA 23219

Dear Ms. Stock:

This letter is in response to the Federal Railroad Administration and Virginia Department of Rail and Public Transportation's request for comments/suggestions on the DC2RVA Draft Environmental Impact Statement. Fairfax County welcomes the opportunity to comment and offer suggestions regarding important issues that should be considered in the final decision. We consider this project as critically-needed to allow increased and enhanced Virginia Railway Express (VRE) service and facilities. This is a needed alternative travel mode to automobile travel in the I-95 corridor.

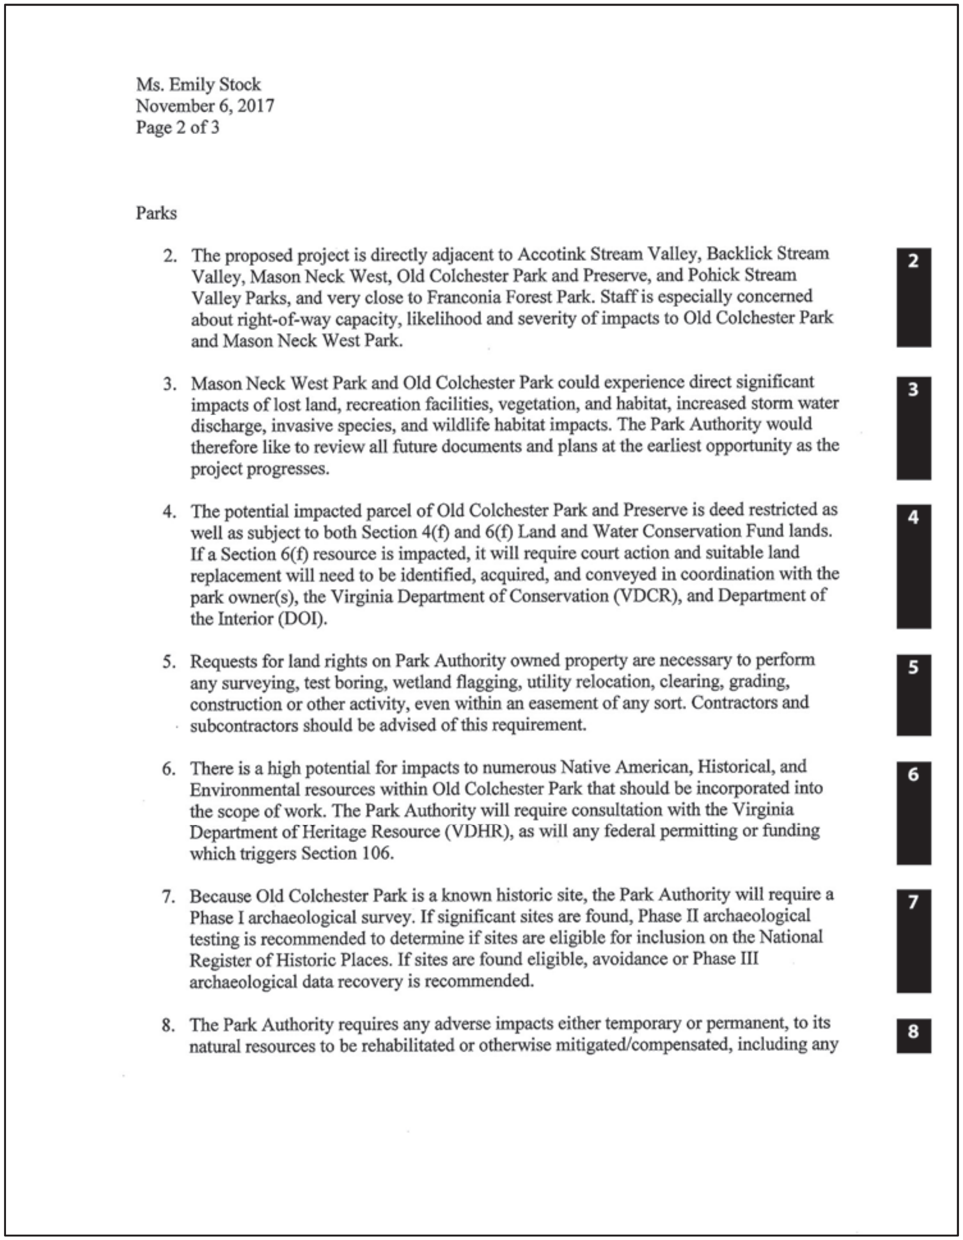
The county has long supported a multi-modal solution to address the traffic congestion problems in the I-95 corridor and to meet current and future travel demands. We would like to see the various aspects of this project proceed as soon as practicable. However, there are some sensitive environmental areas within the project area in Fairfax County. With respect to these environmental concerns, the county's Department of Public Works (Stormwater Planning Division) and the Fairfax County Park Authority have provided comments under separate cover. These comments are summarized below:

Water Quality

1. The Pohick Seeps conservation area is an environment that may be impacted by one of the proposed alignments. Multiple easements, both Stormwater and Conservation, and Resource Protection Areas protect portions of the site. Impacts to this site, whether caused by construction, placement of Stormwater BMPs, or alternative alignments, that touch the core community footprint could be major. These impacts could damage the hydrology, change the ground water base flow conditions, cause excessive surface flow with erosion and deposition of sediment, or fragmentation which results in changes to the plant community structure. The following Fairfax County agencies should be consulted regarding any aspects of the project that occur in the Pohick Seeps conservation area: Stormwater Planning Division, Urban Forest Management Division, Facilities Management Division, and the Land Acquisition Division. 1

FAIRFAX COUNTY

1. The Draft EIS reported that Build Alternative 2A may result in approximately 0.55 acres of temporary impacts to Pohick Seeps Conservation Area. However, DRPT determined that Build Alternative 2A as shown in the Draft EIS would not result in any permanent or temporary impacts to this resource and corrected the impact to zero acres, as shown in the errata table, which is Appendix A of the Final EIS. As reported in Section 5.10.1.1 of the Final EIS, there are no impacts to Pohick Seeps Conservation Area.



Ms. Emily Stock
November 6, 2017
Page 2 of 3

Parks

2. The proposed project is directly adjacent to Accotink Stream Valley, Backlick Stream Valley, Mason Neck West, Old Colchester Park and Preserve, and Pohick Stream Valley Parks, and very close to Franconia Forest Park. Staff is especially concerned about right-of-way capacity, likelihood and severity of impacts to Old Colchester Park and Mason Neck West Park. 2

3. Mason Neck West Park and Old Colchester Park could experience direct significant impacts of lost land, recreation facilities, vegetation, and habitat, increased storm water discharge, invasive species, and wildlife habitat impacts. The Park Authority would therefore like to review all future documents and plans at the earliest opportunity as the project progresses. 3

4. The potential impacted parcel of Old Colchester Park and Preserve is deed restricted as well as subject to both Section 4(f) and 6(f) Land and Water Conservation Fund lands. If a Section 6(f) resource is impacted, it will require court action and suitable land replacement will need to be identified, acquired, and conveyed in coordination with the park owner(s), the Virginia Department of Conservation (VDCR), and Department of the Interior (DOI). 4

5. Requests for land rights on Park Authority owned property are necessary to perform any surveying, test boring, wetland flagging, utility relocation, clearing, grading, construction or other activity, even within an easement of any sort. Contractors and subcontractors should be advised of this requirement. 5

6. There is a high potential for impacts to numerous Native American, Historical, and Environmental resources within Old Colchester Park that should be incorporated into the scope of work. The Park Authority will require consultation with the Virginia Department of Heritage Resource (VDHR), as will any federal permitting or funding which triggers Section 106. 6

7. Because Old Colchester Park is a known historic site, the Park Authority will require a Phase I archaeological survey. If significant sites are found, Phase II archaeological testing is recommended to determine if sites are eligible for inclusion on the National Register of Historic Places. If sites are found eligible, avoidance or Phase III archaeological data recovery is recommended. 7

8. The Park Authority requires any adverse impacts either temporary or permanent, to its natural resources to be rehabilitated or otherwise mitigated/compensated, including any 8

FAIRFAX COUNTY (continued)

2. The Preferred Alternative in Area 2A does not have any impacts to Accotink Stream Valley, Backlick Stream Valley, Mason Neck West, Old Colchester Park and Preserve, Pohick Stream Valley Park or Franconia Forest Park. No temporary or permanent right-of-way need to be acquired from any of these park facilities as part of this Project. All permanent and temporary impacts to park facilities for the Preferred Alternative are included in Table 5.14-1 of the Final EIS. These facilities are within the study area and are discussed in the errata table which is Appendix A of the Final EIS; however, these parks are not included in Table 5.14-1 since there are no permanent or temporary impacts. Appendix L includes corridor mapping which depicts the permanent and temporary Limits of Disturbance (LOD) adjacent to these park facilities.

3. No right-of-way is needed from Mason Neck West or Old Colchester Park and Preserve; therefore, no land or recreational facilities will be lost as part of the Project. DRPT will continue to coordinate with the Fairfax County Park Authority through the final design phase of the Project on any appropriate mitigation efforts, which will occur after funding becomes available and incremental improvements are scheduled.

4. No temporary or permanent right-of-way will be required from Old Colchester Park and Preserve as part of the Preferred Alternative in Area 2.

5. If, during final design, DRPT determines that a temporary easement onto Fairfax County Park Authority property is required to construct the Project, DRPT would coordinate use of the property with the Park Authority at that time.

(Responses are continued on next page)

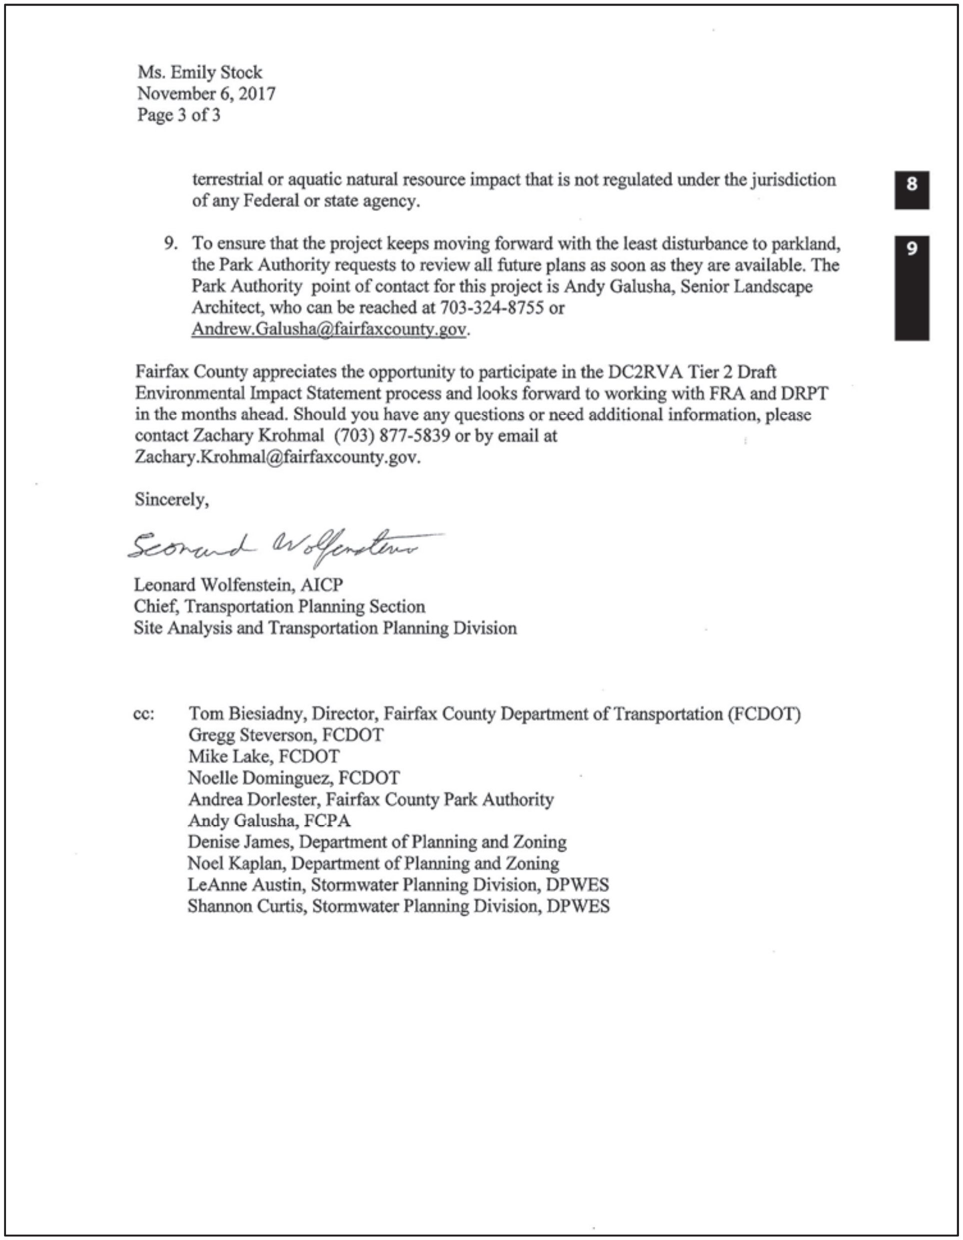
8. The Park Authority requires any adverse impacts either temporary or permanent, to its natural resources to be rehabilitated or otherwise mitigated/compensated, including any 8

FAIRFAX COUNTY (continued)

6. and 7. There are no permanent or temporary impacts to Old Colchester Park as a park. Regarding it as a cultural resource, the FRA and DRPT have conducted all studies in compliance with the National Historic Preservation Act of 1966, including Project initiation, determination of an area of potential effects (APE), archaeological studies with predictive model, and architectural and archaeological identification- and evaluation-level surveys of the APE. All studies have been coordinated with the Virginia Department of Historic Resources (DHR) and details on these studies and the ensuing coordination can be found in Draft EIS Appendices R and U and Final EIS Appendix D and E. While a portion of Old Colchester Park is a recorded archaeological site, the boundaries for this resource do not extend into the Project limits of disturbance. Archaeological studies were completed in the limits of disturbance as part of the DC2RVA Project to confirm that the site does not extend into the Project area, and no archaeological remains were encountered thus confirming the extant site boundaries.

8. Comment noted. Temporary impacts will be minimized during final design of the Project, after funding becomes available and incremental improvements are scheduled. Any land disturbed by the Project will be restored and rehabilitated.



Ms. Emily Stock
November 6, 2017
Page 3 of 3

terrestrial or aquatic natural resource impact that is not regulated under the jurisdiction of any Federal or state agency. 8

9. To ensure that the project keeps moving forward with the least disturbance to parkland, the Park Authority requests to review all future plans as soon as they are available. The Park Authority point of contact for this project is Andy Galusha, Senior Landscape Architect, who can be reached at 703-324-8755 or Andrew.Galusha@fairfaxcounty.gov. 9

Fairfax County appreciates the opportunity to participate in the DC2RVA Tier 2 Draft Environmental Impact Statement process and looks forward to working with FRA and DRPT in the months ahead. Should you have any questions or need additional information, please contact Zachary Krohmal (703) 877-5839 or by email at Zachary.Krohmal@fairfaxcounty.gov.

Re: Comments on Tier II Draft Environmental Impact Statement and Section 4(f) Evaluation
DC to Richmond Southeast High Speed Rail

Dear Ms. Stock:

Prince William County completed its review for the Tier II Draft Environmental Impact Statement (DEIS) and Section 4(f) Evaluation for the DC to Richmond Southeast High Speed Rail project. The County is within Area 2 as outlined in the DEIS and Area 2 has only one design alternative proposed. This alternative adds a third track from the Occoquan River crossing south, past the Powells Creek bridge, where it connects with VRE's Powells Creek to Arkendale third track that is currently under construction. Almost all construction is within the current railroad right of way. CSX Corporation owns the right of way and the existing two tracks and operates heavy freight train consists on this corridor. Other significant work proposed in the DEIS includes improvements to the existing Woodbridge VRE station, a new bridge crossing the Occoquan River, and new bridges crossing Neabsco Creek and Powells creek. After this paragraph, comments are arranged in the following order: transportation, public safety, comprehensive planning, noise and cultural resources.

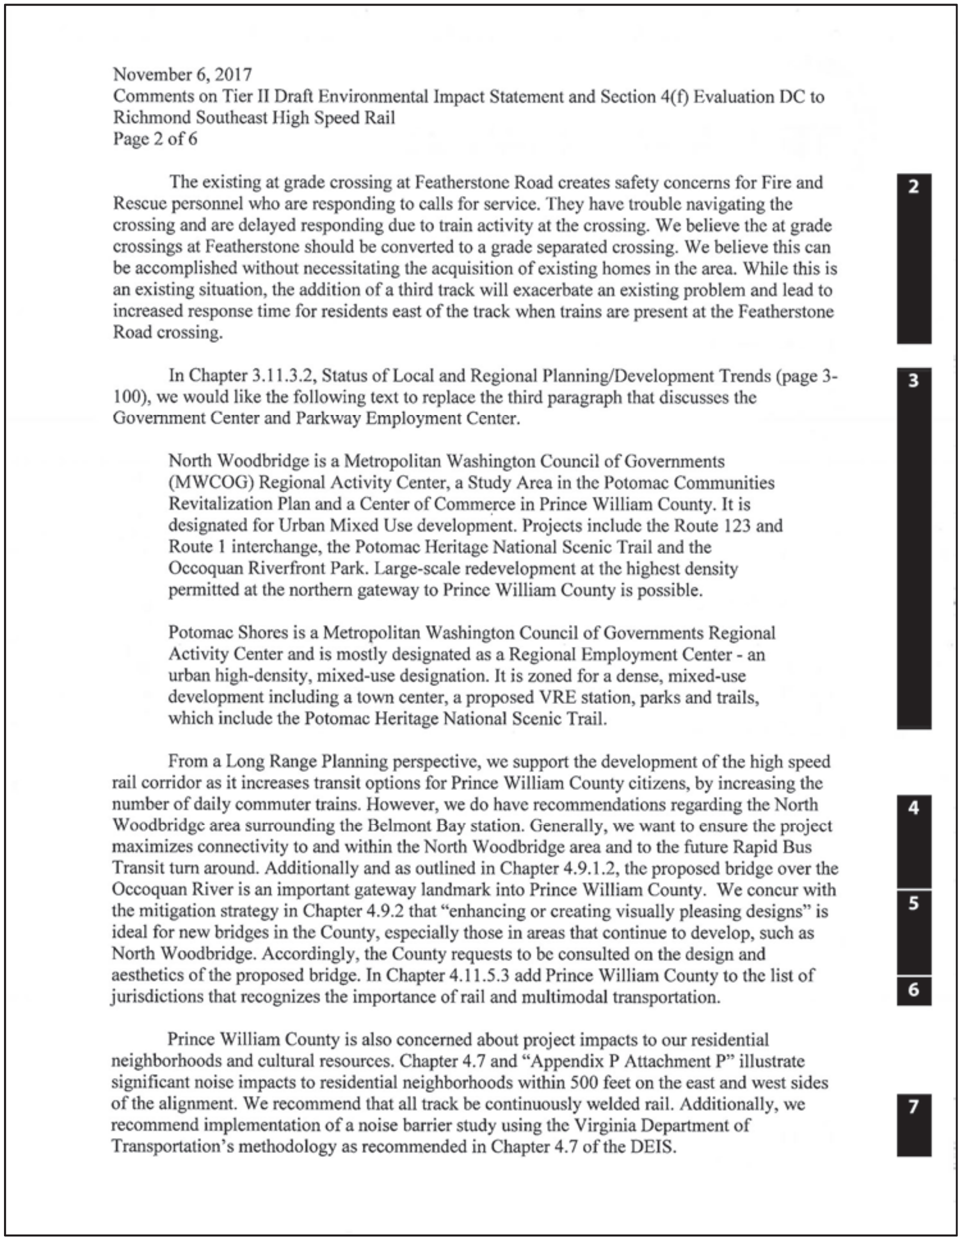
The third track will ultimately allow the addition of five new round trip Northeast Regional passenger trains (three to Norfolk, one to Newport News, one to Richmond) with stops in Woodbridge and Quantico, within the Southeast High Speed Rail corridor. There would be four new round trip Interstate Corridor passenger trains to North Carolina, with no stops in Prince William County. Speeds would be limited to no greater than 79 miles per hour. Current top speeds in Prince William County are approximately 70 miles per hour.

1

With regard to Amtrak service, Prince William County requests this project include an ACELA train stop at the Woodbridge VRE Station. As discussed above, and detailed in Chapter 2 of the DEIS, Prince William County is scheduled to receive more Amtrak Northeast Regional passenger rail service. The Prince William Board of County Supervisors (BOCS) previously voted to request an ACELA stop in Woodbridge. Prince William County understands the limited local service nature of the ACELA trains. To that end, Prince William County asks that DRPT consider an ACELA stop at Woodbridge as it would better serve the region than the proposed stop at Springfield.

PRINCE WILLIAM COUNTY

1. The DC2RVA Project does not include extending the ACELA passenger train service from the Northeast Corridor. The ACELA train sets are electric and operate using an overhead electric catenary system. Based on the decision reached in the 2002 Tier 1 EIS and ROD, and as document in the Project Basis of Design, DRPT is proposing to use conventional diesel-powered train sets. However, one of the guiding principles of the DC2RVA Basis of Design was to not preclude future electrification of the corridor, which would be subject to separate environmental documentation at that time. The actual service levels and schedules proposed for Woodbridge (and other stations) is being refined in the Corridor Service Development Plan, which is being prepared by DRPT as part of the DC2RVA Project (refer to Section 7.3 of the Final EIS for details).



November 6, 2017
Comments on Tier II Draft Environmental Impact Statement and Section 4(f) Evaluation DC to Richmond Southeast High Speed Rail
Page 2 of 6

2 The existing at grade crossing at Featherstone Road creates safety concerns for Fire and Rescue personnel who are responding to calls for service. They have trouble navigating the crossing and are delayed responding due to train activity at the crossing. We believe the at grade crossings at Featherstone should be converted to a grade separated crossing. We believe this can be accomplished without necessitating the acquisition of existing homes in the area. While this is an existing situation, the addition of a third track will exacerbate an existing problem and lead to increased response time for residents east of the track when trains are present at the Featherstone Road crossing.

3 In Chapter 3.11.3.2, Status of Local and Regional Planning/Development Trends (page 3-100), we would like the following text to replace the third paragraph that discusses the Government Center and Parkway Employment Center.

> North Woodbridge is a Metropolitan Washington Council of Governments (MWCOG) Regional Activity Center, a Study Area in the Potomac Communities Revitalization Plan and a Center of Commerce in Prince William County. It is designated for Urban Mixed Use development. Projects include the Route 123 and Route 1 interchange, the Potomac Heritage National Scenic Trail and the Occoquan Riverfront Park. Large-scale redevelopment at the highest density permitted at the northern gateway to Prince William County is possible.
>
> Potomac Shores is a Metropolitan Washington Council of Governments Regional Activity Center and is mostly designated as a Regional Employment Center - an urban high-density, mixed-use designation. It is zoned for a dense, mixed-use development including a town center, a proposed VRE station, parks and trails, which include the Potomac Heritage National Scenic Trail.

From a Long Range Planning perspective, we support the development of the high speed
rail corridor as it increases transit options for Prince William County citizens, by increasing the
number of daily commuter trains. However, we do have recommendations regarding the North 4
Woodbridge area surrounding the Belmont Bay station. Generally, we want to ensure the project
maximizes connectivity to and within the North Woodbridge area and to the future Rapid Bus
Transit turn around. Additionally and as outlined in Chapter 4.9.1.2, the proposed bridge over the
Occoquan River is an important gateway landmark into Prince William County. We concur with 5
the mitigation strategy in Chapter 4.9.2 that "enhancing or creating visually pleasing designs" is
ideal for new bridges in the County, especially those in areas that continue to develop, such as
North Woodbridge. Accordingly, the County requests to be consulted on the design and
aesthetics of the proposed bridge. In Chapter 4.11.5.3 add Prince William County to the list of 6
jurisdictions that recognizes the importance of rail and multimodal transportation.

Prince William County is also concerned about project impacts to our residential
neighborhoods and cultural resources. Chapter 4.7 and "Appendix P Attachment P" illustrate
significant noise impacts to residential neighborhoods within 500 feet on the east and west sides
of the alignment. We recommend that all track be continuously welded rail. Additionally, we 7
recommend implementation of a noise barrier study using the Virginia Department of
Transportation's methodology as recommended in Chapter 4.7 of the DEIS.

PRINCE WILLIAM COUNTY (continued)

2. The Draft EIS includes a queuing analysis at all at-grade crossings (see Section 4.15.2 of the Draft EIS, and an updated analysis for the Preferred Alternative in Final EIS Section 5.15.2), based on the conceptual engineering for the Project. The analyses indicated that the existing four quadrant gates at Featherstone Road provide appropriate crossing protection for current and future train volumes and number of tracks. Additional review of traffic data to update traffic conditions will be performed for all at-grade crossings as part of final design, after funding becomes available and a construction schedule can be established. Although the traffic analysis performed as part of the DC2RVA Project did not identify the construction of a grade separated roadway crossing of the CSXT rail corridor at Featherstone Road, this does not preclude the county or other entity from constructing a grade separation at this location as part of a separate effort.

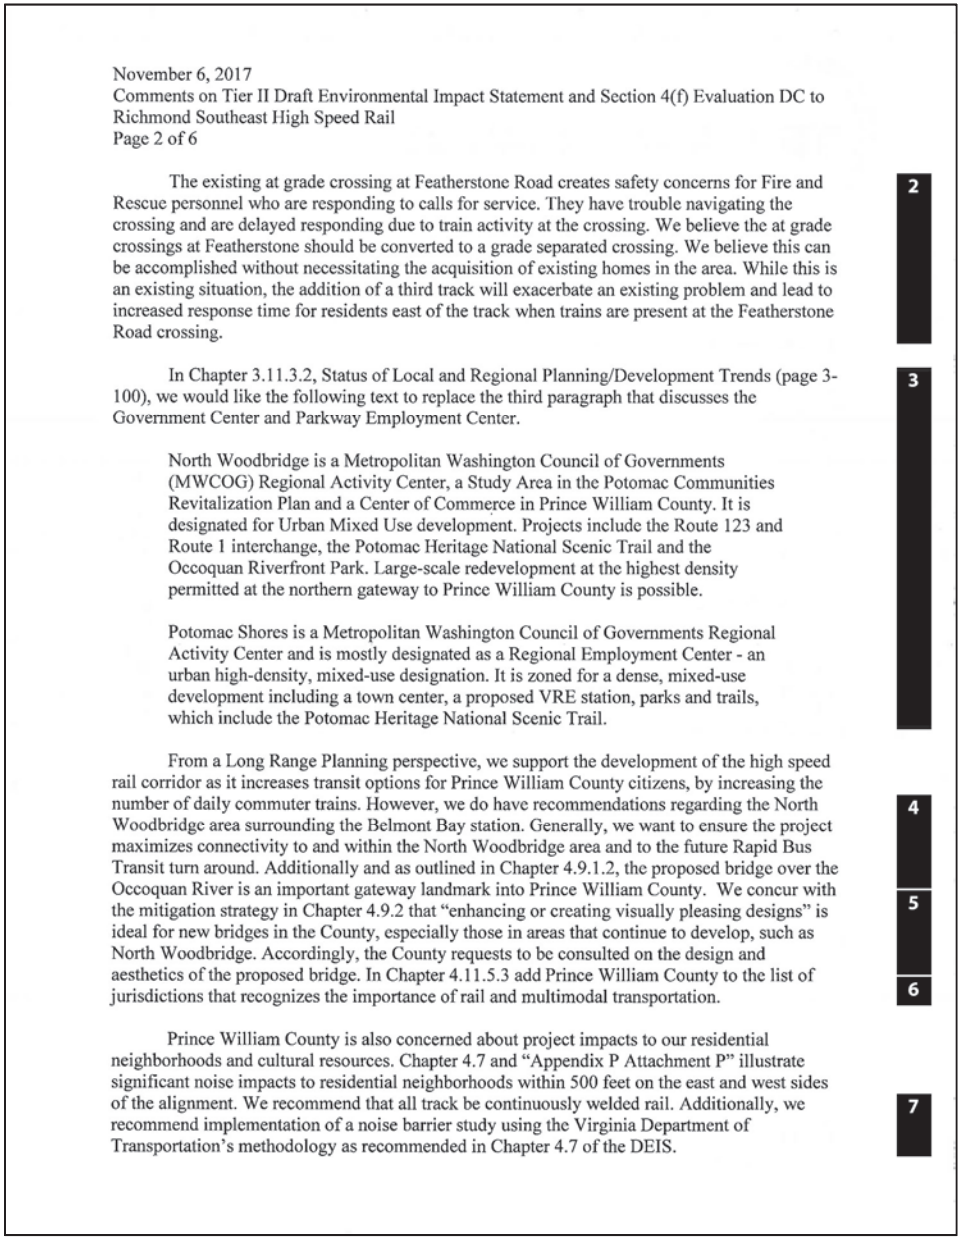
3. The referenced text was replaced, as requested by the County; refer to the errata table for the Draft EIS, which is Appendix A of the Final EIS.

4. The Preferred Alternative will serve both the Amtrak and VRE stations at the Woodbridge Station. While outside the Purpose and Need of the Project, the conceptual designs do not preclude connectivity to and within the North Woodbridge area or to a future Rapid Bus Transit turn around outside of the railroad right-of-way.

5. DRPT welcomes input on the design and aesthetic features of the additional Occoquan River rail bridge, and will continue to coordinate with Prince William County during final design, after funding becomes available and a construction schedule can be established.

6. DRPT acknowledges that Prince William County recognizes the importance of rail and multimodal transportation. The County was added to the list in Chapter 4 of the Draft EIS, as requested by the County; refer to the errata table for the Draft EIS, which is included as Appendix A of the Final EIS.

(Responses are continued on next page)



November 6, 2017
Comments on Tier II Draft Environmental Impact Statement and Section 4(f) Evaluation DC to Richmond Southeast High Speed Rail
Page 2 of 6

The existing at grade crossing at Featherstone Road creates safety concerns for Fire and Rescue personnel who are responding to calls for service. They have trouble navigating the crossing and are delayed responding due to train activity at the crossing. We believe the at grade crossings at Featherstone should be converted to a grade separated crossing. We believe this can be accomplished without necessitating the acquisition of existing homes in the area. While this is an existing situation, the addition of a third track will exacerbate an existing problem and lead to increased response time for residents east of the track when trains are present at the Featherstone Road crossing. 2

In Chapter 3.11.3.2, Status of Local and Regional Planning/Development Trends (page 3-100), we would like the following text to replace the third paragraph that discusses the Government Center and Parkway Employment Center. 3

> North Woodbridge is a Metropolitan Washington Council of Governments (MWCOG) Regional Activity Center, a Study Area in the Potomac Communities Revitalization Plan and a Center of Commerce in Prince William County. It is designated for Urban Mixed Use development. Projects include the Route 123 and Route 1 interchange, the Potomac Heritage National Scenic Trail and the Occoquan Riverfront Park. Large-scale redevelopment at the highest density permitted at the northern gateway to Prince William County is possible.
>
> Potomac Shores is a Metropolitan Washington Council of Governments Regional Activity Center and is mostly designated as a Regional Employment Center - an urban high-density, mixed-use designation. It is zoned for a dense, mixed-use development including a town center, a proposed VRE station, parks and trails, which include the Potomac Heritage National Scenic Trail.

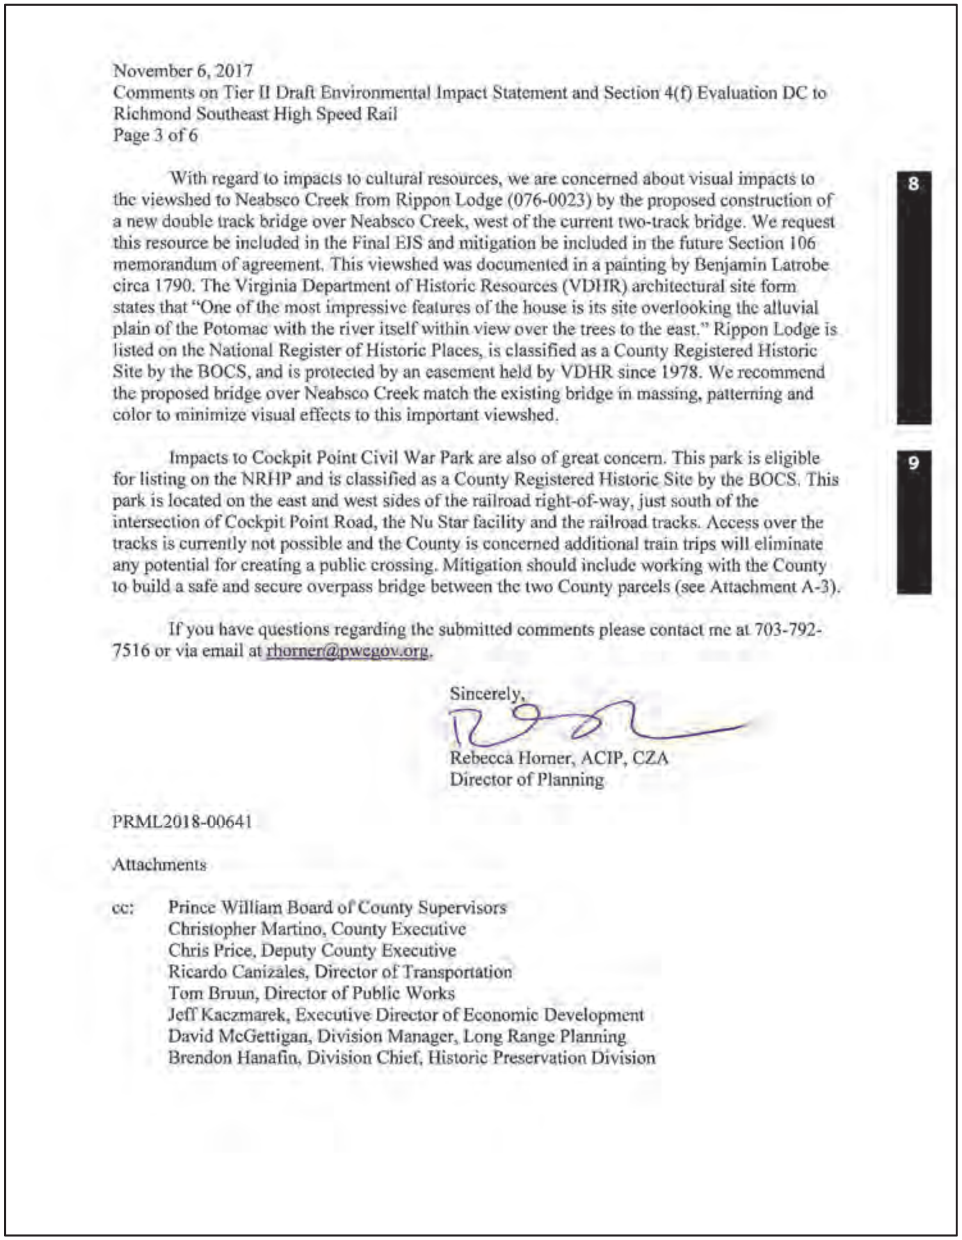
From a Long Range Planning perspective, we support the development of the high speed
rail corridor as it increases transit options for Prince William County citizens, by increasing the
number of daily commuter trains. However, we do have recommendations regarding the North 4
Woodbridge area surrounding the Belmont Bay station. Generally, we want to ensure the project
maximizes connectivity to and within the North Woodbridge area and to the future Rapid Bus
Transit turn around. Additionally and as outlined in Chapter 4.9.1.2, the proposed bridge over the
Occoquan River is an important gateway landmark into Prince William County. We concur with 5
the mitigation strategy in Chapter 4.9.2 that "enhancing or creating visually pleasing designs" is
ideal for new bridges in the County, especially those in areas that continue to develop, such as
North Woodbridge. Accordingly, the County requests to be consulted on the design and
aesthetics of the proposed bridge. In Chapter 4.11.5.3 add Prince William County to the list of
jurisdictions that recognizes the importance of rail and multimodal transportation. 6

Prince William County is also concerned about project impacts to our residential
neighborhoods and cultural resources. Chapter 4.7 and "Appendix P Attachment P" illustrate
significant noise impacts to residential neighborhoods within 500 feet on the east and west sides
of the alignment. We recommend that all track be continuously welded rail. Additionally, we 7
recommend implementation of a noise barrier study using the Virginia Department of
Transportation's methodology as recommended in Chapter 4.7 of the DEIS.

PRINCE WILLIAM COUNTY (continued)

7. DRPT proposes to install continuously welded rail on main tracks throughout the corridor as part of the Project. The Draft EIS identifies where moderate and severe noise impacts (as defined by FRA and FTA) are projected to occur as a result of the proposed intercity passenger rail service. The noise and vibration contour figures in Appendix P of the Draft EIS show where Project-related noise and vibration impacts (as defined by FRA) are projected to occur, including in Prince William County. There are no changes to the noise impact contours since the publication of the Draft EIS, with the exception of two areas (in Area 1 and Area 6); these two areas are detailed in Final EIS Section 5.7 and updated maps are provided in Appendix M of the Final EIS, however, they do not change any analyses in Prince William County.

   DRPT will reevaluate potential noise impacts and mitigation measures during final design, as required, which will occur after funding becomes available and incremental improvements are scheduled.



November 6, 2017
Comments on Tier II Draft Environmental Impact Statement and Section 4(f) Evaluation DC to Richmond Southeast High Speed Rail
Page 3 of 6

With regard to impacts to cultural resources, we are concerned about visual impacts to the viewshed to Neabsco Creek from Rippon Lodge (076-0023) by the proposed construction of a new double track bridge over Neabsco Creek, west of the current two-track bridge. We request this resource be included in the Final EIS and mitigation be included in the future Section 106 memorandum of agreement. This viewshed was documented in a painting by Benjamin Latrobe circa 1790. The Virginia Department of Historic Resources (VDHR) architectural site form states that "One of the most impressive features of the house is its site overlooking the alluvial plain of the Potomac with the river itself within view over the trees to the east." Rippon Lodge is listed on the National Register of Historic Places, is classified as a County Registered Historic Site by the BOCS, and is protected by an easement held by VDHR since 1978. We recommend the proposed bridge over Neabsco Creek match the existing bridge in massing, patterning and color to minimize visual effects to this important viewshed. 8

Impacts to Cockpit Point Civil War Park are also of great concern. This park is eligible for listing on the NRHP and is classified as a County Registered Historic Site by the BOCS. This park is located on the east and west sides of the railroad right-of-way, just south of the intersection of Cockpit Point Road, the Nu Star facility and the railroad tracks. Access over the tracks is currently not possible and the County is concerned additional train trips will eliminate any potential for creating a public crossing. Mitigation should include working with the County to build a safe and secure overpass bridge between the two County parcels (see Attachment A-3). 9

If you have questions regarding the submitted comments please contact me at 703-792-7516 or via email at rhorner@pwcgov.org.

Sincerely,

Rebecca Horner, ACIP, CZA
Director of Planning

PRML2018-00641

David McGettigan, Division Manager, Long Range Planning
Brendon Hanafin, Division Chief, Historic Preservation Division

PRINCE WILLIAM COUNTY (continued)

8. DRPT understands the County's concern about Rippon Lodge, which was presented both during consulting party meetings and in written comments. Given those concerns, Rippon Lodge was the subject of additional architectural study, added as a historic property to the Final EIS (see Section 5.13 of the Final EIS and Chapter 6 of the Final EIS), and included in DHR coordination. An analysis of the potential impacts on Rippon Lodge and its viewshed is included in Sections 5.13.1, 5.13.2.2., 5.20.1.3, and 6.5.3.1 in the Final EIS. DRPT welcomes input on the design and aesthetic features of the additional Neabsco Creek rail bridge, and will continue to coordinate with Prince William County during final design, after funding becomes available and a construction schedule can be established.

9. DRPT carefully evaluated the Project's area of potential effects (APE) and the boundaries of the Cockpit Point Civil War Park as part of the Draft EIS. No development planned as part of the Project will occur within or near the boundaries of this resource; as such, it does not fall within the Project's APE. All work being planned in this area is part of the ongoing Arkendale to Powell's Creek project, which was the subject of environmental and cultural resource studies for that project in 2011 and the impacts of which are separate from this Project.

   Title 56, Chapter 13, §56-363 of the Virginia State Code states "It is hereby declared to be the policy of the Commonwealth that all crossings of one railroad by another, or a public highway by a railroad, or a railroad by a public highway, shall, wherever reasonably practicable, pass above or below the existing facility. It is the policy of the Commonwealth to limit the number of new public at grade crossings and to eliminate unnecessary crossings." In accordance with that, any proposed public crossing at this location should be grade separated with pedestrian traffic channelized to reduce the potential for trespassing on railroad right-of-way. The DC2RVA Project does not preclude the possibility of a future grade-separated crossing to be coordinated by the County with CSXT.

RE: Comments from City of Fredericksburg regarding Draft Environmental Impact Statement for Southeast High Speed Rail

Dear Ms. Stock:

Thank you for the opportunity to comment upon the Draft Environmental Impact Statement for the Southeast High Speed Rail project. Our City Council supports the option that brings the third rail through the City of Fredericksburg, recognizing that we have benefitted from rail service in the past and looking forward to significant benefits in the future. However, they know there will be other types of impacts as well. As a consequence, the City Council has specified several items it would like to see addressed as the high speed rail project is implemented.

These proposed additions to the scope of work are outlined in the attached Resolution, passed by a unanimous vote on October 24, 2017. Additional details for each item, if needed, are contained in the related staff memo, dated October 17, 2017. Also enclosed is a map showing the location of the requested improvements. 1

In addition, the Fredericksburg Comprehensive Plan (2015) indicates that Lansdowne Road is supposed to be widened from its current two-lane configuration to a four-lane roadway (p. 33). Since the scope of the rail project is to separate the grades at the Lansdowne Road crossing, the potential expansion of that roadway should be addressed. 2

Again, thank you for the opportunity to comment. Please do not hesitate to contact me if you have any questions, either at the number above or at enelson@fredericksburgva.gov.

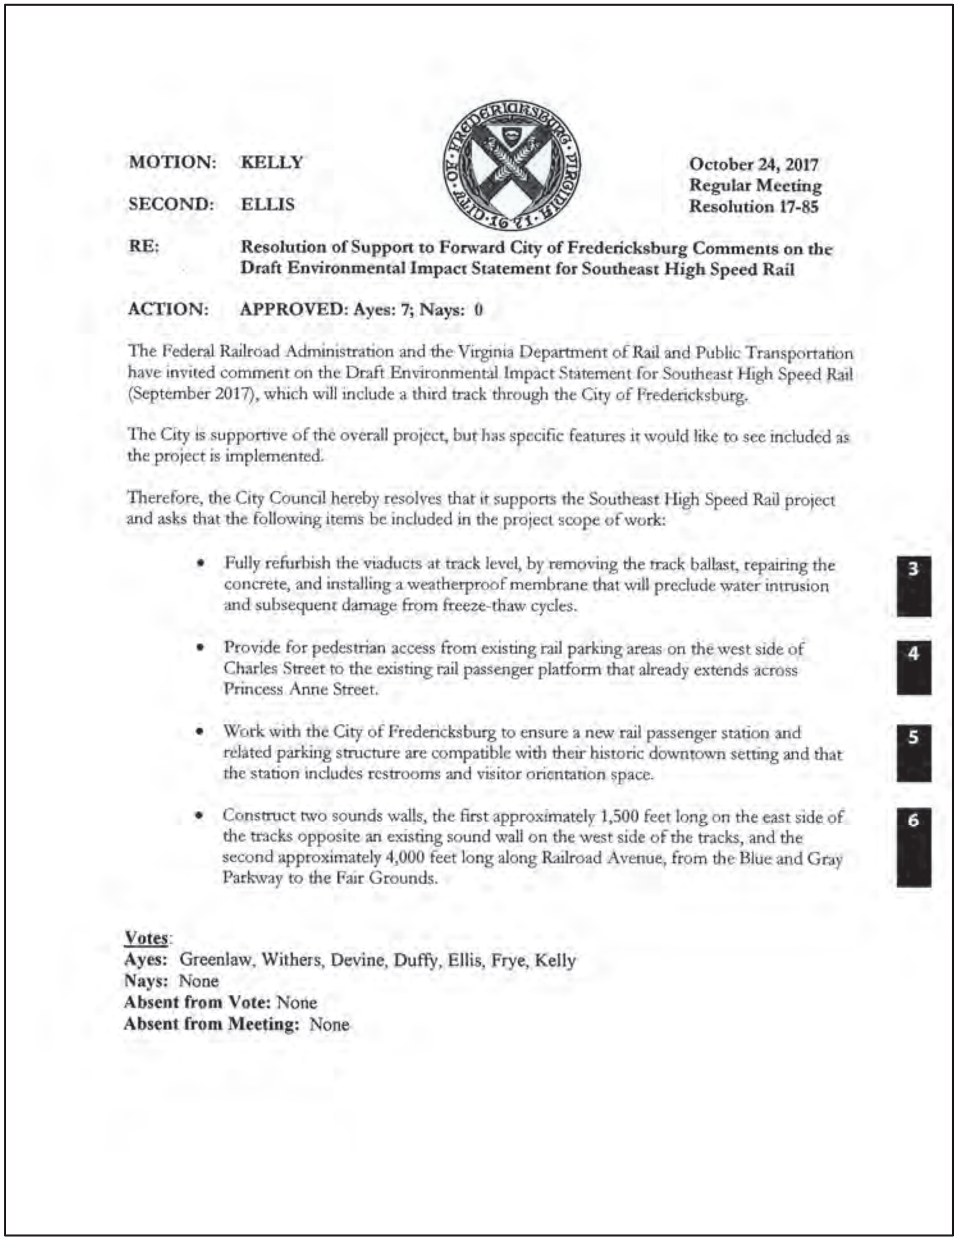
Sincerely,

Erik F. Nelson

CC: City Manager

CITY OF FREDERICKSBURG

1. The Department of Rail and Public Transportation (DRPT) has numbered each corresponding statement within both the resolution and the staff memo that the City provided. Refer to the Resolution page provided by the City (fourth page of their letter) for responses to those statements (DRPT-numbered statements #2 through #6 in this response).
2. Designs in support of the Draft and Final Environment Impact Statement (EIS) were prepared at a conceptual level sufficient for assessing the impacts of the DC2RVA Project, which is approximately a 10% level of design (see the beginning of Chapter 4 of the Final EIS for details). While the expansion of Lansdowne Road to a four-lane facility is in the County's comprehensive plan as a possible improvement by 2030, there are no designs, concept plans, funding, or schedule in place to expand Lansdowne Road. Therefore, the conceptual design for the proposed grade separation of Lansdowne Road over the CSXT right-of-way reflects the two-lane roadway in place as of the completion of the Final EIS. Additionally, it is important to note that the Project is not anticipated to affect vehicle volumes or operations on Lansdowne Road. A future expansion of the roadway to four lanes is independent of the DC2RVA Project, and any impacts associated with expanding Lansdowne Road would be a result of that roadway widening project and not the DC2RVA Project. During future phases of design (see Section 7.5 of the Final EIS), DRPT will continue to coordinate with the County to incorporate the comprehensive plan's future roadway improvements in the DC2RVA design plans, as planned and funded at that time.



MOTION: **KELLY**

SECOND: **ELLIS**

October 24, 2017
Regular Meeting
Resolution 17-85

RE: **Resolution of Support to Forward City of Fredericksburg Comments on the Draft Environmental Impact Statement for Southeast High Speed Rail**

ACTION: **APPROVED: Ayes: 7; Nays: 0**

The Federal Railroad Administration and the Virginia Department of Rail and Public Transportation have invited comment on the Draft Environmental Impact Statement for Southeast High Speed Rail (September 2017), which will include a third track through the City of Fredericksburg.

The City is supportive of the overall project, but has specific features it would like to see included as the project is implemented.

Therefore, the City Council hereby resolves that it supports the Southeast High Speed Rail project and asks that the following items be included in the project scope of work:

- Fully refurbish the viaducts at track level, by removing the track ballast, repairing the concrete, and installing a weatherproof membrane that will preclude water intrusion and subsequent damage from freeze-thaw cycles. 3
- Provide for pedestrian access from existing rail parking areas on the west side of Charles Street to the existing rail passenger platform that already extends across Princess Anne Street. 4
- Work with the City of Fredericksburg to ensure a new rail passenger station and related parking structure are compatible with their historic downtown setting and that the station includes restrooms and visitor orientation space. 5
- Construct two sounds walls, the first approximately 1,500 feet long on the east side of the tracks opposite an existing sound wall on the west side of the tracks, and the second approximately 4,000 feet long along Railroad Avenue, from the Blue and Gray Parkway to the Fair Grounds. 6

Votes:
Ayes: Greenlaw, Withers, Devine, Duffy, Ellis, Frye, Kelly
Nays: None
Absent from Vote: None
Absent from Meeting: None

CITY OF FREDERICKSBURG (continued)

3. DRPT will work with the City, the host railroad, and other stakeholders to identify and plan for the requested maintenance of the railroad viaducts in downtown Fredericksburg; however, repair of the railroad viaducts is not part of the DC2RVA Project. The viaducts are privately owned by CSXT. The DC2RVA Project does not preclude the City from coordinating with CSXT to survey the existing viaducts, identify potential improvements, and design those improvements; however, the rehabilitation described in the comment is not part of the DC2RVA Project.

4 and 5. DRPT developed conceptual station improvements and layouts for the Final EIS (as shown in Section 4.3), including pedestrian access to platforms, to assess potential impacts of the DC2RVA Project to meet the needs of the proposed additional service. Station improvements, however, are typically the responsibility of the host locality and/or the station owners/operators. Accordingly, DRPT will continue to coordinate any additional planning and future design/development of any Fredericksburg station improvements, including platforms, parking facilities, and other station amenities with the City, Amtrak and VRE to ensure a design compatible with the historic downtown setting and the needs of the stakeholders.

6. DRPT evaluated noise effects of the proposed intercity passenger trains using Federal Railroad Administration (FRA) and Federal Transit Administration (FTA) methods, which qualify potential noise impacts as either moderate or severe. Locations where moderate and severe noise impacts are projected to occur are presented in the noise impact contour figures provided in Appendix P of the Draft EIS, which have not changed in the Fredericksburg area as part of the Preferred Alternative. In accordance with FRA guidance, noise mitigation measures will be considered where severe noise impacts are projected to occur. Mitigation measures will be evaluated in more detail during the final design phase of the Project, which will occur after funding becomes available and incremental improvements are scheduled. The process of evaluating and implementing noise mitigation will occur in accordance with FRA and FTA methods and guidelines, and subject to FRA approval.

ITEM #8G

Erik F. Nel

TO: Timothy J. Baroody, City Manager
FROM: Erik F. Nelson, Transportation Administrator
DATE: October 17, 2017
RE: Resolution of Support to Forward City of Fredericksburg Comments on the Draft Environmental Impact Statement for Southeast High Speed Rail

---

ISSUE

In September 2017, the Federal Railroad Administration (FRA) and the Virginia Department of Rail and Public Transportation (VDRPT) released a Draft Environmental Impact Statement (DEIS) for the Southeast High Speed Rail Project. These agencies are soliciting public comments through November 7, 2017. Construction of a third track is proposed to run through Fredericksburg and the City's desired outcomes for this significant transportation investment are contained in the attached resolution.

RECOMMENDATION

In the early 1990s, the U.S. Department of Transportation designated a series of national high speed rail corridors. The railway from Washington D.C. to New York and on to Boston already has high speed rail service. The route from Washington D.C. to Jacksonville, FL is designated the Southeast High Speed Rail corridor and the section between Washington D.C. and Richmond has been evaluated for environmental constraints. The completed DEIS will lead to a Record of Decision for the desired route and allow actual construction to begin.

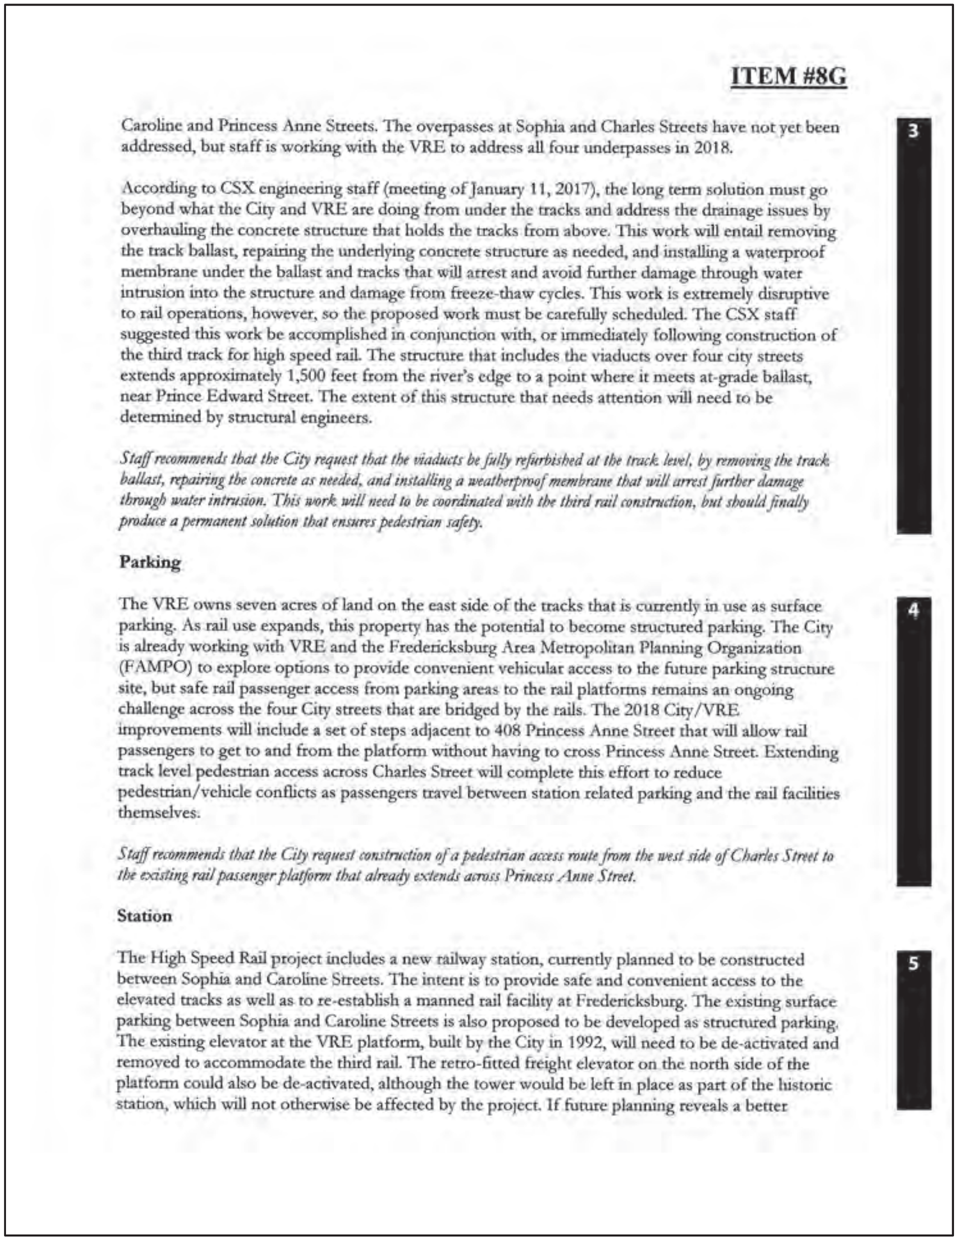
High speed rail service will serve commuters and other rail travelers, as well as enhance the movement of freight in this area that is also called the Atlantic Gateway. As part of the overall project, a new Fredericksburg station is planned, as well as additional rail passenger parking. From the City's perspective, the project also provides the opportunity to obtain improvements to the existing rail facilities, including the four concrete overpasses, which currently compromise pedestrian safety. In addition, certain pedestrian features should be considered. Finally, sound walls will be needed to protect both the Darbytown and Mayfield neighborhoods.

Each area of concern is noted below, with recommendations that are also included in the attached resolution. Activities such as public review of the new bridge design, to be consistent with its historic context, are already prescribed by law and not referenced redundantly.

Viaducts/Overpasses

3

The railway bridge over the Rappahannock River is a poured-concrete structure that extends into town and crosses over four city streets. Track drainage has been a consistent problem and has caused visible damage to the overpasses. The City and the Virginia Railway Express (VRE) have seen to the rehabilitation of the concrete platforms on both sides of the tracks, extending over both



ITEM #8G

3 Caroline and Princess Anne Streets. The overpasses at Sophia and Charles Streets have not yet been addressed, but staff is working with the VRE to address all four underpasses in 2018.

According to CSX engineering staff (meeting of January 11, 2017), the long term solution must go beyond what the City and VRE are doing from under the tracks and address the drainage issues by overhauling the concrete structure that holds the tracks from above. This work will entail removing the track ballast, repairing the underlying concrete structure as needed, and installing a waterproof membrane under the ballast and tracks that will arrest and avoid further damage through water intrusion into the structure and damage from freeze-thaw cycles. This work is extremely disruptive to rail operations, however, so the proposed work must be carefully scheduled. The CSX staff suggested this work be accomplished in conjunction with, or immediately following construction of the third track for high speed rail. The structure that includes the viaducts over four city streets extends approximately 1,500 feet from the river's edge to a point where it meets at-grade ballast, near Prince Edward Street. The extent of this structure that needs attention will need to be determined by structural engineers.

Staff recommends that the City request that the viaducts be fully refurbished at the track level, by removing the track ballast, repairing the concrete as needed, and installing a weatherproof membrane that will arrest further damage through water intrusion. This work will need to be coordinated with the third rail construction, but should finally produce a permanent solution that ensures pedestrian safety.

Parking

4 The VRE owns seven acres of land on the east side of the tracks that is currently in use as surface parking. As rail use expands, this property has the potential to become structured parking. The City is already working with VRE and the Fredericksburg Area Metropolitan Planning Organization (FAMPO) to explore options to provide convenient vehicular access to the future parking structure site, but safe rail passenger access from parking areas to the rail platforms remains an ongoing challenge across the four City streets that are bridged by the rails. The 2018 City/VRE improvements will include a set of steps adjacent to 408 Princess Anne Street that will allow rail passengers to get to and from the platform without having to cross Princess Anne Street. Extending track level pedestrian access across Charles Street will complete this effort to reduce pedestrian/vehicle conflicts as passengers travel between station related parking and the rail facilities themselves.

Staff recommends that the City request construction of a pedestrian access route from the west side of Charles Street to the existing rail passenger platform that already extends across Princess Anne Street.

Station

5 The High Speed Rail project includes a new railway station, currently planned to be constructed between Sophia and Caroline Streets. The intent is to provide safe and convenient access to the elevated tracks as well as to re-establish a manned rail facility at Fredericksburg. The existing surface parking between Sophia and Caroline Streets is also proposed to be developed as structured parking. The existing elevator at the VRE platform, built by the City in 1992, will need to be de-activated and removed to accommodate the third rail. The retro-fitted freight elevator on the north side of the platform could also be de-activated, although the tower would be left in place as part of the historic station, which will not otherwise be affected by the project. If future planning reveals a better

ITEM #8G

5

location for a new station that is acceptable to the City, the City will work with FRA and VDRPT to implement related modified plans.

Staff recommends that the City request that the design of a new station, whether built between Sophia and Caroline Streets or some other nearby location, be compatible with its historic downtown setting and have restrooms and visitor orientation space. Similarly, any new rail parking structure will need careful architectural attention to ensure it will be compatible as a transitional element between the residential neighborhood to the south and the commercial downtown, to the north.

Bicycle/pedestrian access

4

Pedestrian circulation to and from the station has raised numerous safety issues that the City and VRE have addressed over the past 25 years through a series of incremental improvements. High speed rail and expanded VRE use is going to require continued attention to this matter. A 1995 study called the Fredericksburg Station Community Plan suggested construction of a pedestrian underpass through the existing railway embankment, but more recent bicycle/pedestrian analysis suggests this ambitious idea is not needed. Instead, improved bicycle/pedestrian access along existing streets is feasible and preferred.

There is no staff recommendation for additional pedestrian accommodations beyond what has already been noted above.

Sound mitigation

6

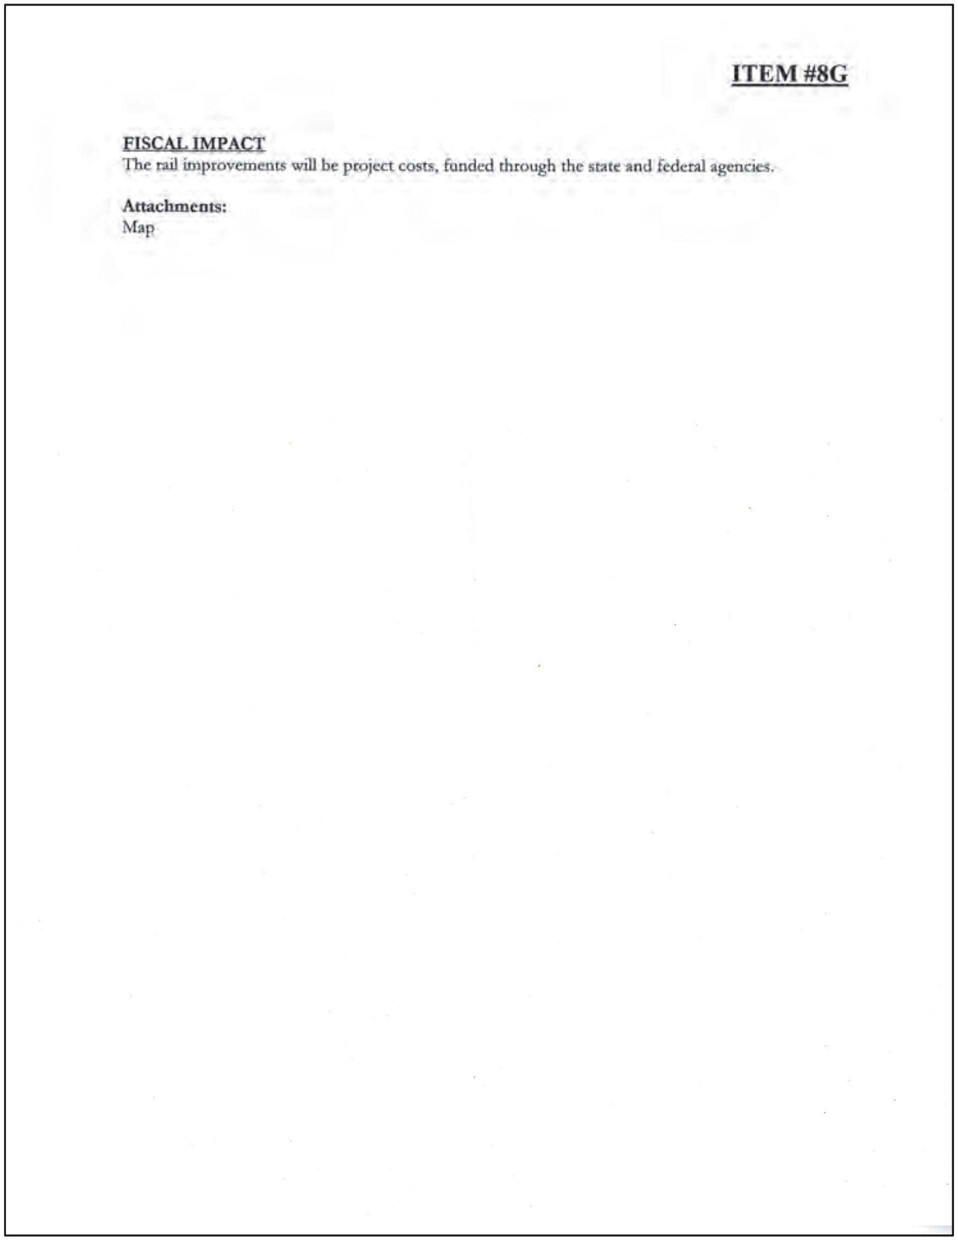
A sound wall is installed adjacent to Cobblestone, which benefits the occupants of that residential complex, but causes the sound of trains to echo into the neighborhoods to the east of the tracks. Installation of a sound wall on the east side of the rail corridor is needed as mitigation. This new wall would match the existing sound wall, extending from the VRE parking area to the area just north of Hazel Run, a distance of approximately 1,500 feet.

A sound wall will also be needed between the rail corridor and the Mayfield community. Railroad Avenue comprises the western edge of Mayfield, where trees have been planted to help screen the railway corridor from nearby houses. A physical sound wall will provide more effective protection for that residential neighborhood, extending from the Blue and Gray Parkway to the Fair Grounds, a distance of roughly 4,000 feet.

Staff recommends that the City request the installation of two sound walls. The first would be approximately 1,500 feet long, on the east side of the tracks opposite Cobblestone. The second would be approximately 4,000 feet long, installed along Railroad Avenue.

Public Participation

The City Council opened a discussion of the High Speed Rail project at its meeting on September 26, 2017. The FRA and VDRPT conducted a public informational meeting and a public hearing on October 18, 2017. The venue was James Monroe High School, starting at 7:00 p.m. and the format included an opportunity to study related maps, ask questions, and provide public comment. Staff also contacted both the Mayfield and the Darbytown Civic Associations to offer to meet with their respective groups exclusively. Those additional meetings have been scheduled.



ITEM #8G

FISCAL IMPACT

The rail improvements will be project costs, funded through the state and federal agencies.

Please accept the following comments from the Spotsylvania County Planning Dept. on the Tier II Draft EIS:

(1) Minor comment, Executive Summary Page 4 Column 2, suggest amending "is shared corridor" to "is a shared corridor". 1

(2) Are there emergency management and commerce considerations that should be included in the discussion looking at this corridor; its importance from a larger view? What I mean by that is the corridor of question is an integral part of east coast commerce and international trade distribution. Is there a backup plan or alternative to this main corridor if a natural or man-made emergency rendered the infrastructure along this rail line unusable or hindered for long periods of time? Is there or should there be north-south rail infrastructure in place (a backup plan) in a different geographically separate location to handle the load if something were to occur along the corridor in question? Are "all eggs in one basket" with three parallel lines? What are the impacts to the east coast, international trade, commerce, people movement if this corridor were rendered incapacitated in some way for days, weeks, months? Would seem to be consideration to mention as part of planning effort given its large scale and reach. 2

(3) I did not note discussion or design considerations for bike/ped in conjunction with at grade crossings. One of the top public comments noted in Scoping Comments Table 6.1-3 included bike/ped. There are a number of trailway in place or planned along the corridor. Two major ones include East Coast Greenway and US 1 Bike Route. In Spotsylvania County we also have the Deep Run Trail that ties into the two aforementioned. As part of at-grade crossings and even separated crossings, bike/ped should be consideration and accommodated. Page 10- Executive Summary. I did not see a lot of focus on consideration of bike/ped in main report body either. 3

(4) Page 13 Executive Summary, road spelling "Lansdowne" appears "Landsdowne". This spelling issue also appears in Chapter 4, page 65. May need to spell check throughout doc for this spelling. 4

(5) Analysis, flow and chronology comment. Chapter 5 page 109 appears to disclose preferred alignment prior to the Chapter devoted to disclosing the preferred alignment in Chapter 7. Not sure if intended. 5

(6) Lansdowne Road in Spotsylvania County is currently a two-lane facility. The EIS mentions a grade separation where is crosses the tracks near the City of Fredericksburg. The County Comprehensive Plan recommends a future four-lane divided roadway for Lansdowne Road. Please take the future planned widening into consideration when the plan for DC2RVA becomes final. 6

(7) There is currently a safety concern at the Mine Road & Benchmark Road intersection. The tracks cross Mine Road and run parallel to Benchmark Road. Cars approaching the tracks must stop. The crossing is gated but the gates need to be upgraded to the safer Four Quadrant Gate system. 7

www.spotsylvania.va.us

SPOTSYLVANIA COUNTY

1. The Department of Rail and Public Transportation (DRPT) notes the grammatical correction; however, the exact Draft Environmental Impact Statement (EIS) Executive Summary content is not reissued as part of the Final EIS.

2. The DC2RVA corridor is one component of the broader rail network serving the East Coast. The rail system is able to divert freight shipments to a different road or rail corridor when necessary, although the competing corridor may be longer and less efficient. Development of "backup" infrastructure to handle interrupted freight shipments due to an event that may temporarily incapacitate the rail line is beyond the scope, or the Purpose and the Need, of this Project.

3. Expanded text on the treatment of existing bicycle and pedestrian facilities has been added to Section 5.18 of the Final EIS. Opportunities for additional bicycle and pedestrian accessibility improvements, including new and/or additional facilities to be compliant with the Americans with Disabilities Act (ADA), could be incorporated during final design, in coordination with FRA.

   The decision to establish a new bicycle and pedestrian greenway is a separate and distinct action from establishing high speed passenger rail service under the National Environmental Policy Act (NEPA), and is not part of the Purpose and Need of this Project. The referenced Deep Run Spur Trail, which is not yet built but would cross the existing 3-4 track right-of-way just north of Slaughter Pen Farm in Fredericksburg, would cross the same number of main tracks in the Preferred Alternative at this location. The DC2RVA Project will not add any additional tracks in this area, and current trail plans will not be affected.

4. The spelling of Lansdowne Road has been corrected in the Final EIS; refer to the errata table for the Draft EIS, which is included as Appendix A of the Final EIS.

5. Comment noted. The Final EIS is presented in chronological order.

(Responses are continued on next page)

SPOTSYLVANIA COUNTY (continued)

6. Designs in support of the Draft and Final EIS were prepared at a conceptual level sufficient for assessing the impacts of the DC2RVA Project, which is approximately a 10% level of design (see the beginning of Chapter 4 of the Final EIS for details). While the expansion of Lansdowne Road to a four-lane facility is in the County's comprehensive plan as a possible improvement by 2030, there are no designs, concept plans, funding, or schedule in place to expand Lansdowne Road. Therefore, the conceptual design for the proposed grade separation of Lansdowne Road over the CSXT right-of-way reflects the two-lane roadway in place as of the completion of the DC2RVA Tier II EIS. Additionally, it is important to note that the Project is not anticipated to affect vehicle volumes or operations on Lansdowne Road. A future expansion of the roadway to four lanes is independent of the DC2RVA Project, and any impacts associated with expanding Lansdowne Road would be a result of that roadway widening project and not the DC2RVA Project. During future phases of design (see Section 7.5 of the Final EIS), DRPT will continue to coordinate with the County to incorporate the comprehensive plan's future roadway improvements in the DC2RVA design plans, as planned and funded at that time.

7. A four-quadrant gate system is the proposed crossing treatment at Mine Road as part of the Preferred Alternative for the Project, which is in line with the County's request in this comment. See Chapter 4 of the Final EIS for detailed descriptions of the Preferred Alternative, and Appendix L of the Final EIS, which provides an updated mapbook of the Preferred Alternative.

Emily Stock, Manager of Rail Planning
Department of Rail and Public Transportation
DC2RVA Project Office
801 East Main Street, Suite 1000
Richmond, VA 23219

Dear Ms. Stock:

Thank you for the opportunity to provide comments on the DC to Richmond Southeast High Speed Rail Tier II Draft Environmental Impact Statement (DEIS). We would also like to thank the Department of Rail and Public Transportation staff and members of the Commonwealth Transportation Board for convening the Ashland/Hanover Citizens Advisory Committee to further review alternatives for the Ashland area.

Attached please find Hanover County comments submitted on behalf of the Board of Supervisors. The DEIS is a very detailed and in-depth analysis of the DC2RVA corridor however the attached comments are focused on Alternative Area 5, Ashland (Doswell to I-295) CFP 19-9.

We believe the DEIS clearly demonstrates the adverse impacts resulting from the West Bypass alternative 5C greatly exceed those of the other alternatives for the vast majority of the criteria considered. It further demonstrates the 3-2-3 alternative (5A) has the fewest impacts and is consistent with the incremental development approach recommended in the Southeast High Speed Rail Tier I Final Environmental Impact Statement. 1

Also attached is a resolution adopted on October 11, 1017 by the Hanover Board of Supervisors on a vote of six to one. The resolution expresses support for the DEIS Alternative 5A (3-2-3 option) which maintains two tracks through town with new grade separations at Ashcake and Vaughan Roads, and opposes a west bypass alternative.

Thank you for your consideration of these comments.

Respectfully,

Cecil R. Harris, Jr.
County Administrator

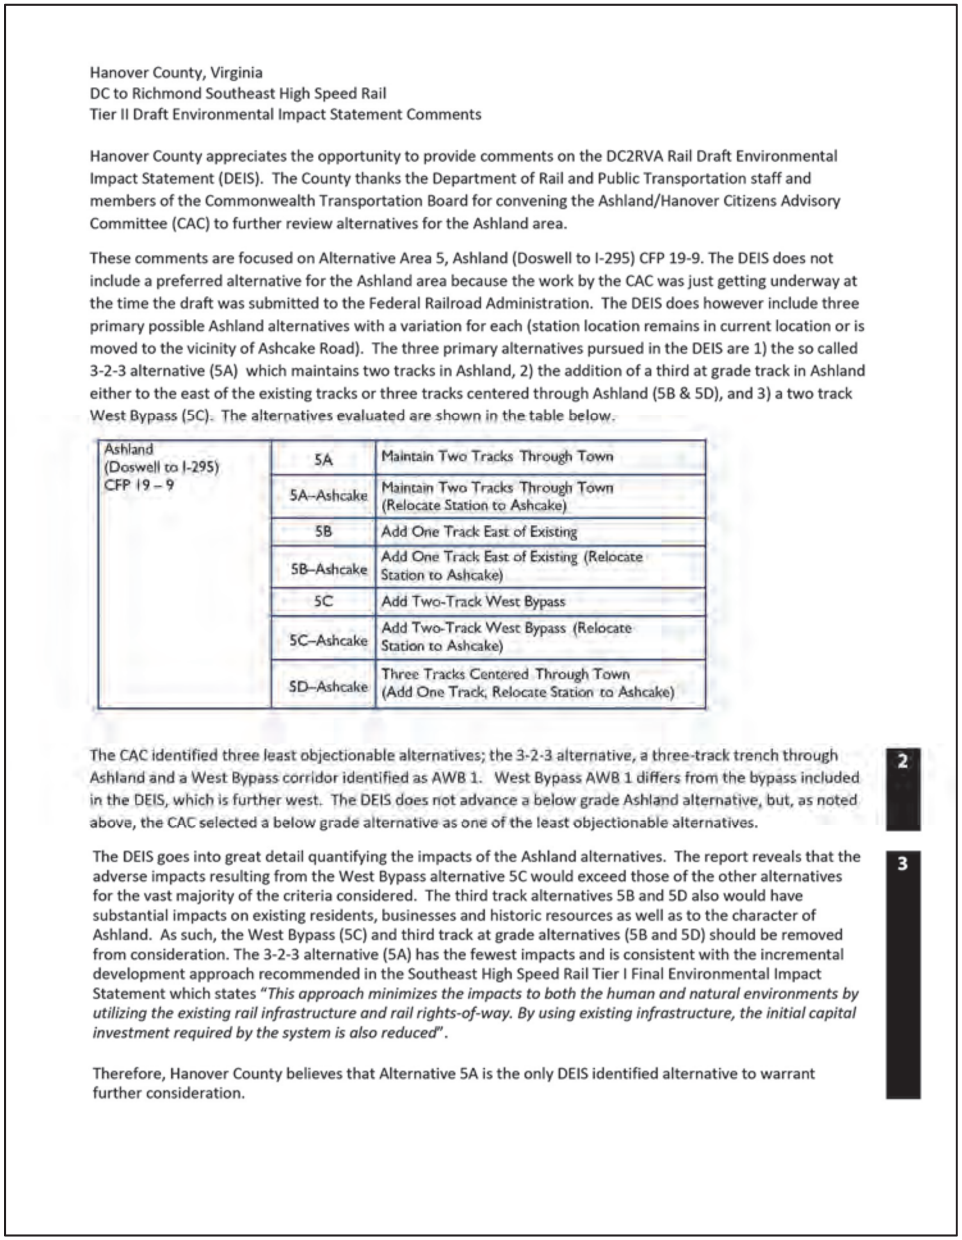
Enclosures: Hanover County DC2RVA Southeast High Speed Rail Tier II DEIS Comments
Hanover County Board of Supervisors Resolution

Cc: Hanover County Board of Supervisors
Joshua Farrar, Ashland Town Manager

Hanover: People, Tradition and Spirit

HANOVER COUNTY

1. The Department of Rail and Public Transportation (DRPT) acknowledges the resolution adopted by the Hanover Board of Supervisors. In accordance with the September 2017 recommendation of the Town of Ashland/Hanover County Community Advisory Committee (CAC) and with the December 2017 resolution of the Commonwealth Transportation Board (CTB), Alternative 5A: Maintain Two Tracks Through Town was selected as the Preferred Alternative in the Final Environmental Impact Statement (EIS). Refer to Section 4.3.5 of the Final EIS for a description of the Preferred Alternative in this area and the basis for its selection. Further, DRPT, in accordance with the December 2017 Commonwealth Transportation Board resolutions, commits to working with the Town, the host railroad (CSXT), the Federal Railroad Administration (FRA), and other stakeholders to develop safety improvements for public road and pedestrian crossings in Ashland, separate from the DC2RVA Project.



Hanover County, Virginia
DC to Richmond Southeast High Speed Rail
Tier II Draft Environmental Impact Statement Comments

Hanover County appreciates the opportunity to provide comments on the DC2RVA Rail Draft Environmental Impact Statement (DEIS). The County thanks the Department of Rail and Public Transportation staff and members of the Commonwealth Transportation Board for convening the Ashland/Hanover Citizens Advisory Committee (CAC) to further review alternatives for the Ashland area.

These comments are focused on Alternative Area 5, Ashland (Doswell to I-295) CFP 19-9. The DEIS does not include a preferred alternative for the Ashland area because the work by the CAC was just getting underway at the time the draft was submitted to the Federal Railroad Administration. The DEIS does however include three primary possible Ashland alternatives with a variation for each (station location remains in current location or is moved to the vicinity of Ashcake Road). The three primary alternatives pursued in the DEIS are 1) the so called 3-2-3 alternative (5A) which maintains two tracks in Ashland, 2) the addition of a third at grade track in Ashland either to the east of the existing tracks or three tracks centered through Ashland (5B & 5D), and 3) a two track West Bypass (5C). The alternatives evaluated are shown in the table below.

Ashland (Doswell to I-295) CFP 19 – 9	5A	Maintain Two Tracks Through Town
	5A–Ashcake	Maintain Two Tracks Through Town (Relocate Station to Ashcake)
	5B	Add One Track East of Existing
	5B–Ashcake	Add One Track East of Existing (Relocate Station to Ashcake)
	5C	Add Two-Track West Bypass
	5C–Ashcake	Add Two-Track West Bypass (Relocate Station to Ashcake)
	5D–Ashcake	Three Tracks Centered Through Town (Add One Track, Relocate Station to Ashcake)

2 The CAC identified three least objectionable alternatives; the 3-2-3 alternative, a three-track trench through Ashland and a West Bypass corridor identified as AWB 1. West Bypass AWB 1 differs from the bypass included in the DEIS, which is further west. The DEIS does not advance a below grade Ashland alternative, but, as noted above, the CAC selected a below grade alternative as one of the least objectionable alternatives.

3 The DEIS goes into great detail quantifying the impacts of the Ashland alternatives. The report reveals that the adverse impacts resulting from the West Bypass alternative 5C would exceed those of the other alternatives for the vast majority of the criteria considered. The third track alternatives 5B and 5D also would have substantial impacts on existing residents, businesses and historic resources as well as to the character of Ashland. As such, the West Bypass (5C) and third track at grade alternatives (5B and 5D) should be removed from consideration. The 3-2-3 alternative (5A) has the fewest impacts and is consistent with the incremental development approach recommended in the Southeast High Speed Rail Tier I Final Environmental Impact Statement which states *"This approach minimizes the impacts to both the human and natural environments by utilizing the existing rail infrastructure and rail rights-of-way. By using existing infrastructure, the initial capital investment required by the system is also reduced"*.

Therefore, Hanover County believes that Alternative 5A is the only DEIS identified alternative to warrant further consideration.

HANOVER COUNTY (continued)

2. As noted in DRPT-numbered statement #1 above, the CTB has recommended and the FRA has approved Alternative 5A (also known as "3-2-3" by the CAC) as the Preferred Alternative in the Final EIS. While DRPT recognized that the CAC selected a "least objectionable alternative" for each of the through-town, below-grade, and bypass alternatives, the alternative selected as the Preferred Alternative was Alternative 5A, which was the only CAC-identified alternative that had been carried through the alternatives screening process to the final alternatives selection phase, as described in the Draft EIS and its Alternatives Technical Report (Appendix A of the Draft EIS). The west bypass corridor, identified as AWB1, was evaluated during the early screening process and was dismissed for many of the same reasons as documented in the Draft EIS for Alternatives 5C and 5C-Ashcake. Similarly, below-grade alternatives were dismissed early in the screening process due to high costs, extended period of construction and associated disruption to downtown Ashland businesses, residences, and travelers. The recommendation and approval of Alternative 5A was attributed in part to the recommendations made by the CAC, which listed it as one of the three least objectionable alternatives considered. This was reinforced by the County Board of Supervisors recommendation for its support of Alternative 5A.

   Additionally, DRPT performed refined analysis of railroad operations through the DC2RVA Project corridor (see Section 3.2 of the Final EIS for details), including consideration of retaining a two-track railroad through the Town of Ashland. This refined operations analysis determined that while constructing a two-track western bypass or adding a third track to the existing CSXT railroad through the Town of Ashland would improve the efficiency of railroad operations through DC2RVA study Area 5, the additional capacity was not required to meet the Purpose and Need of the DC2RVA Project. Also, Alternative 5A (Maintain Two Tracks through Town) results in the least impacts to historic properties; per Section 4(f) of the US DOT Act of 1966, unless the use of such a property is determined to have a de minimis impact, FRA

Hanover County, Virginia
DC to Richmond Southeast High Speed Rail
Tier II Draft Environmental Impact Statement Comments

Hanover County appreciates the opportunity to provide comments on the DC2RVA Rail Draft Environmental Impact Statement (DEIS). The County thanks the Department of Rail and Public Transportation staff and members of the Commonwealth Transportation Board for convening the Ashland/Hanover Citizens Advisory Committee (CAC) to further review alternatives for the Ashland area.

These comments are focused on Alternative Area 5, Ashland (Doswell to I-295) CFP 19-9. The DEIS does not include a preferred alternative for the Ashland area because the work by the CAC was just getting underway at the time the draft was submitted to the Federal Railroad Administration. The DEIS does however include three primary possible Ashland alternatives with a variation for each (station location remains in current location or is moved to the vicinity of Ashcake Road). The three primary alternatives pursued in the DEIS are 1) the so called 3-2-3 alternative (5A) which maintains two tracks in Ashland, 2) the addition of a third at grade track in Ashland either to the east of the existing tracks or three tracks centered through Ashland (5B & 5D), and 3) a two track West Bypass (5C). The alternatives evaluated are shown in the table below.

Ashland (Doswell to I-295) CFP 19 – 9	5A	Maintain Two Tracks Through Town
	5A–Ashcake	Maintain Two Tracks Through Town (Relocate Station to Ashcake)
	5B	Add One Track East of Existing
	5B–Ashcake	Add One Track East of Existing (Relocate Station to Ashcake)
	5C	Add Two-Track West Bypass
	5C–Ashcake	Add Two-Track West Bypass (Relocate Station to Ashcake)
	5D–Ashcake	Three Tracks Centered Through Town (Add One Track, Relocate Station to Ashcake)

The CAC identified three least objectionable alternatives; the 3-2-3 alternative, a three-track trench through Ashland and a West Bypass corridor identified as AWB 1. West Bypass AWB 1 differs from the bypass included in the DEIS, which is further west. The DEIS does not advance a below grade Ashland alternative, but, as noted above, the CAC selected a below grade alternative as one of the least objectionable alternatives. 2

The DEIS goes into great detail quantifying the impacts of the Ashland alternatives. The report reveals that the adverse impacts resulting from the West Bypass alternative 5C would exceed those of the other alternatives for the vast majority of the criteria considered. The third track alternatives 5B and 5D also would have substantial impacts on existing residents, businesses and historic resources as well as to the character of Ashland. As such, the West Bypass (5C) and third track at grade alternatives (5B and 5D) should be removed from consideration. The 3-2-3 alternative (5A) has the fewest impacts and is consistent with the incremental development approach recommended in the Southeast High Speed Rail Tier I Final Environmental Impact Statement which states "*This approach minimizes the impacts to both the human and natural environments by utilizing the existing rail infrastructure and rail rights-of-way. By using existing infrastructure, the initial capital investment required by the system is also reduced*". 3

Therefore, Hanover County believes that Alternative 5A is the only DEIS identified alternative to warrant further consideration.

HANOVER COUNTY (continued)

must determine that no feasible and prudent avoidance alternative exists before approving the use of such land (see Chapter 6 of the Final EIS for further details).

3. The County's summation and comparison of potential impacts to the natural, cultural, and socioeconomic resources of the Ashland-Hanover County area are consistent with the evaluations prepared by DRPT that resulted in the recommendation and approval of Alternative 5A as the Preferred Alternative in the Final EIS. The Preferred Alternative was considered to be the least environmentally damaging of the Draft EIS Build Alternatives in Area 5 and as noted by the County, was consistent with the Project's Purpose and Need, including the incremental development approach recommended in the Tier I Final EIS and Record of Decision (ROD). Chapter 5 of the Final EIS details the environmental impacts of the Preferred Alternative, including the resources mentioned by the County, for the Project corridor. Impact values in this chapter have been updated with clarifications, as needed, since the publication of the Draft EIS.

HANOVER COUNTY (continued)

Tier II Draft Environmental Impact Statement Comments

3

According to the DEIS, the environmental and transportation facilities impacts related to the West Bypass are far more significant than those resulting from the third at grade track through Ashland or the 3-2-3 alternative (Table 4.23-1: Summary of Impacts). Although the DEIS does not evaluate the trench alternative, it would be reasonable to presume a below grade alternative through Ashland would have less environmental and transportation impacts than the West Bypass or the at grade third track.

Although the stream resource effects of the various Ashland options are comparable, the wetland effects are almost negligible for the 3-2-3 and third at grade track alternatives. However, West Bypass alternative 5C permanently impacts almost 8.5 acres and temporarily impacts almost 3.5 acres of wetlands (Table 4.1-2). On the face of it, this alternative fails the avoidance and minimization test since the DEIS demonstrates there are other practicable alternatives with almost no wetland impacts.

Table 4.1-2: Wetland Effects (acres)

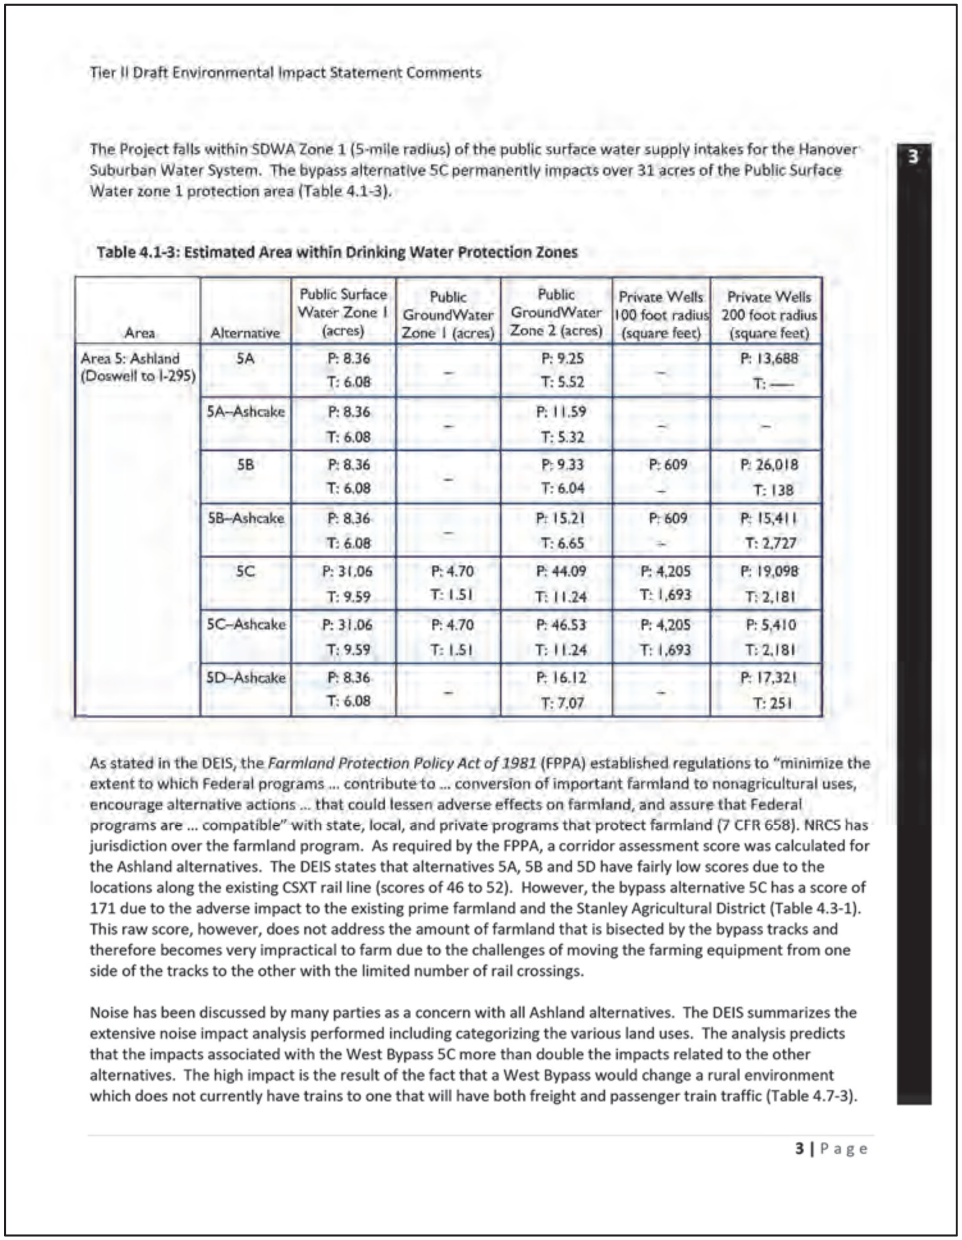
Area	Alternative	Total Wetland Effects
Area 5: Ashland (Doswell to I-295)	5A	P: 0.41 T: 1.48
	5A–Ashcake	P: 0.41 T: 1.48
	5B	P: 0.41 T: 1.53
	5B–Ashcake	P: 0.45 T: 1.50
	5C	P: 8.44 T: 3.47
	5C–Ashcake	P: 8.48 T: 3.47
	5D–Ashcake	P: 0.45 T: 1.51

The report specifies that in 1974, the *Safe Drinking Water Act* (SDWA) regulates the public drinking water supply. Amendments in 1986 and 1996 further protect the water supply by requiring actions that protect drinking water and its sources. The 1996 Amendments mandate that states assess, delineate, and map protection areas for their public drinking water sources and determine potential risks to those sources.

The DEIS notes that as a result of the 1996 SDWA amendments, Virginia adopted a 1-mile wellhead protection zone around all groundwater public sources (Zone 2). Zone 1 includes a 1,000-foot radius in which land use activities should be assessed for their potential to contaminate water supplies (Virginia DEQ, 2005). Whereas there is no impact to the Zone 1 or Zone 2 protection zone as a result of alternatives 5A, 5B or 5D; the West Bypass alternative 5C permanently affects 4.7 acres of the Zone 1 protection zone, between 44 and 46.5 acres of the Zone 2 protection area and 4200 square feet of private wells buffer areas (Table 4.1-3).

HANOVER COUNTY (continued)

(For response to comment 3, refer to page B-273)



3

The Project falls within SDWA Zone 1 (5-mile radius) of the public surface water supply intakes for the Hanover Suburban Water System. The bypass alternative 5C permanently impacts over 31 acres of the Public Surface Water zone 1 protection area (Table 4.1-3).

Table 4.1-3: Estimated Area within Drinking Water Protection Zones

Area	Alternative	Public Surface Water Zone I (acres)	Public GroundWater Zone I (acres)	Public GroundWater Zone 2 (acres)	Private Wells 100 foot radius (square feet)	Private Wells 200 foot radius (square feet)
Area 5: Ashland (Doswell to I-295)	5A	P: 8.36 T: 6.08	–	P: 9.25 T: 5.52	–	P: 13,688 T: —
	5A–Ashcake	P: 8.36 T: 6.08	–	P: 11.59 T: 5.32	–	–

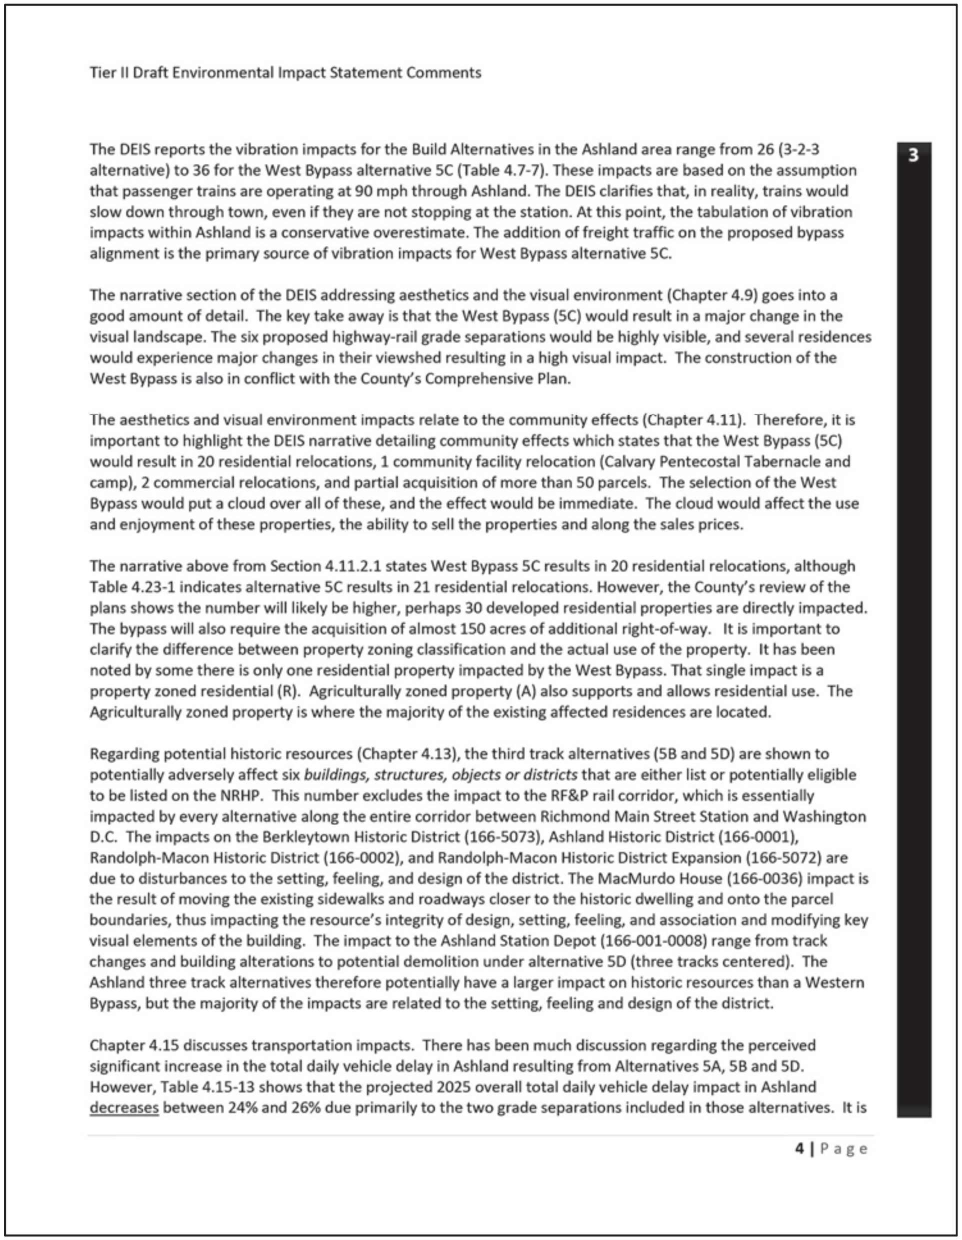
	5D–Ashcake	P: 8.36 T: 6.08	–	P: 16.12 T: 7.07	–	P: 17,321 T: 251

As stated in the DEIS, the *Farmland Protection Policy Act of 1981* (FPPA) established regulations to "minimize the extent to which Federal programs … contribute to … conversion of important farmland to nonagricultural uses, encourage alternative actions … that could lessen adverse effects on farmland, and assure that Federal programs are … compatible" with state, local, and private programs that protect farmland (7 CFR 658). NRCS has jurisdiction over the farmland program. As required by the FPPA, a corridor assessment score was calculated for the Ashland alternatives. The DEIS states that alternatives 5A, 5B and 5D have fairly low scores due to the locations along the existing CSXT rail line (scores of 46 to 52). However, the bypass alternative 5C has a score of 171 due to the adverse impact to the existing prime farmland and the Stanley Agricultural District (Table 4.3-1). This raw score, however, does not address the amount of farmland that is bisected by the bypass tracks and therefore becomes very impractical to farm due to the challenges of moving the farming equipment from one side of the tracks to the other with the limited number of rail crossings.

Noise has been discussed by many parties as a concern with all Ashland alternatives. The DEIS summarizes the extensive noise impact analysis performed including categorizing the various land uses. The analysis predicts that the impacts associated with the West Bypass 5C more than double the impacts related to the other alternatives. The high impact is the result of the fact that a West Bypass would change a rural environment which does not currently have trains to one that will have both freight and passenger train traffic (Table 4.7-3).

HANOVER COUNTY (continued)

(For response to comment 3, refer to page B-273)



3

The DEIS reports the vibration impacts for the Build Alternatives in the Ashland area range from 26 (3-2-3 alternative) to 36 for the West Bypass alternative 5C (Table 4.7-7). These impacts are based on the assumption that passenger trains are operating at 90 mph through Ashland. The DEIS clarifies that, in reality, trains would slow down through town, even if they are not stopping at the station. At this point, the tabulation of vibration impacts within Ashland is a conservative overestimate. The addition of freight traffic on the proposed bypass alignment is the primary source of vibration impacts for West Bypass alternative 5C.

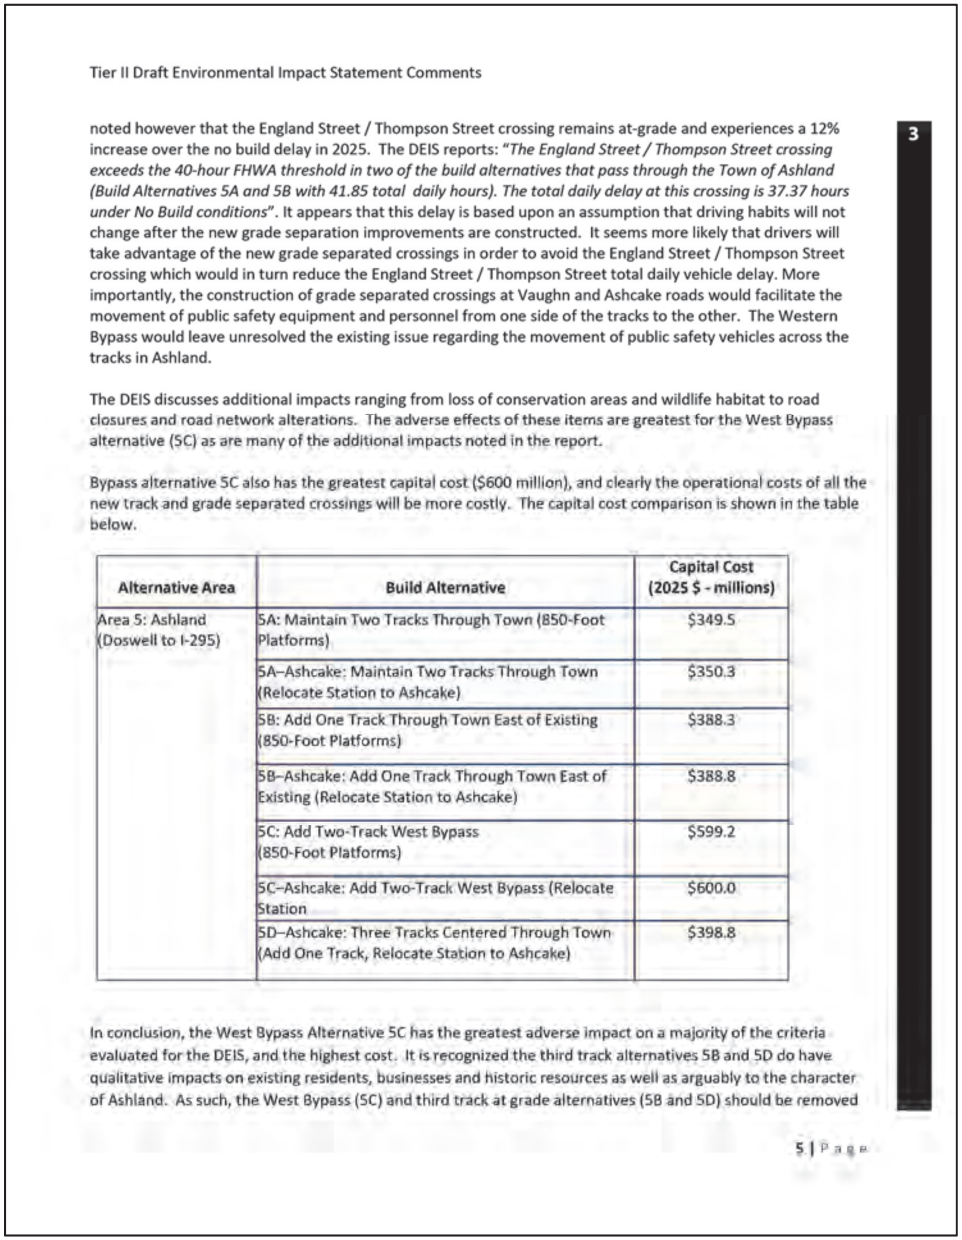
The narrative section of the DEIS addressing aesthetics and the visual environment (Chapter 4.9) goes into a good amount of detail. The key take away is that the West Bypass (5C) would result in a major change in the visual landscape. The six proposed highway-rail grade separations would be highly visible, and several residences would experience major changes in their viewshed resulting in a high visual impact. The construction of the West Bypass is also in conflict with the County's Comprehensive Plan.

The aesthetics and visual environment impacts relate to the community effects (Chapter 4.11). Therefore, it is important to highlight the DEIS narrative detailing community effects which states that the West Bypass (5C) would result in 20 residential relocations, 1 community facility relocation (Calvary Pentecostal Tabernacle and camp), 2 commercial relocations, and partial acquisition of more than 50 parcels. The selection of the West Bypass would put a cloud over all of these, and the effect would be immediate. The cloud would affect the use and enjoyment of these properties, the ability to sell the properties and along the sales prices.

The narrative above from Section 4.11.2.1 states West Bypass 5C results in 20 residential relocations, although Table 4.23-1 indicates alternative 5C results in 21 residential relocations. However, the County's review of the plans shows the number will likely be higher, perhaps 30 developed residential properties are directly impacted. The bypass will also require the acquisition of almost 150 acres of additional right-of-way. It is important to clarify the difference between property zoning classification and the actual use of the property. It has been noted by some there is only one residential property impacted by the West Bypass. That single impact is a property zoned residential (R). Agriculturally zoned property (A) also supports and allows residential use. The Agriculturally zoned property is where the majority of the existing affected residences are located.

Regarding potential historic resources (Chapter 4.13), the third track alternatives (5B and 5D) are shown to potentially adversely affect six *buildings, structures, objects or districts* that are either list or potentially eligible to be listed on the NRHP. This number excludes the impact to the RF&P rail corridor, which is essentially impacted by every alternative along the entire corridor between Richmond Main Street Station and Washington D.C. The impacts on the Berkleytown Historic District (166-5073), Ashland Historic District (166-0001), Randolph-Macon Historic District (166-0002), and Randolph-Macon Historic District Expansion (166-5072) are due to disturbances to the setting, feeling, and design of the district. The MacMurdo House (166-0036) impact is the result of moving the existing sidewalks and roadways closer to the historic dwelling and onto the parcel boundaries, thus impacting the resource's integrity of design, setting, feeling, and association and modifying key visual elements of the building. The impact to the Ashland Station Depot (166-001-0008) range from track changes and building alterations to potential demolition under alternative 5D (three tracks centered). The Ashland three track alternatives therefore potentially have a larger impact on historic resources than a Western Bypass, but the majority of the impacts are related to the setting, feeling and design of the district.

Chapter 4.15 discusses transportation impacts. There has been much discussion regarding the perceived significant increase in the total daily vehicle delay in Ashland resulting from Alternatives 5A, 5B and 5D. However, Table 4.15-13 shows that the projected 2025 overall total daily vehicle delay impact in Ashland decreases between 24% and 26% due primarily to the two grade separations included in those alternatives. It is



3

noted however that the England Street / Thompson Street crossing remains at-grade and experiences a 12% increase over the no build delay in 2025. The DEIS reports: "*The England Street / Thompson Street crossing exceeds the 40-hour FHWA threshold in two of the build alternatives that pass through the Town of Ashland (Build Alternatives 5A and 5B with 41.85 total daily hours). The total daily delay at this crossing is 37.37 hours under No Build conditions*". It appears that this delay is based upon an assumption that driving habits will not change after the new grade separation improvements are constructed. It seems more likely that drivers will take advantage of the new grade separated crossings in order to avoid the England Street / Thompson Street crossing which would in turn reduce the England Street / Thompson Street total daily vehicle delay. More importantly, the construction of grade separated crossings at Vaughn and Ashcake roads would facilitate the movement of public safety equipment and personnel from one side of the tracks to the other. The Western Bypass would leave unresolved the existing issue regarding the movement of public safety vehicles across the tracks in Ashland.

The DEIS discusses additional impacts ranging from loss of conservation areas and wildlife habitat to road closures and road network alterations. The adverse effects of these items are greatest for the West Bypass alternative (5C) as are many of the additional impacts noted in the report.

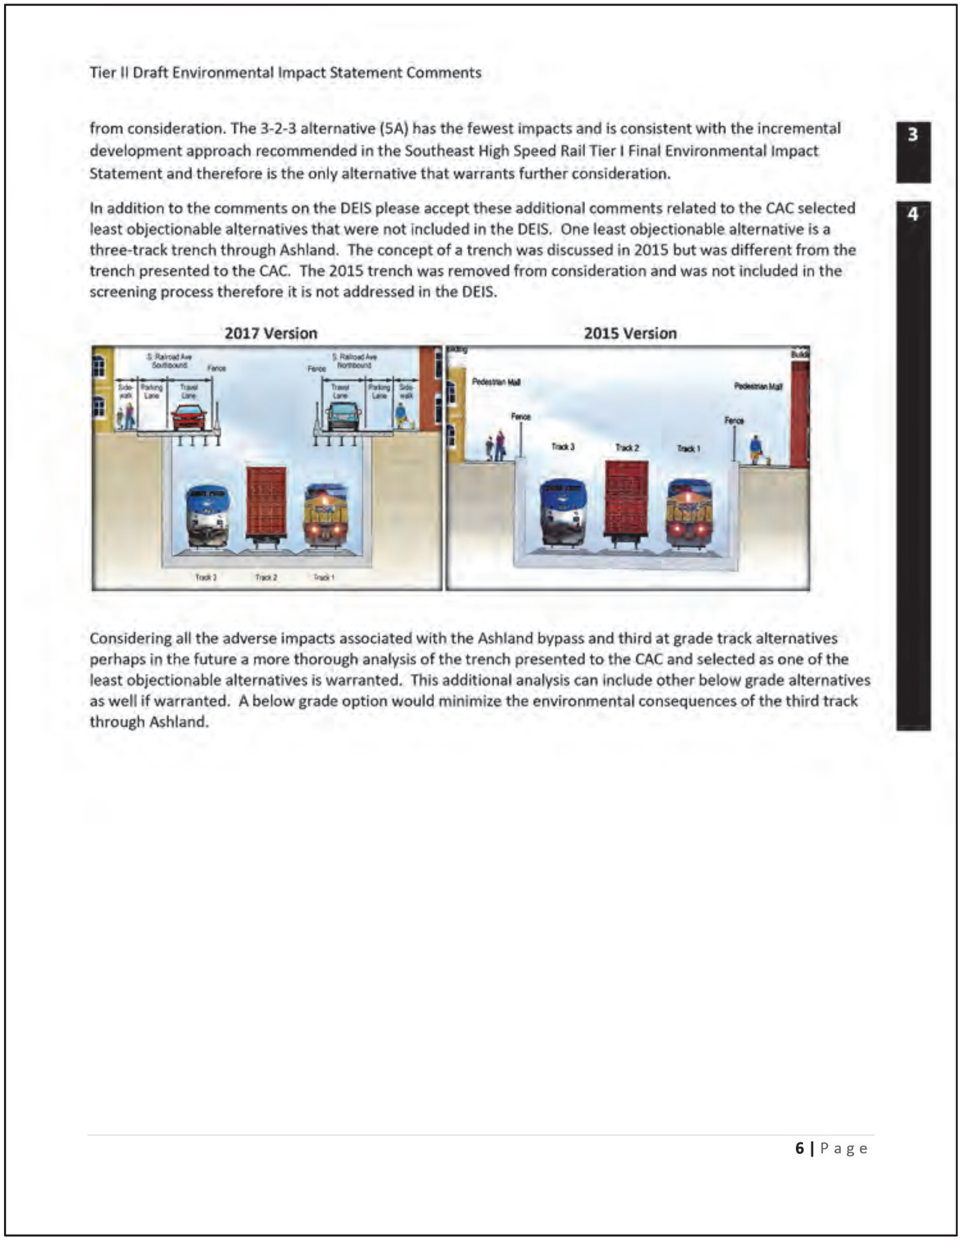
Bypass alternative 5C also has the greatest capital cost ($600 million), and clearly the operational costs of all the new track and grade separated crossings will be more costly. The capital cost comparison is shown in the table below.

Alternative Area	Build Alternative	Capital Cost (2025 $ - millions)
Area 5: Ashland (Doswell to I-295)	5A: Maintain Two Tracks Through Town (850-Foot Platforms)	$349.5
	5A–Ashcake: Maintain Two Tracks Through Town (Relocate Station to Ashcake)	$350.3
	5B: Add One Track Through Town East of Existing (850-Foot Platforms)	$388.3
	5B–Ashcake: Add One Track Through Town East of Existing (Relocate Station to Ashcake)	$388.8
	5C: Add Two-Track West Bypass (850-Foot Platforms)	$599.2
	5C–Ashcake: Add Two-Track West Bypass (Relocate Station	$600.0
	5D–Ashcake: Three Tracks Centered Through Town (Add One Track, Relocate Station to Ashcake)	$398.8

In conclusion, the West Bypass Alternative 5C has the greatest adverse impact on a majority of the criteria evaluated for the DEIS, and the highest cost. It is recognized the third track alternatives 5B and 5D do have qualitative impacts on existing residents, businesses and historic resources as well as arguably to the character of Ashland. As such, the West Bypass (5C) and third track at grade alternatives (5B and 5D) should be removed

HANOVER COUNTY (continued)

(For response to comment 3, refer to page B-273)



from consideration. The 3-2-3 alternative (5A) has the fewest impacts and is consistent with the incremental development approach recommended in the Southeast High Speed Rail Tier I Final Environmental Impact Statement and therefore is the only alternative that warrants further consideration. 3

4 In addition to the comments on the DEIS please accept these additional comments related to the CAC selected least objectionable alternatives that were not included in the DEIS. One least objectionable alternative is a three-track trench through Ashland. The concept of a trench was discussed in 2015 but was different from the trench presented to the CAC. The 2015 trench was removed from consideration and was not included in the screening process therefore it is not addressed in the DEIS.

2017 Version

2015 Version

Considering all the adverse impacts associated with the Ashland bypass and third at grade track alternatives perhaps in the future a more thorough analysis of the trench presented to the CAC and selected as one of the least objectionable alternatives is warranted. This additional analysis can include other below grade alternatives as well if warranted. A below grade option would minimize the environmental consequences of the third track through Ashland.

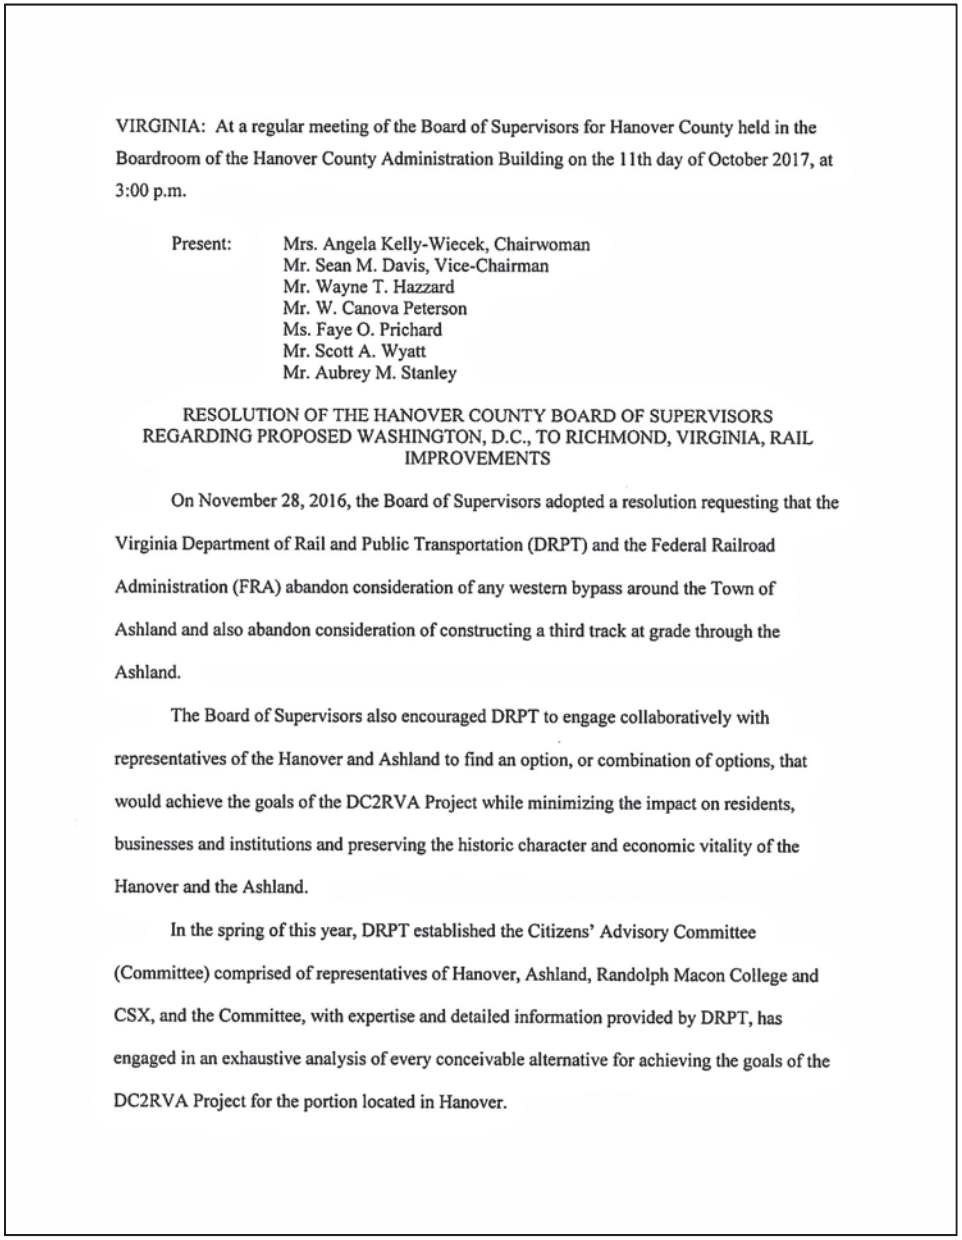
HANOVER COUNTY (continued)

(For response to comment 3, refer to page B-273)

4. A range of below-grade options, including various types of tunnels and trench structures, were considered during the initial alternatives development process, as summarized in Chapter 2 of the Draft EIS and the Alternatives Technical Report (Appendix A of the Draft EIS). As noted in DRPT-statement #2 above, these below-grade options were dismissed due to their higher construction costs, longer construction periods and inherent disruption to local businesses, residences and travelers. Additional open trench options were considered during the CAC sessions; however, for the reasons noted previously, these options were ultimately not considered to be as viable and environmentally less damaging than the ”3-2-3” alternative (i.e., Alternative 5A) by the CAC.

HANOVER COUNTY (continued)

(No comments on this page)



VIRGINIA: At a regular meeting of the Board of Supervisors for Hanover County held in the Boardroom of the Hanover County Administration Building on the 11th day of October 2017, at 3:00 p.m.

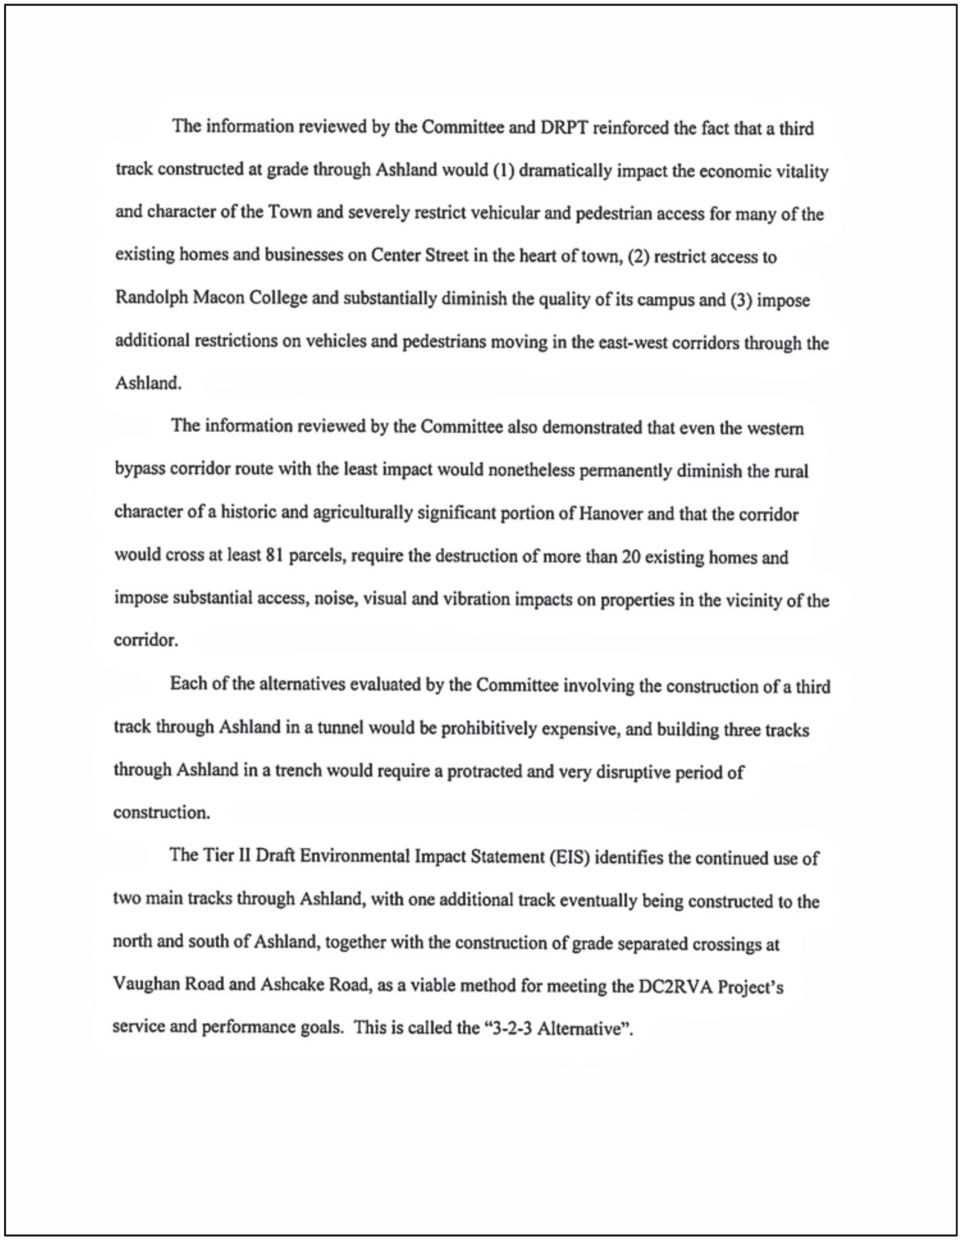
Present:	Mrs. Angela Kelly-Wiecek, Chairwoman Mr. Sean M. Davis, Vice-Chairman Mr. Wayne T. Hazzard Mr. W. Canova Peterson Ms. Faye O. Prichard Mr. Scott A. Wyatt Mr. Aubrey M. Stanley

RESOLUTION OF THE HANOVER COUNTY BOARD OF SUPERVISORS REGARDING PROPOSED WASHINGTON, D.C., TO RICHMOND, VIRGINIA, RAIL IMPROVEMENTS

On November 28, 2016, the Board of Supervisors adopted a resolution requesting that the Virginia Department of Rail and Public Transportation (DRPT) and the Federal Railroad Administration (FRA) abandon consideration of any western bypass around the Town of Ashland and also abandon consideration of constructing a third track at grade through the Ashland.

The Board of Supervisors also encouraged DRPT to engage collaboratively with representatives of the Hanover and Ashland to find an option, or combination of options, that would achieve the goals of the DC2RVA Project while minimizing the impact on residents, businesses and institutions and preserving the historic character and economic vitality of the Hanover and the Ashland.

In the spring of this year, DRPT established the Citizens' Advisory Committee (Committee) comprised of representatives of Hanover, Ashland, Randolph Macon College and CSX, and the Committee, with expertise and detailed information provided by DRPT, has engaged in an exhaustive analysis of every conceivable alternative for achieving the goals of the DC2RVA Project for the portion located in Hanover.



The information reviewed by the Committee and DRPT reinforced the fact that a third track constructed at grade through Ashland would (1) dramatically impact the economic vitality and character of the Town and severely restrict vehicular and pedestrian access for many of the existing homes and businesses on Center Street in the heart of town, (2) restrict access to Randolph Macon College and substantially diminish the quality of its campus and (3) impose additional restrictions on vehicles and pedestrians moving in the east-west corridors through the Ashland.

The information reviewed by the Committee also demonstrated that even the western bypass corridor route with the least impact would nonetheless permanently diminish the rural character of a historic and agriculturally significant portion of Hanover and that the corridor would cross at least 81 parcels, require the destruction of more than 20 existing homes and impose substantial access, noise, visual and vibration impacts on properties in the vicinity of the corridor.

Each of the alternatives evaluated by the Committee involving the construction of a third track through Ashland in a tunnel would be prohibitively expensive, and building three tracks through Ashland in a trench would require a protracted and very disruptive period of construction.

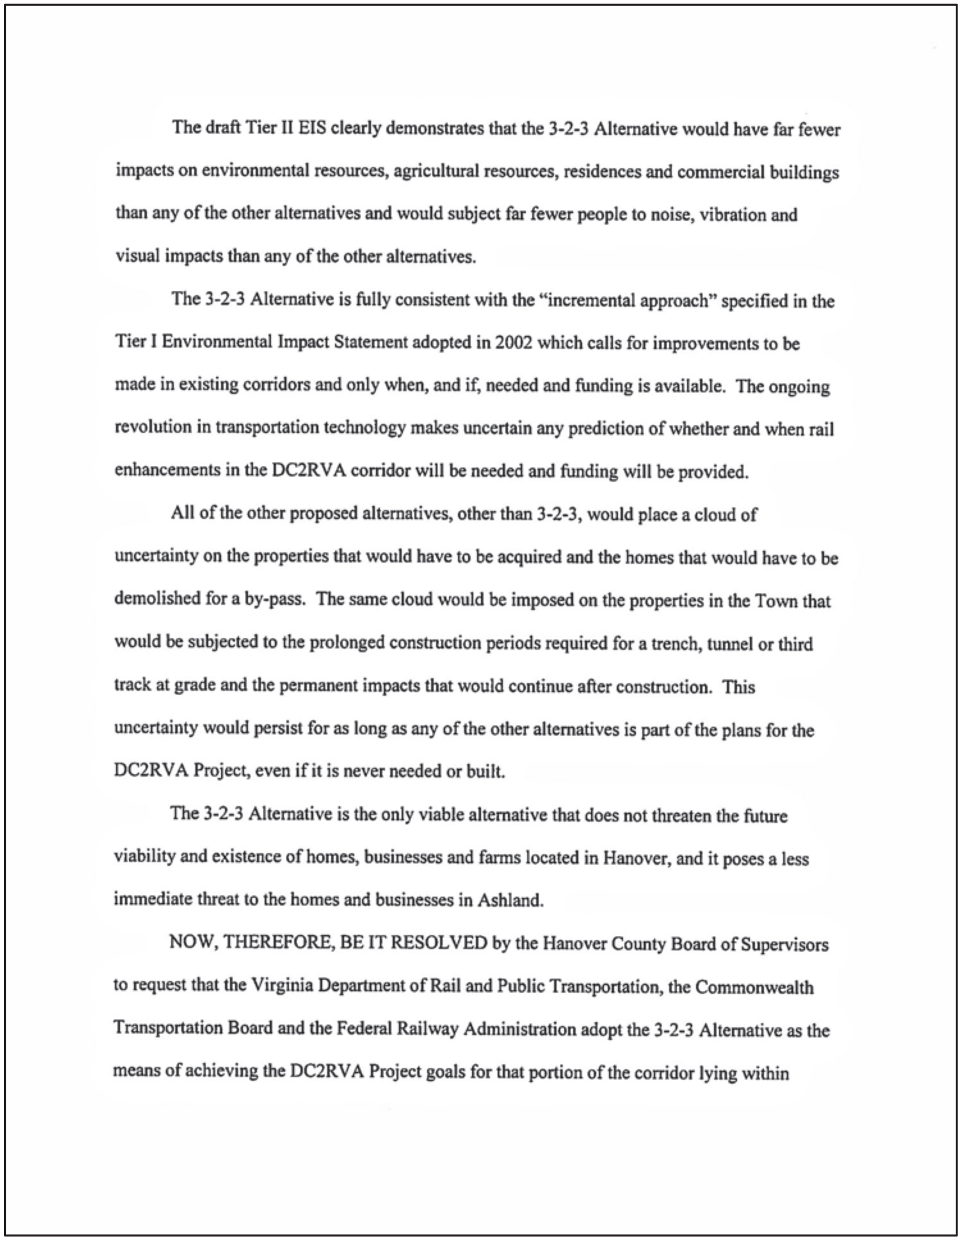
The Tier II Draft Environmental Impact Statement (EIS) identifies the continued use of two main tracks through Ashland, with one additional track eventually being constructed to the north and south of Ashland, together with the construction of grade separated crossings at Vaughan Road and Ashcake Road, as a viable method for meeting the DC2RVA Project's service and performance goals. This is called the "3-2-3 Alternative".

HANOVER COUNTY (continued)

(No comments on this page)

HANOVER COUNTY (continued)

(No comments on this page)



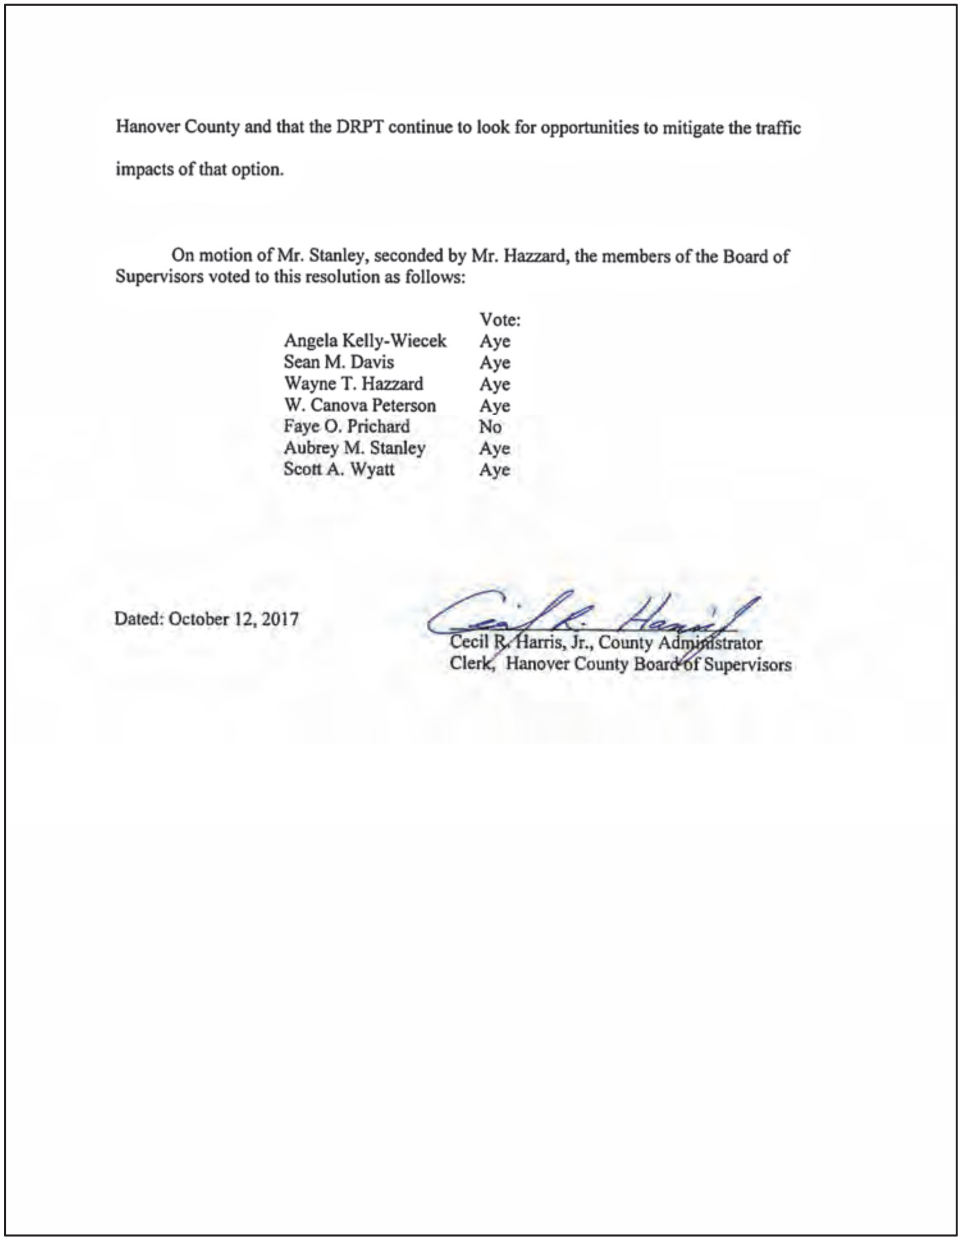
The draft Tier II EIS clearly demonstrates that the 3-2-3 Alternative would have far fewer impacts on environmental resources, agricultural resources, residences and commercial buildings than any of the other alternatives and would subject far fewer people to noise, vibration and visual impacts than any of the other alternatives.

The 3-2-3 Alternative is fully consistent with the "incremental approach" specified in the Tier I Environmental Impact Statement adopted in 2002 which calls for improvements to be made in existing corridors and only when, and if, needed and funding is available. The ongoing revolution in transportation technology makes uncertain any prediction of whether and when rail enhancements in the DC2RVA corridor will be needed and funding will be provided.

All of the other proposed alternatives, other than 3-2-3, would place a cloud of uncertainty on the properties that would have to be acquired and the homes that would have to be demolished for a by-pass. The same cloud would be imposed on the properties in the Town that would be subjected to the prolonged construction periods required for a trench, tunnel or third track at grade and the permanent impacts that would continue after construction. This uncertainty would persist for as long as any of the other alternatives is part of the plans for the DC2RVA Project, even if it is never needed or built.

The 3-2-3 Alternative is the only viable alternative that does not threaten the future viability and existence of homes, businesses and farms located in Hanover, and it poses a less immediate threat to the homes and businesses in Ashland.

NOW, THEREFORE, BE IT RESOLVED by the Hanover County Board of Supervisors to request that the Virginia Department of Rail and Public Transportation, the Commonwealth Transportation Board and the Federal Railway Administration adopt the 3-2-3 Alternative as the means of achieving the DC2RVA Project goals for that portion of the corridor lying within



Hanover County and that the DRPT continue to look for opportunities to mitigate the traffic impacts of that option.

On motion of Mr. Stanley, seconded by Mr. Hazzard, the members of the Board of Supervisors voted to this resolution as follows:

	Vote:
Angela Kelly-Wiecek	Aye
Sean M. Davis	Aye
Wayne T. Hazzard	Aye
W. Canova Peterson	Aye
Faye O. Prichard	No
Aubrey M. Stanley	Aye
Scott A. Wyatt	Aye

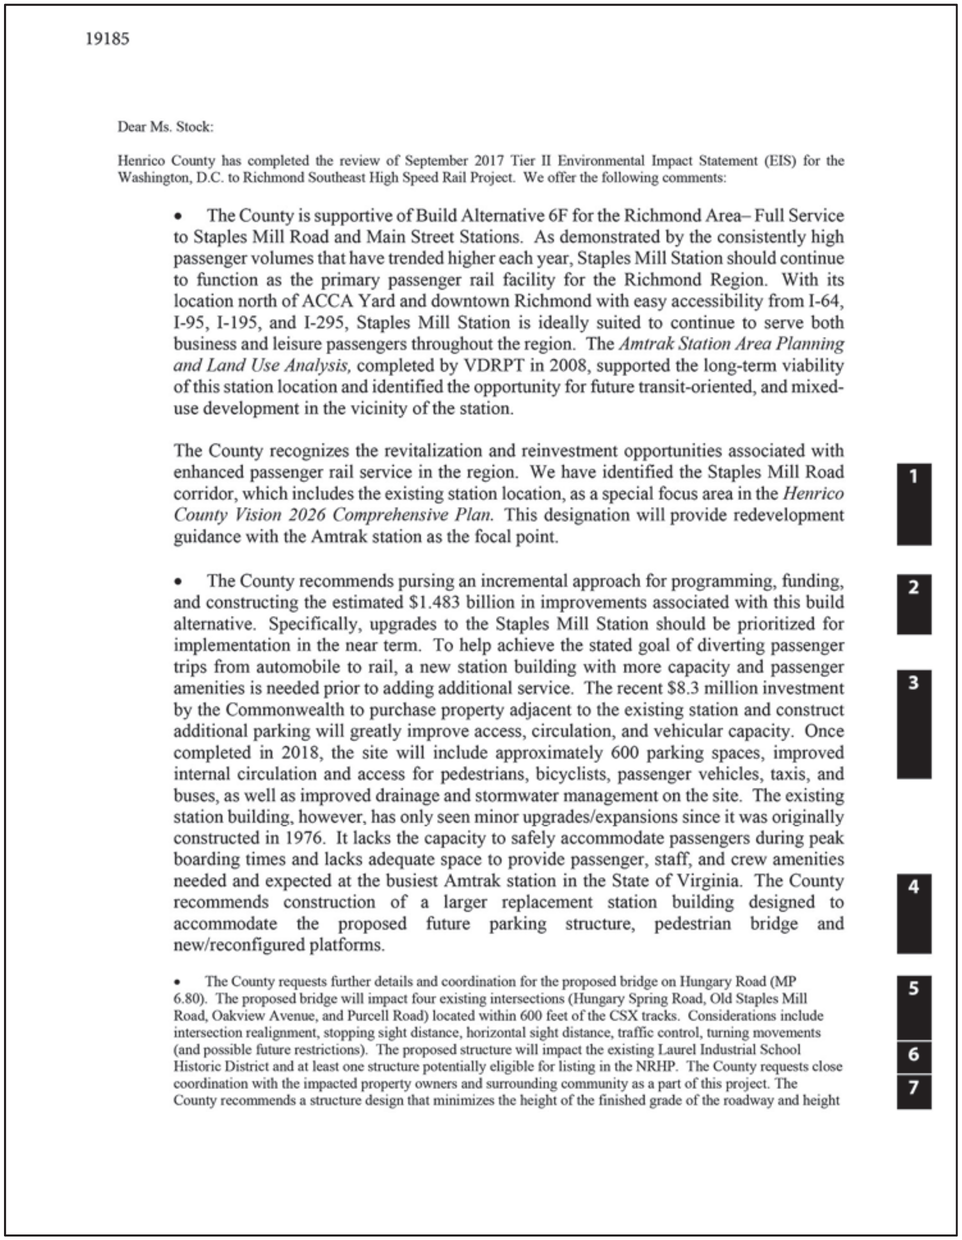
Dated: October 12, 2017

Cecil R. Harris

Cecil R. Harris, Jr., County Administrator
Clerk, Hanover County Board of Supervisors

HANOVER COUNTY (continued)

(No comments on this page)



19185

Dear Ms. Stock:

Henrico County has completed the review of September 2017 Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond Southeast High Speed Rail Project. We offer the following comments:

- The County is supportive of Build Alternative 6F for the Richmond Area– Full Service to Staples Mill Road and Main Street Stations. As demonstrated by the consistently high passenger volumes that have trended higher each year, Staples Mill Station should continue to function as the primary passenger rail facility for the Richmond Region. With its location north of ACCA Yard and downtown Richmond with easy accessibility from I-64, I-95, I-195, and I-295, Staples Mill Station is ideally suited to continue to serve both business and leisure passengers throughout the region. The *Amtrak Station Area Planning and Land Use Analysis*, completed by VDRPT in 2008, supported the long-term viability of this station location and identified the opportunity for future transit-oriented, and mixed-use development in the vicinity of the station.

  1 The County recognizes the revitalization and reinvestment opportunities associated with enhanced passenger rail service in the region. We have identified the Staples Mill Road corridor, which includes the existing station location, as a special focus area in the *Henrico County Vision 2026 Comprehensive Plan*. This designation will provide redevelopment guidance with the Amtrak station as the focal point.

- 2 The County recommends pursing an incremental approach for programming, funding, and constructing the estimated $1.483 billion in improvements associated with this build alternative. Specifically, upgrades to the Staples Mill Station should be prioritized for implementation in the near term. 3 To help achieve the stated goal of diverting passenger trips from automobile to rail, a new station building with more capacity and passenger amenities is needed prior to adding additional service. The recent $8.3 million investment by the Commonwealth to purchase property adjacent to the existing station and construct additional parking will greatly improve access, circulation, and vehicular capacity. Once completed in 2018, the site will include approximately 600 parking spaces, improved internal circulation and access for pedestrians, bicyclists, passenger vehicles, taxis, and buses, as well as improved drainage and stormwater management on the site. The existing station building, however, has only seen minor upgrades/expansions since it was originally constructed in 1976. It lacks the capacity to safely accommodate passengers during peak boarding times and lacks adequate space to provide passenger, staff, and crew amenities needed and expected at the busiest Amtrak station in the State of Virginia. 4 The County recommends construction of a larger replacement station building designed to accommodate the proposed future parking structure, pedestrian bridge and new/reconfigured platforms.

- 5 The County requests further details and coordination for the proposed bridge on Hungary Road (MP 6.80). The proposed bridge will impact four existing intersections (Hungary Spring Road, Old Staples Mill Road, Oakview Avenue, and Purcell Road) located within 600 feet of the CSX tracks. Considerations include intersection realignment, stopping sight distance, horizontal sight distance, traffic control, turning movements (and possible future restrictions). 6 The proposed structure will impact the existing Laurel Industrial School Historic District and at least one structure potentially eligible for listing in the NRHP. The County requests close coordination with the impacted property owners and surrounding community as a part of this project. 7 The County recommends a structure design that minimizes the height of the finished grade of the roadway and height

HENRICO COUNTY

1. Comment noted. Staples Mill Road Station and its location within Henrico County as it relates to transportation and comprehensive planning is discussed in Section 3.11.3 of the Draft EIS. Alternative 6F was selected as the Preferred Alternative for the Richmond Area, which includes service to and improvements at Staples Mill Road Station.

2. DRPT anticipates that the DC2RVA Project will be implemented incrementally, based on identified priorities for track capacity projects, as funding becomes available. DRPT anticipates that funding for the Project will come from multiple sources, including federal, state, and local funds, plus passenger fare revenue recovery and private sector sources. These next steps in the Project (funding, priorities, and the incremental approach, as well as details on final design, permitting, and construction) are summarized in Chapter 7 of the Final EIS, which has been added since the Draft EIS

3 and 4. At Staples Mill Road Station in Henrico County, the Preferred Alternative for the Richmond area (Alternative 6F: Full Service, Staples Mill Road/Main Street Stations) recommends: removing existing platforms and constructing two new 1,200-foot level-boarding island platforms (top elevation 48" above top of rail) on the east side of the right-of-way opposite the existing station building; constructing a pedestrian bridge with an elevator and stairs to access the platforms; and replacing the existing station building with an approximately 10,400 square foot two-story building. The Final EIS reflects the expansion of the existing parking lot at Staples Mill Road Station by DRPT, Amtrak, and VDOT in June 2018; see Section 4.3.6 of the Final EIS.

Refer to DRPT-numbered statement #2 for response on funding and implementation. This does not preclude upgrading Staples Mill Road Station independently of the DC2RVA Project, should federal, state, local, or other funding become available.

19185

Dear Ms. Stock:

Henrico County has completed the review of September 2017 Tier II Environmental Impact Statement (EIS) for the Washington, D.C. to Richmond Southeast High Speed Rail Project. We offer the following comments:

- The County is supportive of Build Alternative 6F for the Richmond Area– Full Service to Staples Mill Road and Main Street Stations. As demonstrated by the consistently high passenger volumes that have trended higher each year, Staples Mill Station should continue to function as the primary passenger rail facility for the Richmond Region. With its location north of ACCA Yard and downtown Richmond with easy accessibility from I-64, I-95, I-195, and I-295, Staples Mill Station is ideally suited to continue to serve both business and leisure passengers throughout the region. The *Amtrak Station Area Planning and Land Use Analysis*, completed by VDRPT in 2008, supported the long-term viability of this station location and identified the opportunity for future transit-oriented, and mixed-use development in the vicinity of the station.

  The County recognizes the revitalization and reinvestment opportunities associated with enhanced passenger rail service in the region. We have identified the Staples Mill Road corridor, which includes the existing station location, as a special focus area in the *Henrico County Vision 2026 Comprehensive Plan*. This designation will provide redevelopment guidance with the Amtrak station as the focal point. 1

- The County recommends pursing an incremental approach for programming, funding, and constructing the estimated $1.483 billion in improvements associated with this build alternative. Specifically, upgrades to the Staples Mill Station should be prioritized for implementation in the near term. To help achieve the stated goal of diverting passenger trips from automobile to rail, a new station building with more capacity and passenger amenities is needed prior to adding additional service. The recent $8.3 million investment by the Commonwealth to purchase property adjacent to the existing station and construct additional parking will greatly improve access, circulation, and vehicular capacity. Once completed in 2018, the site will include approximately 600 parking spaces, improved internal circulation and access for pedestrians, bicyclists, passenger vehicles, taxis, and buses, as well as improved drainage and stormwater management on the site. The existing station building, however, has only seen minor upgrades/expansions since it was originally constructed in 1976. It lacks the capacity to safely accommodate passengers during peak boarding times and lacks adequate space to provide passenger, staff, and crew amenities needed and expected at the busiest Amtrak station in the State of Virginia. The County recommends construction of a larger replacement station building designed to accommodate the proposed future parking structure, pedestrian bridge and new/reconfigured platforms. 2 3 4

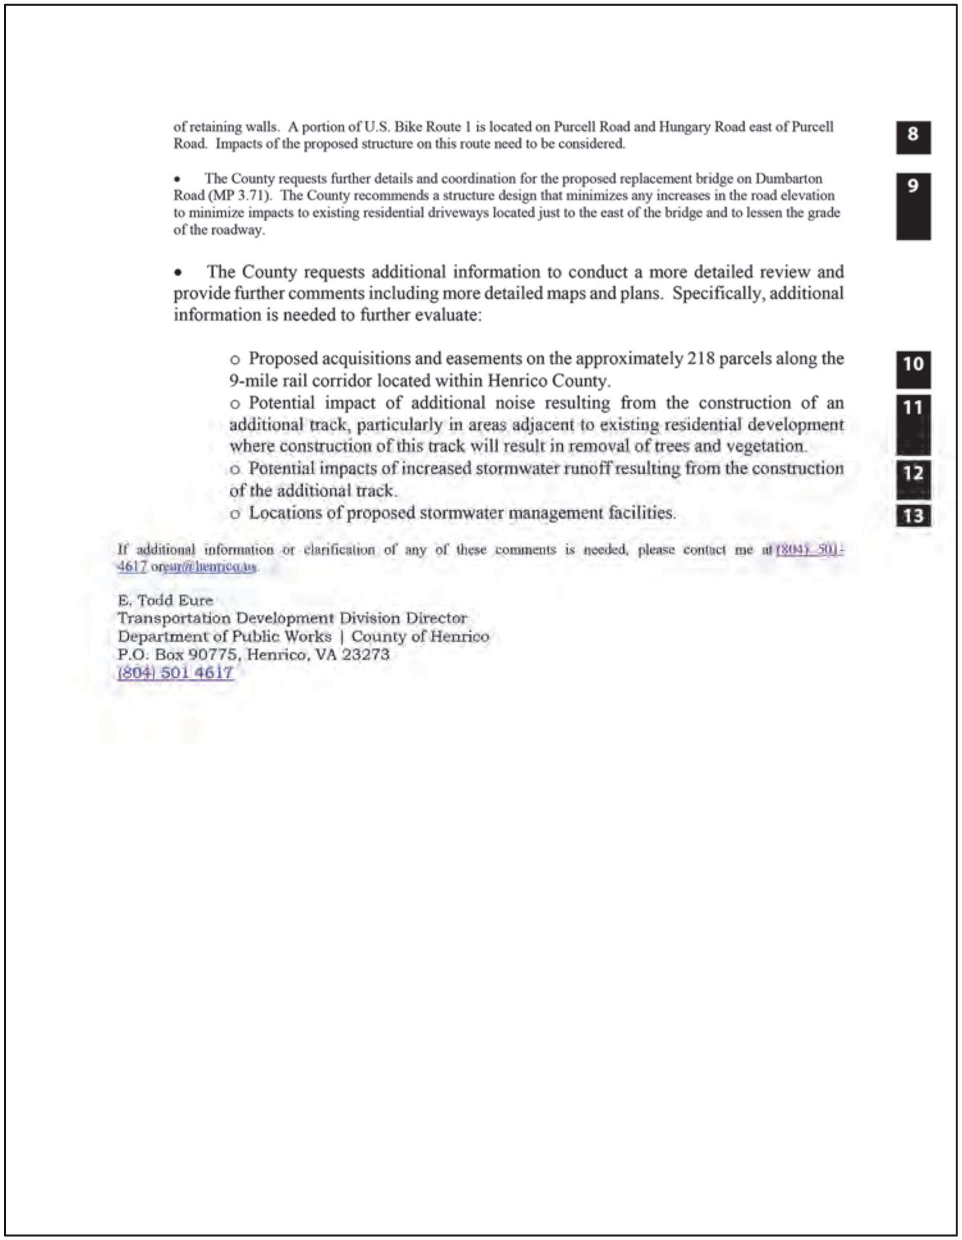
- The County requests further details and coordination for the proposed bridge on Hungary Road (MP 6.80). The proposed bridge will impact four existing intersections (Hungary Spring Road, Old Staples Mill Road, Oakview Avenue, and Purcell Road) located within 600 feet of the CSX tracks. Considerations include intersection realignment, stopping sight distance, horizontal sight distance, traffic control, turning movements (and possible future restrictions). The proposed structure will impact the existing Laurel Industrial School Historic District and at least one structure potentially eligible for listing in the NRHP. The County requests close coordination with the impacted property owners and surrounding community as a part of this project. The County recommends a structure design that minimizes the height of the finished grade of the roadway and height 5 6 7

HENRICO COUNTY

5. DRPT welcomes input regarding the design of the proposed Hungary Road overpass and will continue to coordinate with the County and other stakeholders during final design, which will occur after funding becomes available and incremental improvements are scheduled. The County's considerations for the proposed Hungary Road overpass are noted.

6. The Laurel Industrial School Historic District is eligible for the National Register of Historic Places (NRHP) as a district, and the Main Building (the Robert Stiles Building) on the Laurel Industrial School campus is also individually eligible for the NRHP. Both resources were discussed in the Project technical reports and both the Draft and Final EIS which describe their significance, state their eligibility, and present the potential for the Project to adversely impact these resources. This data can be found in and Chapters 3, 4, and 5 and Appendix R of the Draft EIS and in Chapters 5 and 6 and Appendix D of the Final EIS. Based on coordination with the Virginia Department of Historic Resources (DHR), it has been determined that the creation of the overpass will have an adverse effect on the historic district and the Main Building. Both resources are included in the Section 106 Draft Memorandum of Agreement (Appendix K of the Final EIS), which outlines steps being completed to mitigate the adverse effect on these two resources.

7. The County's recommendations to minimize the height of the finished grade of the roadway and retaining walls are noted. The height of the finished grade of the roadway will be determined during final design, and will be controlled by the existing elevation of the track, the FRA requirement for a vertical clearance of 24 feet 3 inches to the lowest member of the structure, the structure depth determined by the span width to meet CSXT horizontal clearance requirements, and the superstructure depth based on the projected traffic volumes and types of vehicles.



of retaining walls. A portion of U.S. Bike Route 1 is located on Purcell Road and Hungary Road east of Purcell Road. Impacts of the proposed structure on this route need to be considered. 8

- The County requests further details and coordination for the proposed replacement bridge on Dumbarton Road (MP 3.71). The County recommends a structure design that minimizes any increases in the road elevation to minimize impacts to existing residential driveways located just to the east of the bridge and to lessen the grade of the roadway. 9

- The County requests additional information to conduct a more detailed review and provide further comments including more detailed maps and plans. Specifically, additional information is needed to further evaluate:
  - Proposed acquisitions and easements on the approximately 218 parcels along the 9-mile rail corridor located within Henrico County. 10
  - Potential impact of additional noise resulting from the construction of an additional track, particularly in areas adjacent to existing residential development where construction of this track will result in removal of trees and vegetation. 11
  - Potential impacts of increased stormwater runoff resulting from the construction of the additional track. 12
  - Locations of proposed stormwater management facilities. 13

If additional information or clarification of any of these comments is needed, please contact me at (804) 501-4617 or eur@henrico.us.

HENRICO COUNTY (continued)

8. US Bike Route 1 is included in the proposed improvements approaching the proposed Hungary Road overpass. US Bike Route 1 connectivity will be maintained during the construction of Project improvements.

9. DRPT welcomes input regarding the design of the Dumbarton Road overpass and will continue to coordinate with the County and other stakeholders during final design, which will occur after funding becomes available and incremental improvements are scheduled. The County's recommendations for the proposed Dumbarton Road overpass are noted.

10. DRPT will continue to work to minimize property impacts during the final design process of the Project, which will take place once funding becomes available and incremental improvements are scheduled.

    Right of way and relocations are discussed in Section 5.11 of the Final EIS, which have been updated since the Draft EIS to reflect the conceptual design of the Preferred Alternative, as described in Chapter 4 of the Final EIS. Total and partial acquisition of parcels are expected throughout the corridor as part of the Project. The right-of-way acquisition process, including property owner notification, appraisal, acquisition, and relocation, will be conducted by VDOT, in coordination with DRPT and FRA, in accordance with Federal and state statutes and regulations. The CSXT crossing of Hungary Road, in Henrico County, is proposed to be modified to a grade-separated crossing under the Preferred Alternative. Due to the grade at this location, residential and business relocations may be unavoidable, primarily due to loss of access. Partial acquisitions of parcels will occur in other areas of Henrico County as well.

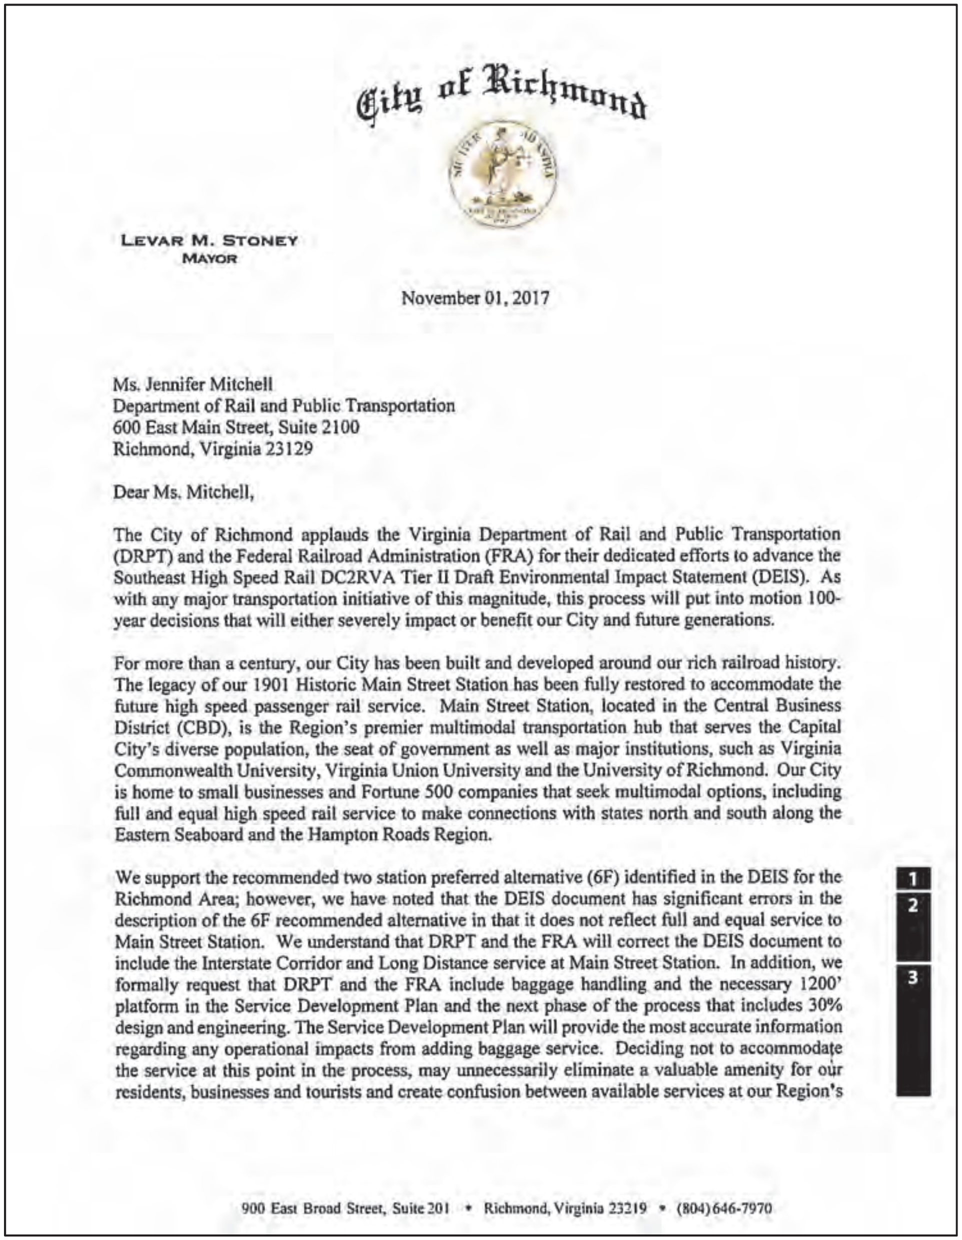
HENRICO COUNTY (continued)

11. DRPT evaluated noise effects of the proposed intercity passenger trains using FRA methods which qualify potential noise impacts as either moderate or severe. Locations where moderate and severe noise impacts are projected to occur are presented in the noise impact contour figures, in the noise and vibration technical report (Appendix P of the Draft EIS). There are no changes to the noise impact contours since the publication of the Draft EIS, with the exception of two areas for noise only; these two areas are detailed in Final EIS Section 5.7 and updated maps are provided in Appendix M of the Final EIS.

    DRPT also evaluated construction noise associated with the Project. After the final design is complete, potential noise impacts will be reevaluated, and mitigation measures will be finalized. Final design will occur after funding becomes available and incremental improvements are scheduled. DRPT also notes that FRA does not consider trees and vegetation to be effective at reducing train noise.

12. Section 5.1.1.3 of the Final EIS discusses the potential stormwater runoff impacts from the construction of additional rail bed and track for the Preferred Alternative. The Preferred Alternative will be designed and constructed in accordance with the Virginia Erosion and Sediment Control Law (§10.1-560 et seq. of the Code of Virginia), the Stormwater Management Act (§10.1-603. 1 et seq. of the Code of Virginia), and the terms and conditions of water quality permits required by USACE, Virginia DEQ, and VMRC.

13. Detailed drainage plans, including the locations of proposed stormwater management facilities, will be developed and shared with stakeholders during final design, which will take place once funding becomes available and incremental improvements are scheduled.



City of Richmond

LEVAR M. STONEY
MAYOR

November 01, 2017

Ms. Jennifer Mitchell
Department of Rail and Public Transportation
600 East Main Street, Suite 2100
Richmond, Virginia 23129

Dear Ms. Mitchell,

The City of Richmond applauds the Virginia Department of Rail and Public Transportation (DRPT) and the Federal Railroad Administration (FRA) for their dedicated efforts to advance the Southeast High Speed Rail DC2RVA Tier II Draft Environmental Impact Statement (DEIS). As with any major transportation initiative of this magnitude, this process will put into motion 100-year decisions that will either severely impact or benefit our City and future generations.

For more than a century, our City has been built and developed around our rich railroad history. The legacy of our 1901 Historic Main Street Station has been fully restored to accommodate the future high speed passenger rail service. Main Street Station, located in the Central Business District (CBD), is the Region's premier multimodal transportation hub that serves the Capital City's diverse population, the seat of government as well as major institutions, such as Virginia Commonwealth University, Virginia Union University and the University of Richmond. Our City is home to small businesses and Fortune 500 companies that seek multimodal options, including full and equal high speed rail service to make connections with states north and south along the Eastern Seaboard and the Hampton Roads Region.

We support the recommended two station preferred alternative (6F) identified in the DEIS for the 1
Richmond Area; however, we have noted that the DEIS document has significant errors in the 2
description of the 6F recommended alternative in that it does not reflect full and equal service to
Main Street Station. We understand that DRPT and the FRA will correct the DEIS document to
